The larva of this insect lives in the bark of trees and is said to prey upon other insects. It is exceedingly active in its motions, which are somewhat like those of a snake. The body is soft, long, and slender, of a brown colour, striped, and variegated with yellow; the head and prothorax are corneous and of a black colour. In the pupa all the parts of a perfect insect are distinct, being enveloped in a thin membrane.

Family *Termitidæ*.—This family is distinguished by the following characters:—Wings with few transverse nervures, folding horizontally; tarsi four-jointed; antennæ short and moniliform; body depressed.

In the genus *Termes* the head is large and rounded, and besides the ordinary compound eyes, it has three ocelli, or simple eyes, situated on the upper surface; the antennæ are as long as the head and thorax, inserted in front of the eyes, and composed of about eighteen joints. The abdomen is terminated by two small jointed appendages.

The Termites, or white ants, as they are often called, though they have little affinity with the true ants, are chiefly confined to the tropics; some few species however extend into the temperate regions. Like the bees, wasps, and ants, which live in society, the Termites are composed of three kinds of individuals, males, females, and what are termed neuters or workers. Their ravages in the warmer parts of the globe are well known. They unite in societies composed each of an immense number of individuals, living in the ground and in trees, and often attacking the wood-work of houses; in which they form innumerable galleries, all of which lead to a central point. In forming these galleries they avoid piercing the surface of the wood-work, and hence it appears sound when the slightest touch is sometimes sufficient to cause it to fall to pieces.

The termites sometimes erect their domiciles on the ground in the form of pyramids or cones, sometimes with a roof, and these nests are often very numerous, and resemble the huts of savages.

The larvæ nearly resemble the perfect insect, excepting that they possess no wings. The pupæ have rudimentary wings. The neuters differ from the males and females in possessing no wings, in having the body stouter, the head much longer and provided with long jaws crossing at the

extremity. They are said to defend the nests, and stationing themselves near the outer surface, they are the first to make their appearance when their habitation is disturbed: they will attack the party molesting them, and bite with considerable strength.

The negroes and Hottentots consider these insects a great delicacy. They are destroyed with quick-lime, or more readily with arsenic, which is thrown into their habitations.

The *Psocidæ* are very small insects, having soft and swollen bodies: the head is very large, nearly trigonal, and provided with three ocelli on the upper surface. The wings when folded meet at an angle above the abdomen, and are sparingly provided with nervures. The antennæ are setaceous, and composed of about ten joints. The tarsi are short, and usually two-jointed. They are very active in their motions, and live in the bark of old trees and in dwelling-houses. Nearly forty species are said to be found in this country.

TE'RMOLI. [Sannio.]

TERMONDE. [Dendermonde.]

TERN, STERNA, the name of those web-footed long-winged birds which are vulgarly known as *Sea-Swallows*.

Linnæus, in his last edition of the *Systema Naturæ*, places the genus *Sterna* between *Larus* and *Rhynchops*.

Cuvier arranges the *Hirondelles de Mer* between the *Goelands* (*Larus*) and *Rhynchops*. He observes that these *Hirondelles de Mer* derive their names from their excessively long and pointed wings, their forked tail, and their short legs, which give them a port and flight analogous to those of the Swallows. Their bill, he adds, is pointed, compressed, straight, without curvature or projection; their nostrils, situated towards the base, are oblong and pierced through; the membranes which unite their toes are very much notched, they therefore swim but little. They fly in all directions, and with rapidity over the sea, uttering loud cries and cleverly picking up from its surface the mollusks and small fishes which form their food. They also advance inland to lakes and rivers.

Head and foot of Tern.

The same author states that the *Noddies* may be distinguished from the other Sea-Swallows. Their tail is not forked.

The views of Mr. Vigors, Mr. Swainson, and others, as to the position of the Terns, will be found in the article Laridæ.

Mr. Swainson makes the genus *Sterna* consist of the following subgenera:—*Sterna*, Linn.; *Thalassites*, Sw.; *Phaeton*, Linn.; *Rhynchops*, Linn.; *Gavia*, Briss.

The Prince of Canino places *Sterninæ*, the second subfamily of his *Laridæ*, between the subfamilies *Rhynchopsinæ* and *Larinæ*. The *Sterninæ* consist of the following genera:—

Sterna, Linn.; *Hydrochelidon*, Boie; *Megalopterus*, Boie (N.B. *Sterna Stolida* of authors); *Thalasseus*, Boie; *Gelochelidon*, Brehm; and *Stylochelidon*, Brehm. (*Birds of Europe and North America.*)

Mr. G. R. Gray (*Genera of Birds*) arranges the *Sterninæ* as the third and last subfamily of *Laridæ*, immediately after *Rhynchopinæ*, with the following genera:—*Phætusa*, Wagl.; *Gelochelidon*, Brehm; *Thalasseus*, Boie; *Stylochelidon*, Brehm; *Gygis*, Wagl.; *Sterna*, Linn.; *Sternula*, Boie; *Hydrochelidon*, Boie; *Anoüs*, Leach (*Sterna stolida*, of authors); *Onychoprion*, Wagl.; and *Pelecanopus*, Wagl.

The *Pelecanidæ* immediately follow.

Geographical Distribution and Habits.—The habits of the Terns, which are widely diffused over the maritime parts of the globe, are noticed in the article Laridæ. The following have occurred, some occasionally only, in Europe:—

The Caspian Tern, *Sterna Caspia* (genus *Stylochelidon*, Brehm); The Sandwich Tern, *Sterna Cantiaca* (genus *Thalasseus*, Boie); the Gull-billed Tern, *Sterna Anglica* (genus *Gelochelidon*, Brehm); the common Tern, *Sterna Hirundo* (genus *Sterna* of authors); the Roseate Tern, *Sterna Dougallii* (genus *Sterna*); the Arctic Tern, *Sterna Arctica* (genus *Sterna*); the Little Tern, *Sterna minuta* (genus *Sternula*, Boie); the Noddy, *Sterna stolida* (genus *Anoüs*, Leach; *Megalopterus*, Boie); the Black Tern, *Sterna nigra* (genus *Hydrochelidon*, Boie; *Viralva*, Leach); the White-winged Tern, *Sterna leucoptera* (genus *Hydrochelidon?* Boie); and the Moustache Tern, *Sterna leucopareïa* (genus *Hydrochelidon?* Boie; *Viralva?* Leach). Of these, the largest is the Caspian Tern.

Our limits will not allow us to give more than two examples, and we select the Common Tern and the Noddy. We should premise that all the Terns of the British Islands are strictly migratory: many species visit us regularly for the purpose of breeding; but those, the Noddy for instance, whose home is far away, are seen casually and rarely.

The Common Tern.—*Description.*—Forehead, top of the head, and long feathers of the occiput, deep black; posterior part of the neck, back, and wings, bluish ash; lower parts pure white, with the exception of the breast only, which is slightly clouded with ash-colour; quills whitish ash, terminated by ashy-brown; tail white, but the two lateral feathers blackish-brown on their external barbs; bill crimson-red, often blackish towards the point; iris reddish-brown; feet red. Length 13 to 14 inches. Such is M. Temminck's description of the *adult male and female.*

The same author describes *the young of the year before the autumnal moult* as having the front, and a part of the top of the head, of a dirty white, marked towards the occiput with blackish patches; the long occipital feathers brownish-black; upper parts of tarnished bluish-ash; all these feathers bordered and terminated with whitish and irregularly spotted with brown or bright reddish; the lower parts of a dirty tarnished white; tail-feathers ash-coloured, terminated with whitish; base of the bill faded orange; iris blackish-brown; feet orange.

This is the *Pierre Garin* of the French; *Fionco* and *Rondine di Mare* of the Italians; *Meerschwalbe* and *Rothfussiger Meerschwalbe* of the Germans; *Zee-zwaluw* of the Netherlanders; *Kria* of the Icelanders; *Tende*, *Tendelobe*, *Sand-Tolle*, and *Sand-Tærrne* of the Norwegians; *Tærne* of the Danes; *Sea-Swallow* of the modern British; and *Y fôr-wennol fwyaf* and *Yscracan* of the antient British.

Geographical Distribution, Habits, &c.—'The Common Tern,' says Mr. Gould, in his great work on *the Birds of Europe*, 'although not universally dispersed over our coasts, is nevertheless a very abundant species, being found in great numbers over the southern shores, but more sparingly over the northern, which are almost exclusively inhabited by its near ally, the Arctic Tern. It is now satisfactorily ascertained that the common Tern does not extend its range to the American continent, and that its place is there supplied by another species, to which the Prince of Musignano,' now Prince of Canino, 'has given the specific appellation of *Wilsoni*, in honour of the celebrated ornithologist by whom it was first described.' The Prince however gives both *Sterna Wilsoni* and *Sterna Hirundo* as American species, in his *Birds of Europe and North America;* and M. Temminck states that individuals killed in North America differ in nothing from those of Europe. In the fourth part of his *Manuel* (1840), though he adds to the synonyms and references, quoting among the rest Mr. Gould's work, he leaves his own observation above noticed uncontradicted. 'How far,' says Mr. Gould in continuation, 'the Common Tern is distributed over the Old Continent we have not satisfactorily ascertained, but we believe its range is extended from the Arctic Circle to the Mediterranean, and even to the coasts of Africa and India, to which southern and eastern countries it is supposed to retire during our winters. The Common Tern does not confine itself entirely to the sea, but frequently resorts to inland streams, &c.; and when thus ascending our creeks and rivers these little fairies of the ocean fear-

lessly fish around our boats, nothing can be more pleasing than to observe their poise and dip. When with their scrutinizing eyes they have observed a fish sufficiently near the surface, they precipitate themselves upon it with unerring certainty, and a rapidity that is truly astonishing: this mode of capture strongly reminds us of the fissirostral tribe among the land birds, and they may indeed be truly termed the swallows of the ocean, their long and pointed wings, and small but muscular bodies, being admirably adapted for rapid and sustained flight, and affording the means by which they are enabled to traverse the surface of the deep with never-tiring wings.'

We have seen them performing their graceful evolutions so far inland as near Oxford, where they were continually dipping in the Isis for bleak, as it appeared to us, which were abundant there.

Mr. Selby states that this tern breeds upon the sand or shingle beyond high-water mark, making no artificial nest, but scraping a slight concavity for the reception of two or three eggs, which vary much in colour, the ground in some being of a deep oil-green, in others of a cream-white, or pale wood-brown, but all blotched with blackish-brown and ash-grey. 'In warm and clear weather,' says Mr. Selby in continuation, 'this bird incubates but little during the day, in such situations the influence of the sun upon the eggs being sufficient; but it sits upon them in the night, and also through the day under a less favourable state of weather. The young, when excluded, are covered with a mottled grey and white down, and are assiduously attended by the parents, and well supplied with food until able to fly and accompany them to sea. During the time of incubation the old birds display great anxiety, and are very clamorous when any one approaches their station, in flying round and frequently descending so near as to strike the hat of the intruder.'

Common Tern: two adults; one in winter, the other in summer plumage. (Gould.)

The following notice respecting the Arctic Tern, from the 'Bristol Mirror' newspaper (1842), is deserving of attention. The time alluded to was that when we had very blowing weather:—'During the high winds that prevailed on Sunday last, our harbour and floating-docks were visited by large flights of a rare and beautiful species of bird, the *Sterna Arctica*, or Arctic Tern. The birds were assembled in such vast numbers, that two or three hundred were killed with stones and other missiles, whilst several were caught alive; and so tame were they, that many were observed to pitch on the backs of passers by. This tern, as its name indicates, is a native of the higher arctic regions, and has been met with in all the late expeditions to the polar seas. It is a summer visitant to the coasts of Scotland and the north of England, but is rarely met with more southerly, and until the present there was no instance on record of a specimen having been obtained in this neighbourhood. The appearance of such vast flights of arctic birds, rare as a species, in the very heart of a large city, is an occurrence as remarkable as it is interesting. Flocks of these birds were also observed the same day at Clevedon, Weston, and other places along the Channel Coast.'

The Tern was formerly considered choice food. Thus, in the 'Household-book of the Earl of Northumberland' we find 'Ternes' among the delicacies for principal feasts or his lordship's own 'mees;' and they are charged at fourpence a dozen.

The Noddy.—Description.—In this form of tern the wings reach beyond the rounded tail. Forehead white, passing into grey-ash towards the top of the head, and into a deeper grey at the occiput, in front of the eyes a deep black patch; throat and cheeks grey-brown; all the upper and lower plumage chocolate or sooty-brown. Bill and feet black. (*Summer or nuptial dress.*) Length about a foot.

Geographical Distribution and Habits.—America principally, where its head-quarters appear to be the Gulf of Mexico, the coasts of Florida, and the Bahama Islands. Dr. Latham was told that they breed in great numbers on certain small rocky islands near St. Helena. Mr. Audubon observed numbers collected from the American coasts above mentioned in 1832, on one of the Tortugas, called, from the flocks that visit it, Noddy Key.

Mr. Gould remarks that the noddy, unlike the generality of terns, builds in bushes on low trees, making a large nest of twigs and dry grass, while hovering over or near which the old birds utter a low querulous murmur: the eggs, three in number, are reddish-yellow, with dull red and purple patches and spots, and the young are said to be very good eating. It does not take its prey like the other terns, but as it skims along the water; and, when full grown, seeks its food at much greater distances from the land than the rest of the group.

Two were shot off Wexford in Ireland in 1830. Temminck states that it has been seen in France, but he had never seen it on the coasts of Holland.

Noddy.

Mr. Nuttall gives a lively description of its habits.

'Familiar to mariners who navigate in the equatorial regions, the noddy, like the voyager, frequents the open seas to the distance of some hundreds of leagues from the land, and with many other birds of similar appetites and propensities, they are seen in great flights, assiduously following the shoals of their finny prey. They pursue them by flying near the surface of the water, and may now be seen continually dropping on the small fish, which approach the surface to shun the persecution of the greater kinds, by which they are also harassed. A rippling and silvery whiteness in the water marks the course of the timid and tumultuous shoals; and the whole air resounds with the clangor of these gluttonous and greedy birds, who, exulting or contending for success, fill the air with their varied but discordant cries. Where the strongest rippling appears, there the thickest swarm of noddies and sea-fowl are uniformly assembled. They frequently fly on board of ships at sea, and are so stupid or indolent on such occasions, as to suffer themselves to be taken by the hand from the yards on which they settle: they sometimes however, when seized, bite and scratch with great resolution, leading one to imagine that they are disabled often from flight by excessive fatigue or hunger. Some have imagined that the appearance of the noddy at sea indicates the proximity of land; but in the manner of the common tern, they adventure out to sea, and, like the mariner himself, the shelter of whose friendly vessel they seek, they often voyage at random for several days at a time, committing themselves to the mercy of the boundless ocean;

and having at certain seasons no predilection for places, where the climate suits, the roving flocks or stragglers find equally a home on every coast, shoal, or island.' (*Manual of Ornithology.*)

The vessel however is not always friendly. Bligh found the bird a seasonable supply to himself and his famished crew in his celebrated boat-voyage after the mutiny of the Bounty [BLIGH]; and Byron has improved the incident in the terrible scene after the shipwreck in 'Don Juan.' [BOOBY, vol. v., p. 159.]

TERNATE, an island in the Indian Archipelago, is traversed by 50′ N. lat. and 127° 20′ E. long. It is 10 miles long and from four to five miles wide. It derives its reputation from the circumstance that its sovereign is in possession of a considerable portion of the islands of Gilolo and Celebes; and on this account the Dutch have thought it expedient to form a considerable establishment on the island at Fort Orange. The northern group of the Moluccas has been called the Ternate Islands, though this island is only one of the smaller ones which belong to them, some of which are of great extent, especially Gilolo.

The greater part of the island appears to be occupied by a volcano, which, according to Valentyn, attains an elevation of 367 ruths and 2 feet, or 4095 feet English, above the sea-level. The remainder of the island is very fertile, and affords rice and the other productions of the Indian Archipelago: but we have very little information on these points, as the Dutch have always excluded foreigners, and prevent the natives from trading with the neighbouring islands, lest the spices which grow on this and other islands of the group should be brought to other countries by any other channel than their own commerce; and although the English have been twice in possession of the Dutch settlement, their attention has been more directed to the great Dutch colonies than to this comparatively small establishment. We learn only from Forrest, that the inhabitants of the Sooloo Archipelago were permitted to trade with Ternate, and that they imported large quantities of different articles of Chinese manufacture, which they exchanged for rice, edible birds'-nests, trepang, sharks' fins, tortoise-shells, and small pearls: they exported also a great number of lories.

The inhabitants are Malays, who have embraced Islam. There are three mosques. The king, who possesses also the northern part of Gilolo, and the north-eastern limb of Celebes, where the Dutch have two settlements at Manado and Gurontalu, and several of the adjacent islands, lives in great state. These countries however are governed by separate chiefs, who in many respects resemble the feudal aristocracy of the middle ages: but the king and the chiefs are dependent on the Dutch governor of Amboyna, of which government Ternate forms a regency.

Ternate was first visited by the Portuguese in 1521, and some years afterwards they formed a settlement, which passed into the hands of the Dutch in 1606; who, in 1680, reduced the king to a state of dependence on them, and enlarged their establishment. In 1797 it was taken, together with Amboyna, by the English, who restored it at the peace in 1801: it was again taken in 1810, and again given up to Holland by the treaty of Paris in 1814.

(Forrest's *Voyage to New Guinea and the Moluccas, &c.*; Stavorinus's *Voyages to the East Indies*; Von Buch's *Physikalische Beschreibung der Canarischen Inseln, &c.*)

TERNI. [SPOLETO.]

TERNSTRÖMIA'CEÆ, a natural order of plants belonging to the Calycose group of polypetalous Dicotyledons. As at present constituted, by Cambessedes, who is followed by Lindley, this order consists of trees or shrubs with alternate coriaceous leaves, without stipules, mostly undivided, and sometimes with pellucid dots. The flowers are generally white in colour, sometimes pink or red, and are arranged in axillary or terminal peduncles, articulated at the base. The calyx is composed of 5 or 7 sepals, imbricated in æstivation, the innermost the largest; petals 5, 6, or 9, often combined at the base; stamens indefinite with monadelphous or polyadelphous filaments, and versatile or adnate anthers; ovary superior; capsule 2 7 celled; seeds few, attached to a central axis, with little or no albumen, and a straight embryo, the cotyledons of which are very large, and often filled with oil. This order includes the Theaceæ of Mirbel and the Camellieæ of De Candolle. Their closest affinity is with the order Guttiferæ, from which they differ in their alternate leaves; in the parts of their flowers being 5 and its multiples; in the calyx being distinct from the corolla; in their twisted æstivation, and in their thin inadherent cotyledons. They have also relations with Hypericaceæ and Maregraaviacæ. The plants of this order are principally inhabitants of Asia and America; one species only is a native of Africa.

This order includes the genus Thea, and hence is one of great œconomical importance. [THEA.] It is supposed that the dried leaves brought to this country under the name of tea are not alone the produce of the genus Thea, but that the leaves of some species of Camellia are also mixed with them. [CAMELLIA.] Independent of these two genera, little is known of the properties of this order. The Cochlospermum insigne is used as a medicine in internal bruises in Brazil, where it is called *Butua do curvo*. The C. tinctorium yields a yellow dye; and the seeds of C. Gossypium yield a gum resembling Tragacanth, for which it is substituted.

Thea Bohea.

1, branch with flowers and leaves; 2, superior ovary with trifid stigma; 3, fruit entire; 4, capsule dehiscent.

TERPA'NDER (Τέρπανδρος), the earliest and the most important historical personage in the history of Greek music and its connection with poetry, for he was both a musician and a poet. He was a native of Antissa, in the island of Lesbos, and his best period falls in the latter half of the seventh century before Christ. There are few events in his life that can be chronologically established. In B.C. 676, at the first celebration of the musical contests during the festival of the Carneia near Sparta, Terpander was crowned as victor. (Athenæus, xiv., p. 635.) He afterwards gained four successive prizes in the musical contests at the Pythian games (Plutarch, *De Musica*, 4); and these victories probably fall between the years 672 and 645 B.C., since in the latter of these years he was at Sparta, and there introduced his nomes (νόμοι) for singing to the accompaniment of the cithara, and was engaged in reducing the music of the Greeks, such as it then was, to a regular system. (*Marmor. Parium, Epoch.* 34; Plutarch, *De Mus.*, 9.) At this time his fame must have reached its height. His descendants, or at least the musicians of his school (κιθαρῳδοί), continued for more than a century to obtain the prize at the Carneia every year without any interruption.

Numerous musical inventions are said to have been made by Terpander; many of them however may have been made by other persons, especially such as belonged to his school, and were subsequently ascribed to the father and founder of the art. Of many of his inventions we are unable to form any clear idea. The most important among them however is the seven-stringed cithara (heptachord).

Previous to his time songs, hymns, and rhapsodies had been accompanied with a cithara of only four strings (tetrachord), to which Terpander added three new strings, so as to make the cithara comprise a full octave, or, as the Greeks called it, a diapason. The heptachord soon came into general use, and remained the favourite instrument of the Greeks, especially the Dorians, notwithstanding the various alterations and improvements that were made. Another very important improvement which the antients unanimously assign to Terpander, is the reduction of the antient melodies to certain systems (νόμοι), which continued unaltered for several centuries. These nomes appear to have been of a twofold character: he either invented them himself, or he merely fixed those which had been used before his time. This fixing of certain tunes and melodies he is said to have effected by marks or notes which he made over the verses of a poem. In this manner he marked the tunes of his own poems, as well as of portions of the Homeric rhapsodies. His own poetical compositions, which, with the exceptions of a few fragments, are now lost, consisted of hymns, proœmia, and scolia.

(Müller, *History of the Literature of Antient Greece*, i., p. 149, &c.; Bode, *Geschichte der Lyrische Dichtkunst der Hellenen*, ii., p. 363, &c.)

TERPSI'CHORE. [Muses.]

TERRA DI LAVO'RO. [Lavoro, Terra di.]

TERRACI'NA, a town of the Papal State, in the administrative province of Frosinone, near the borders of the kingdom of Naples, and on the high road from Rome to Naples. The old town, which is built on the site of the antient Anxur, rises in the form of an amphitheatre on the slope of a calcareous rock which is a projection of the ridge called Monti Lepini, leaving but a narrow strip of land between it and the sea, along which runs the high road to Naples in the track of the antient Via Appia. Along the road are the modern buildings of Terracina, constructed by Pius VI., and consisting of the post-house and inns, custom-house, granaries, and other structures for public use. The old harbour, which was restored by the emperor Antoninus, has been long since filled up, but remains of the mole are still seen. The old town is an assemblage of poor-looking houses, perched one above another, surrounded and overtopped by white cliffs which are seen from afar (Horace, *Sat.* i. 5), and intermixed with myrtle, orange, and palm trees, and with plants of aloes and cactus. Above all rise the cathedral with its lofty steeple, an elegant palace built by Pius VI., the remains of the palace called that of Theodoric, which is a structure of the fifth century of our æra, and is situated on the summit of the hill, and about 600 feet above the sea, and an old castle raised in the middle ages. The cathedral is ornamented with some fine fluted Corinthian columns, which have been taken from a temple of Jupiter now ruined. Remains of a theatre are also seen. The climate of Terracina is very mild and genial in winter, but is unwholesome in summer.

The population of the town is 4000 inhabitants. Terracina is 56 miles south-east of Rome and 59 miles north-west of Naples. Beyond Terracina, on the side towards Naples, is a detached rock of a pyramidical form, nearly 200 feet high, one side of which was cut perpendicularly by C. Appius to make room for his road. About two miles farther is the frontier of Rome and Naples, where a military post is kept by each respective state. (Tournon, *Etudes Statistiques sur Rome*; Valéry, *Voyages en Italie*; Calindri, *Saggio Statistico dello Stato Pontificio.*)

Anxur was a thriving town of the Volsci long before the Roman conquest, was taken by the Romans in the year 403 B.C., was retaken by surprise in 399, and taken again by the Romans three years after. It afterwards became a Roman colony by the name of Tarracina. During the second Punic war the temple of Jupiter at Tarracina is mentioned by Livy as having been struck by lightning. (Livy, iv. 59; v. 10-13; xxviii. 11.)

TERRANO'VA. [Sicily.]

TERRAPE'NE. [Tortoises.]

TERRASSON, JEAN, a French writer of the last century. He was born at Lyon, A.D. 1670: his father was Pierre Terrasson, one of a family of considerable eminence and activity in that city, and a man whose devout temper led him to make all his four sons (of whom Jean was the eldest) members of the Congregation of the Oratory. They were all at Paris in the house of that Society when their father died: the three younger remained members of the Congregation, but Jean (now a sub-deacon) whose disposition disinclined him to the life of an ecclesiastic, quitted the Society, not however without having acquired considerable acquaintance with theology. The simplicity of character which ever distinguished him rendered him the dupe of men, by whom his small patrimony was soon wasted; but he found a shelter in the house of a friend, M. Rémond, to whose son he became tutor. He subsequently (A.D. 1714) undertook the education of the son of his cousin Mathieu Terrasson, a celebrated advocate in the parliament of Paris. He had become an associate of the Académie Royale des Sciences, A.D. 1707. In 1715 he made his first appearance as an author by taking part in the dispute then raging on the value of the Homeric Poems, and the comparative merits of the antients and moderns. His work was entitled 'Dissertation Critique sur Iliade d'Homère,' 2 vols. 12mo., Paris: it met with a favourable reception from those who joined in or approved of the attacks then made on Homer, who was severely criticized. Next year Terrasson published an addition to his dissertation on Homer, in 12mo., in reply to André Dacier, by whom he had been attacked. In A.D. 1719 the financial system of Law enabled Terrasson to obtain a large fortune, and induced him to form an establishment and set up his carriage: but wealth was to him rather a source of embarrassment than of pleasure; and when he lost his fortune the next year in the financial change which took place, he contentedly observed that it would be more convenient to him to live on a little. In A.D. 1720 he published a small work in defence of Law's financial schemes, entitled 'Trois Lettres sur le Nouveau Système des Finances,' 56 pp., 4to., Paris, and another small work in defence of the French India Company. He saved some small part of his fortune from the general wreck; and this, with the income of a professorship, which he obtained next year (A.D. 1721) in the Collège Royal, and a pension subsequently conferred by the crown, rendered his circumstances easy for the rest of his life. He became a member of the Académie Française A.D. 1732.

In 1731 Terrasson published a romance in imitation of the 'Telemaque' of Fénélon. It was entitled 'Séthos,' 3 vols. 12mo., Paris, and professed to be a translation of a Greek manuscript. The scene is laid chiefly in Egypt. This work obtained sufficient circulation to go through several editions, of which the last was in 1813, in 6 vols. 18mo., but never became popular. An English translation was published in London in 1732. In the years 1737-44 he published the seven successive volumes in 12mo. of a translation of Diodorus Siculus. This translation has been reprinted once or twice, but is very inaccurate. This was his last work of any extent. His memory and his bodily strength gradually failed, and he died A.D. 1750, aged 80.

He wrote also a treatise entitled 'De l'Infini Créé,' of which he allowed one or two transcripts to be taken during his life; but it was never published, nor was the original manuscript found among his papers at his decease. He left also a small work, published after his decease, entitled 'La Philosophie applicable à tous les Objets de l'Esprit et de la Raison' (Paris, 8vo., 1754).

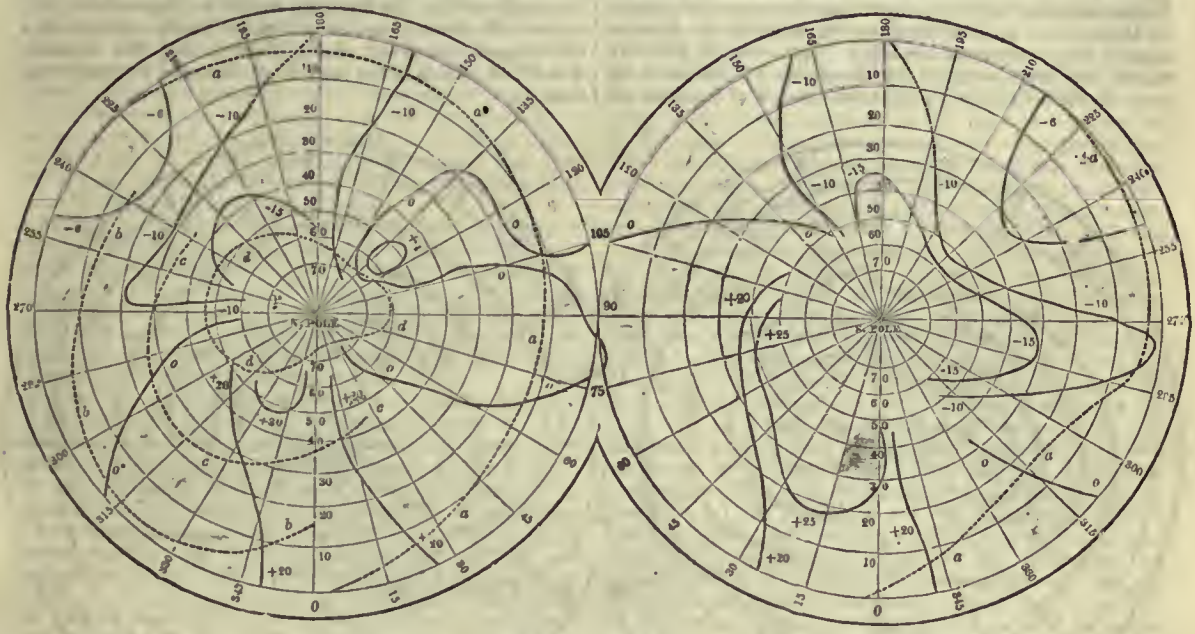
From an anonymous letter printed, with one or two other pieces, at the commencement of this small volume, and containing a biographical notice of Terrasson, we have derived the substance of this article. See also the *Eloge de Terrasson*, by D'Alembert; Quérard, *La France Littéraire*; *Biographie Universelle.*

TERRESTRIAL MAGNETISM. This term is used to denote the action of the magnetic fluid in or about the earth; the effects of that action being manifested in the phenomena presented by magnetized needles or bars.

The general polarity of a magnetized needle when supported or suspended in a balanced state, and its inclination to the horizon, with the slow variations to which those elements, as well as the intensity of the magnetic force, are subject, are phenomena which are conceived to arise from causes existing in the earth and pervading its whole mass; while the temporary effects, as the diurnal variations of the needle, are supposed to depend upon electrical currents produced by variations of temperature at the surface in consequence of the changes in the sun's position with respect to the horizon, and perhaps from other circumstances: finally, great temporary discharges of electricity in the upper regions of the atmosphere may be the causes

of those occasional agitations in the needle, to which the name of magnetic storms has been lately applied, and which are now known to extend at the same moment over a great portion of the earth's surface.

The declination (variation) of the needle is that element of terrestrial magnetism which was first observed, and the difference of its amount in different regions, as well as the annual change at the same station, was early noticed. Dr. Halley, on his return to England after his second voyage, during which he had made many observations on the variation in different parts of the Atlantic and Pacific oceans, published, in 1701, a chart, on which were traced what have been since called *isogonal lines*, that is, lines passing through the points on the earth's surface where the variation was the same; and other charts of a like kind have since at different times been constructed. The expectation at first entertained, that such a chart might serve as a means of ascertaining the longitude of a ship at sea by an observed variation of the needle has not however been fulfilled, since as yet no formula has been discovered by which the variation at any given time and place may with sufficient accuracy be found: but though the changes of the variation have hitherto rendered such charts of little use for the purposes of navigation, yet a knowledge of the form of the lines of equal variation at different periods may be of great importance as a step to the discovery of the law of those changes. The latest variation chart is one which was published by Adolf Erman, after his journey, in company with Hansteen and Due, through the whole length of the Russian empire, and his return to Europe by sea. Erman determined the positions of the isogonal lines from his own observations, and from the most authentic of those which had been made by other observers between the years 1827 and 1830; and subjoined is a representation of the principal lines on the two hemispheres of the earth, projected stereographically on the plane of the equator. The lines marked o o pass through places where the variation is zero; the positive sign before a number indicates that the variation is westward, or that the needle deviates to the west of the astronomical meridian; and the negative sign indicates that the variation is eastward. On an inspection of the lines, it is manifest that on a sphere they must be curves of double curvature with bends in opposite directions; that most of them converge towards two points on the earth's surface, one in or near Baffin's Bay, and the other to the southward of New Holland; and that between the inflexions there are some which return into themselves.



The dip, or inclination of the needle to the horizon, which is another element of terrestrial magnetism, was first recorded by Robert Norman [INCLINATION], and numerous observations have been made to ascertain its value in different parts of the world, together with the variations to which it is subject in process of time; but a general chart exhibiting the forms of the isoclinal lines, as those of equal dip are called, is still wanting. On the above cut are represented by dotted curves some of the lines which are best known; and these have been taken chiefly from the partial chart given by Major (now Colonel) Sabine, in the 'Philosophical Transactions' for 1840. The data are stated to have been obtained from above 140 observations made on land between 1834 and 1839, and from many which were made at sea by Mr. Dunlop in 1831, and by Lieut. Sulivan in 1839. Some points have also been taken from the observations made by Erman in the Pacific Ocean, of which last observations a table is given in the 'Seventh Report of the British Association' (vol. vi.).

a, *a*, *a*, represents the line of no dip, which is evidently a curve of double curvature, and crosses the terrestrial equator in two points at least: *b*, *b*, *b*, is the known portion of the isoclinal line for a dip of 30 degrees below the northern part of the horizon: *c*, *c*, is the line for 60°; and *d*, *d*, the line for 75°.

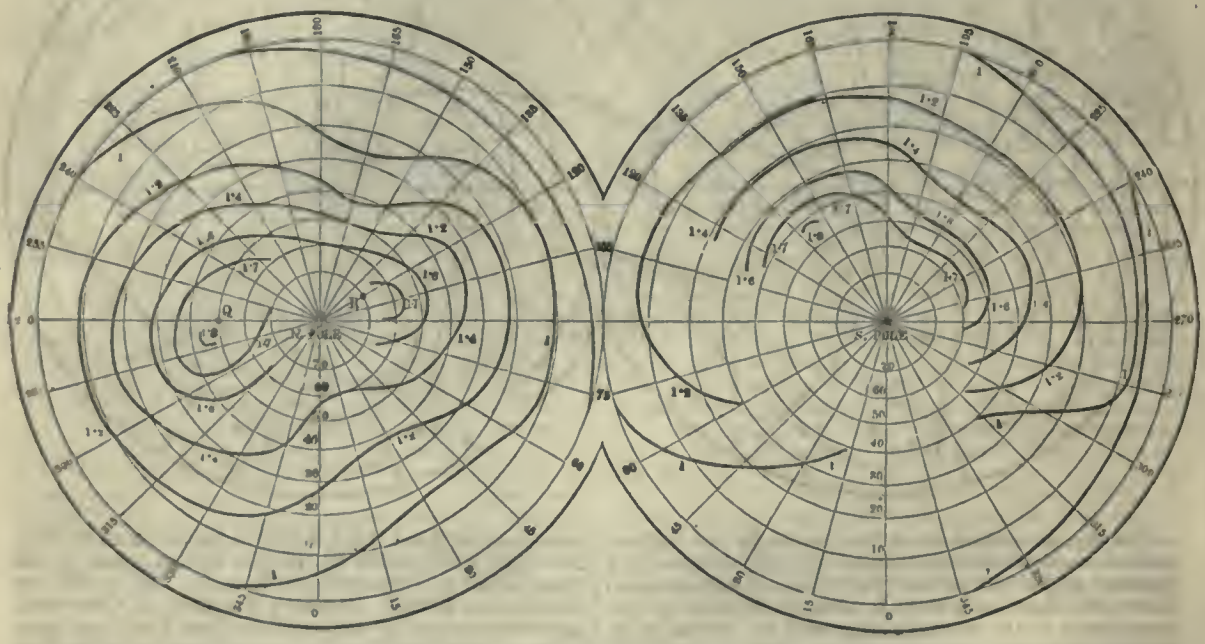
An inspection of the cut will show that the oval lines of equal dip go on diminishing in magnitude northwards, and the pole of the dip, or place where that element is a maximum, may be fixed at a point (P in the diagram) in long. 263° (117° west), and in lat. 70° N.: at that place, by the observations of Captain James Ross, the dip in 1831 was found to be 89° 59'. Professor Hansteen, of Christiania, has deduced, from the observations which have been made in the polar regions, that the isogonal lines in the northern hemisphere tend to two points in the vicinity of the pole of the dip; those which are on the north side uniting in a point a little way to the north of the latter pole, and those on the south side a little way to the south of the same pole.

Till within the last fifty years it was the general opinion that the intensity of terrestrial magnetism was the same at all parts of the earth's surface; and to the Académie des Sciences, in France, is due the honour of having been the first learned body which proposed that observations should be made for the purpose of determining that element. In the instructions which its members drew up for the use of the unfortunate La Perouse, it was recommended that the intensity should be observed at places very distant from one another, in order to ascertain whether or not any differences existed in its value. The accounts of any observations which may have been made during the voyage perished; but between the years 1791 and 1794, M. Rossel, who sailed from France with the expedition in search of La Perouse, determined with a dipping-needle the inclination to the horizon, and the times of performing a vibration, at different places; and from the latter the fact of a difference

of intensity was established. After that time extensive series of observations on the dip and intensity were made by Humboldt in South America, and in France, Italy, and Germany; by Hansteen, Due, and Erman in the north of Europe and in Siberia, and by the last-mentioned gentleman in the Pacific Ocean. Also by Colonel Sabine during his voyages to the polar seas and the equatorial regions of Africa and America; by the Russian admiral Lütke, in a circumnavigation of the globe; and by captains King and Fitzroy in the survey of the coasts of South America; and now, no observations on terrestrial magnetism are considered complete unless all the three elements, the declination, the inclination, and the intensity, are determined at the same time at every station.

Previously to the time when Humboldt made his magnetical observations in South America, the opinion that the intensity was a minimum at places where the dip of the needle was zero prevailed; and that philosopher, in consequence, assumed unity as the measure of the intensity at a certain station in Peru, where the dipping-needle assumed a horizontal position. From the times in which a certain number of vibrations were made by such needle at that station, and subsequently at Paris, Humboldt found that the intensity at the latter place was equal to 1·3842 (that in Peru being unity); and M. Arago and Col. Sabine afterwards, by a comparison of experiments made by themselves, ascertained that the intensity in London was (in 1827) expressed by 1·372. The scale of intensity which had been assumed by Humboldt continues to be used, though it is now known that the zero of dip does not correspond to the minimum of intensity, and it becomes necessary to employ terms less than unity to express the intensity at many places within and even beyond the tropics. The intensity is subject to a secular variation; but of the amount and the law of that variation as yet no certain knowledge has been obtained.

In the subjoined cut (No. 2), which, like the former, is a stereographical projection of the northern and southern hemispheres of the earth, are represented the principal isodynamical lines (lines of equal intensity) from the table and chart given by Col. Sabine in the 'Seventh Report of the British Association.' That chart was formed from all the authenticated experiments on the intensity which had been made between the years 1798 and 1836; but in the cut, in order to avoid confusion, there are given only the lines corresponding to the intensity represented by 1, 1·2, 1·4, 1·6, 1·7, and the points at which the intensity is known to be 1·8, which is the highest as yet observed. In all the tract between the curve lines marked 1, the magnetic intensity is less than unity: the breadth of this tract is very unequal; at points in long. 110° and 250° (110° W.) the lines approach within 3 or 4 degrees of one another, while near the meridian of Greenwich they are separated by an interval of about 50 degrees. In the middle of this band of low intensity which surrounds the earth, it might be expected that the intensity should be the lowest; and, in fact, M. Erman, in his return to Europe, found, at a few degrees westward of St. Helena, that the intensity was 0·743, which is the lowest yet obtained from observation.



Some of the isodynamic lines in both hemispheres are incomplete, because observations are still wanting at places through which the lines are supposed to pass, but no doubt can exist that all of them are curves which return into themselves. A simple inspection will show that in each hemisphere they constitute a system with two loops, or with two polar points: in the northern hemisphere, judging only by the forms, it may be perceived that the western pole, or point of maximum intensity, must be at a spot whose longitude is about 270° (90° W.), and latitude about 50°; that is, near Hudson's Bay. The eastern, or Siberian pole, appears to be in longitude 120°: its latitude is uncertain, but probably about 70°. The eye will readily detect also, that in the southern hemisphere the curves, as they are more distant from the equator, assume more perceptibly the form of loops about two points as poles whose positions are, by estimation, in long. 140°, lat. 60°, and in long. 240° (= 120° W.), lat. 60°; the former being to the south of New Holland, and the latter in the southern part of the Pacific Ocean. The nearest distance in longitude between the intensity-poles about Hudson's Bay and to the south of New Holland is about 130 degrees; and the nearest distance in longitude between the Siberian and the South American pole is about 120 degrees: the nearest distances in latitude are about 110° and about 130° respectively, so that those poles are not diametrically opposite to one another.

The intensity of magnetism at the New Holland pole appears to be nearly equal to that which has been observed at the North American pole, the observed intensity in Van Diemen's Land and at New York being 1·8; and the intensity at the Siberian pole is nearly equal to that at the South Pacific pole, the observed intensity at Vilnisk in Siberia being 1·76, and the highest at present known in the South Pacific being 1·7. The fact that these last intensities are less than the former is indicated by the loops about them being smaller than those about the two western poles; and Erman thinks it probable that the centres of magnetic attraction, where the loops are small, may be at a less depth below the surface than they are where the loops contain greater areas.

Since there exists one pole of stronger and one of weaker intensity in each of the hemispheres on the north and south of the terrestrial equator, it may be inferred, as is

observed by Col. Sabine, that the quantities of magnetism in the two hemispheres are nearly equal; but as all the four poles lie in one hemisphere of the earth, which would be formed it the latter were cut by the plane of a meridian passing through points whose longitudes are 100° and 280° (80° W.), it must follow that the hemisphere which contains the poles, that is, the hemisphere which contains America and the Pacific Ocean, must have a greater quantity than the other.

The isodynamic lines present the appearance of double flexures, like those of equal dip; and in both systems of curves there is a like tendency to form two foci, or centres of greatest attraction; and the bends gradually become less strongly marked as the lines approach the equatorial regions of the earth, but it is obvious that the lines in the two systems are far from being parallel to one another: in the southern hemisphere the isodynamical line 1 crosses the line of no dip in two places at least; and each of the dip-lines, *bb*, *cc*, *dd*, in No. 1, would pass through several of the intensity-lines in No. 2. Even within the limits of the British Isles the deviations of the two systems of lines from parallelism are very sensible ('Memoir,' by Maj. Sabine, in the *Eighth Report of the British Association*); and it may be inferred that, at least in the northern hemispere, the pole of maximum intensity is quite distinct from the pole of the dip, the distance between them in latitude being probably as much as 20 degrees. Q and R in the cut No. 2 are the presumed places of the two intensity-poles in the northern hemisphere. It is at present quite uncertain whether or not there is a corresponding difference between the poles of maximum intensity and of maximum dip in the southern hemisphere, but the circumstanee is probable, from the fact that the highest observed intensities in both are equal at places (New York and Van Diemen's Land) where the dips are also equal, and where they want 20 degrees of being the greatest.

Professor Hansteen, in his treatise on the magnetism of the earth (1819), has shown, from a comparison of the observed places of the four poles of the dip at different times, that each of them has a slow movement about the axis of the earth. Not much dependence can be placed on the computed periods of the revolutions, but M. Hansteen assigns for that of the North American pole 1890 years, and for that of the Siberian pole 860 years.

The existence of two magnetic poles in each hemisphere is thus evident, and Gauss of Göttingen observes that there must also be a third point between each pair, which possesses the character of both, and therefore is a true pole. (*General Theory of Terrestrial Magnetism*, translated in Taylor's 'Scientific Memoirs,' pt. vi.) This is indeed obvious: for if a dipping-needle were carried from one pole towards the other, it would begin to deviate from the vertical direction towards the pole it had quitted; and, coming near the other, it would be found to deviate from the vertical towards the pole which it was approaching; and, as these deviations are in opposite directions, there must be an intermediate point at which the needle would assume a vertical position.

Almost as soon as a few observations on the phenomena of terrestrial magnetism were collected, Dr. Halley (1701) propounded a theory in order to account for them. He conceived that the earth itself might be a shell, containing within it a globe which revolved with it about the same centre of gravity and the same axis; the outer globe, or shell, being supposed to perform its rotation in twenty-four hours, and the other in a time rather greater or less. Each globe was supposed to have a magnetic axis passing through the common centre, but the two axes were supposed to be inclined to each other and to that of the diurnal rotation; and consequently there were supposed to be, in all, four magnetic poles.

The deviation of these magnetic axes from that of the earth's diurnal rotation was supposed to be the cause of the general variation (declination) of the compass-needle, and the slow deviation of the magnetic axes from each other was supposed to be the cause of that continual variation of the declination which is observed at every place on the earth's surface. The theory is highly ingenious, and resembles that of the epicycles, by which, in the infancy of astronomy, it was attempted to account for the variations in the movements of the planets: but when observations were multiplied, and the variations of the needle at considerable intervals of time were compared together, it was found to be incapable of representing the phenomena; and Mayer, of Göttingen, without gaining any advantage, modified the hypothesis by assuming that the centre of the small magnet was placed at a certain distance from that of the earth.

Subsequently (1805) M. Biot, assuming that there were two points in a supposed magnetic axis of the earth, by one of which the magnetized needle was attracted and by the other repelled, investigated a formula for expressing the dip and variation in terms of an indeterminate distance between those points. On comparing the result obtained by computation from the formula with the observed phenomena, he found that the latter were represented with tolerable accuracy when the points of attraction and repulsion were infinitely near to each other and to the centre of the earth. From the result of the investigation it follows that if a plane, supposed to pass through the centre of the earth perpendicularly to the magnetic axis, were considered as a magnetic equator, the tangent of the dip of the needle would be equal to twice the tangent of the magnetic latitude of the place on the earth's surface; and a like conclusion had been previously arrived at by Professor Kraft at St. Petersburgh, from such observations as then existed. It is here supposed that the curve of no dip is the circumference of a great circle on the sphere, and we have seen that this is far from being conformable to observation, yet the rule just mentioned may be advantageously employed when it is required, from any observed dips of small magnitude, to determine the situation of a point on the earth's surface where the dip is zero. The last attempt to account for the phenomena of terrestrial magnetism in this manner was made by M. Hansteen (1811), who assumed the existence of two small magnets of unequal strength at certain distances from the centre of the earth. He compared the results, with respect to variation, dip, and intensity, which he obtained by computation from that assumption, with the values of those elements observed at different places; and though, to a certain extent, the agreement was satisfactory, yet in several instances the differences were such as to show that the hypothesis was erroneous or incomplete. Professor Gauss of Göttingen, in his Treatise on the General Theory of Terrestrial Magnetism above quoted, has investigated the elements independently of all hypotheses concerning the distribution of the magnetic fluids in the earth, and assuming only that the terrestrial force is the collective action of all the magnetized particles in the earth's mass, he has exhibited the resulting formulæ in converging series; and has given, for ninety-one places on the globe, a table of the values of the declination and inclination of the needle, and of the intensity of magnetism, computed from his expressions for the horizontal and vertical components of the force, together with the observed elements at the same places; and the smallness of the differences between these last and the computed elements are satisfactory proofs of the correctness of the theory. For a supposed connection between the temperature of the earth's surface and terrestrial magnetism, see Isothermal Lines.

The want of complete success which has hitherto attended the different attempts to exhibit the laws of magnetical phenomena make it evident that the time has not arrived in which that can be done with respect to magnetism which Newton accomplished with respect to gravitation. But though the hypotheses formed, in order to account for the phenomena of terrestrial magnetism, have not brought out formulæ which will entirely satisfy the observed elements, it must not be understood that they are therefore without utility; since the approximative rules which have been obtained from them afford the means of computing small differences in the elements with sufficient accuracy to allow observations made at times or in places not very distant from one another to be reduced to what they would have been had they been made at one time or station; and thus several observations may be made to concur in the determination of a correct mean value of the element. This remark may be considered as applicable to most of the hypotheses which, in the physical sciences, have been proposed for the purpose of exhibiting the laws of the phenomena; and it may be further remarked, that the assumption of an hypothesis, by indicating the fittest place for observing, or the nature of the observations which are requisite for verifying it, is

advantageous in leading the observer to select his stations or to vary the construction of his instruments, so as to put himself in the most favourable circumstances for determining the laws from observation.

In the year 1818 M. Arago, at the Observatory of Paris, made a series of observations on the irregular changes to which the declination of the needle is subject; and M. Kupffer having about the same time made similar observations at Kasan, a comparison of the results led to the discovery that the perturbations were simultaneous at those places, though they differed in longitude above 47 degrees. This remarkable circumstance immediately attracted the notice of philosophers, and a plan for making simultaneous observations in many different places was organized by M. de Humboldt in 1827. For this purpose magnetic stations were established at Berlin and Freyberg; and the Imperial Academy of Russia, entering with zeal into the project, caused a chain of stations to be extended from St. Petersburg to Pekin, at all which places simultaneous observations were appointed to be made seven times in the year, at intervals of one hour, during twenty-four hours.

In 1834 Professor Gauss discovered the fact that the synchronism of the perturbations was not confined to the declination of the needle, but that every deviation at one place of observation had its counterpart at another; and he was therefore induced to recommend a plan of simultaneous observations at intervals of five minutes during twenty-four hours, four times in the year. This suggestion was immediately adopted, and on the Continent magnetic stations were formed at more than twenty cities of Europe, from Dublin to St. Petersburg. The British Government and the East India Company also, besides the principal observatories of the former at Greenwich and Dublin, immediately sanctioned the formation of magnetic stations, under the direction of scientific officers, at St. Helena and the Cape of Good Hope, in Canada, the East Indies, and New South Wales; and in the present expedition to the antarctic regions under Captain J. C. Ross, one of the leading objects is the determination of the magnetic elements in that remote part of the world. The system of simultaneous observations at numerous and stated times of the year, which has been organized in Europe, is to be conformed to by all the British observers; and the Royal Society of London has caused an able Report of the objects of scientific inquiry in physics to be drawn up for the use of travellers in general, and particularly for the persons who have been appointed to take part in the observations respecting magnetism and meteorology.

The instruments employed for determining the elements of terrestrial magnetism, and the variations to which they are subject, are of three kinds: the declination magnetometer; and the horizontal and vertical force magnetometers. The first is a needle or bar, from twelve to fifteen inches in length, nearly one inch broad, and a quarter of an inch thick, suspended in a horizontal position in a stirrup by untwisted silk fibres about two feet long. The apparatus is contained in a box, to protect it from the agitation of the air, with two apertures in opposite positions; one of these is for illuminating the scale, and the other is used for the readings, which are taken by means of a telescope at a distance. For a description of such an instrument and its adjustments, see Taylor's 'Scientific Memoirs,' part v. By this instrument may be observed the absolute declination, or the angle which the axis of the needle makes with the astronomical meridian of the place, the variations of the declination, and the horizontal component of the earth's magnetic force. The latter is found by experiments of deflection and experiments of vibration; and the formulæ to be employed for the purpose are given in the work of Gauss, entitled 'Intensitas vis Magneticæ Terrestris' (1833). See also the Report of the Committee of the Royal Society, 1840. But Gauss considers that determinations of intensity by the vibrations of a needle are inaccurate on account of the changes which may take place in the intensity during the time in which the vibrations continue; and in 1837 he invented a new instrument, which is called a Bifilar magnetometer, for the purpose of determining the horizontal intensity alone. This consists of a magnetized needle or bar resting horizontally in a stirrup placed under a circular graduated plate, to the upper part of which are attached the two extremities of a fine steel thread or wire. The middle, or the bend, of the thread passes over two pulleys which are fixed in the upper part of the building; and the two parts of the thread hang in vertical positions, or parallel to one another, when the needle rests in the magnetic meridian. Then, on turning the whole apparatus horizontally so as to make the needle deviate from the magnetic meridian, the tendency of the needle to return to its former position causes the threads to assume directions oblique to each other; and there is some position of the needle in which its directive force is equal to the force by which the threads resist being made to cross each other's directions: it is easy to adjust the instrument so that, when this equilibrium takes place, the needle shall lie in a direction at right angles to the plane of the magnetic meridian. The torsion of the threads by which the needle is made to assume that position indicates the horizontal component of the magnetic force, and every change in the intensity of the latter affects in a direct manner the position of the needle. The magnetized bar in use at the Göttingen observatory weighs 25 lbs., and the length of the pair of suspending threads is 17 feet. (Taylor's *Scientific Memoirs*, parts vi., vii.) Instruments on the same principle, but of smaller dimensions, are made for ordinary occasions. See the Royal Society's Report.

The vertical force magnetometer consists of a magnetic needle resting on agate planes by what are called knife-edges, and it is made to assume a horizontal position by means of weights: the deviations of the needle from that position, when in the plane of the magnetic meridian, or in a vertical plane making any angle with that meridian, serve to determine the variations in the vertical component of the magnetic intensity.

Gauss observes that, on account of the simple relation that the horizontal and vertical components bear to one another, these are more proper to serve as the foundation of a theory, than the usual expression of the magnetic force by the total intensity, the inclination, and the declination; and he recommends that, in all observations, the intensity in the horizontal direction should be kept distinct from the other elements.

TERRIER (*Canis familiaris Terrarius*), a variety of the dog remarkable for the eagerness and courage with which it goes to earth, and attacks all those quadrupeds which come under the gamekeeper's denomination of *Vermin*, from the Fox to the Rat.

In the genealogical table of the different races of dogs we find the Hound immediately next in descent from the Shepherd dog, which is placed as the immediate descendant of the Lapland dog, the highest in the table, and collateral to the *Hound*, the *Terrier*, and *Harrier*.

Lieut.-Col. Hamilton Smith (*Naturalist's Library*, 1840), treating on the *Cur Dogs*, after stating that in Southern Africa we have a race of small Saealian dogs; in Arabia, one of Thoan form; in India, the parent Pariah breed, apparently captured in the woods of the country;—that Southern China, all Persia, Natolia, and Russia have a similar predominant race of curs; and that in Europe there is everywhere evidence of an originally indigenous species of small dimensions, or at least of one, brought in by the earliest colonists of the west, extending from Lapland to Spain,—goes on to observe, that if we search for that kind which now seems to be the most typical, that possessing innate courage, sagacity, and prolific power, without training or care in breeding,—these qualities are found most unquestionably united in the terrier, and nowhere so fully marked, with all the tokens of antient originality, as in the rough-haired or Scottish breed. 'In the terrier,' says Col. Smith in continuation, 'we still see all the alacrity of innate confidence, all resources of spirit, all the willingness to remain familiar with subterraneous habitations, and all the daring and combination which makes him fearless in the presence of the most formidable animals; for it is often noticed in India, that when the bull-dog pauses, British terriers never hesitate to surround and grapple with the hyæna, the wolf, or even the panther. . . . If there be an original and indigenous dog of Britain, it is surely the species we have now under review: for if the Irish wolf-dog, or a questionable gaze-hound, were derived from the British wolf, such a conquest over a powerful and ferocious animal could scarcely have been achieved without the aid and intelligence of a previously domesticated and smaller species. But it is more likely the terrier of antiquity was of the same race with the

hard-footed dogs of the Cymbers, and that the first were brought over from the north-west of Europe with the primitive inhabitants. Certain it is that the intermixture of terrier blood with other and later races has in no instance tended to diminish their courage, hardihood, and fidelity; and in no part of Europe has the rough-haired breed retained so completely as in Britain all the traits which constitute a typical species.'

Terriers may be divided into two sections, the one rough and wire-haired, the other smooth-haired and generally more delicate in appearance. In courage and sagacity there is little difference if the dogs be well bred, but the rough and wiry coat of the former is a greater protection from the attack of its adversary, and it is, if anything, the most severe biter of the two. They are of all colours, red, black, with tanned faces, flanks, legs, and feet, brindled, sandy, brown pied, white, and white pied. The Pepper and Mustard breeds, rendered famous by Sir Walter Scott, are highly valued.

Every pack of fox-hounds, to be complete, should be accompanied by a brace of terriers, and one should be smaller than the other, so that if one should be stopped by a small earth, the other may enter. For terriers going with hounds, any colour is better than all red, for a red terrier is sometimes mistaken for a fox, and hallooed off as one by inexperienced sportsmen.

Mr. Daniel, in his 'Rural Sports,' gives the following account of the ferocity and affection of a terrier bitch:—After a very severe burst of more than an hour, a fox was by Mr. Daniel's hounds run to earth at Heney Dovehouse, near Sudbury, in Suffolk; the terriers were lost, but as the fox went to ground in view of the headmost hounds, and it was the concluding day of the season, it was resolved to dig him. Two men from Sudbury brought two terriers for that purpose, and, after considerable labour, the hunted fox was got and given to the hounds. While they were breaking the fox, one of the terriers slipt back into the earth and again laid; after more digging a bitch-fox was taken out. The terrier had killed two cubs in the earth, but three others were saved from her fury. These the owner of the bitch begged to have, saying he should make her suckle them. This was laughed at as impossible; the man however was positive, and had the cubs: the bitch fox was carried away and turned into an earth in another country.

Mr. Daniel then relates that, as the terrier had behaved so well at earth, he some days afterwards bought her, with the cubs which she had fostered. The bitch continued to suckle them regularly, and reared them until they were able to shift for themselves: what adds to the singularity, Mr. Daniel observes, is that the terrier's whelp was nearly five weeks old, and the cubs could just see, when this exchange of progeny was made. He also states that a circumstance partly similar to the foregoing occurred in 1797, at the duke of Richmond's, at Goodwood, where five foxes were nurtured and suckled by two foxhound bitches.

The same author states, that in April, 1784, his hounds found at Bromfield-Hall wood. By some accident the whipper-in was thrown out, and after following the track two or three miles, gave up the pursuit. As he returned home, he came through the fields near the cover where the fox was found. A terrier that was with him whined and was very busy at the foot of a pollard oak, and he dismounted, supposing that there might be a hole at the bottom harbouring a polecat or some small vermin. No hole could he discern. The dog was eager to get up the tree, which was covered with twigs from the stem to the crown, and upon which was visible the dirt left by something that had gone up and down the boughs. The whipper-in lifted the dog as high as he could, and the terrier's eagerness increased. He then climbed the tree, putting up the dog before him. The instant the terrier reached the top the man heard him seize something, and, to his surprise, found him fast clapped with a bitch-fox, which he secured, as well as four cubs. The height of the tree was twenty-three feet; nor was there any mode for the fox to go to or from her young, except the outside boughs: the tree had no bend to render the path easy. Three of the cubs were bagged, and bred up tame to commemorate this extraordinary case: one of them belonged to Mr. Leigh, and used to run tame about the coffee-room at Wood's hotel, Covent Garden.

The breed of terriers recommended in the old times when the huntsman went on foot, was from a Beagle and Mongrel Mastiff, or from any small thick-skinned dog that had courage. Thus the coat and courage were supposed to come from the Cur, and the giving tongue from the Beagle. The time for entering the young terriers at a fox or badger was when their age was ten or twelve months, with an old terrier to lead them on. When entered at a fox, and the old one was taken, the young terriers were set to attack the cubs unassisted, and when they killed them, both young and old terriers were rewarded with the blood and livers fryed with cheese, with fox's or badger's grease: at the same time the dogs were shown the heads and skins to encourage them. There were other ceremonies recommended, too cruel to be repeated, and which could have been of little or no service. Honest Dandie Dinmont's mode of entering his Pepper and Mustard generations is as good as can be practised.

A cross of the terrier with the bull-dog for the purposes of badger-baiting, &c., was at one time much in vogue. Of this breed was the celebrated dog Billy, famous for his destruction of rats. He was often turned into a room with a hundred of those animals, and he frequently killed every one of them in less than seven minutes.

Of those inhuman practices—it is degrading the term to call them sports—badger-baiting, cat-killing, dog-fighting, and the like, we purposely say nothing here, except that they have been, most properly, put down by law in the metropolis and its vicinity.

TERRIER, from the French word *terrier*, a land-book, a register or survey of lands. Those best known in this country are the ecclesiastical terriers made under the provisions of the 87th canon. They consist of a detail of the temporal possessions of the church in the parish. They ought to be signed by the parson, and are sometimes also signed by the churchwardens and some of the substantial inhabitants of the parish. Their proper place of custody is the bishop's or archdeacon's registry: a copy also is frequently placed in the parish chest. If a terrier is proved to be produced from the proper custody, and therefore may be presumed to be genuine, it is in all instances evidence as against the parson. And in those instances where it has been signed by churchwardens elected by the parish or by the inhabitants, it is also evidence as against the inhabitants generally; even against those occupying lands other than the lands occupied by the inhabitants who signed it. The questions in respect of which a terrier is generally employed as evidence are those relating to the glebe, tithes, a modus, &c.

(Starkie, *On Evidence.*)

TERTIARY STRATA, the title given by almost universal consent of geologists to the uppermost great group of strata. Previous to the publication of the 'Essay on the Geology of the Basin of Paris,' by MM. Cuvier and Brongniart, in 1810, but little attention had been awakened to this great mass of deposits, though the familiar use of the terms primary and secondary, and the acknowledged dissimilitude between the latest of these strata and modern accumulations from water, in respect of mineral aggregation and organic exuviæ, seemed to be prophetic of the discovery of a newer type more in harmony with existing nature.

The extent to which, over great tracts in all quarters of the globe, this type has been found to prevail, is exceedingly great: most of the capital cities of Europe are built upon tertiary strata; many of the broadest plains and widest valleys in the New and the Old World are nothing but the dried beds of seas and lakes of the tertiary period: and some considerable mountain ranges bear on their high summits, and still more abundantly on their flanks, portions of the shelly tertiary strata which were uplifted from their original horizontality and subjected to the convulsive movements of which the mountain ranges are the result. In almost every part of the globe strata of this tertiary series prevail, and yield astonishing numbers of shells, corals, crustacea, and other remains of marine, freshwater, and terrestrial invertebrata, and more locally abundant layers of fishes, and rich deposits of bones of mammalia, &c. Possessing so many attractions, and affording such unusual facilities for study, the tertiary strata of Italy, France, England, Northern Europe, the eastern states of North America, the great tracts of Brazil, Patagonia, &c., have been the theatre of great and laborious investigations, which have brought forward our knowledge of these de-

posits to at least an equal advance with that of the older strata.

More than this can hardly be said with justice; for though, in consequence of the great similitude between the agencies concerned in producing modern accumulations of sediments and organic exuviæ, and those which produced the tertiary strata, the *minute* history of particular portions of these is almost completely known, their *general* history is imperfectly comprehended, because the original formation of those strata was performed under as great a variety of *local* conditions as the accumulations of sands and shells on the actual sea-bed, and because, since their production and elevation from seas or lakes to form dry land, they have, from their surface position and inferior induration, been more subject to superficial waste and destruction than the older, more sheltered, and more consolidated strata. The incompleteness of our knowledge of the *general* history of the tertiary strata is evident by the incompleteness of the classification which represents that history, and on this point, the only one which it appears necessary here to discuss, we shall offer a few remarks. Among the primary and secondary strata [GEOLOGY] subdivisions corresponding to successive times of production have been found practicable and definable, and traceable over immense areas by means of a combination of mineral, structural, and organic characters. Limestones of certain kinds, as chalk, oolite, magnesian-limestone, accompanied with green, brown, or red arenaceous and argillaceous beds, and holding spatangi, apiocrinites, or palæonisci, mark and distinguish cretaceous, oolitic, and magnesian formations and systems of secondary strata corresponding to the carboniferous and other older systems of rocks. This has not been found so practicable in regard to the tertiary strata, which, though presenting many different sorts of strata, offer in the *manner of combination* amongst these too many general analogies, and too much of local difference, to be conveniently ranged into formations or systems having more than a local value, by means of mineral and structural characters.

Some assistance towards the desired classification appeared to be furnished by the alternation of marine and fresh-water sediments, as in the Isle of Wight, and in the basin of Paris, and hence the titles of Upper and Lower Marine, Upper and Lower Freshwater deposits acquired a considerable application. But the most successful and probably best-founded classification of tertiary strata rests upon a study of their organic contents.

It has been long remarked that in those strata, wherever they occur, the forms of animal and vegetable life make a near approach, even specifically, to living types. By careful examination, a certain number of species have been found in tertiary strata actually identical with or undistinguishable from living objects. The proportion in which these still living species are mixed with now extinct (or believed to be extinct) forms varies, so that in Sicily tertiary beds occur with above 90 per cent. of still living species of shells, but in the basins of London and Paris others are found containing only about 5 per cent.

There are reasons independent of these proportions which leave no doubt that the strata near London and Paris, which contain only 5 per cent. of living forms, are among the oldest of tertiary beds; while the Sicilian beds, which contain only about 5 per cent. of extinct species, are amongst the most recent.

Views of this kind generalized lead to a speculation which is strongly confirmed by the general current of geological discovery, that the relative antiquity of tertiary strata may be judged of by the relative proportion of extinct species of shells which are found in them. On this postulate M. Deshayes and Mr. Lyell have founded the most prevalent modern classification of tertiary strata, which may be thus briefly sketched:—

Recent Period.

Newer Pleiocene Period, the strata containing not above 10 extinct species in a hundred.

Older Pleiocene Period, the strata containing about 50 or 60 extinct species in a hundred.

Meiocene Period, the strata containing about 80 extinct species in a hundred.

Eocene Period, the strata containing about 95 extinct species in a hundred.

Secondary Period.

(These terms are taken from the Greek καινός, recent, combined with πλείων, more, μείων, less, and ἠώς, the dawn.)

The principle of *per centage* employed by Mr. Lyell in this classification should not be strongly objected to on account of its rigorous numerical results being sometimes found locally inapplicable. It is impossible that this should be otherwise, for the numerical proportions of organic life must always vary in proportion to local conditions as well as to the general succession of physical influences; but that the great cause of the systematic variations of the forms of plants and animals in successive geological periods, whether primary, secondary, or tertiary, is the successive and systematic change of physical circumstances influential on organic life, appears amply proved. There appears no good reason to doubt that the variations of individual organizations, and the numerical proportions of their combinations, are in harmony with and indicative of the successive physical conditions when they lived, and consequently of the successive periods to which these physical conditions belonged. The comparison of individual fossil and living forms is merely *one*; and that not the most general or important, mode of manifesting the *numerical constants* of organic life of the several geological periods. By some other less obvious arithmetical processes, the relative analogies of antient and modern nature may be made to appear numerically, independent of any such specific comparisons, and without limitation of geological age or geographical region. This has been attempted in regard to the Palæozoic fossils generally, and to the fossils of Devonshire specially, and the result affords remarkable encouragement to the application of rigorous calculations based on exact data representing the *numbers* of distinctly recognisable forms of different groups of organic remains, whether these be of living or extinct tribes.

We have only further to remark, that the tertiary strata are far more distinctly defined and separated from the uppermost secondary strata than from the recent deposits of water. In fact the most natural classification of tertiary volcanic products, tertiary strata, and tertiary organic remains, is with the living creation. In tertiary strata the phenomena of mineral accumulation seem to be such as are witnessed in daily operation: they contain marine, littoral, and pelagic deposits; æstuary and fluviatile sediments; lacustrine beds hardly distinguishable from such as are now in progress. In these sediments occur remains of a system of terrestrial and aquatic life as complete (if we except reasoning man) as that now in activity; and if the absence of man, and the animals which seem to be associated with him for his comfort and advantage in the actual creation, be thought a sufficient reason to remove from historic time the account of tertiary deposits, and to justify the adoption of a distinct quaternary or modern period in geological classifications, it is not the less true that the geological date of the epoch of this period, the line of separation between it and the tertiary æras, is entirely unknown by direct and positive facts, and appears incapable of determination by reasoning on any collateral phenomena at present ascertained.

(Lyell, *Principles of Geology;* De la Beche, *Geological Manual;* Phillips, *Palæozoic Fossils of Devon.*)

TERTULLIA'NUS, QUINTUS SEPTIMIUS FLORENS, the earliest of the Latin ecclesiastical writers, lived in the latter part of the second century and the beginning of the third. The exact date of his birth is unknown; Tillemont supposes that it was in 160 A.D., and others have fixed it as early as 135. He was born, according to Jerome (*De Vir. Illust.*, 53), at Carthage, where his father was a centurion in the service of the proconsul of Africa. He embraced the profession of an advocate or rhetorician, in which he appears to have attained to some eminence. During this period of his life he was a heathen, as he himself informs us (*Apolog.*, 18; *De Spectac.*, 19; *De Resurrect. Carn.*, 19, 59; *De Pœnitent.*, 1). He was converted to Christianity at Carthage in all probability, though an expression of Eusebius (*Hist. Ecc.*, ii. 2) has been thought to imply that his conversion took place at Rome. Immediately upon his conversion he was ordained a presbyter. About the end of the second century several writers suppose about the year 200), he became a Montanist. [MONTANISTS.] Jerome (*l. c.*) ascribes this change to his suffering from the envy and insults of the clergy of the Roman church, but a more adequate and more pro-

bable reason for it is found in the character of Tertullian himself. In his writings composed before his Montanism he shows many traces of that zeal and asceticism which formed the peculiar characteristic of the Montanists. It has been doubted whether he remained a Montanist to his death. Some have thought that he returned to the catholic church, and others suppose that he at last settled down into opinions intermediate between those of the Montanists and those of the orthodox. For neither of these suppositions is there any sufficient proof. There existed indeed at Carthage, in the fifth century, a sect called Tertullianists; but between them and Tertullian there appears to have been no historical connection.

Whether he remained a Montanist or not, he continued to be held in the greatest respect by the African churches. In fact it is to his influence that we must trace the characteristics which distinguished those churches from other Christians, and which at length, through Augustin, gave a tone to the Christianity of the West. His influence was especially great upon Cyprian, in whose writings there is much which closely resembles some of Tertullian's, and of whom Jerome says that in asking for the works of Tertullian he was wont to say, 'Da magistrum' ('Give me my master').

The date of Tertullian's death is unknown, but we are told by Jerome that he lived to a great age. One of his works ('Ad Scapulam') was written as late as 216 A.D.

A large portion of his works have come down to us, and these may be divided into three classes: (1) apologetic, (2) practical, and (3) doctrinal or controversial. The same classification is sometimes stated differently, as follows:— (1) writings against the heathen; (2) writings on the nature, morals, rites, &c. of the church; and (3) writings against heretics. It is important to distinguish, if possible, between the works which he wrote before he became a Montanist and those which he wrote afterwards. This distinction has been attempted by Neander and Bähr. On the other hand, a few writers have thought that all the works of Tertullian were composed after he adopted the opinions of Montanus. (J. G. Hoffmann, *Diss. omnia Tertull. in Montanismo scripta videri*, Wittenberg, 1738.)

I. Of Tertullian's Apologetic Works the following appear to belong to the earlier part of his life, and to have been written in the reign of Septimius Severus. They are free from the peculiar tenets of Montanism:—

(1.) 'Ad Martyres;' for the encouragement and vindication of those who suffered for being Christians.

(2.) 'De Spectaculis;' written about 198, against the Roman games and festivals, and to dissuade Christians from being present at them.

(3.) 'De Idololatria;' an exposure of the character and influence of idolatry, with an exhortation to Christians to avoid every approach to participation in it.

(4.) 'Apologeticus adversus Gentes pro Christianis;' his principal work of this class, and one of the best of all his works, is a powerful refutation of the accusations made against the early Christians, and a warm remonstrance against the persecutions they suffered, addressed to the Roman magistrates. It was written in the year 198, and has been deservedly held in very high esteem both in antient and modern times.

(5.) 'Ad Nationes Libri II.' These two books, which were discovered in manuscript by James Gothofred, and printed by him at Geneva, 1625, 4to., form a kind of supplement to the 'Apologeticus.' The first contains much the same matter as that book, sometimes expanded, sometimes abridged, and sometimes newly arranged; the second takes up the general subject of heathen theology. The date of these books appears to be about 199, if they were written after the 'Apologeticus;' but some writers of high authority, as Neander and Münter, suppose that they were written before the latter work, in the year 198.

(6.) The treatise 'De Testimonio Animae' may be regarded as another supplement to the 'Apologeticus,' the 17th chapter of which contains in fact the same argument in a shorter form. Its object is to prove that there exists originally in the human mind, to a certain extent, a knowledge of the true God, and that this knowledge of God confirms the Christian doctrine of his character.

The remainder of Tertullian's apologetic works appear to have been written after he became a Montanist. They are:

(7.) 'De Corona Militis;' a vindication of a Christian soldier, who refused to wear a crown which had been awarded to him, on the ground that it was a badge of heathenism, and who was imprisoned for his refusal. This work contains remarks on other questions relating to the duties of a Christian citizen under a heathen government.

(8.) 'De Fuga in Persecutione;' a statement of the Montanist opinion that Christians, when persecuted, might neither attempt to save their lives by flight nor by money. Written about 202.

(9.) 'Contra Gnosticos Scorpiace;' an answer to the slurs thrown upon the martyrs in the persecution of Septimius Severus, by those *scorpions* the Gnostics.

(10.) 'Liber ad Scapulam;' a defence of the Christians, addressed to Scapula, the proconsul of Africa, who persecuted them.

II. *Practical Works*, relating to Christian morals and discipline. The following were written before he became a Montanist:—

(11.) 'De Patientia;' on Christian patience.

(12.) 'De Oratione;' on prayer: one of Tertullian's earliest works.

(13.) 'De Baptismo;' on baptism: a defence and explanation of the rite.

(14.) 'De Poenitentia;' on repentance: a manual for Catechumens and newly-baptized Christians.

(15.) 'Libri Duo ad Uxorem;' exhorting his wife not to marry a second time, if he should die before her.

The two following works were, in Neander's opinion, most probably written after Tertullian became a Montanist:

(16.) 'De Cultu Feminarum;' on female attire: consisting of two books, the first of which is sometimes denoted by a separate title, namely, 'De Habitu Muliebri.'

(17.) 'De Virginibus Velandis;' on the veiling of virgins: in opposition to the custom then prevalent at Carthage, of virgins appearing in church with the face exposed.

The remaining works of this second class are undoubtedly Montanistic:—

(18.) 'De Exhortatione Castitatis;' dissuading a friend from marrying a second time. To the same purport are

(19.) 'De Monogamia;' and (20.) 'De Pudicitia.'

(21.) 'De Jejunitate,' or 'De Jejuniis;' recommending the severe practices of the Montanists, in preference to the milder doctrine of the orthodox respecting fasts. In this work, and others of his writings, he applies to the orthodox the term 'psychici' (ψυχικοί), *carnal*, which is used by Paul (1 *Cor.*, ii. 14) in opposition to 'spiritual.'

(22.) 'De Pallio,' composed in the year 208, is a treatise recommending the wearing of the Greek pallium in preference to the Roman toga. It contains much information respecting the form of these garments.

III. *Works on Christian Doctrine and Polemics.* The only one of this class which seems to have been written before his Montanism is

(23.) 'De Praescriptione (or Praescriptionibus) Haereticorum;' against heretics in general, and especially the Gnostics and Marcionites.

He continued his attacks upon the heretics, and especially the various sects of Gnostics, after he became a Montanist, in the following works:

(24.) 'Adversus Marcionem Libri V.'

(25.) 'Adversus Valentinianos;' which Semler supposes to be a close imitation of Irenaeus, 'Contra Haereses.'

(26.) 'De Carne Christi,' and (27.) 'De Resurrectione Carnis,' are treatises on the resurrection, in opposition to the Gnostics.

(28.) 'Adversus Hermogenem;' against the doctrine held by a Gnostic of that name, that matter is eternal, and that out of this eternal matter not only all sensible things, but also the souls of men are made, the latter being besides endowed with a divine principle of life (πνεῦμα). Against this doctrine concerning the soul Tertullian wrote another work, from which only some quotations have come down to us: 'De Censu Animæ.' Our loss is the less, as we have a fuller treatise by Tertullian on the same subject, (29.) 'De Anima;' in which he discusses the theories of heathen philosophers concerning the soul, and opposes to them all the doctrines of Christianity, that it is spiritual, immortal, and received direct from God.

There is also a work by him on the doctrine of the Trinity.

(30.) 'Adversus Praxean;' written about 204 or 205, against the doctrine of Praxeas, which was in fact essen-

tially the same with that which afterwards became known as Sabellianism.

In the latter part of his life he wrote a work, (31.) 'Adversus Judaeos,' in answer to the Jewish objections against Christianity.

The above list contains all the extant works of Tertullian, but he must have written many more, since Jerome informs us that many of his works had been lost even before his time. (Hieronym., *De Vir. Illust.*, c. 53.) Among his lost works, of which the titles are known, besides that 'De Censu Animae,' already mentioned, are some which were especially designed to explain the opinions of the Montanists, namely, 'De Spe Fidelium,' one of the earliest works in which was put forth the doctrine now known as Millenarianism, of the personal reign of Christ on earth for a thousand years [MILLENNIUM], and 'De Paradiso.' He also composed a defence of the 'ecstasies' of the Montanists in six books, to which was added a seventh against a certain Apollonius. His treatise 'De Aaronis Vestibus' appears to have been lost before Jerome's time. (See Hieronym., *Epist.* lxiv., near the end.)

Two works which are sometimes erroneously ascribed to Tertullian are the 'Carmina Sibyllina,' and the 'Acta Perpetuae et Felicitatis.' Tertullian holds one of the first places, if not the very first, among the Latin fathers, for learning and intellectual power. Even those to whom his peculiar opinions were the least acceptable have eulogized him in the highest terms. Thus Jerome says (*Epist.* lxx., sec. 5), 'What more learned, what more acute than Tertullian? whose apology and books against the heathen embrace all the learning of the age.' Vincentius Lirinensis (*Commonitor.*, c. 24) adjudges to him 'by far the highest place among the Latin fathers,' and attributes to him 'the most extensive learning both in things divine and human, and a grasp of mind which comprehended all philosophy, all sects of philosophers, their authors and supporters, and every variety of historical and scientific knowledge.' Erasmus calls him 'by far the most learned of all the Latin theologians.' (*Prefat. ad Hilar.*) In short, the general judgment of the orthodox in antient and modern times may be summed up in the words of Jerome: 'His genius I praise, his heresy I condemn' (ejus ingenium laudo, haeresin damno). In fact, he appears from his writings to have become acquainted with all the learning then taught in the schools of the rhetoricians, while to this he added the results of careful observation, and then brought all his knowledge to the support of the opinions he embraced, first as a Christian and afterwards as a Montanist. Perhaps the most striking feature in his writings is his intimate acquaintance with all the ramifications of heathen theology and worship, and the powerful use he makes of this sort of learning in his controversies with the heretics.

His excellencies and defects are strangely mingled. We trace the skill of the rhetorician in his forcible reasonings and his eloquent style, but he has also the rhetorician's faults in arguing often with more sophistry than truth, and in taking liberties with language till his meaning becomes obscure. His warm and zealous temper gives life and impressiveness to his writings; but its excess made him an enthusiast and ascetic, perhaps we ought in truth to say, a fanatic. In his writings we may generally see a striving after words to express the warmth of his feelings and the depth of his convictions, and the result of this effort, combined with the rhetorical character of his style, is often to render his eloquence inflated and obscure. He indulges frequently in figures and hyperboles, and excels in satire and irony. His writings differ greatly both in argument and style. His polemical works are the clearest, but not the most elegant. His best works are his Apology (4), and those on the Prescription of the Heretics (23), on Repentance (14), on Baptism (13), on Prayer (12), on Patience (11), and his address to Martyrs (1).

The best editions of Tertullian are those of Rhenanus, Rigaltius, and Semler. A full account of editions and illustrative works is given at the end of the excellent small edition of Tertullian by Leopold, in Gersdorf's 'Bibliotheca Patrum Ecclesiasticorum Latinorum Selecta,' 4 vols. 12mo., Leips., 1839-41, Tauchnitz.

It is doubtful whether the Tertullianus, or Tertyllianus, from two of whose works there are excerpts in the 'Digest,' is this Tertullianus. The subject is briefly discussed by Zimmern ('Geschichte des Röm. Privatrechts'), with references to other remarks on this subject. Tertullian, in his theological works, shows that he was well acquainted with Roman law.

(The Church Histories of Mosheim, Neander, and Schröckh; Baehr's *Christlich-Römische Theologie;* Neander, *Antignosticus Geist des Tertullianus*, &c., Berlin, 1825, 8vo.; Bishop Kaye, *The Ecclesiastical History of the Second and Third Centuries, illustrated from the Writings of Tertullian*, Camb., 1826, 8vo.; Münter, *Primordia Ecclesiae Africanae*, Hafn., 1829, 4to. Other works on the Life and Writings of Tertullian are mentioned in the Appendix to Leopold's edition.)

TERU'NCIUS. [As.]

TESCHEN, a circle of Austrian Silesia, is bounded on the north by Prussian Silesia, on the east by Galicia, on the south by Hungary, and on the west by Moravia. Its area is stated by most authors at about 720 or 740 square miles: Von Liechtenstern (alone, we believe) makes it 1360 square miles. The number of inhabitants is about 180,000. The country consists entirely of mountains and valleys, but especially in the south, where the Carpathian chain commences. The northern part is flatter, but marshy, with many small lakes or meres, so that it is not well adapted for tillage. The Oder forms for a short distance the north-western boundary towards Prussian Silesia, and the Ostravitza divides it on the west from Moravia. The Vistula rises in the Carpathians on the Hungarian frontier, from three springs, which unite near the mountain Tankow, flow to the village of Weichsel, and to the towns of Skotschau and Schwarzwasser, and then running along the northern frontier of the circle, pass into Galicia. The circle has many forests, and consequently timber in abundance; fine pasturage; and a good breed of horses, horned cattle, and swine. The inhabitants raise some oats and rye, and a great quantity of potatoes. There are mines of iron and coals, which are not so extensively worked as they might be. The inhabitants in general manufacture woollen cloth, linen, and wooden-wares. The circle contains the duchies of Teschen and Bielitz, and several inferior lordships. [BIELITZ.] The duchy of Teschen however constitutes by far the greater part of the circle, having a population of 140,000 inhabitants, who are mostly of Slavonian origin.

The duchy of Teschen formerly belonged to the emperors, as kings of Bohemia. In 1722 it was assigned to Leopold, duke of Lorraine, as an indemnity for the Italian duchy of Montferrat, to which he had some pretensions. Upon his death in 1729 it was inherited by his son, afterwards the emperor Francis I., whose daughter Maria Christina obtained it in 1776, and she having married Prince Albert of Saxony, he took the title of Duke of Saxe-Teschen. Prince Albert dying February 10, 1822, without lineal descendants, the duchy was inherited by the Archduke Charles, who governs it under the sovereignty of Austria.

TESCHEN, the capital of the circle and the duchy, is situated in 49° 40′ N. lat. and 18° 32′ E. long., at the foot of a gentle eminence, an offset of the Carpathians, on a peninsula, or tongue of land formed by the river Elsa or Olsa, and a small stream called the Bober or Bobreck. The town has three suburbs, which are not separated from it by walls or gates: the streets are in general broad and straight, a great fire in 1789, before which it resembled an irregular dirty Polish town, having given an opportunity to rebuild it in a better style; there are still however some narrow and steep streets. There are four Roman Catholic churches and one Lutheran church; the last is a very large and handsome edifice. The Oberring is a regular square, or rather parallelogram, in which is the town-house, a fine building with a lofty tower, at the back of which are a theatre and concert-room. Teschen is the seat of all the courts of justice and public offices of the circle and the duchy. There is a Roman Catholic gymnasium, with a library of 12,000 volumes, and collections of minerals, insects, and medals; and a Protestant gymnasium, and several schools. The inhabitants, now 7000, manufacture fine broadcloths, kerseymere, leather, and a kind of muskets known in Germany by the name of Teschinks. They have also a considerable trade in leather, wool, broadcloths, Hungarian wines, honey, and wax. The treaty between Frederick II. of Prussia and the empress Maria Theresa, which terminated what is called the war of the Bavarian succession, was concluded at Teschen in 1779.

(Hassel; Stein; Cannabich; *Oesterreichische National Encyclopädie.*)

TESI, MAURO ANTONIO, or, as he is sometimes called, after the name given him by his patron and admirer, Algarotti, Il Maurino, was born at Montalbano in the territory of Modena, January 15, 1730. Though in poor circumstances, his parents were so desirous of giving him a good education, that they removed for that purpose to Bologna, where he was admitted into the Scuole Pie. Manifesting a great taste for drawing, he was placed under Carlo Morettini, a mere heraldry painter. It is therefore not without reason that Algarotti calls him self-taught, for though he afterwards received some instruction from an engraver named Giovanni Fabbri, it could have contributed but little towards the excellence he displayed in that branch of art which he selected,—architectural design and painting. For this he was doubtless most of all indebted, after his own talent, to the instruction and assistance of Algarotti himself, who made him the companion of his journeys to various places, and treated him as a son. The attachment was reciprocal; and it was owing to his attentions to his patron during his last illness at Pisa, that he fell into ill health himself, and died two years afterwards at Bologna, July 18, 1766.

Algarotti has made frequent mention of Tesi in his letters, where he has described many of his works at considerable length, and speaks both of them and him in terms that would seem quite exaggerated, if they were expressed by a less intelligent critic, or were his praises not confirmed by the opinions of others. The encomium paid to his memory in the inscription on his monument in the church of St. Petronio, Bologna,—'Elegantiæ veteris in pingendo ornatu, et architectura restitutori,'—has not been considered more than is due to one who set an example of more refined and purer taste in architectural design and composition. His productions are highly esteemed, and though his pictures are few, he left a great number of drawings, and also a series of architectural plates engraved by himself.

(Tiraboschi, *Bibl. Modenese*; Lanzi, *Storia Pittorica.*)

TE'SSERA, a small cube or square resembling our dice, which was used by the antients for various purposes, and accordingly it consisted of different materials, as marble, precious stones, ivory, glass, wood, or mother-of-pearl. Such small tesserae of different colours were used to form the mosaic floors, or pavements in houses, which were hence called tesselata pavimenta. (Sueton., *Cæsar*, 46.) The same kinds of cubes, usually made of ivory, bone, or hard wood, and marked on all their six sides, were used by the antients as dice in games of hazard, just as in our times. In the earlier times three dice were used in a game, but afterwards only two.

The word tessera was also employed to signify any token which was given to persons by which they might recognise one another. In this case however the tesserae were probably not cubes, but were of an oblong form, or small tablets marked with certain signs. Thus we find mention of a *tessera hospitalis*, which strangers when forming a connection of hospitality gave to one another, that they or their children might afterwards recognise one another, and it appears that a tessera in this case was marked with the figure of Jupiter hospitalis. (Plautus, *Poenul.*, v. 1, 25; 2, 87, &c.) Tesserae frumentariae, or nummariae, were occasionally given at Rome to the poor to serve as a token or ticket, on the presentation of which they received a certain amount of corn or money. (Sueton., *Aug.*, 40; *Nero*, 11.) The Roman soldiers also, before they commenced a battle, received a tessera containing the watchword by which they recognised their comrades, and were enabled to distinguish them from strangers. (Virgil, *Æn.*, vii. 637, with the note of Servius.)

(*Dictionary of Greek and Roman Antiq.*, 'Tessera.')

TESSIN. There are three eminent Swedes of this name, father, son, and grandson. The first of them, Nicodemus the elder, or Nicodemus Valentinson Tessin, was born at Stralsund in 1619, and held the appointment of royal or crown aremtect, which was conferred upon him by Queen Christina in 1645, then vacant by the death of Simon de la Vallée. Very little more has been recorded of him, except that he visited Italy, that a patent of nobility was granted to him in 1674 by Charles XI., and that he filled the office of magistrate at Stockholm. Even the time of his death is not precisely stated, but it appears from collateral evidence to have been somewhere about 1688. As an architect one of his chief works is the palace of Drottningsholm, begun by him for the queen-dowager Hedwig Eleonora (widow of Charles Gustavus), but completed by his son. He also erected the royal villa of Strömsholm, and the mausoleum of Charles Gustavus. In fame he has been surpassed by his more eminent son,

Count Nicodemus Tessin, who was born at Nyköping in 1654, and had for one of his baptismal sponsors the queen Maria Eleonora, widow of Gustavus Adolphus. He was carefully educated by his father, expressly with a view to his future profession. As soon as he had completed his studies, first at Stockholm, afterwards at Upsala, he was sent at the age of eighteen to Italy, whither he accompanied the Marquis del Monte, a nobleman in the service of Christina of Sweden. He studied at Rome under Bernini, and acquired a taste for the fine arts generally. After four years thus spent, he visited Naples, Sicily, and Malta, and again returned to Rome, at which place he received from Sweden his appointment as future hof-architect in 1689. On his return he was allowed, by Charles XI., to prosecute his travels conformably with his earnest wish for further improvement, and this time he visited England and France, in which latter country he remained three years. On finally settling in his native country, he received, in addition to his former appointment, that of city-architect to the magistracy of Stockholm. The destruction of the royal palace by fire in 1697 afforded him an opportunity for displaying his ability far more favourable than might else have offered itself; and of which he so well availed himself as to render the new edifice one of the noblest of its kind in Europe, though not what it would have been had his ideas been fully carried out. He had also numerous opportunities of exhibiting his taste on a magnificent scale; but unfortunately they were only of a temporary nature—on occasions of splendid court pageants and festivals, in which his talent for architectural decoration was employed. One of them was at the solemnization of the public entry and coronation of Ulrica Eleonora, the wife of Charles XI., who was herself an artist, and displayed considerable proficiency in portrait-painting. By the queen-dowager Hedwig Eleonora he was employed not only to complete Drottningsholm, but to lay out the grounds and gardens both there and at Ulriksdal. Besides the cathedral at Calmar, and Oxenstiern's monument, he executed or designed a great number of other buildings, including a project for rebuilding the palace at Copenhagen, which was partly carried into effect, many years after his death, when it was curtailed, and by no means improved in other respects. Elevations of the original design were published by his son, under the title of 'Regiæ Hafniensis Facies,' &c. In addition to his professional occupations, the count (which title was conferred upon him in 1714) was engaged in many offices that he held at court, and he took a considerable share in public and political affairs. At the time of his death (1728) he was chancellor of the university of Lund. Count Nicodemus was twice married.

Count Charles Gustavus Tessin, the son of Count Nicodemus by his first marriage, was born at Stockholm in 1695. Though not without talent for architecture, which he had considerably improved by travelling, he did not exercise it professionally, except in completing the palace at Stockholm after his father's death. His claim to celebrity was of a very different kind; it was as a statesman and diplomatist that he chiefly distinguished himself. He was ambassador at the court of France from 1739 to 1742, and president of the chancery from 1747 to 1752. As tutor to the prince-royal, afterwards Gustavus III., he wrote for his instruction a series of letters on political and moral topics, which were published, and of which there is a French translation. Count Gustavus was a zealous promoter of every scheme for the advancement of his country; he did much for the encouragement of arts and manufactures, and first established the Swedish Academy for Painting and Sculpture in 1735. Some years before his death he withdrew from public business and affairs, and lived in retirement on his estate at Akeroe in Sudermania, where he died in 1771; and by his death the family became extinct.

(Weinwich, *Kunstner-Lexicon*; Nordin, *Minna ofver Namnkunniga Svenka Män*; Ehrenström, *B. Arts en Suede*; *Biogr. Univers.*)

TESTACELLUS, the name of a genus of testaceous pulmoniferous mollusks. For the views of authors as to

its place in the system, see the article Limax. Mr. J. E. Gray arranges it between *Plectrophorus* and *Helix*, under the *Helicidæ*, his second family of *Pneumonobranchiata*.

Generic Character.—*Animal* elongated, cylindriform, acuminated at each extremity; no cuirass; head distinct, furnished with four retractile tentacles, of which the posterior are the longest and carry the eyes; foot long and rather indistinct; pulmonary cavity situated at the posterior fourth of the animal's length, its orifice placed entirely backwards, under the right side of the apex of the shell, the anal aperture is very near it; organs of generation united, and showing their orifice near and behind the great right tentacle.

Shell external, solid, auriform, depressed, with the spire more or less projecting, having a very large and oval aperture; the right lip simple and trenchant, the left convex and reflected: the shell covers the posterior part of the pulmonary cavity.

The number of species given by Lamarck is one only; and though M. Deshayes in his Tables makes the number two (both recent), one only is recorded in the last edition of Lamarck. Mr. G. B. Sowerby figures and describes three:—*Testacelli haliotideus*, *Scutulum*, and *Maugei*.

History, Habits, &c.—This form appears to have been first noticed by M. Dugué, in a garden at Dieppe in 1740: but it does not seem to have attracted much attention till M. Maugé, some years since, brought home specimens from the island of Teneriffe. 'It has also been found,' says Mr. Sowerby, 'in several parts of France, and in Spain, and more lately in a garden at Bristol. Some specimens from the last-mentioned place have been handed to us by Mr. Miller of that city. It feeds upon earthworms, having the power of elongating its body to such a degree that it is able to follow them in all their subterranean windings: we have observed them attentively, and were rather surprised that an animal generally so extremely sluggish in its motions, after discovering its prey by means of its tentacula, thrusting from its large mouth its white crenulated revolute tongue, should instantly seize upon with extraordinary rapidity, and firmly retain, an earth-worm of much greater size and apparent force than itself, but which by its utmost exertion is unable to escape.' Mr. Sowerby adds, that De Férussac and Cuvier consider this to be the only carnivorous terrestrial mollusk.

De Férussac remarked that the simple, gelatinous, contractile mantle of the animal, hidden habitually under the shell, is divided into many lobes capable of enveloping the whole body by an extraordinary development, when the animal finds it necessary to protect itself from the consequences of too great dryness.

Localities.—*Testacellus haliotideus* inhabits the South of France; *Test. Maugei* is an inhabitant of Teneriffe, but naturalized at Bristol; and *Test. Scutulum*, which was discovered by Mr. Sowerby in a garden at Lambeth, may, in the opinion of Mr. G. B. Sowerby, be considered as a native of this island.

Shell of Testacellus Maugei: *a*, outside; *b*, inside.

Testacellus Maugei.
a, shell in situ. (G. B. Sowerby.)

TESTAMENT. [Will.]

TESTAMENT, OLD AND NEW. Some critical disputes have arisen respecting the meaning of the word *Testament*, as applied to the Canonical Scriptures. These, under the name of the two Testaments, comprise the revelations of God to man, which, being imparted under two principal conditions—the Law and the Gospel—are divided into two corresponding classes. The word thus translated by *covenant* is the Hebrew *berith*, so used in the first division of the sacred writings, and rendered in the latter by *diathece*. But a further notion than that conveyed by the Hebrew is contained in the Greek term (and which belongs also to the ecclesiastical Latin one, *Testamentum*, the original of the ordinary designation of the two portions of the Scriptures, the Old and New *Testaments*). No more appropriate designation than that of the New Testament can be applied to the second portion. Its application to the books of the Old was defended by St. Jerome (among other authorities of equal weight), on the ground that 'Testamentum non voluntatem defunctorum sonat, sed pactum viventium.'

This compact or covenant was originally entered into by the Almighty with Abraham (although, to speak strictly, the outline of it was given on the fall of man). The history of the religion of the Old Testament subsequently to the call of Abraham may be regarded as that of the progressive development of a belief in the One True God. It is most fitly contemplated under two principal points of view: 1, the knowledge of a Revelation from God as a connected work, and in its subject-matter; and 2, that of the attributes of God, so multiformously but at the same time so harmoniously manifested. 'Antient prophecy ended as it had begun. The first discovery of it in Paradise, and the conclusion of it in the book of Malachi, are directed to one point. In its course it had multiplied its disclosures, and furnished various succours to religion, and created an authentic record of God's providence and moral government to be committed to the world. But its earliest and its latest use was in the preparatory revelation of Christianity.' (Davison.) The other subject, by which the Old Testament is taken up, is, as we have observed, the progressive declaration of the attributes of God. There is observable throughout the books of the Old Testament a *moral* as well as a *Christian* revelation. In like manner with the latter, 'the divine law was unfolded. The Patriarchal and the Mosaic covenants do not express so full a model of the law of righteousness whereby man is to serve his Creator, as the later revelation given by the Prophets.' (Ibid.)

The leading use of the Old Testament was the preparatory revelation of Christianity. Its one great lesson, expressed or implied, was that of the indwelling guilt, depravity, and weakness of man. How deeply rooted in human conviction was this feeling, may be estimated from the universality of sacrifice for sin, and reliance on the mediatorial ministry of a priesthood. Their guilt and weakness, and consequent estrangement from God, were exhibited to the Jews by the sin offerings of their law, which God deigned to receive, not at the guilty hands of ordinary men, but at those of his especially appointed servants. Nor were even these favoured servants regarded as free from the lurking infection of their race by Him, before whom the very heavens are not clean. Even to the priests the nearest access to God was forbidden: even to the high priest (that awful and mysterious functionary of Heaven) the Holy Place was closed, save on one day, and under certain restrictions. So clearly then did their divinely appointed law show forth to the Jews their guilt, and the necessity and difficulties of a reconciliation with God, which other nations saw but faintly, although none were destitute of some glimmerings of the truth. But the Jewish nation went a step beyond others. All recognised in practice the necessity of sacrifice and a priesthood, but the people of God stood alone in this,—that they looked hopefully forward to a time when the law which made high-priests of men having infirmity should cease, and a period be put to the daily ministering and offering the same sacrifices, which can never take away sin. A time was coming, when the words of God's messengers were to be fulfilled respecting a more copious diffusion of the knowledge of the Lord. And all this was wrought in Him who was at once offering and priest, God and man, namely, Jesus Christ.

This great doctrine of Christ's atonement, and its results to mankind, form the end of the types, the predictions, and the sacrifices of the Old Testament. But a total change was necessarily introduced by the absorption of all sacrifice and priesthood in the great and enduring ones of the Son of God. Christ entered in once into the Holy Place, having obtained eternal redemption for us, and leaving behind him, to the faithful, boldness to enter into the holiest by his blood, by a new and living way.

Christianity, or the religion of both Testaments, is that habitual course of life which rests upon a conviction of the necessity of the redemption of the world, and of the need of a personal redeemer—Jesus Christ. Hence the inadequacy of various terms employed occasionally as synonymous with Christianity (such as the religion of moral conduct; a practical belief in immortality and retribution; or the worship of God according to the *pattern* given by Jesus) to express its distinctive peculiarities. None of the religions to be found in the world at the birth of Christ can claim alliance with Christianity, save that one which alone has any pretensions to be regarded as historical and positive, and which was directly alluded to by our Lord in the words that 'Salvation cometh from the Jews.' Nor are the reasons of this difficult to be traced. The conviction of the need of redemption turns the mind upon the conviction of sin; sin leads it to the consideration of the law broken and violated; and this last conducts it up to the original destination and capability of man and his relation to God; and nowhere are these steps to be traced so clearly as in the Law and the Prophets—the writings which contain the fullest account of the existing disease and promised remedy.

It is true that heathenism served in some sort to prepare the way for Christianity. This is clear from two facts: the ease with which heathen converts adopted the tenets of Christianity; and the analogy instituted by the early Christian apologists between the relics of revealed truth, which formed the brightest gems of heathenism, and their own purer faith. But this preparation was merely *negative*. Heathenism did no more than point out contraries which it could not reconcile, doubts which it could not solve, and wishes which it could not gratify. All *positive* preparation for Christianity and the subject-matter of revelation belongs to the Old Testament exclusively.

The knowledge of the subject-matter of the Christian system is drawn from one source exclusively, apostolical tradition, as preserved to us in the sacred writings of the New Testament. From these alone authoritative instruction is deduced. An analytical outline of the system of faith contained in these writings is most properly divided into two portions, respectively comprising the periods of time anterior and subsequent to the coming of Our Lord.

In considering the ante-Christian period, the attention is divided between Judaism and heathenism, or in other words, between man under the law of God, and man without this law,—the two great classes into which the human race was divided subsequently to the publication of the Mosaic code. But although different in many particulars, both classes are included under one general point of resemblance, their wretchedness and want of a redeemer.

From this helpless condition of man the mind reverts to the point whence this dominion of sin and death, inseparably united, dates its commencement. But here a question arises, whence was derived the power of sin to extend itself among those who, like the Jews, possessed a knowledge of the will of God? The considerations arising from this, of the relation of sin and death to the law, lead to the conclusion that the commandment which was ordained unto life was unto death. The law, according to St. Paul, so far from affording deliverance from sin, or producing sanctification, was the means of aggravating both condemnation and guilt. This is still further illustrated by other facts laid down by St. Paul, that the law can never make man holy or happy in the sight of God. Being such, why was it given at all? The answer is, that it belonged to the plan by which God designed to make man capable of redemption through Christ. To establish the necessity of such redemption, to impress upon men a conviction of the need of it, and to kindle a longing for it in their hearts, is the object of the period anterior to Christ.

Accordingly a survey of the state of the human race antecedently to the coming of Christ leads to a conviction of the need of a redeemer. The heathens lived in vice, without knowledge of God, serving idols. Their standard of action was little higher than that afforded by earthly motives, few traces remaining of a higher knowledge. The condition of the Jews was very different. They were indeed in possession of the divine law, but they sought in vain to establish their righteousness before God by observance of its precepts.

Through redemption, the difficulties which characterized the ante-Christian period (and more especially the Jewish portion of it) were removed, and God and man reconciled. The statement of the conditions and accomplishment of this reconciliation leads to the consideration of the new and holy life arising from it.

The primary source and commencing point of the whole scheme of redemption is God. According to his eternal council, God decided on reconciling to himself a world which had become alienated from him, and on rescuing the race of Adam from the ruin to which they were hastening. This decree God had made known through his prophets. An evidence of his truth and faithfulness was supplied by its accomplishment. The instrument of this was the mission of his Son, according to the eternal purpose of his Father, 'that in the dispensation of the fulness of time he might gather together in one all things in Christ, both which are in Heaven and which are in earth.' This mission of the Son, from which the newer period, that of Christianity, dates, coincides with the time when heathenism and Judaism may be said to have filled their appropriate spheres of moral action. Although no dogmatic system, technically speaking, is to be found in the writings of the New Testament, two points immediately relating to the person of Christ are brought prominently forward throughout. The first of these is his *claim* to divine honours as the Son of God; the second, his meritorious course of action, of which the crowning point was his death, to which his resurrection was the glorious sequel, and the proof of the completeness with which his office had been discharged.

The object of our Lord's earthly life was rather a course of blameless and exemplary action than the delivery of a moral code for human guidance. Hence, although in the hortatory portions of St. Paul's Epistles allusion is made to the excellencies exhibited by Christ, the mode 'of becoming like him' was conceived in a spirit far deeper than that of mere moral imitation. It is described as a putting off the old man, and being clothed with Christ; as being buried with Christ, and as rising again with him. Such expressions arise necessarily from the inseparable connection, laid down in the New Testament scheme, between the death and resurrection of Christ, as the foundation of the justification of man in the sight of God.

The doctrines of repentance and a holy life implied in these characteristics of the new covenant are essential conditions on the side of the human party to the contract. This is the sum and substance of the Sermon on the Mount, which stands at the entrance of our Lord's earthly ministry, a fit entrance and portal to the temple which lies beyond, and an unfolding of the spirit and pure meaning of the law under which Christ came to live and suffer. A better observance of this would have obviated the Antinomian perversions which have risen up from the earliest times. One garment, and one only, will make man meet for Heaven (the wedding garment of Christ's parable), which is the imputed righteousness of Christ, the accepted sacrifice for the children of Adam. But while the human race exists, the essential rules of that law which Christ came to satisfy will be binding, and men will find their truest pleasure and profit in obedience to its spirit. Christ came to found a new kingdom. Accordingly he opens his first discourse by describing the members of it, their condition and prospects in the world. And yet his kingdom was not so much a new one, as a fulfilling and spiritualizing of the former dispensation; for which reason the second part of his sermon is taken up in expounding the law of Moses, and its real obligations, and, in the words of Robert Hall, 'in animating its spirit, and in filling up or directing its practice.' But essential to a due performance of the conditions of this law 'must be reckoned the assistance or guidance of God's holy spirit, as the chief of all aids, and which contains all others. And because this cannot be understood without admitting that the Holy Spirit is omnipresent, all-sufficient, and, in a word, strictly divine; therefore the divinity of the Holy Ghost is a fundamental article of the Christian covenant.' (Latham, *Harmonia Paulina*.)

Christian Society forms the second part of the theological system which may be extracted from the New Testament, as comprehending the origin of the Christian community, its gradual progress and necessary conditions, the relation of its members to each other, and their unity in the spirit. We cannot fail to observe, according to Hammond, 'from the interchangeable mixture of the graces described by Christ in the opening of the Sermon on the

Mount, that to God belongs the chief and first and last of our love and obedience, yet so as not to *exclude*, but *require* also in its subordination our care of duty and love towards man also; one intermixing lovingly and friendly with the other, and neither performed as it ought, if the other be neglected.' The common bond of all Christians is the faith and hope by which they become partakers of the benefits and salvation placed within their reach by the meritorious death and the resurrection of Christ. Accordingly, 'the partakers of this common faith and hope form collectively that spiritual body of which Christ is the head, namely, the Christian Church, in which, as in the natural body, various offices are distributed to the different members; but the most excellent endowment of any member is to walk in Christian love and purity under the guidance of the Holy Spirit. The two sacraments, which were typified to the Israelites in the wilderness, baptism and the Lord's Supper, are symbols of the Church's union with Christ. In baptism, the outward sign of our resurrection to a new life from the death of sin, and of our admission to the Church, we are joined by the Holy Spirit to Christ our Head; and the perpetual commemoration of Christ's death, according to his command in the Lord's Supper, is a means whereby we perpetually renew our spiritual strength, and draw more closely our union with him and with each other.' (Latham, *Harm. Paul.*)

The conclusion of the subject-matter of the New Testament is a sketch (by prophetic anticipation) of Christian society in its completeness of glory, which shall be accomplished by Christ at his second coming as the glorified Son of God, when he shall triumph over all opposition, and the redeemed be united with God in everlasting happiness. We have seen that Christ's obedience unto death was in order that many might live; and this will be accomplished at that resurrection which Christianity alone teaches clearly. Those who are now in the image of the earthly, will then be in that of the heavenly. The same spirit, which we learn from the New Testament dwelleth in our mortal bodies, shall quicken these that they shall be raised from the dead. When 'those that dwell in the dust shall awake,' then our mortal bodies will be changed, and made like unto the glorified one of Christ, by the power wherewith he is able to subdue all things unto himself.

TESTAMENT, OLD AND NEW. The view of the connection of the Old and New Testaments and the general theory of divine revelation given in the preceding article are by no means admitted by all Christians. They are departed from in various directions and degrees by different sects, but are most completely opposed by Unitarians. They deny that the doctrine of hereditary and total depravity is either consistent with reason and experience or at all sanctioned by Scripture. They hold the nature of the sacrifices, both in the patriarchal times and under the law, to be altogether misunderstood by those who consider them as referring to a corrupted nature and to an atonement. They endeavour to prove that the sacrificial language of the New Testament is founded on figurative allusions to the rites and ceremonies under the law, may be naturally traced to the circumstances of the writers, and has peculiarities which it could not have had if intended literally to express a great religious doctrine. They maintain that the whole system of types and antitypes in the Old and New Testament is without good Scriptural authority, and loaded with inconsistencies and false views both of the law and the gospel. They also reject the applications which are made of some real or supposed prophecies.

The view which prevails among modern Unitarians of the general theory of revelation and the connection of the various parts is, that the different divine interferences were adapted to different stages in the progress of mankind from infancy towards maturity; that each was best fitted for the time in which it was given, uniting the greatest amount of immediate good with the greatest power to promote the advancement of the race; that the Jewish system in particular was designed to preserve the great doctrine of the Unity of God at a time when the world in general was sinking fast into a degrading and corrupting idolatry, to exhibit to the nations around, and to all who should afterwards contemplate the history of the chosen people, a proof and illustration by example of the moral government of God, and to prepare the way for the establishment, when the world should be in a fit state for receiving it, of the more perfect dispensation of Christianity, which may be properly represented as a spiritualised and perfected Judaism, adding to it whatever important religious truths could not have been previously delivered with advantage, especially the grand doctrine of a future life, and opening the privileges of religious knowledge, faith, and hope to men of all nations without distinction, and without ritual observances. The knowledge of the paternal character of God and of his readiness to accept all his children who sincerely desire and endeavour to serve him; the doctrine of a future life distinctly taught and directly proved, and the enforcement of the purest moral principles, constitute, according to their view, the peculiarity and value of Christianity; and the whole system of God's holiness requiring human punishment, and of Christ's merits saving men from wrath, is rejected as unscriptural, unreasonable, and pernicious. It is enough for us here to state the opposite doctrines which form the grand subject of controversy in the Christian world. Any attempt to give an account of the evidence appealed to on each side would lead us far beyond the bounds which we are obliged to prescribe to ourselves.

TESTAMENTS OF THE TWELVE PATRIARCHS, a Greek work which professes to contain the last words of the twelve patriarchs, the sons of Jacob, but which is considered to be undoubtedly spurious by all writers except Whiston, who accepts it as a part of the canon of the Old Testament; but no weight can be attached to his judgment on the matter.

The age and authorship of this work are much disputed. It is once quoted by Origen, who flourished about A.D. 230. The most probable opinion is that of Cave and Lardner, who suppose it to have been written by a Jewish convert to Christianity about the end of the second century after Christ.

It appears to have been the writer's object to foist his work into the Canon, since, though he makes frequent quotations from the books of the Old Testament, he never mentions any of them by name. The only book which he quotes by name is 'the book of Enoch the Righteous.'

These testaments have been frequently published in Latin. They were first printed in Greek by Grabe in his *Spicileg. Patr.*, and afterwards by Fabricius in his *Cod. Pseudepigraph.*, and Whiston published an English translation of them in his *Authentic Records.*

(Lardner's *Credibility*, part ii., c. 29, § 3, and the authorities there quoted.)

TESTIMONY. [EVIDENCE.]

TESTIMONY, PERPETUATION OF. [PERPETUATION OF TESTIMONY.]

TESTONE, or TESTOON. [MONEY.]

TESTS, CHEMICAL, or Chemical Re-agents, are those substances which are employed to detect the presence of other bodies, by admixture with which they are known to produce certain changes in appearance and properties: thus, for example, as the blue colour of litmus is turned red by acids, it is considered as and used for a test to determine their presence when uncombined or in excess: so also litmus which has been reddened by an acid has its blue colour restored by the action of an alkali: reddened litmus is therefore used as a test of the presence of free or uncombined alkalis.

We give these examples from thousands which might have been selected, merely to explain the meaning of the term chemical test, observing that change of colour is one only of the many alterations adduced in proof of chemical action: thus the solubility of certain substances in some re-agents and not in others, constitutes another criterion or test of the nature of bodies.

We cannot enter particularly into this subject, for its extent is equalled only by its importance; and it is the less requisite that we should do so, since, in describing the various metals, &c., the tests of their presence are usually given with the properties of their salts.

We refer the reader who wishes for a complete view of the subject to two works which have appeared in France, viz. 'Traité élémentaire des Reactifs,' &c., by Payen and Chevallier, in 2 vols. 8vo., and 'Dictionnaire des Reactifs Chimiques,' by Lassaigne, in 1 vol. 8vo.

TESTUDINĀTA. [TORTOISES.]

TESTU'DO. [TORTOISES.]

TE'TANUS (τέτανος, derived from τείνω, *to stretch*) is both a generic and a specific term: generically, it may be

defined to be a more or less violent and rigid spasm of many or all of the muscles of voluntary motion; the name is also particularly applied (as will be seen hereafter) to one of the species of this affection. Both the disease and also its name are as old as the time of Hippocrates; and, as it is proved by experience to be much more frequent in warm climates, the antient physicians probably had peculiar advantages in observing it, and accordingly seem to have paid particular attention to it. The following description by Aretaeus (*De Caus. et Sign. Morb. Acut.*, lib. i., cap. 6, p. 6, ed. Kühn) is written in his usual graphic style. (The translation by Dr. Reynolds has been chiefly followed.)

'Tetanic spasms,' says this author, 'are attended with severe pain, and prove rapidly fatal, and by no means readily admit of relief; they make their attack on the muscles and tendons of the jaws and neck, but impart the disease to every other spot, for all parts become sympathetically affected with those which were primarily assailed.

'There are three forms of the convulsions: the straight, the backward, and the forward. The straight one is true *Tetanus*, when the patient is stretched straight and inflexible; the backward or forward varieties have their name from the direction and locality of the tension; hence the deflexion of the patient backwards is termed *opisthotonos* (ὀπισθότονος), from the nerves being affected in this direction; while, if the bending be forward, by the nerves in front, it is termed *emprosthotonos* (ἐμπροσθότονος), for *tonos* (τόνος) is a term which signifies both *a nerve* and *tension*.

'The causes of these affections are numerous: they often follow a wound of a membranous part, or punctures in muscles or nerves, and in such cases the patients usually die, for (as Hippocrates says, *Aphor.*, sect. v., § 2, tom. iii., p. 735) "traumatic spasms are fatal." A woman may be convulsed after miscarriage, and she seldom recovers; some persons are seized with spasms from a violent blow on the neck; intense cold may prove a source, and hence these diseases are particularly liable to occur in the winter; they are less frequent in the spring and autumn, and least of all in the summer, unless they arise from a wound, or a visitation of foreign diseases. Women are more liable to convulsions than men, because they are of a colder temperament, but they more frequently recover, from the moisture of their temperaments.

'As respects the various periods of life, children are liable to this affection, but do not often die, for it is one they are used to, and familiar with; youths are less frequently affected, but more die; adults are least of all liable to be attacked; while the old have it, and die from it, more than any other class of persons: the cause is referrible to the frigidity and dryness of old age, which is also the nature of death, for, if the cold be attended with moisture, the spasms are less injurious and fraught with less danger.

'It may be said in general of all these affections, that they are attended with pain and tension, both of the tendons and spine, and of the maxillary and thoracic muscles; for they so clench the lower jaw to the upper, that it is not easy to separate them either by lever or wedge; and if, on forcibly separating the teeth, any liquid be introduced, it is not swallowed, but returned, or retained in the mouth, or ejected through the nostrils, for the passage of the fauces is closed, and the tonsils, being hard and tense, do not collapse so as to depress the food in swallowing. The face is red and mottled, the eyes nearly fixed, turned with difficulty round, there is a strong feeling of stifling, respiration laboured, the arms and legs on the stretch, the muscles quivering, the face distorted in all sorts of ways, the cheeks and lips tremulous, the chin in constant motion, the teeth grate, and sometimes the ears will move, as I have myself witnessed with amazement: the urine is either retained with violent pain, or flows off involuntarily from compression of the bladder. These appearances are common to all the species of spasms; each variety of this disease has however its peculiarities.

'In *tetanus* the whole body is stretched in a right line, rigid and immovable, while the legs and arms are straight.

'In *opisthotonos* the patient is bent back, so that the head pulled in that direction lies between the shoulder-blades, while the throat projects; the lower jaw is usually open, and is rarely locked with the upper; the respiration is stertorous, the abdomen and thorax are prominent, and in this form especially there is incontinence of urine; the epigastrium is tense and resonant when struck, the arms are forcibly wrenched back in a state of tension, while the legs lie bent together, for the elbow bends in a manner the reverse of what the ham does.

'If *emprosthotonos* take place, the back is bent, the hips are forced on a level with the shoulders, the whole spine is on the stretch, the head is dependent and bent on the chest, the chin fixed upon the sternum, the arms cramped up, and the legs at full stretch. The pain is severe in all the forms, and wailing is the voice, deep are the sobs and groans, and if now the disorder has assailed the chest and respiration, it soon hurries the sufferer off—a boon indeed to him, as it relieves him from pain, distortion, and humiliation, and serving also to lighten the distress of those present, even if they be his own father or son; but if there be still respiration enough to support life, and although oppressed it be still performed, the patients are not merely bowed forward, but are even rolled up like a ball, so as to have their head on their knees, and their legs and back parts wrenched forward, so as to look as if the knee joint were thrust into the ham. It is an affliction more than man can bear, a sight revolting and painful to behold; and this cruel disease is irremediable, and from the distortion the sufferer is not recognised, even by his dearest friends, and the prayer of those around (which would have been heretofore impious, but hath become now righteous) is, that the wretched sufferer may depart out of life, and be released at the same time from his existence, pain, and horrible torment; and the physician, though present and looking on, is not merely unable to save his life, or to give relief to his pains, but he cannot even improve his shape; for to attempt to straighten the limbs would be like mangling and breaking the man in pieces while yet alive, and therefore, no longer offering his assistance, he is reduced to the sad necessity of merely contributing his sympathy.'

The three forms of the disease mentioned by Aretaeus are described by most of the antient writers: the species called *trismus*, or *locked-jaw* (which is the name applied to it when the spasms are confined to the muscles of the jaw or throat), forms a fourth in modern authors; and to these has been added a fifth, under the name *Pleurosthotonos* (πλευροσθότονος), which signifies that the body is drawn to one side. These different terms applied to tetanic affections do not imply so many particular diseases, but only the seat and various degrees of one and the same complaint. Trismus is invariably a part of each of the other varieties. This subdivision of the disease is of little or no practical importance; but a much more essential division is into *acute* or *chronic*, according to its greater or lesser intensity. The former kind is exceedingly dangerous and usually fatal; while the latter, on account of the more gradual progress of the symptoms, affords more opportunity of being successfully treated. (Larrey, in *Mém. de Chirurgie Militaire*, tome i., pp. 235, 236, quoted in Cooper's *Dict. of Pract. Surgery*.) Tetanus is also divided into *traumatic*, or that arising from a wound, which is also occasionally termed *symptomatic;* and into *idiopathic*, or that which proceeds from other causes.

Traumatic tetanus sometimes comes on in a surprisingly sudden manner, and quickly attains its most violent degree. The most rapidly fatal case that has ever been recorded is one that we have on the authority of the late Professor Robison of Edinburgh. It occurred in a negro, who scratched his thumb with a broken china plate, and died of tetanus a quarter of an hour after this slight injury. (Rees's *Cyclopædia*, art. 'Tetanus,' quoted by Cooper.) Most commonly however the approaches of the disorder are more gradual, and it slowly advances to its worst stage. In this sort of case the commencement of the disorder is announced by a sensation of stiffness about the neck, a symptom which, increasing by degrees, renders the motion of the head difficult and painful. In proportion as the rigidity of the neck becomes greater, the patient experiences in the throat a sense of dryness and soreness, and about the root of the tongue an uneasiness, soon changing into a difficulty of mastication and swallowing, which after a time become totally impossible. The attempt at deglutition is attended with convulsive efforts, especially when an endeavour is made to swallow liquids; and so great is the distress which accompanies these convulsions, that the patient becomes very reluctant to renew the trials,

and occasionally refuses all nourishment: sometimes it even inspires him with a dread of the sight of water, and a great resemblance to hydrophobia is produced.

With respect to the causes of tetanus, 'it must ever be regarded,' says Dr. Gregory (*Theory and Practice of Med.*), 'as a very singular fact in pathology, that an affection of so peculiar a character as this should have its source in causes apparently so dissimilar; that the puncture of a nerve, the laceration of a tendon, or an extensive burn, should bring on the same *kind* of nervous affection as that which is the occasional consequence of *cold*.' Every description of wound, no matter how inflicted, or in what part, or in what stage, may be the occasion of tetanic symptoms which form the species denominated *traumatic*. Cases are on record (and are quoted by Dr. Symonds in the *Cyclopædia of Practical Medicine*, art. 'Tetanus'), wherein the patient was attacked with the disease in consequence of a bite on the finger from a tame sparrow; in which it supervened on the mere stroke of a whip-lash under the eyes, though the skin was not broken; in which it was occasioned by a small fish-bone sticking in the pharynx; by a slight solution of continuity in the external ear from a musket-shot; by the application of a seton to the thorax; by the stroke of a cane across the back of the neck; by a blow on the hand from the same instrument; by the extraction of a tooth, &c. In short, according to Sir James M'Grigor (quoted by Dr. Symonds), 'it occurs in every description and in every stage of wounds, from the slightest to the most formidable, from the healthy and the sloughing, from the incised and the lacerated, from the most simple and the most complicated.'

Next in frequency to wounds as an exciting cause of tetanus is exposure to cold and damp; indeed there are but very few cases of true idiopathic tetanus which are referrible to any other. The irritation of worms and other disordered states of the alimentary canal have been considered by some authors as the cause of tetanic affections. To generate this form of disease however, it would appear that a certain *predisposition* is also requisite, and it is doubtless the same with that which operates as an *accessory cause* of the traumatic tetanus. The predisposition to tetanic affections is given, in the first place, by warm climates and warm seasons. Within the tropics therefore it prevails to an extent unheard of in colder latitudes. Secondly, tetanus is chiefly observed to prevail when the atmosphere is much loaded with moisture, and particularly where this has suddenly succeeded to a long course of dry and sultry weather. Even in this country exposure to the cold and damp air of the night has occasionally been followed by an attack of tetanus. In tropical climates children are particularly subject to this complaint, and with a few peculiarities which, though producing no specific difference, have been thought sufficient to constitute a variety known by the name of *trismus nascentium*. The disease in this case is vulgarly known by the absurd name of *falling of the jaw*. It occurs chiefly between the ninth and fourteenth day after birth, and seldom after the latter period. Without any febrile accession, and often without any perceptible cause whatever, the infant sinks into an unnatural weariness and drowsiness, attended with frequent yawnings and with a slight difficulty of moving the lower jaw. This last symptom takes place in some instances sooner, in others later, and soon increases in intensity. Even while the infant is yet able to open its mouth, there is occasionally an inability to suck or swallow. By degrees the lower jaw becomes rigid, and totally resists the introduction of food. There is no painful sensation, but the skin assumes a yellow hue, the eyes appear dull, the spasms often extend over the body, and in two or three days the disease proves mortal.

The prognosis of this disease is mainly to be determined by the nature of the exciting cause, and by the type of the seizure. Tetanus of the idiopathic kind has certainly been cured in a larger proportion of cases than that which follows external injury, which 'is a fact well-known' (says an able writer in the 'Edinburgh Journal,' vol. xv., p. 292, quoted by Dr. Symonds) 'to every planter in the West Indies, who never considers his negroes as safe when the disease supervenes on a wound, but is frequently successful in alleviating the idiopathic species.' The type of the disease as acute or chronic is a no less important guide as to the probable termination. It may be said that recovery in a case of acute tetanus is almost, if not altogether, hopeless: the chronic form however is of a much milder character. The usual termination of the disease may be stated to occur on the third or fourth day; and if the patient survives that time, there are good hopes of his recovery: it is rarely protracted beyond the eighth day. Mr. Cooper however mentions (*Surg. Dict.*) that he had a patient (who had been wounded, and suffered amputation of the thigh) who lingered five weeks with chronic tetanus before he died.

The dissection of patients who have died of tetanus has thrown little or no light upon the real nature of the complaint, as is indeed the case in almost all spasmodic or neuralgic disorders. Sometimes slight effusions are found within the cranium, but in general no morbid appearance whatever can be detected within the head. There is always more or less of an inflammatory appearance in the œsophagus and in the villous coat of the stomach about the cardia. These appearances however are common to a great number of diseases, and are uniformly met with in every case of rapid or violent death. Besides the redness and increased vascularity of these parts, Baron Larrey found the pharynx and œsophagus much contracted, and covered with a viscid reddish mucus. He also found numerous lumbrici in the bowels of several of the patients who died; but this, as Mr. Cooper remarks, could only be an accidental complication, and not a cause. In several cases Dr. M'Arthur found the intestines much inflamed; and in two of them a yellow waxy fluid, of a peculiar offensive smell, covered their internal surface; but whether the inflammation was primary, or only a consequence of the pressure of the abdominal muscles, which contract so violently in this disease, he is unable to decide. (*Med. Chir. Trans.*, vol. vii., p. 475, quoted in Cooper's *Surg. Dict.*)

The treatment of Tetanus is confessedly a subject of infinite difficulty, as the disease frequently baffles every mode of practice, and, in certain instances, gets well under the employment of the very same remedies which decidedly fail in other similar cases. Upon the whole it will probably be universally admitted that no effectual remedy for Tetanus has yet been discovered, as every plan has occasionally succeeded, and every plan has still more frequently failed. The following is the abstract of the opinions of the antients on this point given by Mr. Adams in his Notes to 'Paulus Ægineta.'

Hippocrates (*Aphor.*, v. 70), Galen (*De Loc. Affect.*, lib. iii.; *De Meth. Med.*, lib. xii.), Octavius Horatianus (lib. ii., cap. 10), and Avicenna (lib. iii., fen. 2, cap. 5, 6, 7) agree in stating that a fever coming on tends to remove the tetanic affection. Cælius Aurelianus (*De Morb. Acut.*, lib. iii., c. 6) seems to question the truth of this antient aphorism. Hippocrates disapproves of the cold affusion in cases of traumatic Tetanus: Alexander Aphrodisiensis however speaks rather favourably of it (*Problem. Phys.*, i. 53). Aëtius (lib. vi., c. 38), Oribasius (*Synops.*, lib. viii., c. 16), and Nonnus (*De Medic.*, c. 38), like Paulus Ægineta (*De Re Med.*, lib. iii., c. 20), recommend bleeding, emollient fomentations, and the bath of oil. Archigenes (ap. Aëtium, *loco cit.*) directs to prepare the bath by adding a fifth part of oil to the water.

The treatment recommended by Celsus (*De Medic.*, lib. ii., c. 1) is judicious, and not unlike that of Paulus Ægineta. He expresses himself hesitatingly about venesection, and forbids the early use of wine; he approves of opening the belly. This practice is strongly recommended by Dr. Hamilton of Edinburgh.

The treatment of Aretæus (*De Cur. Morb. Acut.*, lib. i., c. 6) is altogether soothing and relaxant. He recommends to lay the patient upon a soft warm bed, and, from whatever cause the complaint arise, to begin with abstracting blood from the arm. Then soft liquid food is to be given, and the whole body wrapped in wool moistened with some calefacient oil; or bladders half filled with tepid oil are to be applied to the parts most affected. He directs to cup the back part of the neck, but cautions against exciting irritation by the application of heat. To the wound he recommends suppurative applications containing frankincense, turpentine-rosin, and the like; for he remarks (and the fact is confirmed by the experience of the late M. Larrey, who recommends a similar mode of practice) that, when tetanus supervenes, the sore becomes dry. He praises castor and assafœtida as anti-spasmodics; and, if these cannot

be swallowed, they are to be given in an injection. He advises also to give hiera in an injection.

Cælius Aurelianus (*loco cit.*) enumerates nearly the same causes as Aretæus, and describes all the symptoms of the disease with the greatest precision. His treatment is also nearly the same as that of Aretæus, namely, emollient applications to the neck, venesection, and oily clysters. He even enjoins the bath of oil, which has fallen into disuse in modern practice, most probably solely on account of the expense with which it would be attended. He also permits sometimes to use the common bath, but not of cold water. He allows wine in certain cases. He condemns Hippocrates for giving both wine and emetics, and having recourse to venesection, without due discrimination. He blames him also for recommending the affusion of cold water, inasmuch as he himself had pronounced cold to be injurious to the nerves, bones, &c. Galen however remarks, in his Commentary upon this aphorism of Hippocrates (sect. v. § 21), that cold in this case is not the direct cause of the benefit derived from this remedy, but (if I understand him right) that the shock which it imparts to the system proves beneficial by rousing the vital heat and energies of the patient. Hippocrates however, as stated above, forbade the cold affusion in traumatic tetanus. Paulus Ægineta's opinion of this practice is just such as the profession in general now entertains, after it has received another trial upon the recommendation of the late Dr. Currie. (See *Medical Reports*, and Larrey's *Mémoires de Chirurgie*, t. 1.)

Octavius Horatianus (*loco cit.*) recommends bleeding, emollient applications, purgative clysters, the tepid bath, antispasmodics, and *soporifics*. The use of the last-mentioned class of remedies does not appear to have been sufficiently understood by the antients; at all events they were less partial to them in this case than the moderns.

The Arabians enjoin nearly the same treatment as the Greeks. Avicenna (*loco cit.*) and Mesue join the preceding authorities in recommending strongly the use of castor and assafœtida as antispasmodics; and yet it is deserving of remark that modern surgeons do not repose much confidence in these medicines. (See Sir James M'Grigor's communication in the *Medico-Chirurg. Transact.*, vol. vi.) Avicenna, like all the others, praises the bath of oil. Serapion (lib. i., c. 27) speaks of a bath prepared with emollient herbs. Haly Abbas (*Theor.*, lib. ix., cap. 10, 11; *Pract.*, lib. v., c. 31) describes minutely the two varieties as occasioned by repletion or inanition. For the former, he approves of purging with hot drastic purgatives, of rubbing the part affected with hot oils, and of using the warm bath with friction after it; he also approves of castor. For the other variety he praises the affusion of plain water in which lettuces, barley, &c. have been boiled. He recommends the internal use of milk and other demulcents, and the bath of oil, and rubbing the body with oil of violets. The treatment recommended by Alsaharavius (*Pract.*, lib. i., § 2, c. 21) is very similar. Rhazes mentions (*Divis.*, lib. i., c. 16; *Contin.*, lib. 1) Hippocrates' proposal of the cold affusion; but, like Paulus Ægineta, he rather disapproves of it. He himself recommends bleeding, when there are symptoms of repletion, emollient applications to the neck, the bath of oil, the application of leeches to the part affected, purging with aloes, &c., and the administration of antispasmodics, such as castor, assafœtida, and the like.

The general principle of cure, as Dr. Good remarks, is far more easily explained than acted upon: it is that of taking off the local irritation, wherever such exists, and of tranquillizing the nervous erethism of the entire system. The former of these two objects is of great importance in the locked-jaw, or trismus, of infants; for, by removing the viscid and acrimonious meconium, or whatever other irritant is lodged in the stomach or bowels, we can sometimes effect a speedy cure without any other medicine. Castor oil is by far the best aperient on this occasion, and it may be given both by the mouth and by injections. If this however do not succeed, we should have recourse to powerful anodynes: of these the best is opium, which should be administered in doses of from three to five drops of the tincture according to the age of the patient. Opium has also been more extensively resorted to in the cases of adults than almost any other remedy; and Dr. Good, Dr. Gregory, and others profess that it is that on which they place their chief, if not their only reliance. To give it a fair chance of success, we must begin its use from the earliest appearance of tetanic symptoms. It must be given in very large doses; and these doses must be repeated at such short intervals as to keep the system constantly under the influence of the remedy. It is astonishing to observe how the human body, when labouring under a tetanic disease, will resist the operation of this and other remedies, which, in its healthy state, would have been more than sufficient to overpower and destroy it. It is advisable to begin with fifty drops of laudanum, and to repeat this at intervals of two or three hours, or even oftener if the urgency of the symptoms require it, until some effect has been produced on the spasms. In the early stage of the disease we are to bear in mind the approaching closure of the jaw and difficulty of deglutition; and our remedies are accordingly to be pushed before such serious obstacles to their administration arise. When they have occurred, and are found to be insuperable, opiate enemata and frictions may be tried; but we must not anticipate much benefit from such feeble means. Such are Dr. Gregory's remarks; but Dr. Symonds considers that the employment of opium is recommended chiefly by systematic writers, and for theoretical, rather than for practical reasons; while most of those who give the results of their own experience express the greatest dissatisfaction with the remedy.

Probably a much more efficient class of remedies than the preceding is that of purgatives; both on account of the obstinate costiveness which attends the disease, and also because we have in daily practice such convincing proofs of their strong revulsive influence on diseases of the cerebro-spinal centre. The testimony of the army physicians, as we learn from the report of Sir James M'Grigor, is highly in favour of a rigid perseverance in the use of purgatives, given in adequate doses to produce daily a full effect. Dr. Forbes states that a solution of sulphate of magnesia in infusion of senna was found to answer better than any other purgative; and it was daily given in a sufficient quantity to produce a copious evacuation, which was always dark-coloured and highly offensive; and to this practice he chiefly attributes in one severe case the removal of the disease. (*Med. Chir. Trans.*, vol. vi., p. 452, quoted by Mr. Cooper.) Dr. Good condemns drastic purgatives, forgetting apparently that mild ones have no effect. Strong cathartics have indeed frequently proved of great service, and none has higher repute than croton oil.

The employment of the warm bath has been recommended by numerous writers, but it would be difficult to trace in their accounts any facts which decidedly show that its adoption was ever followed by unequivocal benefit. Cold bathing has also been advised, but it has generally been found to be worse than useless; and there are several cases upon record of almost instant death having followed its employment.

The practice of bleeding is another that has been tried, but most frequently without effect. In some few cases amputation of the limb, from the injury of which the tetanus has arisen, has been successful; but as this extreme measure is also very uncertain, it is not likely to be ever extensively adopted.

Numerous other remedies have been tried, with no, or very imperfect, success; for instance, acupuncture, strychnia, mercury, caustics, blisters, tobacco, oil of turpentine, æther, camphor, musk, bark, wine, sesqui-oxide of iron, &c. &c. However, it must, after all these have been tried, be confessed that tetanus is one of the most formidable and unmanageable of disorders, and that recovery in the acute form still continues to be almost hopeless.

(Cooper's *Surgical Dict.*; Symonds, in the *Cyclop. of Pract. Med.*; Good's *Study of Med.*; Gregory's *Theory and Practice of Med.*; from which works most of the preceding remarks have been taken. A reference to numerous other works on the same subject will be found in Ploucquet's *Liter. Med. Digesta*; Cooper's *Surg. Dict.*; and Forbes's *Medical Bibliography*, in the *Cyclop. of Pract. Med.*)

TETBURY, an antient market-town in Gloucestershire, near the borders of Wiltshire, situated on elevated ground near the source of the Warwickshire Avon, 99 miles west by north from London, and 20 miles south-east of Gloucester. The parish, with four hamlets, contains a population of

2339, according to the census of 1831. The town consists of one long street intersected by two shorter ones, with the market-place and a spacious market-house in the centre. The streets are paved and lighted, and the houses built chiefly of stone. A bailiff and constable are annually appointed at the court-leet of the feoffees of the manor. There are fairs held three times a year, for cheese, cattle, sheep, horses, &c. The parish church, which was built soon after the Conquest, was taken down in 1784, with the exception of the tower, and rebuilt in the pointed style; and a modern spire was placed on the tower. The living is a vicarage, of the annual gross value of 903*l*. The Baptists and Independents have places of worship. In 1723 Elizabeth Hodges left a rent-charge of 30*l*. for the education of 15 children; and in the years 1783, 1795, and 1797, the sum of 100*l*. was left by three different persons for the support of a Sunday-school. In 1833 there were ten daily schools, attended by 173 children, and three Sunday-schools, at one of which, in connection with the Established Church, 174 children were instructed, and the other was a Baptist school, attended by 153 children. In the reign of James I., Sir William Romney, a native of the town, founded almshouses for eight poor persons, and left property for the endowment of a grammar-school. The traces of an antient encampment were visible on the south-eastern side of the town up to the middle of the last century; and at this spot fragments of British weapons and coins of the Lower Empire have been found.

TETE'. [SENNA.]

TETHYS. [NUDIBRANCHIATA, vol. xvi., p. 361.]

TETRABRANCHIATA, Professor Owen's second order of the class *Cephalopoda*. This order is equivalent to the 'Céphalopodes testacés polythalamés' of Lamarck; to the 'Polythalamacés' of De Blainville; the 'Siphonoides' of De Haan; and the 'Sifonifères' of D'Orbigny.

The following characters of the order are given by the Professor:—

Eyes, subpedunculate. *Mandibles*, calcareous at the apex. *Arms*, abbreviated, tubular, and furnished with retractile tentacles. *Mantle*, membranaceous, with two anterior apertures; a posterior membranaceous tubule running through the siphon of the multilocular shell. *Gills*, four. *Branchial heart*, null. *Excretory tube*, with the walls disconnected below. *Shell*, internal or external multilocular.

The genera comprised by Professor Owen under this order, in his *Memoir on the Pearly Nautilus* (1832), are—*Belemnites*, *Baculites*, *Lituola*, *Spirula* (?), *Ammonites*, *Orbulites*, *Nautilus*, *Cibicides*, *Rotalites*, &c.

In the *Cyclopædia of Anatomy and Physiology* (1836), Professor Owen modifies the views above given. In that work the *Tetrabranchiata* form the first order of the *Cephalopoda*, with the following synonyms: *Polythalamacés*, Blainville; *Siphonifera*, D'Orbigny; minus the *Spirulidæ* and *Belemnites*.

The *Tetrabranchiate Cephalopods* (of which the *Pearly Nautilus* may be regarded as the type) are described as provided with a large external univalve shell, symmetrical in form, like the body of the animal which it protects, straight or convoluted on a vertical plane, and divided by a series of partitions into numerous chambers, of which the last formed is the largest, and alone contains the body of the animal; a dilatable and contractile tube is continued from the posterior part of the animal through all the partitions and chambers of the shell; but the attachment of the shell to the body is effected by means of two strong lateral muscles which are inserted into the walls of the last chamber. The numerous hollow arms and retractile tentacles are peculiar to this order, and the head is further provided with a large ligamento-muscular plate or flattened disc, which, besides acting as a defence to the opening of the shell, serves also, in all probability, as an organ for creeping along the ground, like the foot of the Gastropods. There are no fins or analogous organs for swimming.

The following are the characters given in the *Cyclopædia of Anatomy* by the Professor:—

Jaws strengthened by a dense, exterior, calcareous coating, and with thick dentated margins. *Eyes* pedunculated and of a simple structure. No *organ of hearing*. *Gills* four in number and without branchial hearts. *Circulating system* provided with but one ventricle, which is systemic or propels arterial blood. No *ink-bag*. Inferior parietes of the funnel divided longitudinally.

The second order, *Dibranchiata*, has the following synonyms: *Cryptodibranches*, Blainv.; *Acetabulifera*, D'Orb.; plus the *Spirulidæ* and *Belemnitidæ*.

The *Tetrabranchiata* are divided into two families:

1. *Nautilidæ:* Genera:—*Nautilus*, Lam.; *Clymene*, Münst.; *Campulites*, Deshayes; *Lituites*, Breyn; *Orthoceratites*, Breyn.

2. *Ammonitidæ*: Genera:—*Baculites*, Lam.; *Hamites*, Parkinson; *Scaphites*, Parkinson; *Ammonites*, Brug.; *Turrilites*, Lam.

Of the *Dibranchiata*, Professor Owen remarks, that this order also had its representative in the seas of the antient world, as the shells called *Belemnites*, or thunder-stones, the fossil shells of the *Sepiæ* discovered by Cuvier, and the horny rings of the acetabula found by Buckland in the coprolites, or fossil fæces, of *Ichthyosauri* testify; but, he remarks, our knowledge of this order is chiefly founded on observation of existing species. 'These,' says the Professor, 'are extremely numerous: they frequent the seas of every clime, from the ice-bound shores of *Boothia Felix* to the open main, and floating Sargasso or Gulf-weed of the Equator; they seem however to be most abundant in temperate latitudes. Many species frequent the coasts, creeping among the rocks and stones at the bottom; others are pelagic, swimming well, and are found in the ocean at a great distance from land.'

Professor Owen then adverts to the great variety of size presented by the *Dibranchiata*, remarking that although the bulk of the gigantic species has been undoubtedly exaggerated, yet the organization of this order is favourable to the attainment of dimensions beyond those presented by the individuals of any other group of invertebrate animals. He then alludes to the Uncinated Calamary caught by Banks and Solander in the southern ocean [SEPIADÆ, vol. xxi., p. 253], and to the fragment of the cephalopod weighing one hundred pounds obtained by the French naturalists in the Atlantic ocean under the line, and preserved in the Museum of the Garden of Plants at Paris.

The *Dibranchiate Cephalopods* are divided by Professor Owen into two tribes, the *Decapoda* and the *Octopoda*.

The *Decapoda*, besides the possession of ten arms, are characterised by having a pair of fins attached to the mantle; by having the funnel either adherent at the antero-lateral parts of its base, and without an internal valve, or articulated at the same part by two ball-and-socket joints to the mantle, and provided with a valve internally at its apex; by having fleshy appendages to the branchial hearts, and glandular appendages to the biliary ducts; by having generally a single oviduct with detached superadded glands; and lastly, by the shell or rudiment being single, mesial, and dorsal.

Professor Owen considers the Decapodous tribe to be that which is most nearly allied to the Tetrabranchiate order, and he regards *Spirula* as the type of the first family of the Decapodous tribe, or that which immediately succeeds the *Tetrabranchiata*.

The following are the families of the *Decapoda*:—

1. SPIRULIDÆ: genus *Spirula*.

2. *Belemnitidæ:* genera, *Belemnites*, Lam.; *Actinocomax*, Miller; *Pseudobelus*, Blainv.

3. *Sepiadæ* (Cuttle-fishes): genus *Sepia*.

4. *Teuthidæ* (Calamaries); thus divided:—

A. Funnel with an internal valve, and articulated at its base to two ventro-lateral cartilaginous prominences of the mantle.

Genera:—*Sepioteuthis*, Blainv.; *Loligo*, Cuv.; *Onychoteuthis*, Licht.; *Rossia*, Owen; *Sepiola*, Leach.

B. Funnel unprovided with an internal valve, and adherent at the antero-lateral parts of its base to the mantle.

Genera:—*Loligopsis*, Lam.; *Cranchia*, Leach.

Of the tribe *Octopoda* the Professor observes, that besides wanting the long tentacles, they are also characterised by the want of mantle-fins, and consequently are limited to retrograde progression while swimming; their acetabula, he adds, are sessile and unarmed, and they have two oviducts, but without detached glands for secreting a nidamentum: the Decapods have a single oviduct and detached glands for secreting the nidamentum.

The Octopods are thus arranged by Professor Owen:—

1st Family, *Testacea:* genus *Argonauta*, Linn.

2nd Family, *Nuda:* genera *Octopus*, Leach; *Eledone*,

Leach. [Belemnite; Bellerophon; Cephalopoda; Cornu Ammonis; Goniatites; Nautilus; Paper Nautilus; Polythalamacea; Sepiadæ; Spirulidæ; Teuthidæ.]

TETRACE'RATA. [Polybranchiata.]

TETRACHORD, the Greek name for any part of the scale consisting of four notes, the highest of which is a perfect fourth to the lowest. Thus in the common diatonic Scale (we assume a knowledge of this article throughout) we have the following tetrachords:—

CDEF, DEFG, EFGA, GABC, ABCD, BCDE.

We despair of giving anything like a satisfactory account of the Greek music; not that we think the difficulty lies in the Greek writers, but in the manner in which they have been treated. It was an assumption that the nation which produced models such as the moderns could not surpass in architecture, sculpture, and perhaps in painting, was to be considered as necessarily possessed of a system of music approaching to perfection. Their writers on the subject were to be taken as having an agreement with each other, which was to be detected and established, any apparent discrepancy, however evident, notwithstanding. The numerical relations which were the objects of inquiry in the settlement of the parts of the scale gave the subject the air of an exact science; and explanations which required the assistance of the scholar, the mathematician, and the musician, were undertaken by persons who were deficient in one character, if not in two. The consequence has been such a mass of confusion as the world never saw in any other subject; writers whose undertakings required them to say something, copying absolute contradictions from different other writers; others glad to adopt anything intelligible, whether true or not; others again, unable or unwilling to state the simplest facts of their own premises, so that their readers are not even made aware which of the most remarkable opposite opinions they mean to adopt.

We intend in the present article, without looking into any modern writer, to draw from Ptolemy and Euclid, writers who are known to be trustworthy on other subjects, all concerning the tetrachord that we can find to bear the character of certainty and precision, and to be likely to aid an unbiassed reader in approaching, should it please him so to do, the mass of different accounts which have been given.

All parties seem agreed that the Greek scale, which at first consisted of only two or three leading consonances, was gradually enlarged until it comprehended two octaves, or fifteen notes. It is generally stated that this scale, when it was what we now call diatonic (a word which means the same with us as with the Greeks), was minor in its character, so that in fact it would be represented by

A B C D E F G A¹ B¹ C¹ D¹ E¹ F¹ G¹ A¹.

It is also known that the Greeks were early in possession of the mode of dividing a string so as to produce their several notes; and that, by the time of Ptolemy at least, they took the rapidity of the vibrations (on which they knew the pitch to depend) to be inversely as the lengths of the strings.

Their scales were numerous: three were considered classical, if we may use the word, and were called enharmonic, chromatic, and diatonic; the two first words not having the same meaning as with us. The remaining scales had names of locality attached to them, Lydian, Dorian, &c. The distinction between these lay in the different modes of dividing the octave, as seems to be now generally agreed, though there have been those who have thought that these terms, Lydian, &c., were the names, not of scales, but of single notes.

Of enharmonic, chromatic, and diatonic scales, Ptolemy lays down fifteen from his predecessors, and eight from himself. In each of them is an octave, and all of them agree in two particulars: first, each has the fourth and fifth of the fundamental note perfect; secondly, each has the tetrachord made by the fundamental note and its fourth divided in precisely the same manner as that of the fifth and the octave. That is, if we call the notes of this octave—

C P Q F G R S C¹;

then CF is a fourth, and CG a fifth, always; and the intervals CP, PQ, QF are severally equal to the intervals GR, RS, SC¹. Thus it appears that the fourth was to the Greeks what the octave is to us, the unit, as it were, of the scale, in the subdivision of which consisted the differences of their systems. We now give a tetrachord from each of these twenty-three scales, assigning the intervals first by the ratios of the vibrations, next by the number of mean semitones they contain, as in the article Scale. We prefix the Latin rendering of Ptolemy's appellatives from Wallis.

And first as to enharmonic scales, which are mentioned first, and seem to have been antient, and regarded with high approbation.

	Ratio of Numbers of Vibrations in each Interval.			Mean Semitones in each Interval.

Aristoxenus / Eratosthenes	19 : 15	39 : 38	40 : 39	4·10	·44	·44
Didymus	5 : 4	31 : 30	32 : 31	3·86	·57	·55
Ptolemy	5 : 4	24 : 23	46 : 45	3·86	·74	·38

It seems then that the enharmonic system would allow only of the following notes in an octave—

C E P F G B Q C¹;

where P means a note about half way between E and F, and Q one half way between B and C. An odd scale truly for a modern musician to look at; but, it may be, not incapable of pleasing effects to ears not accustomed to music in parts.

The chromatic scales come next in order, as follows:

	Ratio of numbers of Vibrations in each Interval.			Mean Semitones in each Interval.		
	C P	P Q	Q F	C P	P Q	Q F
Archytas . .	32 : 27	243 : 224	28 : 27	2·94	1·41	·63
Aristoxenus, mollis Chromatica . . .	56 : 45	29 : 28	30 : 29	3·79	·61	·58
Do., Sesquialterius Chromatica .	37 : 30	77 : 74	80 : 77	3·63	·69	·66
Do., tonici Chromatica Eratosthenes . .	6 : 5	19 : 18	20 : 19	3·16	·94	·88
Didymus . . .	6 : 5	25 : 24	16 : 15	3·16	·71	1·12
Ptolemy, mollis Chromatica .	6 : 5	15 : 14	28 : 27	3·16	1·19	·63
Ptolemy, intensi Chromatica .	7 : 6	12 : 11	22 : 21	2·67	1·51	·80

To make something as like as we can to these scales, we should write down in modern music

C E♭ E♮ F G B♭ B♮ C¹

The diatonic scales, Ptolemy allows, are more agreeable to the ear, and his specimens are as follows: we shall now write the scale with the usual letters throughout.

	Ratio of numbers of Vibrations in each Interval.			Mean Semitones in each Interval.		
	C D	D E	E F	C D	D E	E F
Archytas . . .	9 : 8	8 : 7	28 : 27	2·04	2·31	·63
Aristoxenus, mollis diatonica	7 : 6	38 : 35	20 : 19	2·67	1·43	·88
Do., Intensi Diatonica . . .	17 : 15	19 : 17	20 : 19	2·17	1·93	·88
Eratosthenes* .	9 : 8	9 : 8	256 : 243	2·04	2·04	·90
Didymus . . .	9 : 8	10 : 9	16 : 15	2·04	1·82	1·12
Ptolemy, mollis Diatonica . .	8 : 7	10 : 9	21 : 20	2·31	1·82	·85
Do., tonici Diatonica . . .	9 : 8	8 : 7	28 : 27	2·04	2·31	·63
Do., intensi Diatonica . . .	10 : 9	9 : 8	16 : 15	1·82	2·04	1·12
Do., aequabilis Diatonica . .	10 : 9	11 : 10	12 : 11	1·82	1·65	1·51

These scales have all so far the diatonic character that they divide the tetrachord into two larger intervals followed by a smaller one: the scale of Didymus would have been exactly the modern untempered diatonic scale, if he had inverted the order of the two larger intervals in his second

* This is also Ptolemy's Ditonici Diatonica.

tetrachord. As to the other modes, the Dorians, &c., there is much confusion in Ptolemy respecting them, arising from the corruptness of the text, which Wallis has endeavoured to remedy. According to him, they are divisions of the octave, somewhat more fantastic than those which preceede. In more recent times the idea has been started of their being simply different keys, or rather answering to different variations of the diatonic scale, by using intermediate semitones instead of some of the notes: it would be difficult, we think, to produce authority enough for this conjecture.

If it were true, as supposed, that the two octaves of the Greek scale, beginning, say with A, were minor, it would follow that Ptolemy, in his diatonic scales, exhibited the octave from C to C^1, as we have supposed. Accordingly, the principal mode of exhibiting the formation of the octave from two tetrachords and a tone would be the one we have taken, namely,

(C D E F) (G A B C^1)

But it is frequently supposed that it was the following:

C { D E F (G } A B C)

or the following—

A { B C D (E } F G A).

On this point we shall only say that there never was, we believe, so strong a union of the three characters of scholar, mathematician, and musician, as was seen in Dr. Smith, the author of the Harmonics. He had studied the Greek scale attentively, and to him the first of these methods was a matter of course. 'The Greek musicians' (*Harmonics*, 1749, p. 45), 'after dividing an octave into two-fourths, with the diazeuetic or major tone *in the middle between them*, and admitting many primes to the composition of musical ratios, subdivided the fourth into three intervals of various magnitudes placed in various orders, by which they distinguished their kinds of tetrachords.'

We do not, we confess, though admitting that it is exceedingly hard, and probably impossible, to reconcile the Greek writers with themselves and each other, find that sort of difficulty which Dr. Burney owned to, when he said that he neither understood those writers himself, nor had met with any one who did. He was a musician, and was looking out for an intelligible mode of arriving at and distributing the most agreeable concords, with a strong predetermination to arrive at musical truth or nothing. But the Greek writers were arithmeticians, with as strong a determination to find natural foundations in integer numbers: they did not ask how to find sounds which would best suit the ear, but how to discover triplets of fractions which multiplied together should produce four-thirds of a unit. Pleased with the simplicity of the ratios which give the fourth, fifth, and octave, their efforts at musical improvement were confined to the attempt at discovering magic numbers to fill up the intervals. It was not until one of these philosophers had laboured at his abacus, and tasked his metaphysics to find *à priori* confirmation of some question in arithmetic, that he strung his monochord and tried how his scale sounded: it would have been hard indeed if his ear had refused to sympathize with his brain. In all probability the musicians, whose object was simply to please, laughed at the arithmeticians, as Tycho Brahé did at Kepler, when the latter had discovered reason for the distances of the planets in the properties of solid bodies: they had motive enough, and, beyond all question, reason more than enough.

TETRACHORD (τετράχορδον, 'four-stringed'), in the music of the Greeks, was a system of four sounds,—as, for example, the diatonic tetrachord, C, D, E, F; the chromatic, C, C♯, D, F; and the enharmonic, C, C♯, D♭, F. The antients proceeded from the key-note to the octave by two conjoint tetrachords; and so far as the diatonic scale is concerned, they and the moderns agree. In what relates to the two other scales, so little is accurately known, and the subject is so unimportant, to either the general or the musical reader, that we should not further enter on it, even if the space allotted to our department allowed of extension. [Genera; Music, History of.]

TETRADY'NAMOUS (from τέτταρες, *four*, and δύναμις, *power*), a botanical term employed by Linnæus to indicate the character of those flowers which, possessing six stamens, have two of them shorter than the other four. This peculiarity is found exclusively in the plants belonging to the natural order Cruciferæ. Hence the Linnæan class Tetradynamia, including only plants with the stamens arranged in this manner, is an exceedingly natural one, and is one of the few instances in which a peculiarity in the stamens prevails throughout a whole family. *Didynamous* is the term which expresses the existence of four stamens, two of which are short and two long. This character exists in a great number of natural families, as Labiatæ, Scrophulariaceæ, Bignoniaceæ, &c., and is always prevalent throughout a family where it exists. The Linnæan class Didynamia is founded on this peculiarity of the stamens.

TETRAGON (properly a four-angled figure), a term usually applied to the square only, when used, which it seldom is. [Regular Figures.]

TETRAGONIA'CEÆ, a natural order of plants, placed by Lindley in his Curvembryose group of incomplete Dicotyledons. It includes the genera Tetragonia, Aizoon, Sesuvium, and Miltus, which are generally placed in the order Ficoideæ or Mesembryaceæ. The reason given by Dr. Lindley for this separation is the want of petals in these genera, as he considers that the tendency to produce petals in the Mesembryaceæ is of too powerful a nature to admit exception. The relation of these apetalous Ficoideæ to Chenopodiaceæ is so strong, that Dr. Lindley says 'there is no character to distinguish them, except their ovary being formed of several carpels.'

Like Ficoideæ, this order possesses thick succulent leaves, which in many of the species might be used as a substitute for spinach. The *Tetragonia expansa* is a native of New Zealand and Japan, and is used by the natives of those countries as a remedy in those forms of cutaneous disease called scorbutic. It might be used in cookery instead of spinach. The *Aizoon canariense* and *A. hispanicum* grow on the sea-coasts of the Canary Isles and Spain, and are amongst the plants which yield soda after burning.

TETRAGONO'LOBUS (from τέτταρες, *four*, γωνία, *angle*, and λόβος, *lobe*), a genus of plants belonging to the papilionaceous division of the natural order Leguminosæ. It contains herbs with broad leafy stipules, trifoliate leaves, winged petioles, alternate leaflets and flowers seated on axillary pedunceles, furnished with a bract. The calyx is tubular 5-cleft, the wings shorter than the vexillum; the stigma is funnel-shaped and beaked; the legume is cylindrical, furnished with four foliaceous wings, which give it a 4-cornered appearance.

T. purpureus (purple winged-pea) is a pilose plant with decumbent stems, entire obovate leaflets, bracts longer than the calyx, and a glabrous legume, with globose seeds. It is a native of the south of Europe, and has dark purple flowers; a variety is, however, found with flowers of a dark yellow colour.

There is also a variety called *T. p. minor*, in which the stem, leaves, and legumes are much smaller. In southern regions, where this plant grows in perfection, the unripe legumes are cooked and eaten in the same manner as we eat French beans.

There are four other species of Tetragonolobus, all of them inhabitants of Europe. In general appearance they very much resemble the species of Bird's-foot trefoil (Lotus), and in gardens are well adapted for ornamenting rock-work. They are best propagated by seeds.

TETRAHEDRON (a solid of four faces), a term usually applied to the regular tetrahedron. [Regular Figures.]

TETRAO. [Tetraonidæ.]

TETRAOGA'LLUS, Mr. J. E. Gray's name for a genus of birds, placed by Mr. G. R. Gray in the subfamily *Lophophorinæ*, of the family *Phasianidæ*. Example, *Tetraogallus Nigellii*. (*Ill. Ind. Zool.*)

TETRAO'NIDÆ, Dr. Leach's name for the Grouse family.

Linnæus, in his last edition of the *Systema Naturæ*, places the genus *Tetrao* at the end of his fifth order, *Gallinæ*, next to the genus *Numida*. The *Gallinæ* come between the *Grallæ* and the *Passeres:* the genus *Struthio* is the last of the order *Grallæ*, and the genus *Columba* the first of the order *Passeres*.

The Linnean genus *Tetrao* is very extensive, comprising not only the true Grouse, but also the Francolins, Partridges, and Quails.

Cuvier, in his last edition of the *Règne Animal*, arranges the *Tétras* (*Tetrao*, Linn.) under his fourth order, *Gallinacés* (*Gallinæ*, Linn.), placing them between the Phea-

sants (*Phasianus*, Linn.) and the Pigeons (*Columba*, Linn.).

This great genus in the arrangement of Cuvier is more comprehensive even than that of Linnæus, for it includes the following subgenera:—1. *Les Coqs de Bruyère* (*Tetrao*, Lath.); 2. the *Lagopèdes*, or Snow Partridges (*Perdrix de neige*); 3. the *Ganga*, or *Attagen* (*Pterocles*, Temm.); 4. the *Partridges* (*Perdix*, Briss.); comprising the Francolins, the ordinary Partridges, the Quails, and the *Colins* or Partridges and Quails of America; 5. the *Tridactyls* (Lacép., *Hemipodius*, Temm.), including *Turnix* (Bonap., *Ortygis*, Ill.), and *Syrrhaptes*, Ill.; 6. The *Tinamous* (*Tinamus*, Lath., *Crypturus*, Ill., *Ynambus*, D'Azara). Of this last subgenus Cuvier remarks that some, the *Pezus* of Spix, have still a small tail hidden under the feathers of the rump; others, the *Tinamus* of Spix, have no tail at all, and their nostrils are placed a little farther backward; and he adds that one should distinguish *Rhynchotus* of Spix, which has the bill stronger, without any furrow, slightly arched and depressed, with the nostrils pierced towards its base.

Mr. Vigors places the *Tetraonidæ* among the RASORES, observing that the groups which form the family are chiefly distinguished in modern systems from those of the *Phasianidæ* by their more simple appearance; by the absence in fact of those ornaments to the plumage, and those naked or carunculated appendages to the cheeks and head, so conspicuous in the latter family, but which are reduced in the present to the mere space that encircles the eye. The still weaker conformation of the hinder toe tends, Mr. Vigors observes, further to separate them; for this member in the *Tetraonidæ* becomes shorter and gradually weaker, until it is completely lost in some of the groups. Thus viewed, Mr. Vigors is of opinion that the family under consideration holds an intermediate station between the *Phasianidæ*, where the hind toe, although articulated high on the tarsus, is yet comparatively strong, and the *Struthionidæ*, where it is generally, if not always, deficient. He further remarks that the groups which compose the *Tetraonidæ*, corresponding with those that form the genus *Tetrao* of Linnæus, seem to be immediately united to the preceding family by means of the genus *Cryptonyx*, Temm., which resembles them in the similar appendage of the plumage of the head. This group, he thinks, leads directly to *Coturnix*, Briss., and the true *Perdix*, where it has, he observes, been generally arranged, and from which it has been chiefly separated by the defalcation of a nail to the hinder toe. From *Perdix* Mr. Vigors proceeds to *Pterocles*, Temm., which, by its half-plumed tarsus, is intermediate between that genus and the true *Tetrao*. By means of *Lagopus*, Cuv., in which the toes as well as the legs are feathered, Mr. Vigors arrives at the singular genus *Syrrhaptes*, Ill., which is immediately connected with *Ortygis* of the same author by the entire deficiency of the hind toe. With these groups, in his opinion, the genus *Tinamus*, Lath., corresponds by the slight conformation of the same member, the joint of which is feeble and the nail scarcely developed. This group leads him back again to *Cryptonyx*, which has no nail to the joint of the hinder toe. The whole of these last-mentioned groups, thus united, correspond also, Mr. Vigors observes, in the shortness or weakness of their tails. Those of the *Tetraonidæ* which exhibit a weakness or deficiency in the hinder toe, lead Mr. Vigors to the three-toed groups of the *Struthionidæ*, with the bills of which, more particularly that of *Rhea*, those of some species of *Tinamus*, he observes, correspond. (*Natural Affinities that connect the Orders and Families of Birds*, in *Linn. Trans.*, vol. xiv.).

Mr. Swainson makes the *Tetraonidæ* form the third family of *Rasores*, and states that it is composed of the partridges, Grouse, and Quails; all of which agree in the extreme shortness of their tails and of their hind-toe: they are also, he observes, remarkable for a total want of that brilliancy of plumage which so eminently characterises the *Pavonidæ*, between which family and the *Struthionidæ* he places the *Tetraonidæ*. The genus *Cryptonyx*, he observes (a small group of Oriental birds highly beautiful from their elegant form and the texture of their crests), has been thought to connect the two; a supposition, he remarks, by no means improbable, yet requiring analogical proof. He then notices, as following these, the Grouse: those of the colder latitudes, he adds, constitute the genus *Tetrao*, while *Pterocles* includes such as inhabit the arid sands of Africa and Southern Europe. The northern parts of our empire, he observes, still furnish us with several species; but he laments the extermination in Britain* of the largest and most noble grouse of Europe the cock of the rock (cock of the wood must be meant).

Mr. Swainson goes on to point out how sometimes the side feathers on the neck of the male grouse are developed in a singular manner, so as to resemble little wings—a character mostly confined to the American species (*Tetraones Umbellus* and *Cupido*). He also adverts to the several new additions to this group brought home by the expedition under Captain (now Sir John) Franklin. The African and Indian Grouse (*Pterocles*) have, he remarks, frequently very pointed tails, and the hind-toe is very small: heat with them, he observes, appears to be as essential as cold to the true grouse. But he notices one species, *Pt. setarius*, Temm., which extends its range to the South of France. He then proceeds to point out that nearly all the Grouse have the toes and legs more or less covered with soft feathers; but that this character disappears in the Partridges—an extensive group scattered over nearly all parts of the Old World, but unknown in the New, where they are represented by the genus *Odontophorus*, Vieill. In the Quails, he observes, we have the miniature resemblance of Partridges, but the tail is so short as to be nearly imperceptible. Closely approaching to the true quails, we have, he remarks, the genus *Hemipodius*, distinguished by the total absence of the hind-toe; and he adverts to the extreme pugnacity of these little birds, a disposition taken advantage of by the Javanese and other Indian nations with whom quail-fighting is even a more fascinating amusement than cock-fighting is, or rather was—for we are happy to say it is much on the decline—in Europe.

Mr. Swainson then calls attention to that singular race of birds in Tropical America called *Tinamous* by some of the Brazilians, and *Ynambus* by D'Azara. With scarcely any tail, their body is thick, and Mr. Swainson remarks that their whole appearance reminds the observer of a pigmy Bustard, which group, he thinks, they probably represent in the New World. 'As for their flesh,' says Mr. Swainson in conclusion, 'we have often tasted it, and consider it both in whiteness and flavour infinitely above that of the partridge or pheasant. We believe these birds never perch, as some suppose, but that they live entirely among herbage, principally in the more open tracts of the interior.' (*Classification of Birds.*)

In the Synopsis at the end of the volume, Mr. Swainson places the *Tetraonidæ* in the same relative position as that above assigned to them. He thus defines the '*Tetraonidæ*, Partridges and Grouse:'—'Bill and tail very short. Hallux elevated;' and he comprises under the family the following genera and subgenera:—

Cryptonyx, Temm.; *Odontophorus*, Vieill.; *Ortygis*, Ill.; *Tetrao*, with the subgenera *Tetrao*, Linn., *Lagopus*, Willughby, *Lyrurus*, Sw., *Pterocles*, Temm., and *Centrocercus*, Sw.; *Perdix*, Briss., with the subgenera *Perdix*, *Chætopus*, Sw., *Coturnix*, Briss., *Ptilopachus*, Sw., and *Ortyx*, Steph.; *Crypturus*, Ill., with the subgenera *Crypturus* and *Nothurus*, Wagl.

The Prince of Canino, in his *Birds of Europe and North America*, makes the *Gallinæ* the third order of his second subclass, *Grallatores*; and this order comprises the families *Pteroclidæ*, *Phasianidæ*, *Tetraonidæ*, and *Crypturidæ*. The order next in succession to the *Gallinæ* is formed by the *Grallæ*.

The *Pteroclidæ* include the following subfamilies and genera:—

1. Syrrhaptinæ.

Genus, *Syrrhaptes*, Ill.

2. Pteroclinæ.

Genus, *Pterocles*, Temm.

* See the article CAPERCAILZIE. The attempt at reintroduction has since been followed up with every prospect of success by the patriotic Marquis of Breadalbane. In 1838, and the early part of 1839, that nobleman received at his seat in Scotland forty-four of these magnificent Grouse: they were all old-seasoned birds, and about two-thirds of them were hens. They were collected in Sweden with great pains and expense by Mr. L. Lloyd. Mr. Fowell Buxton presented them to Lord Breadalbane. His Lordship turned out part into the forest, and retained another portion in a large aviary. Both experiments succeeded, and it was ascertained that seventy-nine young birds had been hatched out in the season of 1839. Forty-nine were hatched out in the aviary by Grey Hens (females of Black Grouse).

In 1838 three were sent to the Duchess of Athol at Blair, and several were forwarded to the Earl of Derby at Knowlesley, where five young birds were hatched in the aviary in the summer of 1839; four of these were doing well when last heard of.

The *Tetraonidæ* comprehend the following subfamilies and genera:—

1. Perdicinæ.

Genera, *Lophortyx*, Bonap.; *Ortyx*, Steph.; *Francolinus*, Briss.; *Perdix*, Bonap.; *Starna*, Bonap.; *Coturnix*, Temm.; *Bonasia*, Bonap.; *Tetrao*, Linn.; and *Lagopus*, Vieill.

The *Crypturidæ* consist of the subfamily Ortyginæ and the genus *Ortygis*, Ill.

Mr. G. R. Gray, in his *List of the Genera of Birds*, arranges the *Tetraonidæ* between the *Phasianidæ* and the *Chionididæ*, with the following subfamilies and genera:—

1. Perdicinæ.

Genera, *Rhizothera*, G. R. Gray; *Ptilopachus*, Sw.; *Ithaginis*, Wagl.; *Lerwa*, Hodgs.; *Pternistes*, Wagl.; *Francolinus*, Briss.; *Chacura*, Hodgs.; *Perdix*, Antiq.; *Arborophila*, Hodgs.; *Coturnix*, Antiq.; *Rollulus*, Bonn.; *Odontophorus*, Vieill.; *Ortyx*, Steph.; *Lophortyx*, Bonap.; *Callipepla*, Wagl.

2. Tetraoninæ.

Genera, *Tetrao*, Linn.; *Lyrurus*, Sw.; *Bonasa*, Briss. (*Bonasia*, Bonap.); *Centrocercus*, Sw.; *Lagopus*, Briss.

3. Pteroclinæ.

Genera, *Pterocles*, Temm.; *Syrrhaptes*, Ill.

Mr. G. R. Gray gives the synonyms of all these genera, and sufficiently numerous they are. The same author, in his Appendix, states that *Chacura* should have before it *Caccabis*, Kaup; and directs the reader to add near the genus *Alectoris*, Kaup, *Tetrao*, Gm.; also to add the genus *Oreias*, Kaup. He further remarks that *Ocypetes* is synonymous with *Thinocorus*.

We shall endeavour to illustrate this article with examples of the natural history of the grouse properly so called: an account of some of the leading forms of the family, taken in its more extensive sense, will be found under the respective titles.

European Grouse.

The following species are European:—*Tetrao Urogallus*, the *Capercailzie*, or Cock of the Wood; *Tetrao hybridus*, Sparrm. (*Tetrao medius*, Meyer), the *Hybrid Grouse*, generally considered by ornithologists to be a hybrid between the Capercailzie and the Black Cock; *Tetrao Tetrix* (genus *Lyrurus*, Sw.), the *Black Grouse* or *Black Cock*; *Bonasia Europæa*, the *Hazel Grouse* or *Gelinotte*; *Lagopus Scoticus*, the *Red Grouse*; *Lagopus mutus*, the *Common Ptarmigan*; *Lagopus terrestris*, the *Rock Ptarmigan*;* *Lagopus saliceti*, the *Willow Ptarmigan*; *Lagopus brachydactylus*, the *Short-toed Ptarmigan*; *Pterocles arenarius*, the *Sand-Grouse*; *Pterocles setarius*, the *Pin-tailed Sand-Grouse*.

Of these the *Black Cock*, the *Red Grouse*, and the *Common Ptarmigan* are British; to which we trust that we may now add the *Capercailzie*, restored by the praiseworthy care of the Marquis of Breadalbane and others.†

We select as an example the *Common Ptarmigan*, *Lagopus mutus*.

Description—Winter Plumage (*Male*).—Pure white; a black band proceeding from the angle of the bill and traversing the eyes; lateral tail-feathers black, terminated by a white border; feet and toes well covered with woolly feathers; above the eyes a naked space, which is terminated by a small dentilated membrane; these naked parts are red; claws hooked, subulate, and black; bill black; iris ash-coloured. Length about fifteen inches and a quarter.

Winter Plumage (*Female*).—Differing from that of the male in having the naked space above the eyes less, and no black eye-band. Smaller than the male; the length about fourteen inches and a half.

Perfect Summer Plumage (*Old Male*).—Top of the head, neck, back, scapulars, and the two middle tail-feathers, as well as the upper coverts, rusty ash crossed by numerous zigzags of deep black; breast and sides variegated with feathers of the same colour, among which are always found a great number of feathers of a deep black varied with some scattered zigzags of a bright rust-colour; black eye-band always distinctly marked; throat most frequently white, but often marked with blackish; the whole of the belly, abdomen, lower coverts of the tail, wings, wing-coverts, and feet pure white; eye-brows large, of a very lively red.

* But see post. † Ante, p. 235 (note).

Female always distinguished by the total absence of the black eye-band, and to be recognised also by the tone of her plumage, which has less white; the head, all the upper parts of the body, the neck, the breast, the flanks, and the abdomen streaked with transverse bands of bright rusty and black, with a good deal of regularity; only the middle of the belly, the feet, and the wings are pure white.

The *Young* are marked with very fine, ash-coloured, black and rustyish streaks. (Temm., &c.)

N.B. The bird figured by Mr. Gould, in his great work *The Birds of Europe*, under the name of *Lagopus rupestris*, *The Rock Ptarmigan*, with great doubt by that acute ornithologist as to its identity with the North American species, appears, according to Temminck, to be the female Ptarmigan in her perfect summer plumage.

The *newly-hatched young*, according to Mr. Macgillivray, are covered with a light yellowish-grey down patched on the back with brown, and have, on the top of the head, a light chestnut mark, edged with darker chestnut. When first fledged they are, he says, very similar to the young of the Red Grouse, but banded and spotted with brighter reddish-yellow: but this plumage, he adds, soon changes, so that in the beginning of August many of the yellow and brown feathers of the back are exchanged for others spotted and barred with pale grey and brown, and the under parts are white as well as the wings. In conclusion, he states, that these young birds become white the first winter, like the old ones. (*History of British Birds.*)

This Ptarmigan is supposed by some, and with good reason, to be the *Lagopus* of Pliny (*Nat. Hist.*, lib. x., c. 48), who notices its excellent flavour, and states that its feet with their 'hare-like hair' gave the bird its name. It is the *Tetrao lagopus* of Linnæus; *Lagopus vulgaris* of Fleming; *Pernice de Montagna*, *Pernice alpestre*, and *Lagopo bianco* of the modern Italians; *Perdris blanche* and *Gelinote blanche* of the French; *Perdiz blanca* of the Spanish; *Schneehuhn* and *Haasenfüssige Waldhuhn* of the Germans; *Rype* of the Norwegians; *Riupkarre* (male), *Riupa* (female) of the Icelanders; *Tarmachan* of the Northern Gael; and *Coriar yr Alban* of the Welsh.

Geographical Distribution.—North of Europe: Lapland, Norway, Sweden, Russia. The Alpine districts of the middle and south of Europe. North America: the islands lying in the south-west of Baffin's Bay (Sabine); high hills keeping near the snow-line; Churchill River (Franklin: Richardson).

In the British Islands it was formerly found in the North of England, and, as its Welsh name indicates, in Wales: but it no longer occurs in those localities, nor is it to be met with in Ireland.

Mr. Macgillivray (*History of British Birds*) states that it inhabits the bare and weather-beaten summits of the higher mountains of the middle and northern divisions of Scotland; but, he adds, that even in the transition range of the south of that part of the United Kingdom, many of the mountains of which, being more than two thousand feet high, seem well adapted for it, no individuals are ever met with. 'I have frequently,' says this observing outdoor naturalist, 'chased it on Ronaval and other mountains in Harris; and it is said to occur on Eachdla in South Uist, on the Park and Uig hills in Lewis, on the Cuillin and Strath mountains in Skye, as well as in Mull and Jura. On all the elevated summits of the north of Scotland it is not uncommon; and, on most of the Grampians, but especially the great granite and slaty masses from which issue the sources of the Dee, the Spey, and the Tay, it may be said to be even abundant. Great numbers are annually killed, but as the haunts of this Ptarmigan are not so easily accessible as those of the brown species (*Lagopus Scoticus*), it is not at all likely to be exterminated.'

Food, Habits, &c.—The summer food of the Ptarmigan consists principally of Alpine berries, and in winter of the shoots of young heath. Mr. Macgillivray found in their crops a large quantity of fresh green twigs of *Calluna vulgaris*, *Vaccinium Myrtillus*, and *Empetrum nigrum*, the largest fragments not exceeding five-twelfths of an inch in length. He adds, that leaves and twigs of *Vaccinium Vitis-idæa*, *Salix herbacea*, seeds of various *Juncæ* and *Cyperaccæ*, and other plants, with berries in autumn, also form part of their food, which is thus, he observes, for the most part the same as that of the Red Grouse, or, as he terms it, the Brown Ptarmigan.

The author last quoted gives the following description

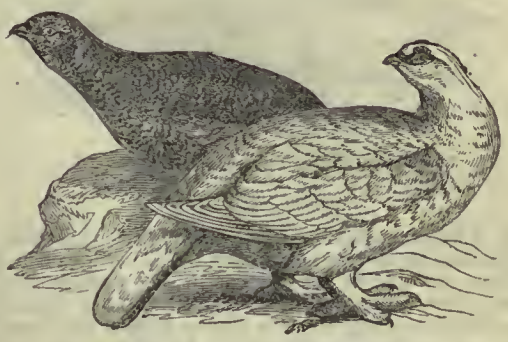
of the habits of this species from personal observation: 'These beautiful birds, while feeding, run and walk among the weather-beaten and lichen-crusted fragments of rock, from which it is very difficult to distinguish them when they remain motionless, as they invariably do should a person be in sight. Indeed, unless you are directed to a particular spot by their strange low croaking cry, which has been compared to the harsh scream of the missel-thrush, but which seems to me much more like the cry of a frog, you may pass through a flock of Ptarmigans without observing a single individual, although some of them may not be ten yards distant. When squatted however they utter no sound, their object being to conceal themselves; and, if you discover the one from which the cry has proceeded, you generally find him on the top of a stone, ready to spring off the moment you show an indication of hostility. If you throw a stone at him, he rises, utters his call, and is immediately joined by all the individuals around, which, to your surprise, if it be your first rencontre, you see spring up one by one from the bare ground. They generally fly off in a loose body, with a direct and moderately rapid flight, resembling, but lighter than, that of the Brown Ptarmigan, and settle on a distant part of the mountain, or betake themselves to one of the neighbouring summits, perhaps more than a mile distant.'

In winter it appears that these birds associate, forming flocks of fifty or more; and it is also stated that, during this season, they burrow under the snow, thus giving countenance to the statement and cut of Olaus Magnus, copied by Gesner, showing that the 'Urogalli minores' lie hid 'sub nive:' to be sure, this retirement is said to be of rather long duration—two or three months, and 'sine cibo.'

Mr. Macgillivray states that early in the spring the Ptarmigans separate and pair. He describes the nest as a slight hollow, scantily strewn with a few twigs, and stalks or blades of grass; the eggs, as regularly oval, about an inch and seven-twelfths in length, and an inch and from one to two twelfths across, white, yellowish-white, or reddish, blotched and spotted with dark brown, the markings being longer than those on the eggs of the red grouse. He states that the young run about as soon as they leave the shell, and are, from the first, so nimble and expert at concealing themselves, that a person who has accidentally fallen in with a brood very seldom succeeds in capturing one. The parent bird it seems has recourse to the same stratagems as the partridge and other gallinaceous birds to lead the intruder from her little ones. 'On the summit of the Harris mountains,' says Mr. Macgillivray, 'I once happened to stroll into the midst of a covey of very young ptarmigans, which instantly scattered, and in a few seconds disappeared among the stones, while the mother ran about within a few yards of me, manifesting the most intense anxiety and pretending to be unable to fly. She succeeded so effectually in drawing my attention to herself, that when I at last began to search for the young, not one of them could be found, although the place was so bare that one might have supposed it impossible for them to escape detection.'

This species has been reared in confinement without any great difficulty, and has bred in a tame state. (Selby.)

Every one must have observed the numbers of Ptarmigan which are sent to this country early in the spring. The shops of many of the London poulterers are then positively white with them. These are imported from the north of Europe, where they are principally taken in snares made of horsehair. Mr. Yarrell states that he has more than once found a hair noose round the neck of Norway Ptarmigan in the London market, and that others have found the same. The numbers taken are immense. According to Mr. Lloyd, whom we have so often had occasion to quote, one peasant will set from five hundred to a thousand of these snares in the winter season. The captured birds are kept in a frozen state till the dealers come; and one of these dealers will sometimes buy and sell fifty thousand ptarmigan in a season. According to the calculation of Sir Arthur de Capell Brooke, sixty thousand of these birds were killed during one winter in a single parish, which was however large. Mr. Grant informed Mr. Yarrell that he was assured, when in Norway, that the number of ptarmigan killed in that country every winter was beyond belief: two thousand dozen, if Mr. Grant remembered right, was the quantity exported from Drammen in one ship for England in 1839, and great numbers, he adds, are sent to the Copenhagen market. Mr. Yarrell goes on to state that besides those brought to this country from Drammen, great quantities are also received in London, during the months of February, March, April, and May, from Bergen, Drontheim, and other ports on the west coast of Norway, from whence conveyance is obtained for them in the boats which bring constant supplies of lobsters to the London market. 'On one occasion,' says Mr. Yarrell, 'late in the spring of 1839, one party shipped six thousand ptarmigan for London, two thousand for Hull, and two thousand for Liverpool; and at the end of February or very early in March of the present year, 1840, one salesman in Leadenhall market received fifteen thousand ptarmigan that had been consigned to him; and, during the same week, another salesman received seven hundred capercaillies and five hundred and sixty black grouse.'



Common Ptarmigan in winter and summer plumage. (Gould.)

Asiatic Grouse.

We select the *Pin-tailed Sand-Grouse*, *Pterocles setarius*, *Ganga Cata*, as an example.

Description.—Old Male.—Throat black; sides of the head and front of the neck yellowish-ash; on the breast a large cincture, about two inches, of rusty orange, bordered above and below by a narrow black band; head, nape, rump, and tail-coverts streaked with black and yellowish; back and scapulars streaked in the same way, but towards the end of each feather there is a large band of bluish-ash, succeeded by another of a yellowish colour; lesser and middle wing-coverts marked obliquely with chestnut-red, and terminated by a white crescent; greater coverts olive-ash, terminated by black crescents; belly, sides, abdomen, thighs, and extremity of the lower coverts of the tail pure white; tail-feathers terminated with white, and the external one bordered with that colour; the two middle feathers, which are very long, slender, and of loose texture, are three inches longer than the others. Total length, without reckoning the long tail-feathers, 10 inches 6 lines.

Female differing much from the male; throat white; below this part a large black semicollar, which only extends to the sides of the neck; the cincture large and orange-coloured as in the male; upper parts nearly the same; middle, lesser, and greater wing-coverts bluish-ash, then an oblique reddish band, and all the feathers terminated by black crescents; the two long tail-feathers or filaments are longer than the others by an inch and six lines.

Young before their first moult.—Plumage less variegated; upper parts olive clouded with ash; the white of the sides, the thighs, and the abdomen is barred with yellowish and brown zigzags. (Temm.)

Geographical Distribution.—Very numerous on the arid plains of Persia. Not very numerous in France, on the sterile 'Landes' near the Pyrenees, and along the coasts of the Mediterranean; less common in Provence and Dauphiné, where they occasionally arrive; more common in Spain, Sicily, Naples, and throughout the Levant. Temminck, who gives these localities, states, in the fourth part of his *Manuel*, second edition, that it is common in Provence, in the uncultivated plains of Crau, and says that it avoids cultured tracts, and only inhabits the sterile Landes of the south; but he adds that it is abundant in the Pyrenees, and that it is to be found all the year round in the markets of Madrid. Mr. Gould states that the species is found in the North of Africa.

Food, Habits, &c.—Seeds, insects, and the young shoots

of plants form the food of this sand-grouse: but its wild nature and the barren places which it frequents are adverse to observation; and little or nothing is known of its habits. The nest is a hollow in the earth, and, according to Temminck, the eggs, nearly of the same size at each end, of an Isabella grey, marked with small brown points and large black patches, are only two or three, a small number compared with those of the majority of the *Tetraonidæ*.

Pin-tailed Sand-Grouse, male and female. (Gould.)

African Grouse.

Dr. Andrew Smith remarks, that though we find species of *Pterocles* beyond the confines of Africa, yet the majority of those now known are peculiar to that quarter of the globe. The regions south of the equator, he observes, have furnished nearly as many species as those to the north of it; and he thinks that both will doubtless afford many additional ones when the yet unknown districts shall have been thoroughly explored. Each of the known species, as far as his observations go, has a limited range; and should the range of such as inhabit the unexplored tracts of the interior not be greater, he is of opinion that we may in time expect great additions to the following list of known species which he gives:—

Pterocles arenarius, Temm., Barbary and Senegal; *Pterocles guttatus*, Licht., Egypt; *Pterocles quadricinctus*, Temm., Senegal; *Pterocles coronatus*, Licht., Nubia; *Pterocles Lichtensteinii*, Temm., Nubia; *Pterocles tricinctus*, Swain., Senegal; *Pterocles exustus*, Temm., Egypt and Senegal; *Pterocles Tachypetes*, Temm., South Africa; *Pterocles bicinctus*, Temm., South Africa; *Pterocles simplex*, Roux, South Africa; *Pterocles maculosus*, Burchell, South Africa; *Pterocles gutturalis*, Smith, South Africa. It will be seen that *Pterocles setarius*, to which Mr. Gould assigns North Africa as a locality, is not in Dr. Smith's list.

We select as an example *Pterocles gutturalis*, Smith.

Description.—Male.—Top of the head dull green, faintly freckled with black; sides of the head and chin straw-yellow; eyebrows yellowish-white; space between the eye and bill black; neck, breast, and a portion of each shoulder intermediate between oil-green and sulphur-yellow; bases of all the feathers pearl-grey; immediately behind the yellow chin, the throat and sides of the neck are crossed by a deep brownish-black crescent. Inter-scapulars and scapulars clouded with pale reddish-brown, pearl-grey, and bluish-black or brownish-black, the latter generally prevailing towards the quills. Back and upper tail-coverts pearly grey, strongly tinged with brown, and when the feathers are separated, each is found with a yellowish tint at the base, and with a strong satin lustre. Secondary wing-coverts intermediate between Dutch and reddish orange, with the base and a considerable portion of the inner vane of each pearl-grey; primary wing-coverts and all the quill-feathers umber-brown; secondaries narrowly tipped with rusty-white; tail-feathers blackish-brown, the outer vanes edged with pearl-grey, and all, except the two middle ones, broadly tipped with the same colour as the secondary quill-coverts. Belly and under tail-coverts between chestnut and reddish-brown. Bill and claws dark horn-colour; eyes dark brown; toes greenish-brown. Wings when folded nearly reaching the tip of the tail; first quill-feather rather longer than the second; longest of the tertiaries intermediate between the sixth and seventh quill-feathers; tail wedge-shaped, the two middle feathers rather the longest and acuminated at their extremities; outer and inner toes of equal length. Total length 12 inches 6 lines.

Female.—Top of the head brownish-black, spotted with rusty-white; back of the neck dull cream-yellow, freely dashed with brown; sides of the neck and throat pale honey-yellow; back, shoulders, and breast brownish-black, with large cream-coloured spots; belly deep black, barred with pale chestnut. Under tail-coverts bright chestnut, towards their bases barred with black. Tail blackish-brown, with partial bars of light cream-yellow; and all, except the two middle feathers, tipped with pale reddish-orange. Length 11¼ inches. (Smith.)

Pterocles gutturalis: male and female. (Smith.)

Locality, Food, Habits, &c.—Dr. Smith states that this species was first discovered in lat. 25° 40′, about eighty miles to the eastward of Latakoo; and it was when he remarked its cry to differ from that uttered by *Pterocles Tachypetes*, Temm., that he was led to suspect that it was distinct. He says that, in common with the other South African species of this genus, it repairs in large flocks at regular and fixed periods to localities where water is, and that at such times specimens are most readily procured; but he warns the sportsman to be quick in his movements, as they scarcely reach the water before they are again on the wing. As they approach and recede from such spots, they almost incessantly utter cries resembling *twet weet, twet weet*.

Dr. Smith remarks, that from observing these birds when they are in quest of water, one would be disposed to consider them gregarious, a notion soon dissipated when their feeding-grounds are discovered, for there they are generally dispersed singly or in pairs, and the occasional congregation is only effected by solitary individuals successively joining others who are on their way from a greater distance. *Pterocles gutturalis* seeks the water about ten in the morning and three in the afternoon, resembling in this respect *Pterocles Tachypetes*, which inhabits a different part of the country. *Pterocles variegatus*, he tells us, drinks during the early part of the morning, and *Pterocles bicinctus* in the dusk of the evening and early part of the night. In such an arrangement, he observes, we must admit design; for if all the various species

were to experience thirst at the same time, both delay and difficulty would occur in quenching it, since, owing to the general scarcity of water in the districts inhabited by these birds, hundreds of the same species, even as it is at present, are often to be seen fringing the brink of a pool for hours together, and occasionally disputing for the first sip. Dr. Smith found grass-seeds, ants, and abundance of gravel in the stomachs of most of the individuals which he procured. The female lays two or three eggs, which are nearly of the same size at each end, of a dirty-white or cream-colour, marked with irregular streaks and blotches of pale rusty and pale grey or ash-colour, upon the bare ground, without any care, once or oftener during the warm season; and it is only when level spots fitted for the reception of the eggs cannot be readily obtained, that the birds of this genus, according to Dr. Smith, bestow any labour on the preparation of nestling-places. Nothing, he adds, is ever interposed between the eggs and the soil; and indeed whatever is calculated to separate them is carefully avoided. Almost as soon as the young escape from the shell, they take to a wandering life, and remove from place to place with the parent-birds in search of food. (*Illustrations of the Zoology of South Africa.*)

American Grouse.

America possesses several species of grouse, consisting of the genera and subgenera *Bonasia*, or *Bonasa*, *Tetrao*, *Lagopus*, and *Centrocercus*. We have already noticed the *Ruffed Grouse* [Bonasia], and here select for example *Centrocercus urophasionus*.

Description.—Male.—General ground-colour of upper plumage light hair-brown, mottled and variegated with dark umber-brown and yellowish-white. Each feather of the back with three bands of yellowish-white at equal distances from each other, the lowest narrow, the middle one broad, and the outer one at the tip of the feather almost obsolete; between these the colour is hair-brown, prettily marked with small irregular zigzags of light hair-brown: these colours cross the shaft; but on the wing-covers and scapulars the shafts are all marked by a narrow conspicuous line of yellowish-white. On the tail there are about eight bands of this colour, the lower ones being tolerably defined, but those towards the ends obscure: the margins are zigzagged, and bordered by dark umber-brown, with irregular zigzag lines of the same, upon a light hair-brown ground, between each bar. Quills light, and almost unspotted; narrowed extremities of the tail almost black. Under plumage white, unspotted on the breast and part of the body; but dark umber-brown, approaching to black, on the lower half of the body and part of the flanks; the latter, towards the vent, marked as on the upper plumage. Under tail-coverts black, broadly tipped with white. Feathers of the thighs and tarsi light hair-brown, mottled with darker lines. Throat and region of the head varied with blackish on a white ground. Shafts of all the feathers on the breast black, rigid, and looking like hairs; scale-like feathers of the sides white and thicker. Bill, which is thick and strong, and toes blackish. On each side of the breast two prominent naked protuberances, destitute of hair and feathers, more forward than the analogous parts in *Tetrao Cupido*. On each side of the protuberances and higher up on the neck, a tuft of feathers, having their shafts considerably elongated and naked, gently curved and tipped with a pencil of a few black radii. These tufts occur at the same part as those of the Ruffed Grouse, but are placed much behind the naked protuberances in the specimen from which the description was taken,* so that they do not appear intended to cover them when not inflated. On the sides of the neck and across the breast, below the protuberances, the feathers are very short, rigid, and acute, overlying each other like the scales of a fish. Wings short in proportion; lesser quills ending in a small point. Tail rather lengthened, considerably rounded, each feather lanceolate and gradually attenuated to a fine point. Tarsi thickly clothed with feathers to the base of the toes. Length 31 inches 6 lines.

Female.—Whole upper plumage, tail, wing-covers, tertiaries, front of the neck, and sides of the breast, dark umber, or blackish-brown, and yellowish-white, irregularly barred and mottled in nearly equal quantities; but the dark colour forming larger blotches towards the base, and the lighter colour bars on the tips and stripes on the shafts. Fore part of the belly white, barred with black; hinder parts black. Plumage of breast and neck of ordinary form, there being no scale-like feathers nor projecting shafts as in the male. Length 22 inches 6 lines. (*Fauna Boreali-Americana.*)

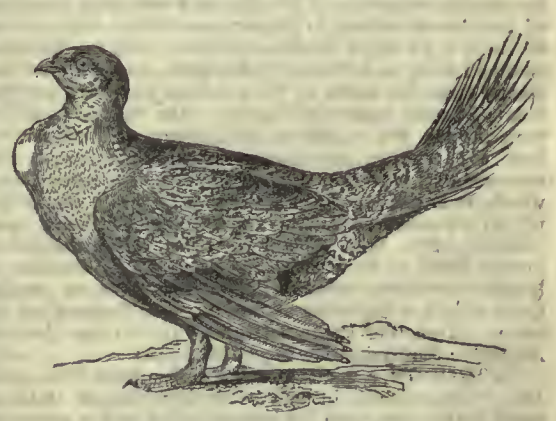
* Now in the British Museum.

This is the *Tetrao urophasianus* of the Prince of Canino, the *Cock of the Plains* of Lewis and Clark, and the *Pyàmis* of the Kyuse Indians.

Food, Habits, &c.—The favourite food of this species is said to be the pulpy-leaved thorn, but it probably feeds also on buds and berries.

This grouse appears to have been first recorded by Lewis and Clark; and it has since become familiar to the fur-traders on the banks of the Columbia. Dr. Richardson gives the following interesting account of its habits by the late Mr. David Douglas:—

'The flight of these birds is slow, unsteady, and affords but little amusement to the sportsman. From the disproportionately small, convex, thin-quilled wing—so thin, that a vacant space half as broad as a quill appears between each—the flight may be said to be a sort of fluttering, more than anything else: the bird giving two or three claps of the wings in quick succession, at the same time hurriedly rising, then shooting or floating, swinging from side to side, gradually falling, and thus producing a clapping, whirring sound. When startled, the voice is "*Cuck, cuck, cuck,*" like the common Pheasant. They pair in March and April. Small eminences on the banks of streams are the places usually selected for celebrating the weddings, the time generally about sunrise. The wings of the male are lowered, buzzing on the ground; the tail spread like a fan, somewhat erect; the bare yellow œsophagus inflated to a prodigious size,—fully half as large as his body, and, from its soft membranous substance being well contrasted with the scale-like feathers below it on the breast, and the flexile silky feathers on the neck, which on these occasions stand erect. In this grotesque form he displays in the presence of his intended mate a variety of attitudes. His love-song is a confused, grating, but not offensively disagreeable tone,—something that we can imitate, but have a difficulty in expressing—"*Hurr-hurr-hurr-r-r-r-hoo,*" ending in a deep hollow tone, not unlike the sound produced by blowing into a large reed. Nest on the ground, under the shade of *Purshia* and *Artemisia*, or near streams, among *Phalaris arundinacea*, carefully constructed of dry grass and slender twigs. Eggs, from thirteen to seventeen, about the size of those of the common fowl, of a wood-brown colour, with irregular chocolate blotches on the thick end. Period of incubation twenty-one to twenty-two days. The young leave the nests a few hours after they are hatched. In the summer and autumn months these birds are seen in small troops, and in winter and spring in flocks of several hundreds. Plentiful throughout the barren arid plains of the river Columbia; also in the interior of North California. They do not exist on the banks of the river Missouri, nor have they been seen in any



Cock of the Plains. Male. (Swainson.)

place east of the Rocky Mountains.' (*Fauna Boreali-Americana.*)

Nuttall says that the flesh is dark and less palatable than that of other species.

TETRAPLA. [Origenes.]

TETRARCHI (τετράρχης), from two Greek words, signifying *four* and *to govern*, a title used by the Greeks at a very early period to describe the ruler of each part of a country which was divided into four parts, either on account of its occupation by different tribes, or merely as a political division. Each of such four parts was called a tetrarchy (τετραρχία or τετραπαρχία). In process of time the title came to be applied to the rulers of different divisions of the same country, or to the chiefs of different tribes inhabiting the same country, without any reference to the number four. In this sense it was equivalent to the titles *ethnarch* and *phylarch*. Under the Roman government, in the later ages of the republic and under the emperors, there were several such petty princes, independent of each other, but tributary to Rome. These *tetrarchs*, *ethnarchs*, or *phylarchs*, were either the legitimate governors of their subjects, or persons who had received the title and government from Rome as a mark of honour. They ranked below those other subject princes who were permitted to retain the title of king.

The principal examples of tetrarchies are those of Thessaly, which was antiently so divided, and the division was again made by Philip, the father of Alexander the Great: of Galatia, which was peopled by three Gallic tribes, each of which was divided into four tetrarchies: of Syria, many of the petty princes of which bore the title of tetrarchs, especially certain princes of the family of Herod the Great. Concerning the tetrarchs of Syria, see Niebuhr's *History of Rome*, ii., pp. 134-5.

TETRAX, Dr. Leach's name for one of the BUSTARDS placed by Mr. G. R. Gray in the subfamily *Otodinæ* of the family STRUTHIONIDÆ.

Example, *Otis tetrax*, Linn.

TETRICUS, CAIUS PESUVVIUS, a Roman senator, one of the numerous usurpers of the Imperial purple in the third century A.D., who are distinguished in Roman history by the name of the Thirty Tyrants. He was governor of Aquitania, and, after the death of several pretenders in Gaul, was made emperor there, A.D. 268, by Victorina, said to be his kinswoman, and the widow of Victorinus. He reigned for a few years not unprosperously; but after the accession of Aurelian, finding himself unable to control the turbulent and licentious soldiery who sustained his power, and becoming weary of their crimes, he invited the new emperor into Gaul, and resigned his usurped dominion in the following manner. Dreading the resentment of his troops if he deserted them openly, he pretended to prepare for an engagement near Châlons in Champagne, and then betrayed his army into the hands of Aurelian. Gibbon places this event before the defeat of Zenobia; but Vopiscus ('Aurelianus,' *Historia Augusta*) says that it took place subsequently. The triumph of Aurelian, A.D. 274, was ennobled by the presence of the queen of the East, and of Tetricus and his son, in the train of captives. The deposed emperor was treated by his conqueror with every mark of distinction during the remainder of his life, and was made corrector of Lucania according to Vopiscus and other writers, or of all Italy, if we follow Trebellius Pollio. His son Tetricus, who had been made Cæsar by Victorina, met with not less favour than his father at the hands of Aurelian, and was honoured with senatorial dignity. On the coins of Tetricus, which are extant in gold, silver, and copper, we find the reading IMP.C.C.PESV.TETRICVS.AVG, and also IMP.TETRICVS.AVG; with, on the reverse, IMP.C.CI.AVDIVS.AVG, which, as Eckhel (*Doct. Vet. Num.*) remarks, would imply an alliance between him and Claudius Gothicus. Spon (*Miscell.*, 274, Lugd., 1685) gives an inscription on a marble found at Rouen with the titles of Tetricus more at length: C.PESVIIO. TETRICO. NOBILISSIMO. CAES.P.F.AVG.L.I. Coins struck in the name of the younger Tetricus yet remain. (Trebellius Pollio, 'Trigint. Tyr.,' in the *Historia Augusta*; Entropius, ix. 13; Gibbon., ii.)

TETRODON, a genus of fishes of the order *Plectognathi*. These fishes, instead of having distinct teeth as usual in the class, have the jaws provided with a substance resembling ivory, formed somewhat like the beak of a bird, and fitted for crushing crustaceous animals and fuci, upon which they live. Both the *Tetrodons* and *Diodons* (*Diodon*, Linn.), a very closely allied genus, have the power of inflating the body with wind, or rather a membrane which extends along the under side of the abdomen, which causes them to float on the surface of the water, without the power, it is said, of directing their course: the membrane when inflated, gives to the fish an almost spherical form, and is usually defended by spines and prickles. The pectoral fins are rather small; and besides these and the tail-fin, they have one dorsal and a ventral fin. The Diodons have but one large tooth above and below, and are usually protected by large strong spines. The Tetrodons are distinguished by the possession of four large teeth, the jaws being each divided by a central suture. These fishes are confined to the seas of warm climates: some of them are called Globe-fishes.

TETUAN. [MAROCCO.]

TETZEL, J. [TEZEL.]

TEU'CRIUM (from Teucer, son of Scamander, and father-in-law of Dardanus, king of Troy) is the name of a genus of plants belonging to the natural order Lamiaceæ or Labiatæ. It has a tubular 5-toothed, nearly equal, or 2-lipped calyx. The tube of the corolla is shorter than the calyx, the upper lip is abbreviated and bipartite; the lower lip is longer, spreading, and trifid. The stamens are much exserted, and the cells of the anthers are confluent and spreading. The species are herbs and shrubs inhabiting most parts of the earth, and having a variable habit and inflorescence. Upwards of seventy species are described in Don's Miller's Dictionary. Of these comparatively few are known in this country; some of them are cultivated in our gardens, and three are natives of the British Isles.

T. Scorodonia, Wood Germander, or Sage, has cordate, downy, petiolate, crenate leaves; the flowers are of a pale yellow colour, with violaceous stamens, and are arranged in lateral and terminal one-sided racemes; the stem is erect, hispid, pubescent, or nearly glabrous. It is a native of Europe in woody hilly situations, where the soil is dry and stony. It is not an uncommon plant in Great Britain. The smell and taste of this plant resemble very much the hop. In Jersey, where it is called *Ambroise*, the inhabitants use it as a substitute for hops in their beer; and by some persons the bitter given by the Germander is preferred to that of the hop.

T. Scordium, Water Germander, has oblong sessile downy serrated leaves; flowers purplish, arranged in axillary whorls, 2-6 flowers in each; the stem is procumbent and villous. It is a native of Europe and the temperate parts of Asia in boggy wet places. It is a rare plant in Britain. Its fresh leaves are very bitter and rather pungent, having a smell similar to garlic. It had once a great reputation in medicine, but is now seldom used: it might however be employed in cases where an aromatic bitter is desirable.

T. Chamædrys, Wall or Common Germander, has ovate incise-serrate leaves, tapering into a footstalk; the flowers are reddish-purple, and arranged in axillary whorls of three flowers; the stem is ascending, and most frequently villous. It is a native of Europe and some parts of Asia, on walls and rocks and dry places. It is only rarely found in Great Britain. This plant was once much employed in medicine, and entered as an ingredient into the celebrated Portland powder. It has the tonic aromatic qualities of the family to which it belongs, which frequently render them valuable in diseases connected with depressed powers of the nervous system and digestive organs.

T. Marum, Cat-Thyme, has small ovate quite entire leaves, with 2-4 flowered whorls; stem erect, branched. It is a native of the region of the Mediterranean. When the leaves are rubbed between the fingers, they emit a volatile aromatic smell, which excites sneezing, and on this account it is used as an errhine, and forms an ingredient in the *pulvis asari compositus* of the 'Pharmacopœia.' It has been recommended as a stimulant and aromatic in various diseases, but is not much used. Cats are very fond of it, and destroy it when they get near it.

T. polium, Mountain Poly, has cuneated oblong or linear leaves with revolute edges; whorls few, condensed into globular terminal heads; stems procumbent, much branched. This plant is a native of Europe and Africa, on the shores of the Mediterranean. According to soil, situation, and other circumstances, it assumes a variety of forms, which have been recognised as species by many botanists. Mr. Bentham, in his monograph on Labiatæ, has placed six of these species under the present. There are other species of Teucrium, chiefly found on the shores of the Mediterranean, called Polies.

In the cultivation of the Germander a dry soil and shady situation are best. The annual kinds are best propagated by seeds sown in an open border. The perennial and shrubby kinds are readily increased by division and by cuttings of the young wood.

TEUTHIDÆ, Professor Owen's name for the *Calamaries*, his fourth family of Decapadous Cephalopods, derived from *Teuthos* (τεῦθος), applied by Aristotle to the ten-armed *Malakia* with an internal horny plate or *gladius*. An outline of the family will be found in the article TETRABRANCHIATA.

Family Character.—Animal, body sometimes oblong and depressed, generally elongated and cylindrical; with a pair of fins varying in their relative size and position, but generally broad, shorter than the body, and terminal.

Shell internal, rudimental, in the form of a thin, straight, elongated, horny lamina; encysted in the substance of the dorsal aspect of the mantle.—(Owen.)

Professor Owen divides the family into the following sections:

Section A.

Genus, *Sepioteuthis*, Blainville.

Generic Character.—Body oval, flattened, with narrow lateral fins, extending its whole length; anterior margin of the mantle unattached. Horny hoops of the acetabula with denticulated margins. *Gladius* or rudimental shell long and wide. (Owen.)

Example *Sepioteuthis loliginiformis*, Rüppel.

Genus, *Loligo*, Cuvier.

Generic Character.—Body elongated, cylindrical, provided with a pair of rhomboidal or triangular fins, shorter than the body, and terminal, their apiecs generally converging to a point, and united to the end of the mantle; anterior margin of the mantle free. Horny hoops of the acetabula denticulated. *Gladius* long and narrow. (Owen.)

Example, *Loligo vulgaris*. The common Calamary, or Pen-fish, abundant on our coasts.

Genus *Onychoteuthis*, Liehtenstein.

Generic Character.—Body and fins as in the genus *Loligo;* long and narrow; horny hoops of the tentaeular, and sometimes of the hraehial, acetabula produced into the form of hooks or claws. *Gladius* long, broadest in the middle. (Owen.)

Genus, *Rassia*, Owen. [SEPIADÆ, vol. xxi., p. 253.]

Genus, *Sepiola*, Leaeh.

Generic Character.—Body rounded, short; anterior margin of the mantle adherent to the baek of the head; fins advaneed, circular, short, subpedunculate, distant and subdorsal. *Gladius* short and narrow. (Owen.)

Example, *Sepiola Rondeletii*, Leach.

Section B.

Genus *Loligopsis*, Lamarck.

Generic Character.—Body long and cylindrical, terminated by a pair of eonjoined, large, round fins, forming generally a circular disc; anterior border of the mantle adherent to the back of the head for a small extent. *Tentacula* very long and slender (frequently mutilated). *Gladius* long, narrowest in the middle, dilated posteriorly. (Owen.)

Example, *Loligopsis Veranii*, Férussac.

Genus *Cranchia*, Leach.

Generic Character.—Body elongated, sacciform; anterior margin of the mantle adherent to the back of the head. Fins short, rounded, subpeduneulate, approximate, dorsal, and subterminal. *Gladius* long and narrow. (Owen.)

Example, *Cranchia scabra*, Leach.

Sueh are the arrangement and definitions given hy Professor Owen in the *Cyclopædia of Anatomy and Physiology*. The family appears to us to be truly natural; and the definitions are very accurate. The views and definitions of other authors regarding the forms belonging to this family, and an illustration of the forms themselves, will be found in the article SEPIADÆ.

TEUTOBURGER WALD. [GERMANY.]

TEUTONIC NATIONS is the general name under which are comprised the different nations of the Teutonic race, which are divided into three branches. The first braneh contains the High Germans, to whom belong the Teutonic inhabitants of Upper and Middle Germany, those of Switzerland, and the greater part of the Germans of Hungary; it is subdivided into the Suabian and the Franconian minor branches. The second is the Saxon branch, which is divided into three minor branches: the first of which contains the Frisians; the second contains the Old Saxons or Low Germans, with the Dutch, the Flemings, and the Saxons of Transylvania; and the third contains the English, the Scotch, and the greater part of the inhabitants of the United States of North America. The third braneh is the Seandinavian, to which belong the Icelanders, the Norwegians, the Danes, and the Swedes. Upwards of eighty-two millions of individuals belong to the Teutonie raee. The Germans amount to about forty-two millions, thirty-three of which live in Germany, the remaining eight or nine millions form a greater or less part of the population of East Prussia, of Switzerland, of Hungary, of Transylvania, of France (in Alsaee and north-east Lorraine), of Russia (in the Baltic provinces, in the kingdom of Poland, in the Crimea, in Bessarabia, and in the German eolonies in the environs of Saratov on the Volga), of the duehy of Sleswig, and of the United States of North America, especially Pennsylvania. The English amount to twenty-eight millions, there being about sixteen millions of English and Scoteh in Great Britain and Ireland, two millions in the English eolonies, and about ten millions of Anglo-Amerieans in the United States. The number of the Frisians is about one hundred and thirty thousand, in the province of West Friesland in Holland, in the islands in the German Ocean along the Dutch and the German shore, in the Saterland (near Oldenburg), and in the islands along the west coast of the duchy of Sleswig. There are about three millions of Dutchmen in Holland, and in her colonies and the Cape of Good Hope; and there are about two millions five hundred thousand Flemings in the north part of Belgium, in the south part of Holland, and in the north-east part of Franee. The number of individuals belonging to the Scandinavian braneh amounts to about six millions, among whom there are nearly fifty thousand Icelanders; one million five hundred thousand Danes in Denmark, in her colonies and in the north part of the duchy of Sleswig; one million two hundred thousand Norwegians; and about three millions two hundred thousand Swedes in Sweden and in the present Russian province of Finland, especially along the coast of the Gulf of Bothnia, in the districts of Abo and Nyland, and on the Aland islands, which are entirely inhabited by Swedes.

Light hair and blue eyes in the northern countries, and brown hair and brown or blue eyes in some of the southern countries, are characteristics of the Teutonic race. Their stature is generally tall, although in those provinces where the Germans are mixed with Wends, Sorabians, and Bohemians, many of the people have the broad shoulders and the short square form of the north-western Slavonians. The straight black hair of some Slavonian tribes also sometimes appears. The mixture of Germans with the south-western Slavonians, such as Winds and Croatians, whose stature exceeds that of the Wends and Bohemians, is more difficult to be distinguished, the black straight hair and a darker complexion being almost the only indication of such a mixture. The mixture of Germans with Celts in Belgium and in the adjoining part of France has formed a tall race which differs from their Teutonic neighbours only in the dark colour of their hair and their black eyes. (Platé, *Scenen aus dem Volksleben in Belgien.*)

It is very difficult to distinguish the descendants of English and Irish parents as belonging either to the Teutonic or the Celtic race, though it appears that wherever aquiline noses are seen among the lower classes they are a proof of Celtic origin, the true Teutonic nose not being aquiline, but either straight or curved only in its upper part. In general also the Teutonic forehead is broader between the temples than the Celtic. (Clement, *Die Nordgermanische Welt*; Herder, *Ideen zur Philosophie der Geschichte*, vol. i.)

The moral and intellectual difference between the Teutonic nations is less remarkable than that which exists between other European nations of the same race with one another. Capable of strong and violent passions, they do not easily lose their self-control, the intellectual functions being more developed than in most other races. Southern nations, confounding liveliness of feeling with intensity, and nervous excitability with moral sensibility, have been deceived by the cool character of the Teutonic nations, and have accused them of indifference. But the most superficial examination will show their sensibility, a fact which is proved by their poetry. The Teutonic nations are less excitable

than the Celtic, the Slavonian, and other races, but capable of deeper thought. Southern nations have accomplished great things by sudden efforts; the Teutonic nations have reserved their enterprise for vast plans, which it requires centuries to carry into effect. Thus they destroyed the Roman empire after a struggle of three centuries, and they formed new kingdoms in Europe upon new social principles, which have maintained their vigour to the present day. The Normans became powerful wherever the sea permitted them to effect a landing. The Germans, diminished in number after they had sent their swarms to western Europe, turned back towards the east part of their country, then occupied by Slavonian nations, which they conquered, and Germanised upon a plan of colonization which enabled them to civilise the east of Europe. And lastly, the English colonies have spread over the world: their dominion in the east and in the west is the result of plans which imply more boldness of conception, more prudence in execution, and more reflection, than the conquests of Alexander the Great and the ephemeral power of Napoleon.

The same character of deep and patient reflection exercised on great objects appears in German philosophy and in the inventions of the Teutonic nations. The watch, the gun, and the art of printing are Teutonic inventions. They have subjugated the power of steam; and the first model of the modern sea-vessel was constructed at the mouth of the Eider by the hands of an old Saxon or Frisian ship-builder. (Clement, *ibid.*)

The name of the Teutones was made known to the antients by Pytheas of Massilia (Marseille), who, in the age of Alexander the Great, about 320 B.C., discovered a nation of that name in the Chersonesus Cimbrica, and on the adjacent islands, or in the present countries of Holstein, Sleswig, Denmark, and perhaps also in the southern extremity of Sweden. It seems that they had long been settled there, for they lived in houses, and were acquainted with agriculture and commerce. Other traces of the name appear later. Among the Celtic tribes which invaded Greece and besieged Delphi under the second Brennus (B.C. 278), there was a people called Teutobodinci, who afterwards passed the Hellespont and settled with the Celts in Galatia, in Asia Minor. About a hundred and sixty years later, the Romans were attacked by the Cimbri and Teutones, who came from the same country, where they had been seen by Pytheas. The Teutonic origin of the Cimbri has been disputed: some historians consider them identical with the Celtic Cymri, but this error has been long since refuted, although it has been reproduced in our days by Thierry, in his 'Histoire des Gaulois.' It is said, and it is not improbable, that inundations of the sea compelled the Teutones and their neighbours the Cimbri to leave their country and to seek other abodes. The choice was soon made. The wealth of Rome and the arts of Greece were not unknown to them. From the most remote times adventurous merchants, starting from the shores of the Black Sea, followed the course of the Dniepr towards its sources, and reaching the Düna and the Niemen, descended these rivers to their mouths in the Baltic, where they exchanged the commodities of the south for amber, the electrum of the antients. The same trade, as it seems, was carried on by the merchants of Massilia along the Rhône and the Rhine, and therefore Schlözer, in his 'Nordische Geschichte,' says that but for the amber Germany would have remained unknown to the antients for five centuries more. Their acquaintance with Rome and Massilia was perhaps the principal cause which led the Cimbri and the Teutones to the south of France and to Italy (B.C. 113-99). Their destruction by Marius has been related. [MARIUS; CIMBRI.]

When the Romans first heard the name of the Teutones, they thought that they were a single tribe. They did not know that it was also the general and ethnographic name of all those nations to which they afterwards gave the vague designation of Germans.

Origin of the name Teutones.—The root of the word Teuton is *thu* or *do*, which originally represented the idea of 'activity,' of 'living, procreating, nourishing,' and also of 'taming, educating, and ruling.' From this root are formed the following words, some of which are still used in the popular dialects:—*Teut*, God, creator, ruler, father, nourisher (*Thor*, *Tuisco*); *thut* or *thiud*, earth; *fott*, *döte*, *dote*, godfather; *toda*, nurse; *thiod*, father of the people, lord, ruler, king, in Gothic *thiudans*, in old Bavarian *theodo*; *diet*, people, in old Swedish *thiaut* and *thyd*; *thiudinassus*, in Gothic, kingdom. (Fulda, *Wurzel-Wörterbuch*.) The names of king and of people being both derived from one root, which expresses the notion of ruling, is a fact which proves that they belong to the language of a nation in which there was neither absolute monarchical power, nor absolute submission to their chiefs. This corresponds exactly to the political state of the antient Teutonic nations, among whom the sovereignty was in the people, and the executive power of the chiefs or kings, although it was obeyed, was always regarded as derived from the people. The idea of ruling, expressed by the root *Teut*, explains why this word occurs so frequently in the names of the antient Teutonic kings, dukes, or chiefs, such as Teutoboch, Theudorix, Diorix, Theodorix, Theodoric, Theodomir, Theodimir, Tentagon, &c. It is likewise contained in the general name of all the Teutonic nations, and in those of various tribes, as the Teutones, the Teutonoarii, Thaifali, and the Dithmarses or Dietmarses. It is visible in 'Teutoburger Wald,' the name of that range of wooded mountains which stretches from Detmold westward beyond Osnabrück, in which is situated the Grotenburg, formerly 'Tent' or 'Teutoburg,' with the farm of 'Teutehof,' where Varus was overthrown by Arminius; in 'Detmold,' 'Doesburg,' 'Duisburg,' 'Deuz,' and in a great many other localities in Germany. (Hammerstein, *Ueber das Schlachtfeld des Varus*; Reichardt, *Germanica*, p. 73, &c.) *Teuton* is identical with *Deutsche* or *Teutsche* (in Low German *Dütsch*, in Dutch *Duitsch*, in Danish *Tysk*, in English *Dutch*), which from the remotest time has been and is still the general name of that part of the Teutonic nations which we now call Germans, who considered the god or hero Tuisco as their common ancestor. There are no direct proofs of the word Teuton having had this extensive meaning in the earliest German history, but this is perhaps the result of the political state of the Teutonic nations, which were originally divided into numerous tribes, each of which became separately known to the Romans. In the twelfth, eleventh, and even as early as the tenth century,* when the difference between Franks and Saxons was well marked in the German empire, these nations, each of which had its own language and laws, never objected to being called by the general name of Deutsche or Teutones. At present there is no German tribe which has the particular name of Teutones, but although the Germans are composed of two very distinct nations, the High Germans and the Low Germans, they call themselves Deutsche and their language Deutsch, though they do not understand each other. This is very different from the state of things in France. The true meaning of 'Français' is political, the name signifying a citizen of the kingdom of France, whether a Frenchman, a German, a Briton, or a Basque; in southern France the name of Français is given to the people north of the Loire; and, on the contrary, the name of French language is never given to any of the dialects of the south, nor to the Walloon dialect in Belginm. Similar facts may be observed in Spain. If however such ethnographic distinctions are the consequence of France and Spain having originally been inhabited by nations of different origin, the circumstance that the name 'Deutsch' has been spread over all Germany and applied to all her dialects from the remotest historical period proves that the name had a general signification long before the commencement of German history. Another circumstance corroborates this opinion. A nation has never changed its name for another except by some great political revolution. Thus the Tata were called Mongols, the Italians Romans, the Romans and Gauls Franks, when one man, or one city, or one tribe exercised a predominant influence over the remainder of the people; and these nations have preserved the memory of such revolutions. [TARTARS.] But no such revolution is recorded in the history of Germany. A further proof of this is, that the Dutch and the Flemings dislike to hear their language called 'de Hollandsche taal,' or 'de Vlaemsche tall,' and they prefer giving it the name of 'de Nederduitsche taal.'

Origin of the Teutonic Nations.—The Teutonic race is originally from Asia. The Teutones immigrated into Europe at different periods unknown to history, although it appears that the last of them entered Europe during the migration of nations in the fourth and fifth centuries. Some

* As early as the beginning of the ninth century Louis, the son of Louis the Pious, who governed Germany, was called Louis the Teutonic.

account of their Asiatic origin is given in their antient national songs, principally in the Sagas of the Scandinavians. The recollection of their antient homes was not entirely lost in Germany in the eleventh century, for we find the following verses in the 'Lobgesang auf den Heiligen Anno:'

'Deren Geschlechte dere quam wilin ere
Von Armente der herin.
Man sagit, daz dar in Halvin noch sin
Die der *Diutschin* sprechin,
Ingegin India vili verro.'

'Their tribe (the Bavarians) came a long time ago from the noble Armenia. It is said that in the Alps, far off towards India, there are still people who speak Teutonic.' (Schilter, *Thesaurus. Antiq. Teuton.*, p. i., sect. ult., p. 15.)

It is also said that Benedict Goesius (Goez), a Jesuit, found in 1603, in the mountains of the Hindu Kush, north-east of Cabul, a people with fair hair like the Dutch, and who are perhaps identical with that tribe of which Pliny speaks, and which was settled in the Montes Emodi. But all this is of little value, unless it is corroborated by other facts. Such facts have been furnished by the learned philologists of our age, especially by Friedrich von Schlegel, Adelung, Bopp, Grimm, and Hammer. A comparison of the Teutonic languages with the Persian, the Zend, and the Sanscrit, has shown the relationship which exists among these languages [LANGUAGE; GERMANY; SANSCRIT], and by means of these facts, the Mythes and Sagas become important for history. According to one of these mythes, Deut or Diuta were the names of antient Indian gods who led the tribes which emigrated from India to the west. (Hammer, in *Wiener Literatur-Zeitung*, October, 1816; Ritter, *Erdkunde*, vol. ii., p. 118, 898-900; Ritter, *Vorhalle*, p. 317, 460, 620; Grimm, *Deutsche Grammatik*, especially in the preface, p. xxvi., &c.; Rühs, *Ausführliche Erläuterung der zehn ersten Kapitel der Schrift des Tacitus über Deutschland*, p. 88, &c.; Herder, cited above, i., p. 400; Mathaeus Riccius, *De Christiana Expeditione apud Sinas suscepta à Societate Jesu*, 1684, p. 600.)

When the Teutonic nations appeared in history, they were divided into many bodies or confederations of tribes, such as, at a later period, the Franks, the Suevi, the Saxons, the Marcomanni, and the Alemanni. Long before these names were known, there was a similar confederation of tribes which came from the north-north-east and conquered the countries on the left bank of the Rhine, then inhabited by Celtic nations, which fled to their brethren in Central Gaul. The epoch of this invasion is not known, but the event happened long time before the age of Cæsar, who found those countries settled by a Teutonic population. Tribes of the Condrusi, the Eburones, the Caerœsi, and the Paemani, were united in a confederation, and had adopted the name of Germani, or 'war-like men.' This name was gradually used by the Romans to designate other nations which belonged to the Teutonic race (Tacitus, *Germ.*, c. 2), and subsequently it was adopted by the English as a name for the 'Deutsche,' while this very name, changed into Dutch, now designates the inhabitants of Holland. It has been pretended that the name of Germani was known long before the time of Cæsar, and this opinion is founded upon the following passage of the 'Fasti Capitolini:'—

'M. CLAUDIUS M. F. M. N. MARCELLUS-
COS. DE. GALLEIS. INSUBRIBUS. ET. GERMANEIS.
K. MART. ISQUE SPOLIA *opima* RETTULIT
DUCE HOSTIUM VIRI*domaro ad clas*TIDI*um*
interfecto.'

If the word 'Germaneis' is here right, and there is no good reason for putting 'Cenomaneis' in its place, the acquaintance of the Romans with the Teutonic nations commenced long before the invasion of the Cimbri and the Teutones. There is a passage in Livy (xxi. 38) which states that at the time of the invasion of Italy by Hannibal (B.C. 218) the country of the Alpes Penninae was inhabited by 'nationes semigermanae,' by which expression some writers have hastily concluded that a mixture of Germani and Celts is meant; but the passage admits of another interpretation.

The Teutonic Nations after Cæsar.—When Cæsar reached the Rhine, Northern Germany, Holland, Belgium, and a part of the countries on the Middle Rhine were inhabited by Teutonic nations which belonged to the northern, now Saxon branch. They had been settled in fixed habitations for several centuries, and they must be considered as the first of this race which settled in Germany. The southern part of this country was then inhabited by Celts and Rhaetians, except the tract between the Upper Rhine and the Upper Danube, which was conquered by the Suevi, who belonged to the Teutonic race. The word 'Suevi,' which comes from 'schweifen,' may be translated 'wanderers,' or people who rambled about for the purpose of settling in any convenient country. It was adopted by a great number of tribes, the majority of which belonged to the High Germans, and came from the countries on the Baltic between the Oder and the Niemen. Cæsar was obliged to fight with their leader Ariovistus (B.C. 58), who had invaded Gaul. Ariovistus was compelled to go back to Germany.

Tacitus divides the Germani into three great bodies: the Ingaevones, in the north; the Istaevones, in the west, from the mouths of the Rhine upwards to Basel; and the Hermiones, in Middle Germany and towards the north-east. This division seems to have an ethnographic and still more a political value. The position of the Ingaevones corresponds to that of the later Saxons, and both the names have one meaning, Saxon signifying a settled people, and In-gae-vones a people who live in a cultivated country divided into districts (In-gau-wohner or Inwohner). The Istaevones, or Western Germani (West-wohner), correspond to the later Franks, and the Hermiones to the Suevi, including the Alemanni. Further, the name of Hermiones is undoubtedly identical with Hermunduri, one of the greatest Suevian or High-German tribes, the name of which is generally supposed to be the same with Doringi or Thuringi, the present Thuringians.

From the time when Cæsar first met with the Suevi under Ariovistus, there was a deadly enmity between the Romans and the Germans. The Romans wished to make Germany into a province, and the Germans aimed at the possession of Gaul: on both sides there was the passion of conquest and the necessity of self-defence. Ambition pushed the Romans into Germany, and want of fertile lands, and perhaps some great revolution among the nations of Eastern Europe, led the Germans into Gaul and Italy. The Roman eagles were seen in the wilds of the Hercynian forest, but Arminius saved his nation from slavery in the forest of Teutoburg, where Varus was slain with three legions (A.D. 9). The campaign of Germanicus, who advanced as far as the Elbe, led to no results, though he gained a complete victory over the Germans on the field of Idistavisus near the Weser (A.D. 16); when he celebrated his triumph in Rome (A.D. 17), the Germans between the Rhine and the Weser were as free as before. These tribes made a confederation, and chose Arminius for their leader. A war arose between him and Maroboduus, king of the Marcomanni, who was defeated and obliged to implore the assistance of the Romans (A.D. 19). Being attacked by Catwald, or Catualdus, the chief of the Gothones, he lost his crown, and the confederation of the Marcomanni was broken. Arminius, the hero of Germany, fell by the hands of his jealous kinsmen, in his thirty-seventh year. (Tacitus, *Annal.*, ii. 88.)

Notwithstanding the civil wars in Germany, the Romans gave up the idea of conquering the country, and Tiberius ordered a defensive system to be observed on the frontiers, which were formed by the Rhine from its mouths to the Moselle, and from the junction of this river with the Rhine they followed the Lahn as far as the present district of Wetterau. The frontier then took a southern direction, passed the Main at Obernburg, the Jagst at Jagsthausen, the Kocher at Hall, and joined the Danube near Pföring, from which town it ran along the Danube as far as Pannonia. The rivers were defended by castles, and the tracts between them by a strong rampart with towers, the Vallum Romanum of Hadrianus, a considerable part of which, the Pfahlgraben, is still visible. The Germans west and south of this barrier became Roman subjects, but those who lived east and north of it enjoyed their antient liberty.

All the German tribes practised agriculture, but warfare being their favourite occupation, they abandoned their fields and their flocks to the care of bondsmen. Their agricultural system, which is still practised in some counties of Westphalia, and which is now called Dreifelder Wirthschaft, consisted in cultivating a field during three successive years, after which it was used as pasture-ground for three years. The fine arts were not exercised among the Germans, but they were acquainted with the

art of writing [Runic Letters], although only for religious purposes. (Rhabanus Maurus, in Goldast, *Script. Rer. Alem.*, ii. 1, p. 67; Hickesius, *Thes. Ling. Septentr.*) The groundwork of their social and political constitution was the union of a certain number of families into a community, 'Marcha,' 'erd-marcha,' now 'Mark-Genossenschaft.' Several marchas formed a 'gow,' now 'gau,' a district which had its own administration. Twice a month, and sometimes every week, the members of a gow assembled and held the 'gowding:' the gowdings were civil and criminal courts, and also meetings for legislation, and war and peace were decided on in them. Besides the gowdings there were 'graven' or 'greven' (graviones, comites), or delegates of the gowding, who were assisted in their judiciary functions by a certain number of freemen. The magistrates were chosen from the nobles (edelings or adelings), the 'principes' of Tacitus, who had also the right of forming a kind of senate, where they deliberated on important affairs previously to their being brought before the gowding, and they dispatched matters of little importance, which did not come before the gowding. The nobles had also the privilege of keeping a 'dienst-gefolge,' or a band of freemen who served them in their feuds and wars; and they had individually the right of protecting unfree people in the gowding, a right which also belonged to the community as a body, but not to individual freemen. The privileges of the nobles were probably connected with the religious institutions, of which we have no positive knowledge, although it appears that priests and nobles formed only one class, an opinion which is corroborated by the fact that wherever Christianity was introduced into Germany, it met with no opposition from the common people as soon as the nobles were converted. Some of the earlier Teutonic nations had hereditary kings, the 'reges' of Tacitus, who however had a very limited authority. The greater part of them chose princes only as commanders of the army in time of war. The name of these commanders was 'herzog,' in low German 'hertog,' or 'hartog,' in Latin 'dux.'

Besides the freemen and the nobles, there were bondsmen, 'lazzi,' 'lati,' or 'liti,' now 'leute,' in low German 'lüde,' or 'lide,' who were either the primitive inhabitants of a conquered territory, or prisoners of war, or freemen who had lost or sold their liberty. Their condition was in no way like that of the Roman Servi, who, legally speaking, were not considered as persons, but in most respects things. Domestic and personal services, and especially agriculture, were their exclusive occupations.

The military organization of the Teutonic nations was founded on two principles. When a gow, or a confederation of several gows, determined on war, every freeman was obliged to take up arms for the defence of the commonwealth. These wars had rather a defensive character, and they occurred principally among the inhabitants of northern Germany between the Baltic and the Rhine. But war was sometimes made for the private interest of some powerful noble, who carried it on with his 'dienstgefolge,' which was a numerous body when the military renown of the chiefs, or the hope of easy conquests, promised rich rewards to the adventurous band. These were generally offensive wars, and we find that they occurred chiefly among the Suevian nations.

We know little about the religion of the antient Teutonic nations. They worshipped a supreme being under the name of Wodan or Odin, but the true character of their religion was the worship of Nature in her different manifestations. Thor, Hertha, and Freya were personifications of the power of heaven, of earth, and of love and procreation.

Such was the moral, social, and political state of the Teutonic nations when they began their wars with Rome. The Vallum Romanum prevented them from invading the Roman empire during the first and second centuries. In the third century they often crossed it. In the fourth they conquered a considerable part of the countries on the Danube; and in the fifth they invaded and conquered all the European provinces of the Roman empire. Instead of following the chronological order, which would cause confusion, we shall give a view of all these invasions by referring them to their several heads, according to the people by which they were effected.

Alemanni. [Alkmanni.] Towards the middle of the fourth century swarms of people belonging to the Suevi came from north-eastern Germany to the country between the Rhine and the Danube, where they settled, the Roman army and colonists having retired beyond these two rivers. They called themselves Alemanni. In the beginning of the fifth century the Alemanni conquered the country on the left bank of the Rhine, as well as parts of Noricum, Vindelicia, and Helvetia, and founded the kingdom of Alemannia. Clovis, king of the Franks, conquered the western part of it in 496: the eastern and larger part, which was protected by Theodoric, king of the Ostro-Goths, was acquired by the Franks in 536. (Cassiodorus, *Var.*, ii. 41.) The freemen lost a considerable part of their lands, almost all the nobles were deprived of their estates, many of them were killed, and the remainder became vassals of the Franks. Between 613 and 628 the laws of the Alemanni were collected by order of the Frankish king Clotarius, under the name of Lex Alemannorum. This collection is in Latin, like the laws of the other Teutonic nations of that period, except the laws of the Anglo-Saxons, which are written in their own language.

The Lex Alemannorum was revised in the time of Dagobert, king of the Franks, and again by Lantfried, the Frankish duke of Alemannia, in the beginning of the eighth century. There is no trace of the Roman law in it except in one single case (tit. 30). The Lex Alemannorum, as well as all the other earlier codes of the Teutonic nations, are contained in Ferdinand Walter's 'Corpus Juris Germanici.' Sichard published an edition of it in the 'Leges Ripuariorum, Bajuvariorum, et Alemannorum,' 1530, 8vo. Besides these collections, the Teutonic laws are in the collections of Herold, Lindenbrog, Eccard, Heineccius, Georgish, Canciani, and Baluzius.

Burgundians. [Burgundy.] The Burgundians came from north-east Germany, and first assisted the Alemanni against the Romans; but they left Germany as early as the beginning of the fifth century, penetrated into Gaul, and formed the powerful kingdom of Burgundy on both sides of the Jura, which was incorporated with the kingdom of the Franks in 534. The collection of the Burgundian laws, Lex Burgundionum, 'Gundobada,' 'Gundobarda,' 'Loi Gombette,' was made towards the end of the fifth century, under king Gundobald, who died in 516, and was augmented (517) by king Siegmund, who died in 523.

The legislation of Gundobald goes as far as title 42. The following titles, although they contain laws and regulations of Gundobald, were added by Siegmund, who completed the code by two 'additamenta,' containing his own laws. Charlemagne made a third additamentum, without altering the code itself. The Lex Burgundionum, which is written in much purer Latin than most of the other Teutonic codes, contains several of the rules of the Roman law concerning donations, and especially testaments (tit. 43 and 60). A separate edition was published at Lyon in 1611.

Franks. [France.] In the very countries which the Romans traversed on their way to the woods where Varus was slain, the Usipetes, the Tencteri, the Sicambri, the Bructeri, the Ansibarii, the Marsi, the Tubantes, the Chamavi, and the Chatti—all tribes belonging to the northern, now Saxon branch (Ingaevones) of the Germani—formed a confederation, and called themselves Franks, either because they were particularly 'free and bold,' or on account of their 'barbed lances' (frameae). Their name first appears in 242, when some of them made an expedition into Gaul during the reign of the emperor Gordianus, whose general, Aurelianus, defeated them. In the beginning of the fifth century they had conquered Belgium as far as the Somme, and in 487 their king Clovis put an end to the Roman power north of the Loire. The Franks subsequently conquered Southern Gaul, then divided between the Burgundians and the Visigoths; Germany, and the Slavonian countries as far as Poland; part of Pannonia; the Longobard kingdom in Italy; and Spain between the Ebro and the Pyrenees. Charlemagne was the lord of all the Teutonic nations, except the Scandinavians, the Anglo-Saxons in England, and the remainder of the Goths in the mountains of Asturias. The Frankish language, a dialect of the Low German, was spoken at the court of this emperor, among the nobles in France, and by many freemen. In Germany the Franks settled among the Suevian tribes on the Middle Rhine and the Main, and the mixture of these languages is the origin of the present Middle German or

Franconian dialects. Among the Teutonic nations which settled in Roman provinces, the Franks were the last who were converted to the Christian religion: their king Clovis was baptized after his victory over the Alemanni at Zülpich (Tolbiacum) in 496. They founded a mighty aristocracy in France, the political influence of which was broken by Louis XI. The personal and social influence of the Franks lasted till the Revolution of 1789, which is justly regarded by the best modern French historians as a reaction of the subjugated Celtic people against haughty and insolent Frankish invaders.

The Franks were divided into Franci Salici, who lived in the Low Countries between the Zuider Zee, the Maas, and the Somme; and Franci Ripuarii, who were settled along the Rhine between Nymegen and Bonn. Each of them had their code. The Lex Salica was written in very barbarous Latin, under Clovis, between 484 and 496, and was never revised, although it contains some laws by the sons of Clovis, which begin with the 62nd (63rd) title. Except one rule in title 14, about the rape of free persons, and another concerning marriage within the prohibited degrees, this code contains no trace of the Roman law. It is very important for the history of the laws of the Teutonic nations. The antient Lex Salica is often confounded with the present Salic Law, which regulates the right of succession in several sovereign and noble families in Europe. But this latter Salic law is only a single rule of the Lex Salica, and originally concerned the succession to the tax-free estates of free or noble Franks (terra Salica), which belonged to the male issue, to the exclusion of females. It is contained in title 62, 'De Alode,' l. 6: "De terra vero Salica nulla portio haereditatis mulieri veniat: sed ad virilem sexum tota terrae haereditas perveniat.'

This law was not peculiar to the Franci Salici: it occurs in the greater part of the other antient Teutonic laws.

(Wiarda, *Geschichte und Auslegung des Salischen Gesetzes;* Heineccius, *Ant. Germ.*, i., p. 265, 285; a separate edition of the Lex Salica was published by Pithou, Paris, 1602, 8vo.)

The Lex Ripuaria was collected by Theodoric, the son of Clovis, between 511 and 534. It was several times revised, especially by Dagobert. It resembles the Lex Salica, and contains no traces of the Roman law.

Goths.—While the Alemanni, the Burgundians, and the Franks invaded the Roman empire on the Danube and the Rhine, its eastern frontiers were attacked by the Goths. The Goths originally inhabited the countries on the Baltic between the Vistula and the Niemen; but as early as the close of the second century A.D. they appeared on the shore of the Pontus Euxinus and the Maeotis, where they founded two great kingdoms,—that of the Ostro-Goths, or Greuthungi, east of the Dnieper, and that of the Visi-Goths, or Thervingi, west of it. Their power was broken by the Huns, by whom they were partly subjugated, partly forced to take refuge in Dacia and in Moesia. The Visi-Goths then left the Danubian countries, traversed Italy as far as Reggio, opposite Sicily, and finally conquered the southern part of Gaul, and Spain. The Ostro-Goths, less fortunate in their attempt on Thrace, were forced to go back to Dacia, where they became subject to the Huns. After the death of Attila, in 453, they recovered their independence, and leaving the dangerous country of the eastern part of Dacia, they settled in the western part of this country, which the emperor Zeno was obliged to cede to them in 474. In 488 their king Theodoric, after having besieged Zeno in Constantinople, compelled him to cede his claims on Italy, then under the dominion of Odoacer, the chief of the Rugii, the Heruli, and other tribes, who had put an end to the Roman empire in Italy by deposing the last emperor, Romulus Augustulus, in 475. [Theodoric.] Odoacer was deprived of his crown and his life by Theodoric in 493, who founded the kingdom of the Ostro-Goths in Italy and Illyricum, which lasted till 552, when Tejas, the last king, was defeated and killed by Narses.

The Code of the Ostro-Goths, 'the Edictum Theodorici,' which was composed by order of Theodoric in 500, is a collection of Roman laws. This king wished to form one people of the Romans and the Goths (*Edictum*, § 30), and he therefore adopted the laws of the most civilised of his subjects. Leaving the Gothic laws exclusively to the memory of the people, he knew that they would soon fall into oblivion without being formally abolished. In some cases, however, he supplanted Gothic customs by Roman laws. The *Wehrgeld*, or *Wehre*,—that is, the fine for crimes,—was entirely abolished, and in place of it the punishment of death was introduced in many cases, an innovation which seemed very hard to the Goths, who, like all the other Teutonic nations, inflicted the punishment of death only for high treason and a few such crimes. Pithou published a separate edition of the 'Edictum Theodorici' (Paris, 1579). Rhon, *Commentatio ad Edictum Theodorici, Reg. Ostrogoth.*, Halae, 1816, 4to.

The *Visi-Goths* settled in the southern part of Gaul in 412, and invaded Spain in 414. This country was then in the hands of the Suevi, the Alani, and the Vandals, who became subject to the Goths, or were forced to emigrate. In 451 the Visi-Goths, together with the Franks, defeated Attila and his 700,000 Huns, Goths, Gepidae, and other vassals, in the plain of Châlons-sur-Marne. Their king, Alaric II., lost Gaul, except the eastern part of Languedoc and Provence, in the battle of Vouglé against Clovis, king of the Franks, in 507. The kingdom of the Visi Goths lasted for three centuries, when it was overthrown by the Arabs in 712. [Spain.]

Among all the Teutonic nations the Visi-Goths were the first who had written laws. (Isidorus Hispalensis, 'Chron. ad annum Aer. Hisp. 504, A.D. 466.') A collection of them was made by their king Euric (466-484), which is written in Latin and has the title of 'Lex Visigothorum.' Its present form dates from King Egica, whose new code was translated into the Gothic language under King Receswind. It contains many traces of the Roman law, and is the only early Teutonic law which may be considered as a code in the modern signification of the word. The Lex Visigothorum must not be confounded with the Breviarium Alarici (Alaric II., in 506), or the Code for the Romans, who were subjects of the Visi-Goths, and continued to live under their own laws until they were abolished by the kings Chindaswind and Receswind, who declared the revised Lex Visigothorum obligatory on all the inhabitants of the kingdom of the Visi-Goths.

The Goths, the most civilized among the Teutonic nations, were the first who adopted the Christian religion. They had a literature from the time when Ulphilas translated the Bible. The Visi-Goths were at first Arians, and though they returned to the Roman Church, they distinguished themselves from the other Roman Catholics by their form of worship, or the Officium Gothicum, which was approved by the fourth Council of Toledo, A.D. 633. It is also called Officium Beati Isidori: Isidore presided over that council. It contains many customs and forms which have been used in the Spanish church from the earliest times of Christianity. It was written in Latin, but in old Gothic characters, which differ from the Scandinavian runes.

The Ostro-Goths soon disappeared among the Longobards, while the Visi-Goths preserved their language and nationality till the invasion of the Arabs; and another portion of them maintained their nationality until a very recent period.

These were the *Gothi-Tetraxitae*, who, after the emigration of their brethren to the western countries, retired to the eastern part of the Chersonesus Taurica, now the Crimea, and the opposite island of Taman. There they lived for eleven centuries under the successive dominion of Huns, Bulgarians, Greeks, Khazars, Tartars of Kiptshak, and Tartars of the Crimea, and, lastly, of Turks Osmanlis. Their part of the Crimea was called Gothia during the middle ages. Busbequius, who was the ambassador of the emperor Rudolph II. at Constantinople, towards the end of the sixteenth century, is the last writer who mentions them. It appears that they afterwards adopted the language, the customs, and the religion of the Tartars. Russian scholars have traced the Gothic language among the Tartars of the Crimea. (*Journal de St. Pétersbourg*, 31st January (12th February), 1829.)

Another part of the Goths invaded Sweden, and founded the kingdom of Gothland (Gautland), which was afterwards divided into East Gothland and West Gothland (Eystra-Gautland and Vestra-Gautland). They mixed with the Scandinavians, and it became a general opinion that they were originally the same people. But a comparison of the Gothic of Ulphilas and the old Scandinavian language

shows that this opinion is unfounded. (Olaus Verelius, *Gothrici et Rolfi Westrogothiae Regum Historia*, Upsalis, 1664; Antonius, *Bibl. Hisp. Vet.*, i., p. 62; Michael Geddes, *Miscellaneous Tracts*, vol. ii., diss. 1; vol. iii., diss. 1; Manso, *Geschichte des Ostgothischen Reichs in Italien*; Mascov, cited below, ii., p. 553-566.)

Suevi.—From the country east of the Black Forest, between the Upper Danube and the Alps, the Suevi, by which name the Quadi and the Hermunduri were perhaps likewise meant, spread over Gaul and forced their way into Spain (406-409). Their king Hermanaric or Hermanrich became master of Portugal, Galicia, and the western parts of Asturias, and Leon: he resided at Bretonia, near the mouth of the Miño, now a small village named Bretaña. His successors were independent kings, but in 585 the Suevi became subjects of Leovigild, king of the Visi-Goths. Their laws have not been collected. They were at first Catholics, but king Remismund (461) professed Arianism; Theodemir (Arianir) returned to the Catholic faith in 561.

Vandals.—This name, which was known to Tacitus, comprises various tribes of Teutonic and also of Slavonian origin, who lived in Eastern Prussia and Pomerania. The Slavonian tribes were subject to the Teutonic Vandals, who are often confounded with the Wends (Venedi), who afterwards occupied the country of the Vandals. The Vandals left their homes towards the end of the fourth century, and a part of them, after a sojourn in Pannonia, traversed Germany and Gaul, and founded the Vandal kingdom in Spain in 409. In 417 they subjugated the Alani, who had also settled in Spain. In 429 they were forced by the Visi-Goths to abandon this country, and they went over to Africa. Their king Genseric or Geiseric took Carthage (439), all Mauritania, and the islands of Sardinia, Corsica, the Baleares, and the western part of Sicily. On the 12th July, 455, they plundered Rome, and their name became proverbial as that of the most barbarous among the barbarians. Their kingdom lasted till 535, when it was destroyed by Belisarius, and became a part of the Byzantine empire. All the names of the Vandal kings are Teutonic, and resemble those of the Gothic kings, a fact which proves that however numerous the Slavonians were among them, the Teutonic tribes were the ruling nation. Their name is visible in that of the province of Andalusia or Vandalusia. (Papencordt, *Geschichte der Vandalen.*)

Longobards. [Lombardy.]—The Longobards lived on the right bank of the Lower Elbe, and afterwards on the left side of this river, near Lüneburg and Brunswick: in language and person they resembled their neighbours the Saxons, a strong body of whom appeared with them in Italy. Before they invaded Italy they had lived in the present country of Upper Hungary, in Pannonia, and in Noricum (494-568). Their king Alboin subjugated the Gepidae in Transylvania (563?), and in 568 he conquered the greater part of Italy. Their last national king, Desiderius, was deprived of his throne by Charlemagne (774), who assumed the title of king of the Longobards: but the Longobards neither lost their constitution nor their estates; the only change was in the reigning dynasty.

When the Longobards were subjugated by the Franks, they had possessed written laws for 130 years. The first collection was made by King Rotharis in 643. The laws of Grimoald were collected in 668, those of Luitprand between 713 and 724; those of Rachis in 746, and those of Aistulf in 754. They contain only a few heads of Roman law concerning prescription and succession. (Muratori, *Script. Rer. Ital.*, tom. i., p. 2; and especially Biener, *De Origine et Progressu Legum Jurumque Germanicorum*, i., p. 150, &c.)

These are the Teutonic nations that founded permanent kingdoms within the limits of the Roman empire. Except the Alemanni, they all came in contact with a population, the educated part of which was entirely Romanized, although, except Italy and some parts of the south of Spain and Gaul, the inhabitants of the villages were still Celts or Iberians when they were subjugated by the Teutonic invaders. (Fauriel, *Hist. de la Gaule Méridionale*, vol. i.) The political institutions of the new masters of the civilized world rested on two great principles.

The Teutonic laws were not territorial, as they now are, but personal: a Frank was judged after the Frankish law, a Burgundian after the Burgundian, wherever he lived. This principle being applied also to the Romans, gave rise to a double legislation, one for the ruling Teutonic nation, and the other for the subject Romans. The second principle was that the sovereignty belonged to the body of the conquerors, and not exclusively to their kings. This sovereignty not only comprised the supreme authority in legislation and administration, but it was considered as comprehending a right to the private landed property of the vanquished nation. Every free Frank or Goth became the master of a considerable portion of land which he took from the Romans. The rights and duties of the kings towards their Teutonic fellow-conquerors remained the same as before; the kings had no right to punish any freeman, unless in time of war and for neglect of military duties. The freemen also could not be forced to serve in any war to which they had not given their consent; and they did not pay any taxes to their kings, who were only the first among their equals. As to the subject Romans, the Teutonic kings became the lords of a numerous civilized nation: as successors to the rights of the Roman emperors, and with regard to the Romans, they had absolute power, and they became proprietors of the extensive private estates of the emperors. They maintained the provincial administration, which was established by Constantine the Great and his successors, but they often conferred various functions on one person in order to render that complicated administration more easy to manage. As the conquerors lived among the subject people, each province had a double administration, one for the ruling nation and the other for the subject nation. But there resulted so much confusion from this circumstance, that the kings were obliged, especially in Gaul, to sacrifice the principles of the Roman administration, and to govern in the Teutonic way, although the names of the higher public functions were Roman. The first functionary in each province in the Frankish kingdom was the Dux, who had the supreme military command, and sometimes also the authority of a judge. The second was the Comes, who was chief judge and director of all affairs concerning taxes and the revenue of the fiscus. From the eighth century the functions of the Dux and the Comes were conferred upon one person, who is sometimes styled Dux, and sometimes Comes.

The fate of the Romans in the Frankish empire was threefold. One part of the Romans entered into the private service of the king, and preserved a portion of their estates on condition of obedience to him. The great landowners belonged to this class, which had the name of 'Romani convivae regis.' A second part, the 'Romani possessores,' remained in possession of their lands, but they were obliged to pay taxes for them, a duty from which the conquerors were exempt: this class principally consisted of small landowners. The third class were the 'Romani tributarii,' who lost their liberty, although they did not become Servi in the Roman sense of the word: these were the antient 'coloni.' In many towns the Romans continued to enjoy their municipal institutions, while a Teutonic community gradually arose within the same walls, and had its separate constitution. In other towns the richest among the Romans lost their liberty and became 'ministeriales,' a kind of privileged vassals; but the poor were treated as the Romani tributarii in the villages.

The Teutonic nations which became subject to the Frankish kings were treated with less severity. The Burgundians, the Longobards, and the Bavarians only changed their dynasty, but the greater part of the Thuringians and of the Alemanni lost a considerable portion of their lands, which were given to Frankish nobles, of whom they became vassals.

Besides those nations which founded permanent kingdoms within the Roman empire, many tribes maintained their independence there only for a short period, or came and went rapidly without leaving further traces, or were subjugated by others, and adopted the names of their vanquishers. Many among them were of Slavonian or other origin.

The *Alani* came from the Caucasus, traversed Europe, and lived independent in southern Spain under their King Respendial, from 409 to 417, when they were subjugated by the Visi-Goths and carried into the south of Gaul. Another part of them settled between Orleans and Nantes under their chief Goar (406), but in 452 they were defeated and dispersed by the Visi-Goths. The Alani were not of Teutonic origin; the names of their kings (Respendial, Utaces, Goar) have no resemblance to

Saxon, Frankish, or Gothic names. They are probably identical with the Ossetes or Iron, an old Persian tribe in the central part of the Caucasus. The country of Albania, north of the Caucasus, was known to the Greeks and Romans. The Byzantines called the tract between the Terek and Shirwan, Alania. (Procopius, *De Bello Goth.*, l. iv.; Stritter, *Memoriae Populor.* '*Alania*,' in tom. iv.; Suhm, *Geschichte der Dänen*, übersetzt von Gräter, i. 1; Zeuss, *Urgeschichte der Deutschen*, 'Alanen.')

The *Quadi*, who lived in Silesia and Moravia in 375, were a Suevian people. The *Gepidae* perhaps were of Gothic origin; their kingdom in Transylvania was destroyed by Alboin, who killed Kunimund, the last king of the Gepidae.

Odoacer, the commander of a band of *Scyrri*, or *Scirri*, *Rugii*, and *Heruli*, put an end to the Roman empire in Italy, and was acknowledged as emperor, but he was put to death by order of Theodoric the Great in 493.

The Rugii were Germani; the origin of the Scyrri and of the Heruli is uncertain. It has been pretended that the Heruli were a Lithuanian tribe.

Tribes within the limits of Germany which lost their Independence under the Franks.—The *Bojoarii*, *Bojobari*, *Bajuvarii*, or *Bavarians* [BAVARIA], whose name became known towards the year 480, were a confederation of Suevian tribes: they lived between the Danube, the Lech, and the Ens. In 540 they were forced to yield to the Frankish kings, and were governed by dukes of the dynasty of the Agilolfingians. Their laws, which were collected between 613 and 638, resemble the laws of the Alemanni, though they contain many traces of the Roman law. (Mederer, *Leges Bajuvariorum, oder ältestes Gesetzbuch der Bajuvarier*, &c., 1793-8.) The *Thuringians* occupied the country north of the Bavarians as far as the Unstrut, and even beyond that river. They were related to the Goths, and their name seems to resemble that of the Thervingi, the Hermunduri, and Hermiones. Their last king, Hermanfrid, was deprived of his crown by the Franks in 531. Charlemagne is said to have made the first collection of their laws, but there is no evidence in support of this statement. Their code is known under the title of 'Lex Angliorum et Werinorum, hoc est Thuringorum.' These Angles and Warini or Werini were settled in the northern part of Thuringia, but it does not appear why their names are mentioned before that of the Thuringians, who were the more numerous nation. This collection is brief and incomplete. (Leibnitz, *Script. Rer. Brunsvic.*, i., p. 81.)

The *Saxons* [SAXONS; SAXONY] dwelt north of the Thuringians. On the east their frontiers were the Elbe, the Stecknitz, and the Baltic; on the north, Denmark, the German Ocean, and Friesland; on the west, they corresponded to the western frontiers of the present province of Westphalia. When they had sent numerous settlers to Britain, their power became less formidable to their neighbours, the Wends in the east and the Franks in the west. The Franks were formerly united with them against the Romans, but when they had conquered Gaul, the Saxons were obliged to desist from their incursions into this country, and hence arose jealousy and hostility. The south-western parts were conquered by the Franks as early as 555; the rich landowners were compelled to give a considerable part of their lands to Frankish nobles, and the common freemen to bend under the yoke of servitude. The remaining and greater part of the population was free, though from time to time the Saxons paid tribute, until, after the memorable war with Duke Wittekind (772-803), Charlemagne became master of all Saxony. But the Saxons were not subjugated like the Romans. They promised to adopt Christianity, to acknowledge Charles as their king, and to obey his governors (greves) and bishops. On the other hand, Charles granted them equal 'Wehre' (value of their body and liberty in case of wounds, murder, &c.), and the same privileges which the Franks had, especially freedom from tribute, and the privilege of being tried in their own country, according to their own laws, and by their equals.

> 'Saxones patriis et libertatis honore
> Hoc sunt postremo sociati foedere Francis,
> Ut gens et populus fierent concorditer unus.'

Anonym., in Leibnitz, *Script. Rer. Brunsv.*, i. p. 153. Compare Möser, *Osnabrückische Geschichte*, i. 3-40, the best work which has been published about the old Saxons in Germany.

Charlemagne was the first king of the Saxons, who formed a great confederation of free communities; they appointed dukes for their wars, and only acknowledged obedience to the 'gowding' and to 'greves,' chosen by the freemen among the 'edelings' of the communities. The laws of the Saxons were collected by order of Charlemagne. They consist of nineteen titles, and are so short and incomplete as to justify the opinion that only a part of them has been preserved. Two 'Capitularia' of Charlemagne concern the political and ecclesiastical condition of those parts of Saxony which were conquered at the time of their publication, 788 and 797. This 'Lex Saxonum' must not be confounded with the 'Sachsen-Spiegel,' the 'Mirror of the Saxons,' a code of Saxon law which was written in Latin and afterwards translated into the Saxon language by Eicke van Rebgow, between 1215 and 1218. (Gaertner, *Saxonum Leges Tres. Accessit Lex Frisionum*, 1730-4.)

Frisians [FRISIANS].—The Frisians were brought under the Roman power by Drusus, the brother of the emperor Tiberius. Olennius, their governor in A.D. 28, oppressed them by fiscal measures, and they cast off the Roman yoke. In the war between the Romans and Claudius Civilis they joined the latter. When the Franks invaded Gaul, the Frisians occupied some countries which were abandoned by the Franks, the islands between the mouths of the Schelde and the Rhine, and the present provinces of Gelderland, Zutphen, and Overyssel; and after the emigration of the Anglo-Saxons they gradually took possession of the coast and the islands of the German Ocean as far as Jutland. In 689 they were attacked by the Franks and obliged to pay them tribute. After the establishment of the German kingdom, the Frisians obeyed the king (emperor) as their sovereign, but they chose their own judges and other authorities. During the middle ages they formed the powerful republic of the Seven Frisian Sealands, which was broken by the counts of Holland, of Oldenburg, and several other princes of the empire. The last independent Frisians were the Dithmarschen between the Elbe and the Eider, who were subjugated in 1559 by Christian III., king of Denmark, and Adolphus I., duke of Holstein.

The laws of the Frisians were collected by Charlemagne under the title of 'Lex Frisionum.' (Gaertner, *Saxonum Leges Tres. Accessit Lex Frisionum.*) The 'Statuta Opstalbomica,' the laws of the Seven Sealands, which are written in the Frisian language, are a different collection. The dialect of this language which most resembles the Anglo-Saxon language is that of the northern Frisian islands on the coast of Sleswig. (Clement, cited below.)

Anglo-Saxons.—An account of their history has been given under the heads SAXONS and ENGLAND. The first settlement of Teutonic tribes in Great Britain previous to the arrival of the Anglo-Saxons has been treated with great learning by Dr. Clement, in his work 'Die Nordgermanische Welt,' Copenhagen, 1840. The author, who has travelled in all parts of Great Britain where he supposed he could find traces of such settlers, has paid particular attention to Caithness and the eastern coast of Scotland. With this book the reader may compare Finn Magnusen, *Om Picternes og deres Navns Oprindelse*, in 'Det Skandinav. Litterafur-Selskabs Skrift,' 1816 and 1817.

The following works contain full information concerning the history of the Teutonic nations:—Mascov, *The History of the Antient Germans*, translated by Thomas Lediard; Gibbon, *Decline and Fall*; Eichhorn, *Deutsche Staats- und Rechts-Geschichte*; Savigny, *Geschichte des Römischen Rechtes im Mittelalter*; Grimm, *Deutsche Rechts-Alterthümer*, and his *Deutsche Grammatik*.

The Scandinavian branch of the Teutonic nations appears late in history. The Sagas tell us that in the fifth century B.C. Odin led the Scandinavians to Sweden and Norway; but this Odin is a god. Less fabulous is the history of a second Odin, who, in the beginning of our æra, came from Asia to Scandinavia, accompanied by his 'Asen,' or perhaps 'Ansen,' or fellow-warriors. The name of the Suiones or Swedes was known to Pliny and to Tacitus, and Pliny knew the name of Scandia, now Scania, the southern extremity of Sweden, which name gradually acquired its present general meaning. Goths came to Scandinavia at a very early period, and the second Odin was perhaps their chief. They mixed with the Scandinavians, and traces of their language have been found in the dialects of the provinces of East and West Gothland in Sweden, and

their name is still preserved in many localities. The aborigines of Sweden and Norway belonged to the Finnish race. They fled towards the north, but not without leaving their traces in the mountains of the Kjœlen and the Dovre Fjeld.

The Scandinavians, Northmen, or Normans, became known to the southern nations by their piracies, and they were often leagued with the Saxons. In the wars between Charlemagne and Wittekind, the Danes assisted Wittekind, who had married Gera, the daughter of their King Siegfried. As early as the beginning of the eighth century the Danes and Jutes appeared in the north of England; in the beginning of the ninth century the Danes settled on the south-east coast of Ireland. Normans or Norwegians occupied the Orkneys before the end of the ninth century: in 861 they came to the Farœ Islands, and they sent colonies to Iceland as early as 870. The northern parts of North America were known to these bold navigators four centuries before the time of Columbus. Other Normans conquered Normandy, Apulia, Sicily, and the opposite coast of Africa. From the eighth century the Waregians, who came from Norway and Sweden, penetrated into Russia and founded the Norman dynasty of the grand-dukes of Kiew: some of the first families of the Russian nobility are of Norman origin.

The Swedes conquered the coast of Finland as early as 850, and settled in great numbers in the districts of Abo and Nyland. Although Finland is chiefly inhabited by a nation of Finnish origin, and though it has become a Russian province, the Swedish language is the only language used for public acts and legal documents. [Scandinavian Language.]

Sulm is one of the best authorities for the critical history of the Scandinavians. He has written in Danish on the origin of the Scandinavians, on their mythology, a critical history of Denmark, a history of Denmark, and several other works concerning this country.

(Müller, in his *Kritisches Examen der Dänischen und Norwegischen Sagengeschichte*, examines the historical truth of the Sagas; Peringskjöld, *Monumenta Sueo-Gothica*, Stockholm, 1710, fol.; Peringskjöld, *Wilkina Saga, sive Historia Wilkinensium*, contains an account of the exploits and conquests of the Scandinavians in Russia, Italy, &c.)

Table of the modern Teutonic Languages and their Dialects.

I. High German Languages.

(The German language as it is written or spoken by the well-educated Germans, belongs to the High German languages, but is not a dialect.)

A. *Suabian* branch.

a. Suabian subordinate branch, containing the dialects of
1, *Suabia*, that is, of the Black Forest, of the Neckar, and of the country between the Danube and the Lech.
2, *Bavaria*, that is, of the Alps, of Salzburg, and of the Danube.
3, *Tyrol*, that is, of Vorarlberg, of the Inn, of the Etsch (Adige), and of the Puster-Thal.
4, *Austria*, that is, of the archduchy of Austria, of Styria, of Carinthia, of Carniola, of Southern Bohemia, and of Moravia.

b. Allemannic, subordinate branch.
1, *Allemannic*, commonly so called in the south-west corner of the Black Forest.
2, Dialects of *Switzerland*, that is, of Bern, of the Oberland of Bern, of Wallis, of the country of the Grisons, and of Appenzell, &c.
3, Dialects of Elsass (Alsace) and of Baden.

c. Old Thüringian, subordinate branch, containing the dialects of the Thüringer Wald, of part of the Fichtelgebirge, and of the northern part of the Böhmerwald. These dialects are generally confounded with those of the adjacent flat countries of Thüringia and the Upper Palatinate, which belong to the Franconian branch.

B. *Franconian* branch.
1, Dialects of Franconia, of the Palatinate, of the Middle Rhine, and of Southern Hesse.
2, Dialects of Thüringia, except the Thüringer Wald, of Northern Hesse, and of the Eichsfeld.
3, Dialects of Lorraine and Luxemburg, which are much mixed with Low German.
4, Dialects of Upper Saxony, of Meissen, of the Erzgebirge, and of Lusatia.
5, Dialects of Northern Bohemia, of Silesia, and of part of the German colonies in Hungary.
6, Dialects of the nobles, the clergy, and the citizens in Curland, Livonia, and Esthonia.

II. Saxon Languages.

A. *Frisian* branch, which contains the dialects of West Friesland, of Saterland, of the islands along the Dutch and the German coast, and of the islands along the coast of Sleswig.

B. *Low German* branch, divided into six sections, viz.:
1, Of *Lower Saxony*, containing the dialects of Sleswig, of Holstein, of Hamburg, of Bremen, of Brunswick, of Hanover, of the country between the Harz and the Weser, and of the Marshes with East Frisia.
2, Of *Westphalia*, with the dialects of Upper Münsterland, of Lower Münsterland, of Osnabrück, of the Upper Weser, of Sauerland, of Mark, and of Eastern Berg.
3, Of the *Lower Rhine* between Neuwied and Düsseldorf, especially the dialects of the Eifel, of Cologne, and of Aix-la-Chapelle.
4, Of the *Netherlands*, containing the Dutch language, the Flemish language, and the dialects of Jülich, of Cleve, and of Geldern in Germany.
5, The dialect of the Saxons in *Transylvania*.
6, Of the antient *Wendish* countries, colonized by the Saxons, containing the dialects of Mecklenburg, of Pomerania, of Brandenburg, of the Marks, and of East Prussia.

C. *English* branch. [Saxons; England.]

III. Scandinavian languages.

A. *Old Norman* branch, containing the dialects of the mountaineers of Norway, the Icelandic language, and the idiom of the Farœ islands.

B. *Danish* branch, containing the Danish language, with the dialects of the islands, of Jutland, and of Northern Sleswig, and the modern Norwegian language.

C. *Swedish* branch, containing the Swedish language, with the dialects of Gothland, of Dalecarlia, of Stockholm and the adjacent country, of Finland, and of the Aland islands.

(Adelung und Vater, *Mithridates*; Balbi, *Atlas Ethnographique*; Ober-Müller, *Atlas Ethno-géographique de l'Europe*, Paris, 1841.)

TEVERO'NE. [Papal States.]

TEVIOTDALE. [Roxburghshire.]

TEWKESBURY, an antient market-town and municipal and parliamentary borough in the north-western part of Gloucestershire, close to the borders of Worcestershire, 9 miles from Gloucester and 103 from London. It is situated on the eastern bank of the Avon, near its junction with the Severn; and the small rivers Carron and Swilgate, which are tributaries of the Avon, flow through the parish. The immediate neighbourhood of the town is subject to floods. Within half a mile of the town is a handsome iron bridge of one arch, 172 feet span, over the Severn; and there is an antient bridge of several arches over the Avon, with a causeway leading from it to the above-mentioned iron bridge. The Carron is crossed by a stone bridge, and the Swilgate by two. The parish extends about 4 miles from north to south, and its width varies from 200 yards in the northern part, to 2 miles, its extreme breadth. Immediately to the north of the town the width of the parish is only half a mile. Here the Avon has been diverted by an artificial cutting called New Avon, or Mill Avon. The parish contains 1890 acres, with the hamlets of Southwick in the southern part and that of Mythe in the northern part. Tewkesbury is a borough by prescription: it received its first charter of incorporation from Queen Elizabeth in 1574. By the charter of William III., granted in 1698, the jurisdiction of the borough magistrates was extended over the whole of the parish. It has returned two members to parliament since the 7 James I. Before the passing of the Reform Act, parts of the town, particularly on the eastward, were not comprised within the limits of the parliamentary borough, but the whole parish is now included. The right of voting was formerly in the freemen and burgage holders, and inhabitants paying scot and lot. The number of electors on the parliamentary register in 1840 was 409, including 89 who possessed double qualifications; and of the former number, 238 were occupiers of houses rated at 10*l.* and upwards. The town is not divided into municipal wards. The corporate body consists of a mayor, four aldermen, and twelve councillors. The old corporation

was composed of a high-steward, twenty-four principal burgesses, including in that number two bailiffs and the recorder; and there were besides several minor officers, and four justices for the borough. The appointment of twenty-four assistant burgesses was directed by the governing charter of William III., but none had been elected for many years prior to the passing of the Municipal Corporation Reform Act. The twenty-four burgesses were elected by the bailiffs and burgesses out of the burgesses at large. The annual income of the old corporation did not exceed 22*l*., and in 1828 it was in debt to the amount of 6000*l*. The sum of 2000*l*. was advanced by the recorder, and the property of the corporation conveyed to him, on which the creditors were paid 6*s*. 8*d*. in the pound. Quarter-sessions for the borough are held, and there is a court for the recovery of debts under 50*l*.

Tewkesbury is said to be of Saxon origin, and to derive its name from Theot, a Saxon, who founded an hermitage here in the seventh century. Early in the eighth century two brothers, dukes of Mercia, founded a monastery, which, in the tenth century, became a cell to Cranbourn Abbey in Dorsetshire. In the twelfth century Robert FitzHaimon enlarged the buildings and liberally endowed the institution, in consequence of which the monks of Cranbourne made Tewkesbury the chief seat of their establishment. At the dissolution the abbey belonged to the Benedictines, and its annual revenue was 1598*l*. A great battle was fought on the 14th of May, 1471, within half a mile of Tewkesbury, when the Lancastrians sustained a most disastrous defeat, and both Queen Margaret and her son Prince Edward were taken. The town was successively in the hands of the royalists and parliamentarians at the commencement of the civil war; but in 1644 it was taken by the latter, and held until the close of the war.

The town principally consists of three good streets, well-built, with a number of smaller ones branching from them. According to the census of 1831, the population amounted to 5780. The principal manufacture is the cotton and lambs'-wool hosiery. In 1810 the number of stocking-frames in the town was 800; and in 1833 there were 600. The wages averaged 12*s*. in the former year, and 7*s*. in the latter. The number of men, aged 20 and upwards, employed in the stocking manufacture in 1831 was 300 (*Pop. Returns*), and 44 were engaged in the lace manufacture. Nail-making formerly employed a considerable number, but in 1833 there were only 50 persons so occupied. (*Mun. Corp. Reports.*) Tewkesbury was and is still the centre of an extensive carrying-trade on the Severn and Avon; but the improvement of the navigation of the Severn to Gloucester, by means of a ship-canal, is said to have been injurious to Tewkesbury, and to the improved means of intercourse with other towns in the same district is also ascribed some decline in the attendance at the corn-market. The iron bridge across the Severn, which opened a communication with Hereford and Wales, counterbalances on the other hand the effects of the above-mentioned improvements. There is a branch railway from Tewkesbury rather more than two miles in length, which joins the Birmingham and Gloucester Railway. The collegiate church of the antient monastery is now the parish church. It is a noble and venerable structure, in the early Norman style, and consists of a nave, choir, and transepts, with a tower rising from the centre, supported on massive and lofty piers with circular arches. The roof is finely groined and carved. There are several antient chantry chapels in the east end of the choir, which is hexagonal. Some of the monuments are in memory of persons who fell at the battle of Tewkesbury. The living is a vicarage, of the gross annual value of 376*l*. A new church was opened in 1837. All the principal denominations of dissenters have places of worship. There is a grammar-school with an endowment of 52*l*. a year. The master is appointed by the corporation. When the corporation commissioners visited Tewkesbury in 1833, the master was a clergyman and one of the borough justices, and for many years the school had not been attended by more than three or four pupils. In 1833 there were, besides the above, and two boarding-schools, 12 daily schools in the parish, attended by 607 children, and several Sunday-schools, at which 588 children were instructed. The national school is partly supported by an antient endowment for the instruction of 20 children, and a Lancasterian school is dependent on voluntary contributions. There are almshouses for 10 poor persons, and several medical and other charities of comparatively recent date. The town-hall was built in 1786: the upper part contains an assembly-room and a hall for meetings of the corporation; and the lower part is appropriated to the borough courts. A gaol, house of correction, and penitentiary were erected under a local act passed in 1812. The market-house is a handsome building, with Doric columns and pilasters supporting a pediment in front. There is a small theatre and public library and news-room. The town is paved, lighted, and watched under a local act passed in 1786. The market-days are Wednesday and Saturday: the former for corn, sheep, pigs, &c.; and the latter for poultry and provisions. There are fairs in March, April, May, June, September, October, December; and a statute fair at Michaelmas.

(Dyde's *Hist. of Tewkesbury; Pop. Returns*, 1831; *Reports of Ecclesiastical Commissioners* and of the *Municipal Corporation Commissioners*, &c. &c.)

TEXAS. Since the publication of the article on Mexico [MEXICAN STATES, THE UNITED], Texas, which was then merely an insurgent province of that republic, has been recognised as an independent state by the leading powers of Europe and America. A succinct statement of the revolution by which this change has been effected is necessary.

A decree of the Constituent Cortes of Mexico, dated 7th May, 1824, declares that Texas shall be annexed to Coahuila until it possess the elements necessary to the formation of a separate state; but that as soon as it shall possess these elements, the connection is to be dissolved, and a separate state-constitution given to Texas.

At the time when this decree was published, Texas probably did not contain 4000 inhabitants of the European race. The district of Bexar, which in 1806 contained 6400 colonists from Mexico, was found in 1835 to contain only 3400 of that class, scattered over the settlement of San Antonio, the missions, and frontier military posts; and this process of depopulation had reached its lowest ebb for some time before the latter date. In the districts of Brazos and Nacogdoches there were, in 1824, no inhabitants of European descent, except at the military posts.

The government of Mexico had made efforts, both while the country was a Spanish colony, and after the recognition of its independence, to promote the settlement of Texas by the Empressario system of colonization, *i.e.* by granting tracts of land to individuals, who were to forfeit the grant unless they settled a specific number of colonists on them within a limited period. In furtherance of this policy, permission was given by the supreme government of the eastern internal provinces, on the 17th of January, 1821, to Moses Austin, by birth a citizen of the United States, to introduce into Texas from Louisiana 300 families, 'being Catholics, or agreeing to become so on entering the Spanish territory,' and also agreeing to take the oath of allegiance to the crown of Spain; and a tract of land in the vicinity of the Brazos river was granted them to settle upon. Some difficulties arose from the disturbed political state of Mexico at that time; but in 1824 colonising operations were begun by Stephen, the son of Moses Austin (his father having died in the interim); and on the 24th of March, 1825, a colonization law for Coahuila and Texas was promulgated. In the course of 1825 and 1826, seven more Empressario grants were made, and the parties obtaining them became bound to introduce about 2000 foreign families, under the same conditions as had been prescribed to the Austins.

Under these grants the colonising of Texas from the United States proceeded with such rapidity, that in 1835 Colonel Almonte, a commissioner of the Mexican government, reported the population of the province to be as follows:—In Bexar, 4000 inhabitants of European origin, of whom 3400 were Spanish Mexicans and 600 Irish settlers; in Brazos, 8000, of whom 1000 were negroes, almost exclusively colonists from the United States; in Nacogdoches, 9000, of whom 1000 were negroes, also Anglo-American colonists. In addition to these, Texas contained about 15,000 Indians, of whom 4000 were friendly to the European race and 11,000 hostile. About 10,000 of the hostile Indians haunted the district of Brehar, the rest were scattered over the district of Brazos. The Mexican commissioner remarked in his report that the part of Texas which presented the greatest difficulties to travellers was that which lay between the frontiers of Coahuila and San Antonio de Bexar: the province was

isolated from the rest of the Mexican provinces, and had an easy communication with New Orleans. The balance of commercial enterprise and wealth was also in favour of the two districts which lay nearest to the United States, and had been colonised from them. The whole trade of Texas in 1834 he valued at 1,400,000 dollars, of which 600,000 belonged to Brazos, 470,000 to Nacogdoches, 270,000 were invested in the smuggling trade of these two districts, and only 60,000 belonged to the Spanish Mexican district of Bexar.

Various incidents had concurred between 1824 and 1835 to excite repulsion and distrust between the Anglo-American colonists on the one hand, and the settlers of Spanish descent and the Mexican government on the other. It had been made one of the conditions of the Empressario grants that schools for teaching the Spanish language should be erected in all the new settlements. This had been entirely neglected. The wealthier settlers of Brazos and Nacogdoches sent their children to be educated at New Orleans, and the poorer gave theirs no education at all. The system of settling some hundreds of families of the new comers in the same neighbourhood, subject to a certain degree of control from the Empressario, further contributed to prevent their amalgamating with the Spaniards. They continued thoroughly English in their language and customs. Religion too became a means of increasing the mutual repulsion: the new-comers had no objection to call themselves Roman Catholics, but they were lax in their observance of religious duties, and this irritated the priests and brought the Spanish settlers to regard them as persons of indifferent character. On the other hand, the settlers from the United States were chafed by the stringent custom-house regulations and semi-military government of Mexico. The question of negro slavery, too, added to their sources of discontent. By the fifteenth article of the treaty of amity and commerce between Great Britain and Mexico, the government of the latter country engaged to prevent all its subjects from taking part in the external slave-trade. The rule was relaxed in favour of the colonists from the United States, so as to allow their bringing their slaves with them; but the restrictions under which this permission was granted occasioned constant collisions between them and the officers of the customs. The decree of 29th September, 1829, abolishing slavery throughout the Mexican dominions, occasioned great discontent in Texas.

The government viewed the increasing numbers and wealth of the Anglo-American colonists with jealousy, partly on account of their democratic propensities, partly on account of its suspicion that the government of the United States was bent upon acquiring Texas. The Scotch and New York masonic lodges at Mexico had become in a great measure mere instruments of the federal and centralising factions; and Poinsett, the American envoy at Mexico, had not only been instrumental in founding the New York lodge, but had persisted in taking a part in the internal political contests and intrigues of Mexico, which was quite inconsistent with his diplomatic character, and ultimately led the Mexican cabinet to insist upon his removal. The *Escoces*, the party attached to a centralised system of government, were then in the ascendant, and they not unnaturally regarded every American from the United States as a *Yorkino*, a democrat or adherent of a constitution which left each individual state more independent of the central authorities in Mexico. The settlers in Texas seem to have taken little concern in politics. When Heyden Edwards and his confederates made their mad attempt to establish an independent republic in Nacogdoches in 1826, Stephen Austin and his colonists rendered prompt and efficient assistance to the Mexican authorities. But on account of their origin they were viewed with the same suspicion as the rest of their countrymen.

The opinion that the United States were anxious to annex Texas to their territory had more appearance of foundation. Aaron Burr's project of revolutionising Spanish America in 1805 had not been forgotten. In 1825 the envoy of the United States at Mexico had been instructed to sound the government on the question of transferring the frontier between the two republics from the Sabine to the Rio Grande or the Colorado. In 1827 he had been authorised to offer the Mexican government a million of dollars for the frontier of the Rio Grande, and half that sum for the frontier of the Colorado. In 1829 he received directions to increase his offer to five millions for the frontier of the Colorado. This pertinacity on the part of the government of the United States naturally led the Mexican government to view with apprehension the growing strength of the Anglo-American settlers in Texas.

In 1830 the irritation on both sides was evidently bringing about a crisis. The military posts on the frontier were strengthened, and new posts were established in the settled districts and at the trading stations on the coast. The number of Mexican soldiers in Texas was increased to about 1300, and placed under the command of the political chiefs of Bexar, Brazos, and Nacogdoches, the first-mentioned being intrusted with the supreme command. On the 6th of April, 1830, Bustamente promulgated a decree prohibiting all citizens of countries adjoining the Mexican territories to settle as colonists in the territories of the republic immediately adjacent to these countries. By this edict the newly arrived settlers from the United States in Texas and those who were on their way were subjected to serious inconvenience and loss. On the remonstrance of Colonel Austin, the enforcement of the decree was mitigated by the local authorities: the colonists were allowed to take possession of their lands, but they received legal titles in only two of the seventeen settlements which were already established in Texas.

After the government had thus unsettled the property of the most numerous and wealthy portion of the population, a revolution was inevitable; but as is generally the case, the first hostile collision between the citizens and the government forces was occasioned by one of the minor grievances. An attempt made by the governor of Anahuac to arrest an Anglo-American colonist arrayed the military and the settlers of Nacogdoches in arms against each other in June, 1832. The insurgents besieged and captured the post at Velasco, intercepted the political chief of Nacogdoches on his way to relieve the garrison of Anahuac, and forced him to surrender, and obliged the governor of that fort to fly from the country. Santa Anna, who had a short time before promulgated what has been called 'the plan of Vera Cruz,' and thus by rallying the Federalist party around him obtained possession of the reins of government, had on the first intelligence of disturbances in Texas dispatched Colonel Mexia with 400 soldiers to that province, who was accompanied by Stephen Austin, representative of Texas in the Mexican legislature. Mexia was satisfied with the explanation that the victorious insurgents gave of their proceedings; and tranquillity being restored, the whole of Texas declared for 'the plan of Vera Cruz.'

In October, 1832, a convention assembled at San Felipe de Austin to frame a memorial to the Central Government for the separation of Texas from Coahuila and for the repeal of the law of 1830 which suspended the contracts of colonization. In 1833 another convention met at the same place to frame a state constitution to be submitted for the approbation of the Central Government. Colonel Austin was appointed commissioner for the province to present and support those memorials. At Mexico he found everything in confusion; and on the 2nd of October he wrote to his constituents, advising them to organize an *interim* government. The contents of this letter having come to the knowledge of Gomez Farias, the president, Austin was arrested on the 10th of December on his way home, and carried back to Mexico, where he was thrown into prison.

The Texans now attached themselves to the Federalists, who had quarrelled with Santa Anna and his party. A state convention of Coahuila and Texas was appointed to be held at San Antonio, in November, 1834, but owing to the apathy of the Spaniards of Coahuila nothing came of it. The more energetic Anglo-American population of Texas began to feel themselves impeded by their union with Coahuila, and a wish for separation gained ground. In April, 1835, a meeting of the joint legislature of Texas and Coahuila was brought about, and a petition in favour of a Federal constitution agreed to. Santa Anna soon after marched against Coahuila: the state authorities attempted to retreat with the archives into Texas; but the governor was taken prisoner, the government dissolved, and a military commission installed at Saltillo in its place: Texas was virtually left without any government.

The appeal to arms was precipitated by a custom-house brawl. An attack was made under some pretext or another on the custom-house at Anahuac. Captain Thompson, dispatched by the Central Government, in June, 1835, at the request of the Ayuntamiento of that place, in the Correo war-schooner, to inquire into the affair, precipitately attacked and captured a Texan trading-vessel. The proprietors of the prize armed another trading-ship, took the Correo, and sent the captain to New Orleans under a charge of piratically interrupting the trade between the United States and Texas. In the month of August Santa Anna requested the Texans to deliver up Zavala, a leader of the Federal party, who had been his friend and supporter while he remained faithful to 'the plan of Vera Cruz,' but latterly his enemy. The request was refused, and reports soon after reached Texas that Santa Anna was mustering troops to invade it.

While affairs were in this position, Stephen Austin was entertained at a public dinner in Brazoria, on his return from his long captivity. Austin had, as long as he could, done his utmost to prevent the discontents of the settlers assuming a political complexion, and when that was no longer possible, had steadily opposed any projects that seemed to point at a separation from Mexico. The advice therefore which he gave on this occasion, to organise committees of safety and vigilance throughout the province, was at once and implicitly followed. He was himself appointed chairman of the committee of his own colony, to which a degree of control over the other committees was tacitly conceded. Before the organisation of the country was completed hostilities were commenced between the colonists and the military in the province: in consequence of which Austin, in the beginning of October, assumed the command of an army hastily collected at Gonsalez, and Zavala was appointed chairman of the Austin committee in his stead.

On the 3rd of October, 1835, General Barragon issued a decree abolishing the legislative powers of the several states and establishing a central republic in Mexico. A general consultation of Texan delegates was, in consequence of this measure, held at Austin, which, on the 7th of November, issued a declaration in favour of state-rights; summoned a convention of delegates to be held at Washington in Galveston, on the 1st of February next; and organized an interim government. Henry Smith was chosen governor and W. Robison lieutenant-governor; Samuel Houston was appointed major-general and commander-in-chief of the regular army of Texas; and Stephen Austin, B. T. Archer, and W. H. Wharton were appointed commissioners to the United States.

The new commander-in-chief immediately established his head-quarters at Washington. In January, 1836, Stephen Austin reported that he had concluded a loan at New Orleans of 200,000 dollars, and had hopes of raising another of 400,000. Volunteer troops in aid of the Texans were raising in Louisiana, Tennessee, Alabama, and Georgia. The Convention met at Washington on the 1st of February, and on the 2nd of March it published a declaration of independence, signed by fifty delegates, of whom Lorenzo de Zavala was one. In the election of officers of state which immediately followed, Zavala was chosen vice-president.

Santa Anna marched from Saltillo on the same day that the Convention met at Washington. He was successful in his first encounters; but on the 21st of April he was defeated and taken prisoner by General Houston. On the 14th of May he signed a convention for the evacuation of Texas, and soon after not a Mexican soldier remained in the state. The constitution adopted by the new state is a close imitation of the state government of the Northern Union; and, like its prototype, presents the anomaly of slavery existing under laws which profess to regard all men as equal.

Texas was recognised as an independent republic by the government of the United States on the 3rd of March, 1837. A motion was made in congress for receiving it into the Union, but after some discussion withdrawn. France recognised the independence of Texas and concluded a treaty with it on the 25th September, 1839. A treaty of amity and commerce between England and Texas was signed in London, on the 16th of November, 1840, and ratified by the Texan government in February, 1841. The Mexican government has expressed a determination to reconquer Texas; but it is not likely that in the distracted and impoverished state of that country it will be able to reduce a population almost inaccessible by land from Mexico, possessed of better harbours and more shipping, in a position to receive constant support from the United States even against the will of the government at Washington, and on terms of alliance and amity with England, France, and the United States. Nor is it to be desired that Texas should on any terms be re-annexed to Mexico: its Anglo-American population never could assimilate with the Spanish Mexicans.

(*Texas*, by William Kennedy, London, 1840; Colonel Almente's *Report on the Statistics of Texas*, Mexico, 1835; *Correspondence of the daily Papers of London and Paris; Debates in the British Parliament, the Congress of the United States*, and *French Chamber of Deputies*.)

TEXEIRA, or TEXERA, JOSEPH, was born of a good family in Portugal, about the beginning of 1543. After distinguishing himself at the University, he entered the order of St. Dominic in 1565, and obtained general respect for his learning and virtue. He was prior of the convent of Santarem in 1578, when King Sebastian undertook his expedition into Africa.

In the troubles which ensued, Texeira attached himself to the party of Don Antonio, and accompanied that prince to France in 1581, where he went to solicit assistance against Philip II. Texeira published at Paris, in the beginning of 1582, a compendium of the history of Portugal. The work is very scarce (it is described as a thin quarto of 70 pages), and appears to have been published for the purpose of supporting Don Antonio's claim to the throne of Portugal. The author was taken prisoner by the Spaniards in the naval battle off Terceira on the 26th of July, 1582, and carried to Lisbon, whence he contrived to make his escape and rejoin Don Antonio. Duard Nonius à Leone, a converted Jew, employed by Philip II. to refute the 'Compendium of Portuguese History,' asserts that Texeira, while a prisoner at Lisbon, denied to him that he was the author.

The partisans of the League having obliged Don Antonio to quit Paris, Texeira accompanied him as his confessor, first to Bretagne, and in 1586 to England. In 1588, having returned to France, he was introduced to Henri III. and the queen-mother: the former appointed him a court chaplain; the latter dispatched him on a confidential mission to Lyon, then in the possession of the League, believing that a Dominican friar was unlikely to be suspected of being an agent of the court. Texeira remained at Lyon from July, 1588, to January, 1589. During this interval he prepared for publication a reply to the attack upon his History by Nonius à Leone. This pamphlet, or some indiscreet expressions in conversation, having given umbrage to the Leaguers, he was obliged to fly; the papers left in his cell were seized, and the whole impression of his pamphlet (with the exception of one or two copies) destroyed.

He rejoined Henri III. at Tours, and after the murder of that prince, in August, 1589, was continued in his office of court-chaplain by Henri IV., to whose service he attached himself. After the entry of Henri into Paris, Don Antonio was enabled to return to that city, and Texeira appears to have resumed his office of confessor. In March, 1595, he published a new edition of the work which had been destroyed at Lyon, but his labour was in vain, for he was called, in the August following, to perform the last service of his church to the prince whose cause he had advocated with such fidelity.

In 1596 Texeira was a witness of the public abjuration of Calvinism by the dowager-princess of Condé at Rouen. The Papal legate selected him to instruct and confirm the princess in her new faith; and from that time till his death he continued attached to the service of the house of Condé. This engagement left him pretty much the command of his own time, and he employed it principally in his favourite study of genealogy. A list of his published works will be found at the end of this article: here it is only necessary to remark that to the second edition of his 'Genealogy of the House of Condé,' published in 1598, he added an account of the public ceremonial of the princess's reconciliation with the Roman Catholic church.

In 1601 he published a narrative of the adventures of Don Sebastian, 'from his expedition into Africa in 1578, till the 6th of January of this present year 1601.' We have

not been able to procure this work; but the following passage from Etoile's 'Journal of the Reign of Henri IV.' throws some light upon the expression quoted from its title-page:—'Friday, the 1st of June, 1601, comes the intelligence that the false or true Don Sebastian (for as yet one knows not which to call him) has been sent to the galleys by order of the viceroy of Naples. . . . The Portuguese maintain that he is the true Don Sebastian: they have solicited various courts to obtain his liberty, and published several works in his favour. Among others Joseph Texeira, a Dominican, has undertaken several journeys to Bavaria, England, Venice, and Rome, where he has disseminated his writings; and finally, he has caused to be printed at Paris a collection of propheeies current among the Portuguese, which foretold all that has happened to their king Sebastian.' That Texeira, whose writings show him to have been an accomplished scholar, whose confidential employment by Catherine de' Mediei is a strong testimony in favour of his abilities, and whose high moral character is acknowledged on all hands, should have believed the individual here mentioned to have been the real Don Sebastian appears upon first thoughts a strong testimony in his favour. But L'Etoile's account of the nature of the book weakens the presumption, and Texeira's inveteracy against the Spaniards renders it probable that the account is correct. He is said to have declared from the pulpit, when preaching on the duty of loving one's neighbour, that 'we are bound to love all men, of whatever religion, sect, or nation—even Castilians.'

Texeira died in the convent of the Jacobins at Paris, on the 29th or 30th of June, 1604. L'Etoile, who mentions his death, says, 'He had just returned from England, whither he had been sent by the king, who gave him a hundred crowns for the expenses of the journey. While there he had seen the king of England, to whom he presented his "Genealogy" which he had compiled, and which was well received. He was on the eve of returning to England when he was taken ill.' Texeira's frequent visits to England, both in the time of Elizabeth and James, gave rise to suspicions of his attachment to the Romish Church. For these there does not appear to have been any reasonable ground: he was opposed to the ultra-Romanist party of the League in France, because it was allied with Philip II., but his religious opinions never appear to have varied.

The published works of Texeira are—1, 'De Portugalliae Ortu, Regni Initiis, denique de Rebus à Regibus universoque regno praeclare gestis Compendium,' Parisiis, 1582, in 4to., 77 pp., very rare; 2, 'De Electionis Jure quod competit viris Portugallensibus in augurandis suis Regibus ac Principibus,' Parisiis, 1590, 8vo.: this is a reprint of the answer to Nonius à Leone, printed and destroyed at Lyon in 1589: a third edition was published at Paris in 1595, with the title, 'Speculum Tyrannidis Philippi, Regis Castillae, in usurpanda Portugallia;' 3, 'Exegesis Genealogica, sive Explicatio Arboris Gentilitiae invictissimi ac potentissimi Galliarum regis Henrici ejus nominis IV.' This work was published at Tours in 1590; at Leyden, with additions, in 1592; again at Leyden in 1617, with the title, 'Stemmata Franciae item Navarrae Regum à prima utriusque Gentis Origine;' all the three editions are in 4to.; 4, 'Explicatio Genealogiae Henrici II., Condeae Principis,' Paris, 1596. An edition in 4to., and another in 8vo., and a translation into French by Jean de Montlyard, all appeared in the same year. To the edition of 1598 was appended 'Narratio in qua tractatur de Apparitione, Abjuratione, Conversione, et Synaxi Illustrissimae Principis Charlottae Catharinae Trimolliae, Principissae Condeae;' 5, 'De Flammula, seu Vexillo S. Dionysii, vel de Orimphla aut Auriflamma Tractatus,' Paris, 1598, 8vo.; 6, 'Adventure admirable par devers toutes autres des Siècles passés et présents, qui contient un Discours touchant les Succès du Roi de Portugal, D. Sebastian, depuis son voyage d'Afrique, auquel il se perdit en la bataille qu'il eut contre les Infidèles en 1578, jusqu'au 6 de Janvier présent, an 1601;' traduit du Castillan, Paris, 8vo.

(This sketch has been compiled from the dictionaries of Bayle and Moreri, and Nicolaus Antonius; from the Prefaces to Texeira's 'Genealogy of Henri IV.,' and his Reply to Nonius à Leone; and from Pierre de l'Etoile's 'Journal of the Reign of Henri IV.,' vol. ii., pp. 559-61, and vol. iii., pp. 194-6, edition published at the Hague in 1761, in 4 vols. 8vo.)

TEXEIRA, or TEXERA, PEDRO, a native of Portugal, one of the earliest cultivators of modern Persian literature. The place and date of his birth and death are alike unknown. The author of the notice of his life in the 'Biographie Universelle,' says that he was born in 1570, but does not mention the authority on which he makes the statement.

Cotolendi, who translated Texeira's work into French, states that his author, 'instigated by a vehement desire to become acquainted with the history of Persia, passed several years in that country, and having made himself perfectly master of the language, devoted himself, by the advice of some able and enlightened Persians, to the study of Mirkhond. [See the account of this historian in the article PERSIA, under the head *Literature*.] Texeira himself has informed us that being at Malacca, in the beginning of 1600, he embarked in the month of May for the Philippine Islands, whence he took shipping for Mexico, and ultimately arrived at Lisbon on the 20th October, 1601. His correspondents in the East having failed to transmit to him some money which he had left in their charge, he was obliged to undertake a voyage to Goa to recover it. Disgusted with the sea, he resolved to return overland; and having in pursuance of his determination sailed from Goa, on the 9th of February, 1604, and arrived at Basrah on the 6th of August (being detained some time at Ormuz), he travelled by way of Meshed-Ali to Bagdad, and thence to Anna, Aleppo, and Scanderoon, where he took shipping for Venice. After a short stay in that city, he made the tour of Italy, crossed the Alps into France, and then retired to Antwerp, where he spent his time in compiling a book, which he published in 1610. After that event we again lose sight of him entirely.

His work, the first book of which, we are told by Antonio de Leon Pinelo, was composed in Portuguese, but translated into Spanish, and the rest written in that language with a view to publication, is entitled, 'Relacion de los Reyes de Persia y Ormuz: Viagi de la India Oriental hasta Italia por Tierra el año de 1604,' Antwerp, 1610. (N. Antonio says it was published in 4to.; Antonio de Leon that it was published in 8vo.) It consists of three parts: the first is a history of the kings of Persia, compiled from Mirkhond with a brief continuation, down to the age of the compiler; the second is an abridgment of the history of Ormuz, by Turan-shah, one of the kings of that district (a work which appears to be known in Europe only from Texeira's abstract), also with a continuation; the third, an account of Texeira's overland journey from India to Europe. Alfonso Lasor translated the work into Italian and inserted it in his *Orbe Universal* the same year in which it was published; Schikhart, in his 'Tarich, seu Series Regum Persiae,' published at Tübingen in 1628, speaks in the highest terms of Texeira's learning and diligence; Van Laet appended a Latin translation of Texeira's Itinerary from Ormuz to Basrah and Bagdad to his 'Persia,' published at Leyden in 1633; Cotolendi published a French translation of the entire book at Paris in 1681, which the writer in the 'Biographie Universelle' justly characterises as 'assez mauvaise.' In short, down to the time of Tavernier and Chardin, Texeira appears to have been regarded as the principal authority respecting Persia. The historical part of his work is now of little importance, but his voyage up the Persian Gulf, and his route from Basrah to Meshed-Ali, Bagdad, Anna, Aleppo, and Scanderoon, may still be studied with advantage.

Antonio and Leon Pinelo mention a book entitled 'Naufragio de Jorge Albuquerque e Prosopopeia a seu louvor,' published at Lisbon in 1601, by a Peter Texeira, but do not identify him with our author. A 'Certificacion del Discubrimiento de el Marañon,' by a Pedro Texeyra, 'Capitan Maior del Parã,' is appended to the account of the discovery of that river, published at Madrid in 1641, by Christoval de Acuña: this was apparently a different person. A third geographer of the name of Pedro Texeira is mentioned by Antonio as alive at Madrid a few years previous to the publication of his dictionary (1672): this one compiled a map of Portugal and a 'Descripcion de la Costa de España,' neither of which appear to have been published.

Batav., 1633, 24mo.)

TEXEL, or TESSEL, is an island in the North Sea, at the northern extremity of the province of North Holland, from which it is divided by a channel called the Maas Diep. Including Eierland, it is 12 miles in length and 6 in breadth. It has a large and secure harbour, and a commodious roadstead on the east coast. The northern part of the island, called Eierland (*i.e.* Eggs-land, from the vast quantity of eggs laid by the sea-gulls), was a separate island till 1629, but is now joined to Texel by a sand-bank. Texel is celebrated for a breed of sheep (50,000) with a silky kind of wool, and many thousand lambs are annually exported to the different provinces of Holland. The inhabitants, 5000 in number, make great quantities of a green cheese from sheep's milk; many of them are engaged in the oyster fishery. Besides the petty town of Texel there are 6 villages in the island. Important naval battles have been fought off the coast of this island: in 1653, when Admiral Blake defeated the Dutch under Van Tromp; in 1673, between the Dutch and the combined English and French fleets, which was a drawn battle; and in 1799, between the English and Dutch fleets, when the latter, being disaffected to the republican government, surrendered without much resistance.

TEZA, or TAZA. [MAROCCO.]

TEZCU'CO. [MEXICAN STATES.]

TEZEL, or TETZEL, JOHANN, a Dominican monk, who lived about the end of the fifteenth and the beginning of the sixteenth century. His name would have been forgotten but for the scandalous manner in which he carried on the traffic in indulgences, which roused the indignation of the better part of his contemporaries, and thus led to the reformation in Germany. He was a native of Leipzig, where he studied theology, and afterwards entered the order of the Dominicans in the Pauliner Kloster. In the year 1502 the pope appointed him preacher of indulgences for Germany. He converted this office into a most lucrative traffic, and is said to have made use of the basest means for the purpose of obtaining money. His conduct too was so bad, that he was condemned at Inspruck to be sewed up in a sack and to be drowned, having been convicted of adultery. But the interference of his superiors caused the sentence to be changed into imprisonment for life. He was accordingly conveyed to Leipzig, and confined in a tower which stood in that city near the Grimmagate (Grimmaer-Thor) until the year 1834, when it was pulled down. He had however not been imprisoned long before he was set at liberty at the request of Albert, archbishop of Mainz, and other ecclesiastical dignitaries. Tezel now made a pilgrimage to Rome, and acted the part of a penitent so well, that Pope Leo X. not only absolved him of his sins, but appointed him commissarius apostolicus in Germany, in addition to which the archbishop of Mainz made him 'inquisitor haereticae pravitatis.' In his capacity of papal commissary he now carried on his traffic in indulgences more impudently than ever. He traversed Saxony in an open carriage, accompanied by attendants, and carrying with him two chests, one of which contained the indulgences, and the other the money raised from their sale. This latter chest is said to have had the following inscription:—

> 'Sobald das geld im kasten klingt,
> Sobald die seel' gen himmel springt.'
> (So soon as the gold in the chest rings,
> So soon the soul to heaven springs.)

His reputation for sanctity had become so great, that in several places the population of towns met him in solemn procession, and his entry was accompanied with the ringing of the church-bells. He sold indulgences for all crimes, murder, perjury, adultery, and not only for crimes already committed, but also for those which a person might commit. At last, in the year 1517, Luther openly opposed him, in the celebrated theses which he fixed on the church-door of Wittemberg. Tezel made a reply in another set of theses, which however were immediately burnt by the students in the market-place of Wittemberg. Tezel seems to have acted contrary to the intention of his superiors, and to have gone beyond his instructions, for Karl von Miltitz, who was sent by the pope to settle the disputes which had arisen out of his conduct, reprimanded him severely. In the year 1518 however Tezel, notwithstanding all this, obtained the degree of Doctor of Divinity at Frankfurt on the Oder. After this event, he returned to Leipzig to his convent, where he died, in August, 1519, of the plague, shortly after the celebrated theological disputation of Eck and Karlstadt. He was buried in the church of his convent (the present chapel of the university); but there is now no trace of his grave, as that part of the church which contained his remains was pulled down in the seventeenth century to make room for some fortifications. [LUTHER.] Comparè P. Melanchthonius, *Historia Vitae M. Lutheri*, i., p. 153, &c.; Gieseler, *Lehrbuch der neuern Kirchengeschichte*, vol. iii., p. 20; Löscher, *Vollständige Reformations-Acta*, ii., p. 324; and more especially Hechtius, *Vita Tezelii*.

THAARUP, THOMAS, a Danish poet and dramatist, highly esteemed by his countrymen as one of the classics in their literature, was the son of an ironmonger at Copenhagen. He was born 21st August, 1749, the very same day as Edward Storm, another poet. This coincidence would hardly deserve notice, if something of the marvellous had not been founded upon it, it being said that Thaarup's mother dreamed that the wife of a clergyman at Guldbrandsdalen was delivered just at the same time of a son, who would be the rival of her own. If not great, both of them were popular and national poets; and though neither very numerous nor of very great extent, their productions, especially their lyric pieces, earned for them a reputation which does not always fall to the lot of writers of more ambition and of higher pretension. This was more particularly the case with regard to Thaarup, whose three little musical dramas, 'Höstgildet,' 'Peters Bryllup,' and 'Hiemkomsten,' are esteemed chefs-d'œuvre of their kind, and the songs and airs were known by heart by every one, and repeated all over Denmark. Their celebrity was not at all less than that of the 'Beggars' Opera' in this country. After the death of Storm [SCANDINAVIAN LITERATURE, p. 3], Thaarup succeeded him as one of the directors of the theatre at Copenhagen, in which situation he remained till 1800. But though he survived Storm a full quarter of a century, Thaarup's literary life did not extend much beyond that of Storm. If he did not entirely lay aside his pen at the commencement of the present century, all the productions by which he will be remembered had appeared in the preceding one. He continued to reside at Copenhagen, where he died in the summer of 1821. Some of his hymns have been translated into German by Voss.

(*Skilderic af Kiöbenhavn*, 1821; *Neue Bibliothek der Schönenwissenchaften*, vol. lv.)

THA'BET BEN KORRAH, an eminent physician, philosopher, and geometrician, whose complete names, as given by Ibn Abí 'Ossaibiah (*Fontes Relationum de Classibus Medicorum*, cap. 10, § 3), were Abú 'l-Hasan Thábet Ben Korrah. He was born at Harrán in Mesopotamia, A.H. 221 (A.D. 835-6), where he at first carried on the business of a money-changer; he afterwards however went to Bagdad to pursue his studies, which he carried on with so much zeal, that he became one of the most celebrated literary and scientific men of his age. He belonged to the sect of the Sabians, but got entangled in some religious disputes, and was expelled from their communion. In consequence of this he left Harrán, where he had been residing for some time, and went to Bagdad with the celebrated astronomer Mohammed Ben Músa. There he lived in his house, and was introduced by him to Mo'tadhed Billah, sixteenth of the 'Abbaside Khalifs (A.H. 279-289, A.D. 892-902), who appointed him one of his astrologers, and ever afterwards, on account of his acquirements and his pleasing manners, continued on terms of great intimacy with him. He died on the 26th of Safar, A.H. 288 (February 18, A.D. 901), aged sixty-seven lunar, or sixty-five solar years. His sons Senán and Ibrahím, and their descendants, practised physic with much reputation at Bag-

dad for more than a century after his death. Thábet himself appears to have been a very learned man, and also a good practical physician, as he tells a story of the way in which he restored to life a man that was supposed to be dead. (Casiri, *Biblioth. Arabico-Hisp. Escur.*, tom. i., p. 389.) He was also a very voluminous author, as the bare titles of his works, as given by the anonymous author of the 'Arabica Philosophorum Bibliotheca,' take up about two folio pages in Casiri's Catalogue. They consist of mathematical, medical, and zoological treatises, written in Arabic, besides translations into that language of several of the works of Galen, Ptolemy, Autolycus, Euclid, &c. He wrote also several in Syriac, on the religious rites and ceremonies of the Sabians; but none either of these or of his Arabic works have (as far as the writer is aware) been published or translated, though several of them still exist in manuscript in some of the European libraries. (Wüstenfeld, *Geschichte der Arabischen Aerzte*; Casiri, *loco cit.*; Nicoll and Pusey, *Catal. MSS. Arab. Biblioth. Bodl.*, pp. 257, 295; De Rossi, *Dizion. Stor. degli Autori Arabi.*)

THA'BET BEN SENA'N, the grandson of the preceding, whose names are given by Ibn Abí 'Ossaibiah (*Fontes Relationum de Classibus Medicorum*, cap. 10, § 5) as Abú 'l-Hasan Thábet Ben Senán Ben Thábet Ben Korrah. He was celebrated, like the other members of his family, as a physician, philosopher, and mathematician, and was superintendant of the hospital at Bagdad during the reign of Al- Motteia, the twenty-third of the 'Abbaside Khalifs, A.H. 334-363 (A.D. 946-974.) He expounded the writings of Hippocrates and Galen; but his principal work appears to have been a History of his Own Times, from the year A.H. 290 (A.D. 903) to the year of his own death, A.H. 363 (A.D. 973-4), which is highly praised by Abú 'l-Faraj (*Hist. Compend. Dynast.*, p. 208), and was continued after his death by his nephew Helál, and by other writers. Dr. Sprenger, in the notes to his translation of El-Mas'údí's 'Meadows of Gold and Mines of Gems,' vol. i., p. 24, Lond., 8vo., 1841, corrects an anachronism of Haji Khalfa, who ascribes this work to his grandfather Thabet Ben Korrah.

(Wüstenfeld, *Geschichte der Arabischen Aerzte*; Assemani, *Bibioth. Orient.*, vol. ii., p. 317.)

THALAMI'TA. [PORTUNIDÆ, vol. xviii., p. 446.]

THA'LAMUS (from θάλαμος, the bridal chamber), a botanical term which was applied by Linnæus to the calyx or outer whorl of floral envelopes. Tournefort applied the term to a receptacle that is not fleshy, but surrounded by an involucre. In this sense it is used in common with the terms Clinanthium and Phoranthium. By some writers, as De Candolle, the term is applied to the receptacle of all plants or that point of the rachis or stem around which the floral envelopes are seated. Thus those plants in which the petals and stamens are inserted into the receptacle constitute the first subclass, Thalamifloræ, of the Exogens, in De Candolle's natural arrangement of plants.

Thalamus is also used in Cryptogamic botany, in common with Thallus, to express the bed of fibres from which many fungi spring up. It is also improperly used by some writers to indicate the shields or apothecia of lichens. In fact it is a term that has been applied in so many cases where others are used, that it is desirable it should be altogether dispensed with, or only used in a very obvious sense.

THALA'SSEMA, Cuvier's name for a genus of footless Echinoderms (*Echinodermes sans pieds*), placed by him immediately after BONELLIA, and thus defined by him:—

Body oval or oblong, with the proboscis in form of a reflected lamina or spoon, but not forked. The intestinal canal is similar to that of *Bonellia*. But one abdominal filament had been discovered.

The genus is divided by Cuvier into the following sections or subgenera:—

1. The Thalassemæ properly so called.

These have only two hooks placed very forward, and their posterior extremity has no bristle-like processes (soies).

Example, *Thalassema Neptuni*, *Lumbricus Thalassema* of Pallas, *Spicil. Zoot.*, fasc. x., tab. 1, fig. 6.

2. The Echiuri,

whose posterior extremity is furnished with some transversal rows of bristle-like processes.

Example, *Echiurus Lumbricus*, *Lumbricus Echiurus*, Gm.,—Pall., *Miscell. Zool.*, xi. 1-6. Common on sandy bottoms on the French coasts, where the fishermen use it as a bait. It is also found on the coasts of Europe generally, and is said to form part of the food of the cod-fish.

3. Sternaspis. (Otto.)

These, besides the bristle-like processes of the *Echiuri*, have under their anterior part a slightly corneous disk surrounded with cilia.

Example, *Sternaspis thalassemoides*, Otto, *Monog.*

N.B.—Cuvier states that a new examination of the anatomy of the *Thalassemæ* had demonstrated to him that the place which he had assigned to them was the true one.

THALA'SSEUS, Boie's name for one of the TERNS.

THALASSIANTHUS, M. Rüppel's name for a genus of *Actinidæ*, familiarly known as *animal-flowers*, with ramified *tentacula*. [ACTINIA; ZOANTHARIA.]

THALASSI'DROMA. [PETRELS, vol. xviii., p. 43.]

THALASSI'NA. [THALASSINIANS.] N.B.—The student should be careful not to confound the crustaceous genus *Thalassina* with the echinodermatous THALASSEMA.

THALASSINIANS. The genus *Thalassina* of Latreille consists of those macrurous decapods which have the four anterior feet terminated by two fingers; the foliations of the lateral fins of the end of the tail narrow and elongated, without ridges; and the last segment of the tail, or the intermediate piece, in the form of an elongated triangle. Sometimes the four anterior feet, or the two first feet and one of the second, are terminated by two elongated fingers, forming a claw perfectly. The two anterior feet are the longest; the lateral foliations of the fin terminating the tail are in the form of a reversed triangle, or widest at the posterior border; the intermediate piece, on the contrary, narrows from the base to the termination, and ends in a point.

M. Milne Edwards arranges the family of *Thalassinians*, or *Burrowing Macrura*, between the *Scyllarians* and the *Astacians*.

The *Crustacea* of which this small but interesting family are composed resemble each other in appearance, and are remarkable for the extreme elongation of their abdomen and the small degree of consistence of their integuments.

Family Character.—Carapace small, and very much compressed laterally; terminated, generally, in front by a very short rostrum, but sometimes entirely without one. *Eyes* ordinarily very small. Internal *antennæ* terminated by two multi-articulate filaments; the external ones inserted externally and a little below the first; their peduncle slender, cylindrical, and without a spiniform lamina, carries at most only one very small moveable spine, which represents that appendage. Disposition of the parts of the *mouth* variable. *Sternum* nearly linear throughout its length, and not constituting a *plastron*. Anterior *feet* large, more or less completely didactylous and triangular; the next pair raised on each side of the thorax. *Abdomen* very long, and, in general, very narrow; rather depressed vertically than compressed laterally; the lateral borders of the dorsal arch of its various rings are but little prolonged, and do not incase the base of the false feet as in the SHRIMPS, nor does the abdomen itself diminish much in size towards its posterior part. The structure of its appendages varies. The disposition of the *respiratory apparatus* varies also; sometimes it only exists, as it ordinarily does in the Decapods, as thoracic branchiæ, enclosed under the carapace in special cavities; sometimes, on the contrary, there are, besides those thoracic branchiæ, accessory branchial appendages suspended under the abdomen and affixed to the false feet. Upon this important difference, M. Milne Edwards, who is the author of the character given above, founds his division of the family into two tribes, the *Cryptobranchids* and the *Gastrobranchids*.

1. Cryptobranchids.

Under this group M. Milne Edwards arranges all the *Thalassinians* which are without respiratory appendages suspended under the abdomen. Their *branchiæ* are in general composed of cylinders, united after the manner of a brush. All the species whose habits are known live in the sand, in which they burrow deeply. The following genera belong to this tribe:—*Glaucothöe*; *Callianassa*; *Axia*; *Gebia*; and *Thalassina*.

Glaucothöe. (Edwards.)

Generic Character.—Carapace nearly ovoid, and without any rostriform prolongation. *Eyes* projecting, large, and nearly pyriform. *Internal antennæ* short, cylindrical, and

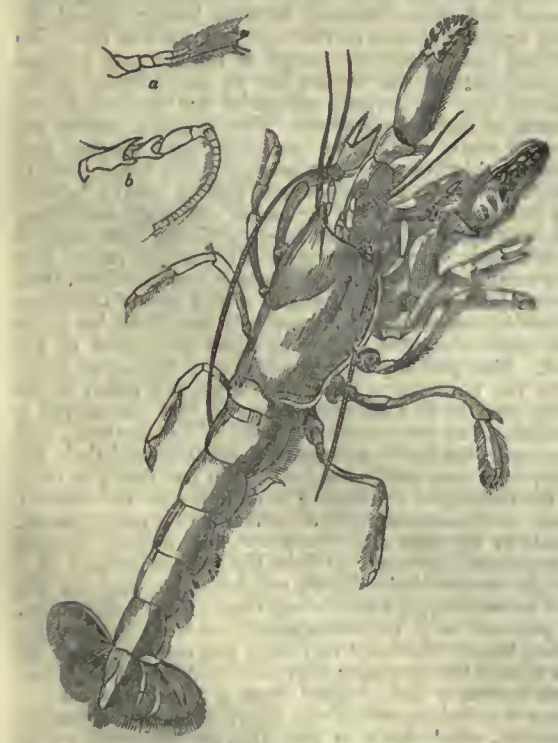
bent (coudées), as in *Pagurus;* the third joint of their peduncle the longest, and carrying at its extremity two small multiarticulate appendages, which are very short and rather stout, one of which is furnished with many long hairs. *External antennæ* inserted lower than the preceding, their peduncle bent, and presenting above a small scale, the vestige of a palp. External *jaw-feet* pediform. The last thoracic ring not anchylosed to the preceding. *Anterior feet* terminated by a stout, didactylous, well-formed hand: they are of very different sizes. Second and third pairs slender and very long: the two last pairs, on the contrary, short and elevated against the sides of the body, as in the *Paguri;* the fourth pair are flattened, rather large, and imperfectly didactylous, the immoveable finger of their hand being only formed by a slightly projecting tubercle; the posterior feet, still smaller than the last, are terminated by a small didactylous rather well-formed hand. The *abdomen* is narrow, elongated, and perfectly symmetrical: the first ring, much narrower than the succeeding ones, has no appendages; the four next segments, on the contrary, each give attachment to one pair of rather large false natatory feet, formed by a cylindrical basilary joint and two terminal blades, one of which is very small and obtuse, and the other large, pointed at the end, and bordered with long ciliary hairs. *Caudal fin* moderate in size; the middle blade, formed by the seventh abdominal segment, is rounded and ciliated, and the external blades are much longer than the middle ones. (M. E.)

M. Milne Edwards observes that this genus establishes the passage between the *Pagurians* and *Callianassa*.

Example, *Glaucothöe Peronii*, the only species known. Its integuments have little solidity, its carapace is smooth, and its length 8 lines. M. Milne Edwards states that it appears to inhabit the seas of Asia. He is of opinion that Latreille's genus *Prophylax* approximates closely to *Glaucothöe*, and ought not perhaps to be distinguished from it: if so Latreille's name has the priority. The latter placed his genus among the *Paguri*, but after the publication of M. Milne Edwards's *Glaucothöe*, was uncertain, according to M. Edwards, whether these two generic divisions should not be united.

Callianassa. (Leach.)

See the article: but the student should refer to the accurate and elaborate description and figures of M. Milne Edwards, who records two species:—*Callianassæ subterranea* and *uncinata;* and he adds that *Callianassa major* of Say seems to be distinguished from the two preceding species.



Axia Stirhynchus.
a, intermediate antenna; *b*, external antenna.

Axia. (Leach.)

Generic Character.—*Carapace* very much compressed, and terminated anteriorly by a small triangular rostrum. *Ocular peduncles* very small, cylindrical, and terminated by a hemispherical cornea. Terminal filaments of the *internal antennæ* nearly of the length of the carapace. Peduncle of the *external antennæ* having above a small moveable spine which represents the great lamellar palp observable in the *Shrimps*. *External jaw-feet* slender and pediform. *Anterior feet* compressed, and terminated by a well-formed claw; carpus small. Second pair of feet nearly lamellar, and equally didactylous. The three next pairs monodactylous. *Abdomen* slightly convex towards the middle, and terminating in a great fin, the five blades of which are nearly of the same length. First ring of the abdomen carrying a rudimentary pair of *false feet*, and the four succeeding rings provided each with a pair of very well-developed natatory false feet, each composed of a short and stout peduncle, which at its extremity carries a small styliform appendage within, and externally two great oval, very large blades, which are ciliated on the borders. (M. E.)

M. Milne Edwards observes that this genus much resembles *Callianassa* and *Gebia*, and he records the only known species, *Axia Stirhynchus*. Its length is about three inches, and it inhabits the coasts of France and England.

Gebia. (*Gebios* and *Thalassina*, Risso; *Gebia* and *Upogebia*, Leach.)

Generic Character.—*Carapace* terminating anteriorly by a triangular rostrum, and sufficiently large to cover the *eyes* almost entirely; on each side of its base is a tooth, which is continued with a crest, and forms the lateral border of the upper surface of the stomachal region. *Internal antennæ* very short, but nevertheless their terminal filaments are longer than their peduncle. *External antennæ* very slender, and presenting at their base no vestige of a moveable scale. *External jaw-feet* pediform. *Anterior feet* narrow, terminated by an elongated and imperfectly subcheliform hand: their moveable finger is very large, and in bending downwards its base is applied against the anterior border of the hand, the lower angle of which is prolonged so as to constitute a tooth performing the office of the immoveable finger. The feet next in succession are compressed and monodactyle; the second pair have their penultimate joint large, widened, and ciliated below; the succeeding pairs are more slender. *Abdomen* long and much narrower at its base than towards its middle, depressed and terminating by a large fin, whose four lateral blades are foliaceous and very wide. First abdominal ring with two pairs of very small filiform appendages; the four next segments giving origin to three pairs of false natatory feet, composed of a stout and short peduncle, and two oval blades with strongly ciliated borders: the external one very large, and the other very small. *Branchiæ* brush-like and fixed on two rows, namely, one above the second foot, and two above the four anterior feet and the external jaw-feet. (M. E.)

Example, *Gebia stellata*. Length 1½ inch.

Locality.—Coasts of England. M. Milne Edwards states that this species comes very near to *Gebia littoralis*.

M. Milne Edwards observes that the *Gebiæ* establish the passage between the *Thalassinæ* and the *Axiæ*, which last they resemble in the general form of the body and disposition of the caudal fin, whilst they approach the first by the conformation of the feet.

Gebia stellata.
a, intermediate antenna; *b*, base of an external antenna.

Thalassina. (Latreille.)

Generic Character.—*Carapace* short, narrow, and very much elevated. *Stomachal region* small and limited backwards by a deep furrow. *Cardial* and *intestinal regions* equally separated from the branchial regions, and representing by their junction a triangle, the apex of which is directed backwards. *Front* armed with a small triangular rostrum. *Eyes* small and cylindrical. *Internal antennæ* inserted above those organs; their peduncle of moderate size, and their terminal filaments slender and unequal, the longest about thrice the length of the peduncle. *External antennæ* very small, their peduncle cylindrical, hardly reaching beyond the rostrum, and presenting above no vestige of appendages. *External jaw-feet* moderate and pediform, their second joint armed with spiniform teeth on its internal surface, and nearly of the same form as the succeeding ones. First pair of *feet* narrow and moderately elongated, but rather robust; they are unequal, and the hand which terminates them presents at its anterior and lower angle a more or less strong tooth, which represents an immoveable finger, against which the base of the moveable finger, which is very large, is bent back. Second pair of feet very much compressed, and rather wide; their penultimate joint especially is large and ciliated below. The succeeding feet have nearly the same form, but they are narrower, and less and less compressed. *Abdomen* very long, narrow, semicylindrical, and nearly of the same size throughout its length. Terminal fin small; the two pairs of lateral blades, formed by members of the sixth ring, nearly linear. *False feet* fixed to the four middle rings of the abdomen; they are very slender, and composed of a cylindrical and elongated pedunele carrying two more or less ciliated multiarticulate filaments. (M. E.)

Example, *Thalassina scorpionides.* Length about six inches. Colour brownish.

Thalassina scorpionides.

Locality.—Coasts of Chili.

M. Milne Edwards remarks that the abdomen of this species reminds the observer of the body of a *Scolopendra.*

2, Gastrobranchids.

M. Milne Edwards observes that this small division of the *Thalassinians* is very remarkable, for it establishes the passage between the *Callianassæ* and the *Squillæ.* In the general form of the body, the crustaceans forming this division differ, he remarks, but very little from the first, and the conformation of their thoracic branchiæ does not permit their separation from the macrurous decapods, nor their distant removal from the Thalassinians; but they have respiratory appendages fixed to their abdominal false-feet, exhibiting the greatest analogy with the ramose branchiæ of the Stomapods.

The type of this group, according to M. Milne Edwards, is a small crustacean, to which he gives the generic name *Callianidea;* but he also arranges in this same division the genus *Isea* of M. Guerin, under the name of *Callianissea,* for he thinks that he perceives in this last an analogous mode of organization. If, he observes, the characters assigned to it by M. Guerin be exact, it would be difficult to place this new genus here, and it ought to be approximated to the *Pagurians;* but it appears very probable to M. Milne Edwards that there has been some error of observation, and that in reality the *Iseæ* and *Callianideæ* differ but very little.

These crustaceans, M. Milne Edwards observes, have all a very small oval thorax compressed laterally: their abdomen, on the contrary, is extremely long and slender. The disposition of the eyes and the antennæ is nearly the same as in *Callianassa.* The external jaw-feet are pediform, and carry externally a slender and multiarticulate palp. The two first pairs of feet are didactylous; the anterior pair are long, very unequal, and terminated by a stout compressed hand; the second are small and very delicate; the third are enlarged towards the end nearly as in *Callianassa,* and terminated by a very short tarsus, forming, with a tubercle of the preceding joint, an imperfect claw. The fourth pair of feet are slender and monodactyle; and the fifth pair, small in dimension, are thrown backwards. As in the *Crpytobranchids,* the abdomen is very long, sufficiently soft, and composed of nearly equal rings, of which the dorsal arch is not prolonged below so as to incase the base of the false feet. The caudal fin offers nothing remarkable; but the false feet, inserted at its lower surface, are furnished with a multitude of branched filaments, which have a structure very analogous to that of branchiæ, and which certainly must be destined to concur in the work of respiration.

M. Milne Edwards concludes by observing that this tribe comprehends two genera, one of which appears to him to be too imperfectly known to be conveniently characterized.

Callianidea. (Edwards.)

Generic Character.—*Body* very delicate, slender, and elongated. *Carapace* hardly a third of the length of the abdomen, and not covering the last thoracic ring, compressed and rather elevated, its lower border applied exactly against the base of the four first pairs of feet. No rostrum, and the anterior border of the carapace notched on each side of the median line for the reception of the base of the *eyes,* whose pedunele are very short, and formed as in the *Callianassæ.* Four *antennæ,* slender and inserted nearly on the same transversal line; the first pair terminated by two filaments nearly equal in length, one of which however is the largest, and slightly convex towards the end. Appendages of the *mouth* very small, occupying but little space; *mandibles* hardly differing from those of *Callianassa;* valvular appendage of the second pair of *jaws* very small; external *jaw-feet* slender and pediform, their second joint furnished internally with a row of dentiform tubercles covered with hairs, and with their three last joints very much elongated. *Sternum* linear throughout its extent. First pair of *feet* long, and one of them very stout, with the terminating hand very large, and nearly of the same form as in *Callianassa,* except that the carpus is smaller. The two succeeding pairs of feet are small and flattened; the fourth pair nearly cylindrical, and their basilary joint very much enlarged. Fifth pair nearly as large as the fourth, and terminating in an imperfect rudimentary claw. *Abdomen* composed as ordinarily of seven segments, nearly of the same size throughout, and carrying beneath five pairs of *false-feet:* of these the first are reduced to a simple narrow blade slightly ciliated at the end, but the four succeeding pairs have a very remarkable conformation. A pedunele is to be distinguished and three terminal laminæ, two of which are very large and one very small on the edge of the preceding ones; all round the border of the great laminæ a kind of tufted fringe is found, composed of a row of cylinders, each of which gives origin to two smaller filaments, which again in their turn are bifurcated nearly in the same manner as the branchial filaments of the *Squillæ* are divided. The five blades of which the caudal

fin is composed are wide and rounded. The thoracic *branchiæ* are enclosed as ordinarily in the carapace, and are each composed of cylinders ranged in parallel order on a stem, nearly as in the lobsters, only these organs and filaments are less numerous, and the branchiæ themselves very small. There are only ten on each side of the body. (M. E.)

Example, *Callianidea typa*. Length about 10 lines.

Locality.—Coasts of New Ireland, where it was found by MM. Quoy and Gaimard.

Callianidea typa, magnified.

a, antenna of the first pair; *b*, external jaw-foot; *c*, extremity of one of the posterior feet; *d*, abdominal false feet, first pair; *e*, false feet of one of the four succeeding pairs; *f*, marginal fringe of those false feet.

So much doubt exists relative to the genus *Isea*, Guerin, *Callianisea*, M. Edwards, that we think we should not be justified in occupying space with the very long and elaborate description of M. Guerin, and the acute criticisms of M. Milne Edwards, who observes that *Isea*, having been previously employed to designate another crustaceous animal, cannot be retained. M. Guerin's description will be found in the 'Annales de la Société Entomologique de France,' tom. i., p. 295; and also in M. Milne Edwards's 'Histoire Naturelle des Crustacés,' tom. ii., p. 322. But though our limits do not permit the insertion of the details, they should be carefully perused by the student, for they are highly interesting and instructive.

Fossil Thalassinians.

M. Milne Edwards states that the crustaceous fossil found in the chalk formation of Maastricht, and figured by M. Desmarest under the name of *Pagurus Faujasii*, belongs to the genus *Callianassa*.

THALASSIO'RNIS, Mr. Eyton's name for one of the ducks (*Clangula*, Smith), subfamily *Erismaturinæ*.

THALASSIOPHYTES (literally 'sea-plants,' from θάλασσα and φύτον) is the name given by Lamouroux to designate the vegetable productions of the ocean and of its rocks and shores. It is equivalent to the term Hydrophytes of Lingbye, and the plants described by Agardh as Marine Algæ. This division of the vegetable kingdom comprehends, in Lamouroux's system, six orders, viz., Fucaceæ, Florideæ, Dictyoteæ, Ulvaceæ, Aphlomideæ, and Phlomideæ. [Sea-Weeds; Ulvaceæ.]

THALES (Θαλῆς) was a native of Miletus, one of the chief cities of Ionia, and descended from a Phœnician family. Apollodorus, as quoted by Diogenes Laertius, fixes the year of his birth in the first year of the 35th Olympiad, or B.C. 640. Herodotus (i. 74) says that Thales the Milesian predicted the year of the great eclipse which took place while the armies of Cyaxares and Alyattes king of Lydia were engaged in battle. Alyattes became king of Lydia in B.C. 617. Herodotus also says (i. 75) that Thales was in the army of Crœsus at the time of the battle of Pterie between Crœsus and Cyrus B.C. 547 or 546; at which time he would be ninety-four years old, if the date of his birth is correctly given by Apollodorus. There was a general tradition that he lived to a great age; and Lucian states that Solon, Thales, and Pittacus all lived to be a hundred years old. (On the subject of the eclipse see the article Alyattes, and Oltmanns, *Abhandlungen der Akad. Berlin*, 1812-13.)

In the Life of Thales by Diogenes we find numerous traditions attached to his name, the value of which it is somewhat difficult to estimate. Thales is enumerated among the Seven Wise Men, whose wisdom was not the theoretical wisdom of philosophers, but the wisdom of actual life. [Bias.] Accordingly we find that Thales took an active part in the political affairs of his native country. Before Ionia fell under the Persian yoke, he advised the Ionians to have one common council, and to establish it at Teos, for Teos was in the centre of Ionia; and he further suggested that all the other Ionian states should be reduced to the condition of parts dependent on the government at Teos. Such a scheme, if carried into effect, might have checked the progress of the Persian arms (Herod., i. 170.) Later writers say that he visited Egypt and Crete in order to improve his knowledge, and that he derived from Egypt his acquaintance with mathematics. There seems no reason for thinking that Thales left any writings. Aristotle at least was not acquainted with any philosophical writings by Thales. Various sayings of Thales are recorded: they are of that sententious character which belongs to the proverb, and they embody truths such as the general experience of mankind recognises; and for this reason they cannot safely be considered as the product of any one mind. Thales is generally considered the founder of the Ionian school; but it is perhaps hardly proper to consider him in any sense as the founder of a school. [Ionian School.] His traditional reputation rested on his physical discoveries and his philosophical speculations. He is said to have been the first astronomer (among the Greeks) who predicted eclipses; and to have discovered the passage (πάροδος) from tropic to tropic, or, in other words, to have laid down the sun's orbit; and to have fixed the length of the year at 365 days. He determined the magnitude of the sun to be 720 times that of the moon; which is apparently the true version of the corrupt passage in Diogenes. His knowledge of geometry was said to be derived from Egypt, and Pamphila attributes to him the discovery of the right-angled triangle of the circle (πρῶτον καταγράψαι κύκλου τὸ τρίγωνον ὀρθογώνιον), which probably means the demonstration that the angle in a semicircle is a right angle, a discovery attributed also to Pythagoras. Hieronymus says that he measured the height of the pyramids of Egypt by observing the shadow which an object cast when it was of the same length as the height of the object.

The philosophical speculations of Thales, like the earliest efforts of philosophers in all countries, were an attempt to solve the problem that admits of no solution—the real nature of the universe. He is considered by modern writers as the originator of the dynamic philosophy, the nature of which, as opposed to the mechanical, is explained in the article Ionian School. Aristotle (*Metaph.*, i. 3) has explained in a short passage the general doctrine of Thales: 'There must be,' observes Aristotle, 'some Nature (φύσις), either one, or more than one, to which all other things owe their origin, this one still subsisting. The number however and the character of such a first principle are not conceived by all in the same way. Thales, the founder of this philosophy, says it is water, and accordingly he taught that even the earth reposes on water, founding this notion probably on the observation that the nourishment of all things is moist, and that heat itself proceeds from water, and that animals live by it: but that from which things come is the origin of all things. He was thus led to this notion, and also by observing that the seeds of all things have a moist nature, and that water is the origin of their nature to all moist things.' Thus the universe contained an active principle by the power of which all things were developed. He considered that the magnet had life, because it attracted iron. The universe then was pervaded by life, or, as Thales expressed it, 'full of gods' (πάντα πλήρη θεῶν).

The doctrine of Thales bears some resemblance to systems that have been promulgated in modern times, which have been viewed as atheistical. The assumption of an active power, such as gravitation for instance (though it is not here meant to affirm that gravitation has ever been viewed as a power sufficient for the production and conservation of all things), which is sufficient to maintain all things in a permanent condition (changes such as we observe in limited portions of time and being only continued developments), may be viewed as an hypothesis

made for the purpose of getting rid of the necessity of admitting the existence of God. Those who propound such an hypothesis, without further explanation, certainly do not take much pains to avoid the imputation of atheism. It does not appear however that the doctrine of Thales was anything more than a pure physical theory; and the traditions recorded of him by Diogenes make him a believer in a Diety. 'The most antient of things existing is God, for he is uncreated; the most beautiful thing is the universe, for it is God's creation.'—It was one of the maxims of Thales, that death did not differ from life. 'Why don't you die then?' said an objector, more witty than wise. 'Because there is no difference,' was the reply. (Diogenes Laertius, i. 'Thales;' Ritter, *Geschichte der Philosophie*, vol. i.)

THALICTRUM (from the Greek θάλικτρον), the name of a genus of plants belonging to the natural order Ranunculaceæ. It consists of herbs which have usually a fetid smell like rue, and hence are called meadow rues. The species have perennial roots with annual stems. The flowers are corymbose, panicled, and somewhat racemose, of a green, white, or yellow colour. They have no involucre and no petals. The calyx is composed of 4 or 5 petal-like sepals. Carpels 4-15 in number. Upwards of 50 species are enumerated, which are mostly natives of the temperate and colder parts of the world.

Th. aquilegifolium, the Feather Columbine, has ovate stipules, placed at the base of the ramifications of the petiole; and a corymbose panicle. It is a native of Europe, in woody districts of Germany, France, and Italy. The stems and stamens of this plant vary in colour, sometimes being greenish-white and sometimes purple. A variety is found in Austria with dark purple stems and stamens, and is called *Th. a. atropurpureum*. Another variety, *formosum*, has the stamens dilated at the apex; whilst another has the stems green and stamens quite white, and is named *Th. a. album*.

Th. minus, Lesser Meadow-Rue, has the stem round, mealy, the flowers panicled, drooping, leaflets smooth, roundish, toothed at apex, glaucous, pericarps acute furrowed. It is a native throughout Europe. In Britain it is found in chalky pastures, and on the sea-coast where shell-sand abounds. The greater meadow-rue, *Thalictrum majus*, is also a native of Great Britain, though rare.

Th. flavum, Yellow Meadow-Rue, has an erect, branched, furrowed stem, fibrous roots, a somewhat corymbose panicle of cream-coloured flowers, with wedge-shaped, trifid acute leaflets. It is a native of all districts in Europe. In Britain it occupies wet meadows, the banks of rivers and ditches. It has a root of a yellow colour, and is said to resemble, both in appearance and properties, rhubarb. It yields a yellow dye, which may be employed for dyeing wool, and was formerly used as a remedy in jaundice. Like many of the family to which it belongs, it is very acrid, and produces blisters upon the skin, when applied to it.

Th. fœtidum, Fœtid Meadow-Rue, has a simple stem, naked at the base, leafy in the middle, and panicled at top; the leaflets are obtuse, toothed, and covered with a clammy pubescence. It is a native of France, Switzerland, Russia, &c., and is found in valleys and on hill sides, and in the fissures of calcarous rocks. It smells more powerfully than any of the species—hence its specific name.

Th. Cornuti has dioecious or polygamous flowers, with club-shaped filaments, obovate roundish leaflets, glaucous beneath. This is a North American species, and is found on the banks of rivers and in woody districts throughout the whole continent.

The character of the leaves of these plants and their thickly-flowered panicles render them favourites in gardens. They are readily increased by parting their roots and planting them out in autumn. They flourish best in moist shady situations, but are not particular; they are free-growing plants and well adapted for borders.

THALLEPUS, Mr. Swainson's name for a genus which he places among the *Aplysians*, apparently upon the authority of one of the late Rev. Lansdown Guilding's drawings.—Ex., *Thallepus ornatus*. (*Malacology.*)

THALLICERA, M. Quoy's name for a genus of Gastropods, placed as the first subfamily (with a ?) of his *Turbidæ* (*Turbinidæ*, we suppose, is meant), by Mr. Swainson. It is immediately followed by the subfamily *Ampullarinæ*. (*Malacology.*)

THALLITE. [EPIDOTE.]

THALLUS is a botanical term used exclusively in cryptogamic botany, and is generally applied to the part of the plant which bears the reproductive organs, and constitutes the principal part of its vegetation. In Jungermanniaceæ the thallus or frond is either a leafy branched tuft, as in mosses, with the cellular tissue particularly large and the leaves frequently furnished with lobes and appendages at the base, called stipulæ or amphigastria; or it is a flattened mass of vegetable matter seated upon the ground. In lichens the parts which bear the reproductive organs, and which constitute the great bulk of the plant, is called thallus or blastema. In the Algæ the term thallus is applied to the whole plant; whilst in the fungi it is used synonymously with thalamus, to express the mass of fibres from which many of the fungi arise. *Thallodes* is the adjective used to express anything arising from the thallus.

THAME. [OXFORDSHIRE.]

THAMES, the most important river in Great Britain, rises in the central part of England, and flows eastward into the German Ocean. Our description will comprehend a notice of its basin, course, and affluents, and commercial importance.

Basin.—The limits assignable to the basin of the Thames will depend on the place at which the mouth is fixed. The opening between Sheerness in Kent and Shoebury Ness in Essex, between five and six miles wide, is commonly regarded as the mouth of the Thames; but it is preferable in some respects to consider as such the opening between Whitstable in Kent and the east extremity of Foulness Island in Essex, where the tideway has a breadth of eighteen miles. Here the Thames opens into a large bay separating Kent on the south from Essex and Suffolk on the north, and having for its extreme points the North Foreland in Kent and Orford Ness in Suffolk, fifty miles distant from each other. Into this bay several rivers, besides the Thames, open: as the Crouch, the Blackwater, and the Colne, from Essex; the Stour, which separates Essex from Suffolk; and the Orwell, the Deben, and the Alde, from Suffolk.

The basin of the Thames, commencing at Whitstable, is bounded by the high grounds which there run down to the coast, and form the cliffs east of that town. The boundary runs in a very irregular line across the county of Kent and the Weald district of Kent and Sussex to the high ground on the southern border of Ashdown Forest in the latter county. This part of the boundary is very irregular from the manner in which the basin of the Thames is complicated with the basins of the Kentish Stour, the Rother, and the Sussex Ouse.

From Ashdown Forest the boundary runs west-north-west across the high ground of Tilgate and St. Leonard's forests to Leith Hill in Surrey, and thence west-south-west, though in a very irregular line, past the head of the Wey in Woolmer Forest to the verge of the chalk downs near Alton, Hants. This boundary separates the basin of the Thames from the basins of the Sussex Ouse and the Arun. Nearly all the waters which rise along the boundary, from its commencement to Tilgate Forest, flow into the Medway; those from Tilgate Forest to Leith Hill, into the Mole; and those from Leith Hill to Alton, into the Wey.

From the neighbourhood of Alton, the boundary of the basin is formed by the chalk downs which extend across Hants and Wilts by Basingstoke, Kingsclere, Highclere, and Burbage near Great Bedwin; and from thence by the downs which run north-westward to the neighbourhood of East Kennet and Abury. These chalk downs separate the basin of the Thames from the basins of the Anton or Test and the Hampshire Avon: that part of the basin of the Thames which they bound is drained by the Loddon and the Kennet.

From near East Kennet the boundary turns north and north-north-east along the green-sand hills by Compton Basset, Clyffe Pipard, and Chadderton; and from thence west-north-west to the western extremity of the basin near the commonly reputed head of the Thames amid the Cotswold Hills between Cirencester and Tetbury. The boundary between East Kennet and the Cotswolds separates the basin of the Thames from that of the Bristol Avon, or more correctly of the Severn, of which the Avon is a tributary.

From the neighbourhood of Tetbury the boundary runs northward along the ridge of the Cotswolds, which here separate the basins of the Thames and the Severn, to the

head of the Churn (or true Thames), about three miles south of Cheltenham; and from thence north-north-east along by the same hills to the head of the Windrush near Campden, and by Long Compton Hill and Edge Hill to the Arbury hills near Daventry at the northern extremity of the basin. Here the basin of the Thames is conterminous with that part of the basin of the Severn which is drained by its affluent the Warwickshire Avon.

From the Arbury hills the boundary of the basin runs south to the neighbourhood of Bicester, and thence eastward across Buckinghamshire, Bedfordshire, and Hertfordshire, along the Dunstable, Luton, and Royston downs, to the north-western corner of Essex; the basin of the Thames being throughout conterminous with that of the midland or Norfolk Ouse. This part of the basin of the Thames is drained by its affluents, the Charwell, the Thame, and the Lea. An irregular line drawn through the county of Essex from its north-western corner, first south-south-east by Dunmow and Brentwood, and then east by Rayleigh and Rochford to the coast, will complete the boundary.

The greatest extent of this basin from east to west is from the mouth of the Thames to the neighbourhood of Tetbury, about 136 miles; the greatest extent from north to south is from the neighbourhood of Daventry, Northamptonshire, to the neighbourhood of Alton, Hants, about 78 miles. The basin comprehends the whole or part of the following counties; its area may be estimated as follows:—

	Sq. Miles.
Kent (considerably more than half the county; the western part)	900
Surrey (the whole county with the exception of some small portions along the southern border)	700
Sussex (a small part along the northern border)	300
Hants (the northern and north-eastern part)	350
Berks (the whole county)	750
Wilts (the northern and north-eastern part)	450
Gloucester (the south-eastern and eastern part)	450
Warwickshire (a very small portion along the south-eastern border)	50
Northamptonshire (a very small portion along the south-western border)	50
Oxon (the whole county, with the exception of two small portions on the north-eastern and north-western borders)	650
Bucks (two-thirds of the county; the central and southern part)	500
Bedford (a small portion at the southern extremity)	50
Herts (the whole county except some portions along the north-eastern border)	550
Middlesex (the whole county)	300
Essex (about one-third of the county; the western and southern borders)	550
Total	6600

We have used round numbers, as in such an estimate an approximation to the truth is all that can be attempted.

The basin of the Thames is occupied wholly by the secondary and tertiary geological formations. The sources of the river and the course of its upper waters are in the oolitic beds of the Cotswold hills. The valley through which the Thames itself flows from above Cricklade to below Oxford is occupied by the Oxford clay, and between Oxford and Goring (a little below Wallingford) the river flows over the formations (the coral rag, Aylesbury stone, Tetsworth clay, and greensand and chalk marl) which intervene between the oolitic and cretaceous groups. It traverses the chalk range between Ilsley Downs and the Chiltern Hills by a winding valley, in which it flows from Goring to Maidenhead, below which it enters the chalk basin of London, and has the remainder of its course through it. The affluents which join the Thames above Oxford have their course chiefly in the oolitic district; the Thame and the Ock flow through the district occupied by the groups between the oolites and the chalk; and of the remaining affluents, those which join it on the north bank chiefly rise in the chalk hills, and have their course in the chalk basin of London: while most of those which join it on the south bank rise in the districts occupied by the subcretaceous formations, and enter the chalk basin of London by openings in the chalk range of the North Downs. Owing to the entire absence of coal, the basin of the Thames has no manufactures except those of the metropolis; but it contains some of the richest agricultural districts in the whole kingdom.

Course and Affluents.—The spring which has commonly been regarded as the head of the Thames is about three miles south-west of Cirencester, near a bridge over the Thames and Severn canal which is called 'Thames-head bridge;' but that which is to be regarded as the true head of the Thames is about three or four miles south of Cheltenham. Two streams rise, one from fourteen springs at what is popularly called The Seven Wells, and the other from four springs near Ullen Farm, the westernmost of which springs is the real (*i.e.* the remotest) head of the river: both streams rise on the south-eastern slope of the Cotswolds, and form by their junction, about a mile from their respective sources, the river Churn (a name the element of which is embodied both in the antient and modern name of the town of Cirencester (the Corin-ium of the Romans), by which it flows; and in the name of two villages, North and South Cern-ey, which are near it. At Cricklade, 19 or 20 miles south-east from its source, the Churn joins the commonly reputed Isis or Thames, the length of which above the junction is only about 10 or 11 miles.

From Cricklade the river flows 9 or 10 miles east-north-east to Lechlade, receiving on the way the Ray (11 miles long) and the Cole (14 miles long), both on the south bank. Just above Lechlade it receives on the north bank a more important tributary, the Colne (23 miles long) from the Cotswold hills east of Cheltenham; and just below Lechlade it receives the Lech, or Leach (19 miles long), which also rises in the Cotswolds, and gives name to the towns of North Leach and Lechlade. From Lechlade the Thames flows 14 miles eastward to the junction of the Windrush, receiving accessions of small brooks on each side. The Windrush rises in the Cotswolds between Winchcomb and Campden, and has a course of 34 miles by Burford and Witney; it joins the Thames on the north bank. Below the junction of the Windrush the Thames makes a bend to the north and north-east, receiving on the north bank the Evenlode, which rises in the Cotswolds near Moreton in the Marsh, and has a course of 31 miles by Charlbury, and receives the Glyme which flows through Woodstock and Blenheim park. The Thames then turns south, and flows to Oxford, where it joins the Charwell. From the junction of the Windrush to that of the Charwell the length of the Thames is 13 miles. The Charwell rises in the Arbury hills near Daventry in Northamptonshire, and flows southward 44 miles by Banbury: it joins the Thames on the left bank.

From the junction of the Charwell the Thames flows 16 miles south-south-east to the junction of the Thame at Dorchester, making however a considerable bend westward to Abingdon, where it receives the Ock. This river rises at the foot of the chalk hills of Berkshire, between Compton Beauchamp and Ashbury, and flows eastward 18 miles into the Thames, which it joins on the right or south-west bank: the Thame rises near Stewkley in Buckinghamshire, between Winslow and Leighton Buzzard, and flows 39 miles south-west by the town of Thame into the Thames, which it joins on the left or north-east bank. From Dorchester the course of the Thames is south-east 22 miles in a winding channel by Wallingford to the junction of the Kennet near Reading. The Kennet rises near Broad Hinton, a village to the north of Marlborough Downs, flows south to East Kennet, and then turning eastward flows by Marlborough, Hungerford, Newbury, and Reading into the Thames, which it joins on the right bank: its whole course is 53 miles. It receives the Lambourn and the Embourn or Anborn.

From the junction of the Kennet the Thames flows eastward, though in a very winding channel, making first a considerable circuit to the north by Henley, Great Marlow, and Maidenhead to Windsor; and then a considerable circuit to the south by Staines, Chertsey, Kingston, and Richmond to Brentford, from whence it proceeds by Hammersmith, Putney, and Chelsea to the metropolis. The distance from the junction of the Kennet to London-bridge is 70 miles. In this part of its course the Thames receives several feeders. The Loddon, 24 miles long, rises in the chalk downs of North Hants near Basingstoke; the Coln, 38 miles long, rises, under the name of the Ver, in the chalk downs of Hertfordshire, and passes St. Albans, Watford, Rickmansworth, Uxbridge, and Colnbrook; the Wey, 36

miles long, rises near Alton, Hants, passes Farnham, Godalming, and Guildford, and joins the Thames at Weybridge; the Mole, 41 miles long, rises on St. Leonard's Forest, in Sussex, passes through Leatherhead, and joins the Thames at East Moulsey; the Cran and the Brent, two small streams, each about 18 miles long, rise on the borders of Middlesex and Herts, and join the Thames, the first at Isleworth, the second at Brentford; and the Wandle, a stream only 9 miles long, joins it at Wandsworth. Of these the Colne, the Cran, and the Brent fall into the Thames on the left or north bank; the others on the right bank. The name of the Ver appears as an element in the name of Ver-olamium, an antient Roman town close to St. Albans.

Below London, up to which sea-borne vessels ascend, the river flows eastward, but with various 'reaches' or bends, 56 miles to its mouth, or to the Nore Light (at the commonly reputed mouth) 48 miles. Between Deptford and Greenwich, about four miles below London-bridge, the Thames receives on the south or right bank the Ravensbourne, 10 miles long, from Keston, near Bromley in Kent; about two or three miles farther down, on the north or left bank, the Lea, 50 miles long, which rises in Bedfordshire, and passes Luton, Hertford, Ware, and Waltham Abbey: four or five miles lower, the Roding, 38 miles long, from near Dunmow, also on the north bank; and six miles lower, on the south bank, the Darent, 20 miles long, which passes Dartford, and receives the Cray. The only remaining feeder of the Thames which here requires notice is the Medway, above 60 miles long, which rises in Sussex, and flows by Tunbridge, Maidstone, Rochester, and Chatham. The principal arm of the Medway joins the Thames at Sheerness just above the Nore; but the smaller arm, called the Swale, which cuts off the Isle of Sheppy from the mainland of Kent, opens into the Thames just above Whitstable.

The whole course of the Thames, from its source to its mouth, is about 220 miles, which is the aggregate of the distances already given.

The principal affluents of the Thames are more fully described elsewhere: the Colne under GLOUCESTERSHIRE; the Windrush, the Evenlode, the Charwell, and the Thame, under OXFORDSHIRE; the Kennet, the Loddon, and the Ock, under BERKSHIRE; the Colne, the Brent, and the Cran, under MIDDLESEX; the Wey, the Mole, and the Wandle, under SURREY; the Lea with its tributaries, under HERTFORDSHIRE, ESSEX, and MIDDLESEX; the Roding under ESSEX; and the Ravensborne, Darent, Cray, and Medway with its feeders, under KENT. The Thames, in the first part of its course, belongs wholly to Gloucestershire, but below Cricklade is almost entirely a border river, dividing Gloucestershire from Wiltshire, Oxfordshire and Buckinghamshire from Berkshire, Middlesex from Surrey, and Essex from Kent. Some part of its course is therefore described in the articles on those counties.

Commercial Importance.—The navigation of the Thames commences at Lechlade, where the river is about 258 feet above low-water mark at London-bridge. Its importance was early appreciated, and there are acts of Parliament relating to it as early as the 2nd Hen. VI. The Thames and Severn Canal, which follows the valley of the Churn and the Thames from near Cirencester, opens into the Thames at Lechlade, thus connecting it with the Severn and the western coast of the island. The navigation of the river formerly extended up to Cricklade, but since the opening of the canal the upper part, between Cricklade and Lechlade, has been abandoned. None of the tributaries above Oxford are navigable. At Oxford the Oxford Canal joins the Thames, and opens a communication with the great canal system of the central counties: it follows the course of the Charwell (which river is not navigable) from above Banbury. At Abingdon the Wilts and Berks Canal joins the Thames, and, as well as the Kennet and Avon Canal, which joins the Kennet at Newbury (where the navigation of that river commences, 20 miles above its junction with the Thames), opens a communication with the Somersetshire (or Bristol) Avon, and by it with the Severn. The Thame is navigable from the town of Thame, about 17 miles above its junction with the Thames; but neither the Loddon nor the Colne is navigable. The Wey is navigable from Godalming, about 17 miles from its junction; and is connected with the Wey and Arun Canal, and the Basingstoke Canal, the former of which opens a communication with the river Arun and the Sussex coast. No other feeder above London-bridge is navigable; but the Grand Junction Canal, which unites with the Oxford Canal at Braunston in Northamptonshire, opens into the Thames by the mouth of the Brent, the lower part of which is incorporated with the canal. Below London-bridge the Lea, which is navigable, chiefly by artificial cuts, for 25 miles, and has one of its feeders (the Stort) also navigable, opens into the Thames; and just above the Lea, the Regent's Canal, which encircles the north and east side of the metropolis, and communicates with the Paddington Canal, and so with the Grand Junction Canal, also opens into the river.

The Medway is navigable below Rochester bridge for sea-borne vessels, and from Penshurst, above 43 miles from its mouth, for river craft.

The navigation of the Thames, in its upper part, is kept up by locks and wears, the lowest of which is at Teddington, which is consequently the limit of the tide. Teddington is about 18 or 19 miles above London bridge. High-water mark at Teddington is about one foot and a half higher than at London-bridge, and the time of high-water is about two hours later. Low-water surface at Teddington is about sixteen feet and three-quarters higher than at London-bridge.

At ebb-tide there is a depth of from 12 to 13 feet water nearly or quite up to London-bridge, and the rise of the tide is about 17 feet, or at the extreme springs about 22 feet.

Vessels of 800 tons get up to the St. Catherine's Docks, and those of 1400 tons to Blackwall, about six miles below bridge. No river in the world equals the Thames in its commercial importance. The river for some two miles or more below bridge is crowded with vessels, chiefly coasters, steamboats, and colliers, which moor alongside the quays or in tiers in the stream; others are moored lower down, though not in such numbers; and for larger vessels there are several docks excavated on the bank of the river. There is a dockyard for the navy (now little used) at Deptford, about four miles below London-bridge; one at Woolwich, nine miles below; one at Sheerness, in the Isle of Sheppy, at the junction of the Thames and Medway; and one at Chatham, the most important of the four, on the Medway. The fortifications at Sheerness defend the entrance to both rivers; the passage of the Thames is further protected by Tilbury Fort, and that of the Medway by Gillingham Fort.

The width of the river at London-bridge is nearly 700 feet. For nearly the whole way below London-bridge the river is embanked, and is almost throughout its lower course skirted with marsh-lands, which however have nowhere a great extent. The width of the river at Woolwich is about a quarter of a mile; at Gravesend, 26 miles below London-bridge, and opposite Tilbury Fort, it is more than half a mile; about four miles below Gravesend it is nearly a mile; and then gradually increases to the width of about six miles at the Nore, and to eighteen at the point where we have fixed the mouth.

It is a common opinion that this river in the upper part of its course is properly called Isis, and that it is only below the junction of the Thame that it is called Thames, which name is said to be formed by combining the two names Thame and Isis. But Camden observed long ago that this is a mistake; that the river was antiently called Thames in its upper as well as in its lower part; that the name Isis never occurs in antient records, and was never used by the common people, but only by scholars. Cæsar writes the name Tamesis (evidently Tames or Thames, with the addition of a Latin termination. Tacitus writes it Tamesa, and Dion Cassius Ταμίσα, which is the same name, with the appendage of a different termination. Ptolemy has it Ἰάμησα, or in some MSS. Ἰαμισαίς, and in some editions Ἰάμισσα; all which we suspect to be forms of the same name, I having been by the carelessness of some early

transcriber substituted for T. In Richard of Cirencester it is Thamesis.

(*Ordnance Survey;* M'Culloch's *Statistical Account of the British Empire;* Camden's *Britannia.*)

THAMES, a certain jurisdiction, though not undisputedly exclusive, appears to have been immemorially exercised over both the fisheries and navigation of a large portion of the Thames by the mayor and corporation of London. In early times, when fisheries were probably of much greater importance than they are at present, the same kind of encroachments upon them by private individuals which were so often made the subject of complaint in other parts of the kingdom were also practised in this river. In 1405 an order was issued from Sir John Woodcock, then lord mayor, enjoining the destruction of wears and nets from Staines to the Medway, in consequence of the injury which they did to the fishery and their obstruction of the navigation. By 4 Hen. VII., c. 15 (1487), the mayor of London and his successors were invested with the same authority as conservator of the fish in 'all the issues, breaches, and ground overflown as far as the water ebbeth and floweth from out of the river Thames,' as he had within the river itself. Before the river was artificially embanked and the adjoining lands drained, this extension was probably of considerable importance. During the reign of Elizabeth, in 1584, an order was put forth by the mayor for the purpose of settling the proper times in which various kinds of fish were to be taken. It prohibited fishing in certain parts of the river, and forbade the taking of the white-bait or 'bloodbag.' The right of the corporation however to the conservation of the river about this time was disputed by the lord-high-admiral, and some litigation took place, in which the corporation were uniformly successful. James I. in the third year of his reign granted a charter to the city, in which the immemorial right of the city to the office of bailiff and conservator of the Thames is recited and confirmed. The same rights are also confirmed and settled by various other charters and acts of parliament. The result of them is to vest in the corporation the conservation of the river, the regulation of the port and harbour of London, and, as is said, the actual property in the soil of the river, subject only to the jus regium of the crown. By this is perhaps to be understood, that property with which the crown is held to be invested for the purpose of securing to the public the use of the river for the purposes of navigation, fishing, and other purposes. The portion of the river over which the jurisdiction of the city extended seems to have been always much the same. It is described in the following terms, in an article entitled 'Antient Prescriptive Jurisdictions over the Thames,' by Joseph Fletcher, Esq., in the 'Quarterly Journal of the Statistical Society of London,' vol. iv., p. 104:—'The charters of James I. here quoted are confirmed in one of the 14th of Charles I. They remain to the present day the great record of the city's rights over the river, and it is as such that they are recited in this statute. The offices of meter and conservator are asserted from Staines to the mouth of the Thames, the commencement of the city's jurisdiction being marked by a stone, with an apocryphal date, called London Stone, placed on the north bank of the river, a short distance above the present bridge of Staines, and its termination on the south shore, by the formerly navigable creek of Yantlet, separating the Isle of Grain from the mainland of Kent, and on the north shore by the village of Leigh, in Essex, placed directly opposite, and close to the lower extremity of Canvey Island. The shore of the Isle of Grain, which separates the mouths of the Thames and Medway, are thus wholly exempt from the city's jurisdiction; notwithstanding that the right of conservancy is still asserted in the waters of the Medway, from the southern mouth of Yantlet Creek, upwards towards Rochester, as far as Cockham Wood, which is on the northern shore, opposite the marshy point below Chatham. At all events, the corporation of Rochester deny the right of the city of London to conservatorial jurisdiction in the Medway below Yantlet Creek, any more than in the Thames; a limitation which appears to have arisen from this creek having anciently been the customary channel of navigation between the two rivers, and marked the mouths of both. But the passage through this creek being now completely stopped, so that the Isle of Grain is connected by a solid roadway with the parish of Stoke, the mouths of these rivers are properly at the lower extremity of this island, opposite the Nore and Sheerness, while the city's jurisdiction, more antient than this geographical change, is completely cut by it into two separate portions. About twenty years ago it was attempted by the city officers, under the direction of a court of conservancy, to reunite these portions, by cutting through the bank which prevents the navigation of fishing-boats through Yantlet Creek; but the final decision of the Court of King's Bench, given July 8th, 1825, on the motion for a new trial, was against this proceeding. The conservancy jurisdiction in the Medway extends a distance of only eight miles, but has little more than a nominal existence. In the Thames it extends a distance of eighty miles, over nearly the entire course of that river through the metropolitan valley; and this distance appears to be divided into thirty-four miles of inland navigation from Staines to Vauxhall Bridge, the towing-path ceasing at Putney; three of town thoroughfare, from Vauxhall to London Bridge; and forty-three of seaport, from London Bridge to Yantlet Creek.'

In their character of conservators of the Thames the corporation have the control and regulation of the fisheries, and are empowered to seize prohibited nets, fish, &c. They have also the regulation and control of the watermen and of the shipping. They are entrusted with the cleansing of the river, the removal of obstructions, erection of stairs, licensing mills, and other such duties. The lord mayor, with the recorder and other civic officers, holds in person eight courts of conservancy in the year, two for each of the counties of Middlesex, Surrey, Kent, and Essex, and occasionally a court in London. The greater part of their functions are at the present time intrusted to a committee of the common council, called 'The Thames Navigation and Port of London Committee.' Various acts of parliament saving the jurisdiction of the city of London have been passed for the purpose of preventing and punishing offences committed on the river, and the maintaining of a police and magistrates to administer the law. The latest of these is 3 Wm. IV., c. 19.

(Griffiths' *Conservancy of the River Thames;* Pulling, *On the Laws, &c. of the City and Port of London;* Stow, *Survey of London.*)

THAMMUZ. [Adonis.]

THAMNO'BIA, Mr. Swainson's name for a genus of birds (*Sylvia*, Vieill.) placed by Mr. G. R. Gray in his subfamily *Saxicolinæ*, of his family *Luscinidæ*.

THAMNOPHILI'NÆ, a subfamily of Shrikes.

THAMNO'PHILUS, Vieillot's name for a genus of Shrikes.

THAMNO'SIA. [Sea Weeds.]

THANE, in Anglo-Saxon *Thegn*, from *thegnian*, or *thenian*, 'to serve,' the same word with the modern German *dienen*, is frequently, in conformity with this origin, translated *minister* in the Latin charters of the Anglo-Saxon period. In other cases its equivalent is *miles*, or *fidelis miles*. So king Alfred, in his translation of Bede's 'Ecclesiastical History,' renders the king's minister, the king's thane, and uses thane wherever Bede has *miles*. In this general sense it may be considered as nearly the same with the Norman term liege or liegeman; and so it seems to have been sometimes used. The exact meaning of the term when employed as a title of honour is involved in considerable obscurity: the rank or dignity which it denoted was possibly not the same at different times, and there were also thanes of more than one kind. The king's thanes, in particular, are distinguished from the *medemc* (in Latin *mediocres*), or inferior thanes, who are otherwise designated the thanes of aldermen (the highest order of the Saxon nobility), earls, and other thanes, and who appear to have been very numerous. After the Conquest thanes (*thaini* or *taini*) are frequently classed with barons (barones): in the laws of Henry I., the two words are apparently used as synonymous; and where the Saxon Chronicler has thanes (*thegenas*), the Latin annalists have commonly *barones*. These were, of course, the superior or king's thanes. The class of common or inferior thanes, again, seems to have answered nearly to that of the barones minores, or landed gentry. One of the few things that are tolerably certain with regard to the rank of a thane is, that it implied the possession of a certain amount of landed property. Such a qualification indeed seems in certain circumstances to have conferred the dignity of thane. One of the laws of Athelstane declares that if a ceorl (or commoner) shall have obtained

five hides of land in full property, with a church, a kitchen, a bell-house, a burghate seat (or office of magistrate in a burgh), and a station in the king's hall (the meaning of which last expression is doubtful), he shall henceforth be a thane by right. Five hides of land was probably the amount demanded even for a thane of the highest order; although it appears from Domesday-Book that this was also the quantity which made the owner a miles, or liable to be called out on the king's military service. Many lands are mentioned in Domesday-Book as thane-lands (terræ tainorum); and it is probable that the dignity, like the oldest of the Norman baronies, was sometimes attached to a particular estate. Thanes were among the members of the Saxon Witenagemot, or parliament, but it is matter of dispute whether they sat in their own right or as elected representatives. The principal facts connected with this dignity in England have been collected by Mr. Sharon Turner, in his 'History of the Anglo-Saxons,' 8vo., London, 1823, vol. iii., pp. 81, 187-206, 227-231; and by Sir Francis Palgrave, in his 'Rise and Progress of the English Commonwealth,' 4to., 1832, i., 15, 577-579; and ii., ccclxxvi.-ccclxxxvi.

There is little mention of the thanes in England after the time of Henry II.; but Lord Hailes has shown (*Annals*, i. 28) that in Scotland thane was a recognised title down to the end of the fifteenth century: the 'Chartulary of Moray' mentions a thane of Cawdor in 1492. It appears from the first to have implied in Scotland a higher dignity than in England, and to have been for the most part synonymous with earl, which was a title generally annexed to the territory of a whole county. It has been commonly assumed that thane is the more antient title, and that it began to be exchanged for earl in the reign of Malcolm Canmore; but, according to Pinkerton (*History of the House of Stuart*, i. 161), the title of thane was not introduced into Scotland till after the time of Malcolm. 'Yet,' he adds, 'the difference between a thane and baron is unknown; and some doubts arise that ignorance may have blended the Saxon *thane* and the Irish *tanist*.'

THANET, ISLE OF. [Kent.]

THANN. [Rhin, Haut.]

THA'PSACUS, or THA'PSACUM, was a very antient, populous, and commercial town in Syria, on the right bank of the Euphrates, about 24 miles west of the junction of the river Chaboras (the Araxes of Xenophon) with the Euphrates. Thapsacus, the Thiphsach of the Bible (1 *Kings*, iv. 24), the Taphsa of the Vulgate, and the Thapsa of Josephus (*Antiq.*, ix. 11), was the most eastern town of the kingdom of Solomon after David had conquered the country as far as the Euphrates. At an equal distance from Tyr by land and from Babylon by water, Thapsacus became an emporium, where the Gerrhaei kept stores of the commodities and spices of Arabia, which they carried there on floats, or probably barks, and which were afterwards transported by land to Syria and Phœnicia and their commercial towns on the Mediterranean. (Strabo, xvi., p. 766, Cas.) Its military position was also of great importance. At the time of the expedition of the younger Cyrus (B.C. 401), there was a ford at Thapsacus, but no bridge; subsequently there was a bridge. This town was the most southern passage by which an army could penetrate, either from Mesopotamia into Syria and Cilicia, or from these countries into Mesopotamia and Persia, without being obliged to traverse the deserts of Arabia, which occupy the whole tract between Palestine and Phœnicia in the west and the lower part of the Euphrates in the east. The younger Cyrus crossed the Euphrates at Thapsacus (Xenophon, *Cyropæd.*, i. 4); Darius also crossed the river at Thapsacus when he was advancing against Alexander in Cilicia; and Alexander, when he was pursuing Darius into Assyria. (Arrian, 2, 13; 3, 7.) In the age of Strabo the bridge at Thapsacus existed no longer, and the passage of the river was made by the bridge at Cominagena. (Strabo, p. 747, Cas.) The circumstance of Thapsacus being a town from which military and commercial roads run in every direction, was probably the cause why Eratosthenes chose it as the centre of his geographical measurements in Asia Minor and the adjacent countries, of which Strabo gives an account (ii., p. 77-91, Cas.). It has been said that the antients did not agree on the situation of Thapsacus, Ptolemy (v. 19) putting it in Arabia Deserta, and Pliny (*Hist. Nat.*, v. 24) and Stephanus Byzantinus and Q. Curtius (x. 1) in Syria. But the town was too well known to allow any such doubts, and the only fact which follows from these different statements is that the antient geographers did not exactly agree as to the frontiers of Syria and Arabia Deserta which joined near Thapsacus. Pliny says that in his time this town was called Amphipolis, but this is very doubtful; nor is it true that Seleucus Nicator founded Thapsacus; he perhaps rebuilt it or adorned it with new buildings. According to Stephanus, the Syrians called it Turmeda; and D'Anville states that there is now a small town on the site of Thapsacus, which has the Arabic name of 'El-der,' or 'the door,' in the Lingua Franca 'Porta Catena.'

(D'Anville, *Géographie Ancienne*, vol. ii., 141; Cellarius, *Notitiae Orbis Antiqui*, vol. ii., p. 367, 368.)

THAPSIA, the name of a genus of plants belonging to the natural order Umbelliferæ. The species are perennial herbs, with doubly or trebly pinnate leaves, large compound umbels of many rays without involucra or involucella, and yellow flowers. The margin of the calyx is 5-toothed; petals elliptic, entire; fruit compressed from the back; mericarps with 5 primary filiform ribs, 3 of which are dorsal, and 2 lateral ones in the commissure, and with 4 secondary ribs, of which the 2 dorsal are filiform and the 2 lateral ones membranous and winged; vittæ in each furrow underneath the secondary ribs.

The species are mostly natives of the countries of the Mediterranean, and are known under the generic name Deadly Carrot.

T. villosa, Velvety Deadly Carrot, has a square glabrous stem; tri-pinnate leaves, many-parted leaflets, villous on both surfaces, lower ones deflexed. This plant is found in Portugal, Spain, the south of France, in Italy, and the northern coasts of Africa. Poiret states that when fresh the root is acrid and corrosive. In Barbary it is used as a remedy for some forms of cutaneous disease, but it appears to be a severe application and attended with inflammation and vesication of the skin.

T. silphium, Silphium Deadly Carrot, has a square glabrous furrowed stem; pinnate leaves, many-parted leaflets, all linear, hairy on both surfaces, with revolute margins. It is a native of the north of Africa, on the mountains of Cyrenaica, and is supposed to be the plant that produced the juice called *Silphium*, and which was held in so high repute by the antients, that a district where it grew in abundance was called 'Silphifera.' [Silphium.]

T. Garganica, Garganian or Greek Deadly Carrot, has a square glabrous stem; bi- or tri-pinnate shining leaves; segments linear, acute, elongated, quite entire along the margins; involucre with few leaves; fruit cordate at the base. This plant is a native of Calabria, Mauritania, Greece, Sicily, Sardinia, Spain, &c. Dr. Sibthorp found it common in Greece and the neighbouring islands, and concludes that it is the *θάψια* of Dioscorides, with whose description it agrees better than any of the rest. It is one of the most stately plants of the family, and was introduced into the gardens of this country as early as 1680. There are seven other species of this genus referred to by Don; they possess the active properties of the above, but are seldom employed at the present day.

In their cultivation the species of Thapsia require but little care, as they will grow in any common garden soil. They may be propagated by seeds, which should be sown in autumn as soon as they are ripe.

THASOS (*Θάσος*), now Thaso, or Tasso, an island situated off the coast of Thrace, at a short distance from the mouth of the river Nestus or Karasou, and a little to the south-east of the Gulf of Kavallo. Volgaro, which is nearly in the centre of the island, is in 41° 45′ N. lat. and 21° 40′ E. long.

Five generations before the time of the Grecian Hercules, Thasos was peopled by Phœnicians, who came from Tyre in quest of Europa, led by Thasos, son of Agenor, from whom the island is said to have taken its name. (Herod., ii. 44; Pausan., v. 25.) It was also called Aeria and Æthria (Pliny, iv. 12); and Chryse, from its gold mines (Eustath., *Ad Dionys. Perieget.*, 517), and it is also distinguished by the epithet Ogygia. It was afterwards colonized by settlers from Paros (Thucyd., iv. 104), among whom was Archilochus the poet, in 708 or 720 B.C. (Clinton, *Fasti Hellen.*, a. 708, who does not decide the question.) Thasos was enriched in very early times by the possession of gold-mines in the island, and at Scapte Hyle, on the opposite coast of Thrace. According to Herodotus, who visited them, the most considerable were those which had

been worked by the Phœnicians on the north-east side of the island, the excavations for which were very evident (vi. 47). Herodotus further states that from the proceeds of these mines, and of their continental territory, which must have extended for some distance along the Thracian coast, there accrued to the Thasians in his time from 200 to 300 talents yearly, of which sum the mines in Scapte Hyle produced 80 talents, and those in the island rather less. (See the remarks on this passage in Boeckh, *Public Œcon. of Athens*, ii. 21, Lewis's translat., who assigns the probable sources of the remainder of this revenue.)

Being unencumbered with any taxes on the produce of their lands, the Thasians were at this time very rich. About B.C. 492 they were besieged by Histiæus of Miletus for a short time, and employed their wealth in consequence in building ships of war and strengthening their fortifications. Their independence and growing power excited the jealousy of Persia: they were reduced by Mardonius; and shortly afterwards, B.C. 491, being suspected of meditating revolt, they were compelled by Darius to throw down their walls and surrender their ships of war. (Herodotus, vi. 46.) On the expedition of Xerxes into Greece, the burthensome honour of receiving his army in their continental territory was imposed upon them, and on this entertainment they expended 400 talents of silver. (Herodot., vii. 118.) After the Persian war they became subject to Athens, and having a dispute with that state about their Thracian possessions, revolted, B.C. 465. (Thucy., i. 100.) Cimon, after defeating them at sea, besieged their island, and took it in the third year of the siege, B.C. 463. The Thasians were compelled to destroy their fortifications, to surrender their ships, to pay a large sum of money at the time and tribute for the future, and to give up their mines and settlements on the continent, among which must have been Stryme (Herod., vii. 108), Galepsus and Œsyme (Thucy., iv. 107), and Datos (Eustat., *Ad Diony.*, 517).

On the ascendency of the party of Pisander at Athens at the close of the Peloponnesian war, Diotrephes was sent by him to Thasos, and established an oligarchy there. This injudicious policy furnished an immediate opportunity of revolting from Athens; the Thasians fortified their city, and communicating with an exiled party, called in the Spartans, B.C. 411. (Thucy., viii. 64.) Much internal dissension ensued; the Spartan harmost Eteonicus and his party were expelled shortly afterwards, and the island, reduced by famine and civil war, was finally restored to the Athenians by Thrasybulus, B.C. 407 (Xenophon, *Hellen.*, 1-4), with the assistance of a party of the inhabitants under Ecphantus (see Demosthenes, *Lept.*, 474, 25, Reiske, who further states that these Thasians received in reward from the Athenians exemption from taxes). Subsequently the Thasians appear to have regained some of their continental possessions, and B.C. 359 they fortified Crenides, probably as a frontier post for their Thracian territory: this was seized by Philip, son of Amyntas, king of Macedon, who placed a number of Macedonian settlers in it, and gave it the name Philippi; under his management its gold-mines were made much more productive than before. Little more mention of the Thasians occurs in antient history. When attacked by Philip V., king of Macedon, they submitted to him, with the stipulation that they should retain their own laws and be exempt from garrison, tribute, or other burthens, B.C. 202 (Polyb., xv. 24). They were shortly afterwards released from his rule by the Romans, B.C. 197. (Polyb., xviii. 31.) Under the emperors Thasos is styled Libera, or a free state. In the Synecdemus of Hierocles it forms part of the Provincia Illyrica I., and is placed by Constantine Porphyrogennetus in the Præfecture, and afterwards in the Theme of Thrace. ('De Them. II., Them I.,' Bandur., *Antiqui. Constantin.*)

Thasos was celebrated among the antients for its marble (Seneca, *Epist.*, 86), its wine (Virg., *Georg.*, ii. 91; Athenæus, i. 51), which was exported to the Pontus Euxinus, and for other productions mentioned by Athenæus.

The coins of Thasos are very numerous. The silver coins may be generally arranged under three classes: 1, those on which the type is a satyr carrying off a nymph; the execution of these is very archaic; the limbs have a knotty, the hair a globular appearance. But this peculiarity of treatment gradually disappears in the improved art of the later specimens. To this archaic class also belong some coins on which are two fish; 2, are a number of massive coins in a good but rather heavy style, with a head of Bacchus on the obverse, and Hercules kneeling, shooting an arrow on the reverse. The Thasians had a colossal statue of Hercules at Olympia, holding in one hand a bow. They originally worshipped the Tyrian Hercules, and afterwards the Grecian (Pausan., v. 25); 3, the broad tetradrachms of the Macedonian period, with the head of the young Bacchus, and Hercules on the reverse: the inscription ΗΡΑΚΛΗΣ ΣΩΤΗΡ. These coins are abundant, and many of them with letters and type ill executed are found in Transylvania, and were probably the work of barbarous Thracians in imitation of the originals. The head of Ceres occurs on these coins (Dionysius Perieg., 523, calls Thasos Δημήτερος ἄκτη), the shore of Demeter or Ceres). The inscription ΘΑΣΙΩΝ ΗΠΕΙΡΟ on a gold coin implies, according to Eckhel (*Doct. Vet. Num.*, 'Thasos'), that it was coined from a continental mine, probably Crenides, which would account for the identity of its design with that of a coin of Philippi, on the supposition that a Thasian type was retained by the Macedonians, when they occupied that settlement. No imperial coins are ascribed to this place in Mionnet, except those of Hadrian, Caracalla, and Geta. The type of Perseus mentioned by Pollux (*Onomast.*, ix. 6) has not been discovered on any Thasian coin.

Coin of Thasos.

British Museum. Actual size. Silver. Weight, $117\frac{2}{10}$ grs.

The antient town of Thasos is situated on the North coast of the island, and occupies three eminences. On the site are remains of the Greek walls, mingled in picturesque confusion with towers built by the Venetians during their occupation of the island after the taking of Constantinople by the Latins, and overgrown with various timber. Near it is a large statue of Pan in a niche in the rock, and upwards of 50 sarcophagi of white marble. Some inscriptions found in the island are given by Boeckh (*Corpus Inscript.*, ii. 183). The longest, No. 2161, is written in the Ionic dialect, and speaks of the theori and hieromnemon of the place. The antient harbour appears to have been used by the Venetians. No remains of Ænyra and Cœnyra, and of the gold-mines situated between them on the east coast, according to Herodotus, now exist.

Thasos is about 40 Italian miles in circumference. (Carpacchi, *Isole del Mondo.*) Its greatest length is from north to south. In the northern and highest part of the island three peaks extend in a north-west and south-east direction. The inhabitants, amounting to 5000 or 6000, are all Greeks, and live in nine villages, Volgaro, Cassawith, Sotiro, Kaikarahi, Moriess, Kastro, Potamia, Liman, or Panagia, and Theolog, the largest situated nearly in the centre of the island. These contain in all 1020 houses. The chief produce of this fertile country is oil, maize, honey, timber; the last grows in great abundance and in picturesque variety everywhere, particularly on the southern and western sides, and forms the chief article of export; much of it was used for shipbuilding by Mehemet Ali, by permission of the Porte, and much is wasted by the inhabitants in the fires kindled for clearing the land; the plane-trees in particular are of great size. Little wine is made here, and some is imported from Tenedos; the principal food of the inhabitants is maize. Large herds of cattle and flocks of sheep are kept in the island: asses and mules are more used than horses on account of the steepness of the roads. The inhabitants are hospitable, industrious, and simple in their manners. They are governed by a Turkish Aga, whom they expelled during the late Greek revolution, but whom they speedily restored. They suffer from the invasions of pirates, to whom they pay a tribute.

(*Denkwürdigkeiten aus dem Orient, von Prokesh von Osten*, Stuttgart, 1837, iii., pp. 611-32; Cousinery, *Voyage dans la Macédoine*, ii. 85, p. 108.) For the antient history of Thasos, besides the authorities already quoted, see Raoul Rochette, *Histoire des Colonies Grecques*, iii. 226.

THATCH is a covering of straw, rushes, or reeds, as a substitute for tiles or slates for houses, barns, and princi-

pally for sheds for cattle. The increase of agricultural produce on a farm makes the stacking of corn out-of-doors a matter of necessity as well as convenience. The temporary thatching of these stacks, as well as of hay-ricks, has made it necessary that some of the regular servants of the farm should be capable of thatching in a neat and substantial manner, that there may be no delay from want of a regular thatcher. We will first describe the mode of thatching hay-ricks and corn-stacks, as the simplest.

The rick or stack having been formed into a proper shape, either with a roof slanting from a ridge, or conical, ending in a central point, the straw is prepared by moistening it, that it may more easily bend without breaking. It is then forked up in a loose heap, the straws lying in every direction, and somewhat matted. Portions are now drawn out from this heap in handfuls, which lays the straws again in a more parallel order: these are placed in a forked stick, which will hold several of these bundles or handfuls, and are thus carried to the thatcher on the top of the rick or stack. He seizes a handful, and bending one end into a kind of a noose, he inserts this into the hay or straw near the bottom of the roof, at one end if it be a square roof, or at any convenient part if it be a round one. He presses down the straw which he has thus inserted to about half its length, in order to form the eaves, which extend a little beyond the lower part of the roof. When he has thus laid several handfuls side by side so as to cover about a yard in width, that is as far as he can conveniently reach without moving his ladder, he begins another row a little above the place where he began, so that the lower end of the straw now inserted may cover the upper part of the first row, as tiles do each other. Thus he proceeds upwards till he comes to the upper ridge of the roof, or to the point of the cone in a round stack. In the latter case the covering diminishes to a point so as to form a triangle. The ladder is now shifted a yard to one side, and the same operation is performed, care being taken that each fresh handful put on shall be interwoven with that which lies beside it, so that no water can possibly pass between them. Thus the work proceeds till the roof is completed, and it only remains to secure the upper ridge in a square stack, or the point of the cone in a round one. In the first case the highest layer of straw is made to extend beyond the ridge on both sides, and the ends are brought together and stand up like the bristles on a hog. A rope of straw has been prepared, and many small rods, about two feet long, and cut sharp at the point: these are inserted just below the ridge, in a line with it, and about a foot apart; one end of the straw rope is inserted into the stack, and twisted firmly round the projecting end of the first rod; it is then wound once round the next rod, and so on the whole length of the ridge: this is done on both sides. The straws which form the ridge are now cut with shears horizontally, to give it a neat finish, and at each end a kind of ornament is usually made by winding a straw rope round a handful of the projecting straw, forming a kind of knot or bow, according to the taste of the thatcher. Rods and straw ropes twisted round them are inserted near the edge of the slanting side and all along the eaves, which prevent the wind from blowing off the thatch.

The only difference in the thatch of a round rick is, that it is brought to one point, where it is tied with straw rope wound round it, and formed into a kind of bow; the rods are inserted a little below in a circle, and a straw rope twisted round them, and likewise around the circular eaves. Barley is generally put into square stacks, and wheat in round ones. When the outside is neatly trimmed and cut smooth, so that no birds can lodge in it, wheat may be kept for years, without danger of injury or loss, much better than in a barn, or even in a granary.

In thatching sheds and buildings which are to last many years, the straw is prepared in the same manner, but the ends of the handfuls, as they are put on a lathed roof, are kept down by means of long rods, which are tied to the laths of the roof by means of strong tar twine. A much thicker coat of straw is put on; and rye-straw, which has a solid stem, is preferred, as more lasting, and less liable to be filled with water than hollow straw. Instead of straw ropes, split willow is used, and the rods which are inserted are much nearer each other and more carefully secured. As this kind of thatching is a peculiar trade, it requires a regular apprenticeship to be master of it. The thatching of temporary ricks may be done from mere description, and a very little practice will enable any one to protect his stacks sufficiently by a thatched covering.

Thatching is usually paid by the square of 100 square feet. The thatcher takes a line and throws it over the stack; if it is square, the ends are pushed under the eaves on each side, to allow for the trimming, &c., and this length is multiplied by the length of the eaves, with the same allowance at the ends. The price varies from 2*s.* to 7*s.* or 8*s.* per square, according to the work. Round stacks are measured by taking the circumference at the eaves, multiplied by one-third of the slant of the cone, with a similar allowance.

THAUMA'NTIAS. [PULMOGRADA, vol. xix., p. 122.]

THAUMA'SIA. [SEA-WEEDS.]

THAXTED. [ESSEX.]

THEA, a genus of plants of the tribe Camellieæ and natural family of Ternströmiaceæ, which has been so named from the slightly altered Chinese name of the dried herb which now forms the almost universal beverage of the British Isles. Though now so extensively employed, the introduction of tea into Europe is of comparatively recent origin. Macpherson, in his 'History of European Commerce with India,' states that 'tea (sah) is mentioned as the usual beverage of the Chinese by Soliman, an Arabian merchant, who wrote an account of his travels in the East about the year A.D. 850;' and that he had been unable to find any mention of it prior to the times of the Jesuit Missionaries, who entered China and Japan a little before the middle of the sixteenth century. Anderson, in his 'History of Commerce,' vol. ii., p. 178, quotes Botero as giving the earliest account in 1590, when he says that 'they,' that is, the Chinese, 'have also an herb, out of which they press a delicate juice, which serves them as drink instead of wine.' Texeira, a native of Portugal, about the year 1600, saw the dried leaves of tea at Malacca, and Olearius found them used in 1633 by the Persians, who obtained them from China by means of the Usbeck Tartars. Tulpius, in his *Observ. Medicæ*, 1641, celebrates the virtues of thea. Anderson says that no mention is as yet made (1660), in the new book of rates, of tea, coffee, or chocolate, though they are all mentioned in an act of parliament of the same year, whereby a duty of eight-pence is charged on every gallon of chocolate, sherbet, and tea made for sale. But the use of it at that time must have been new, for Pepys in his 'Diary,' writes, September 25, 1661, 'I sent for a cup of tea (a Chinese drink), of which I had never drank before.' The Dutch East India Company probably first introduced it into Europe, and from Amsterdam it was brought to London. In the year 1662 King Charles II. married a princess of Portugal, whence, Waller says, 'the best of queens and best of plants we owe to that bold nation,' &c. But tea must have continued to be brought in small quantities only, for in the year 1664 the East India Company purchased, for the purpose of presenting to the king, two pounds and two ounces of tea, and in the year 1678 they imported 4713 pounds of tea, which was then for the first time thought worth their attention as a branch of their trade. (Macpherson, p. 131.)

Tea must have been used in China from very early times. It is differently named in different parts of China, as teha, or eha, also tha, whence we have tsia, the, and tea. In Persian works in use in India, tea is called eha-khutai, or tea of Cathay.

The genus Thea is characterised by having a calyx which is persistent, without bracts, five-leaved, leaflets imbricated, the outer ones smaller. Petals of the corol 6 to 9, hypogynous, imbricated, the inner ones the largest, all adhering together at the base. Stamens numerous, in several rows, adhering to the bottom of the petals; filaments filiform, anthers incumbent, 2-celled, oblong, with a thickish connectivum, cells opening longitudinally. Ovary free, 3-celled. Ovules 4 in each cell, inserted alternately into the central angle, the upper ones ascending, the lower pendulous. Style trifid, stigmas 3, acute. Capsule spheroidal, two to three lobed, three or by abortion 2-celled, with loculicidal dehiscence, or with the dissepiments formed from the turned-in edges of the valves. Seeds solitary or rarely two, in cells, shell-like testa, marked with the ventral umbilicus. Cotyledons thick, fleshy, oily. No albumen. Radicle very short, very near the umbilicus, centripetal.

The genus Camellia is usually considered to be very distinct from Thea; indeed by Cambessedes the two are sepa-

rated from each other by several intervening genera: they are however too closely allied to allow of this separation. Distinctions have been made in the fruit of the two genera. That of Thea is three-lobed with obtuse corners and opening along the middle of the lobes, that is, having the dissepiments opposite to the valves, or, as expressed by modern botanists, having a loculicidal dehiscence. Camellia, on the contrary, is described as having its fruit obscurely triangular, without any tendency to become deeply three-lobed, with the margins of the valves turned inwards and forming the dissepiments, which thus alternate with the valves, and have what is now called a septicedal dehiscence. Mr. Griffith, on the contrary, who is well qualified to form a correct opinion, states, from examination of the Assamese tea-plant and of two species of Camellia from the Khosiya Hills, that there is no difference between Thea and Camellia. The dehiscence in both, he says, is of the same nature, that is, loculicidal, and the only difference that does really exist is simply of specific value, consisting in the fruits of the tea-plant being three-lobed, of the Camellia triangular.

The species of the genus Thea are few in number; some botanists are of opinion that even these are varieties of a single species. Before proceeding to discuss the question of the species which yield the teas of commerce, it is desirable to notice those which are usually described as distinct in systematic works.

T. viridis is a large, strong-growing, almost hardy plant, with spreading branches, its leaves three to five inches long, thin, almost membranous, very broadly lanceolate, light green and wavy, with large and irregular serratures, the flowers large, usually solitary, mostly confined to the upper axil, with 5 sepals and from 5 to 7 petals; fruit nodding. This species is figured by Dr. Lettsom in his account of the tea-plant, t. 1, and by Dr. (now Sir W.) Hooker, *Bot. Mag.*, t. 3148, and in Loddiges' *Bot. Cab.*, t. 227, all from plants which have flowered in this country. Kæmpfer supplies a very good figure, *Amœn. Exot.*, p. 607, from a Japanese plant. This species is found both in China and Japan, and is supposed to be the species which yields the green tea of commerce. It has been long introduced into this country; having been first sent from Japan in 1687 to the Cape of Good Hope, and thence into Europe. Lettsom, in 1772, states that within these few years a few genuine tea-plants had been introduced into England, that the largest tea-plant was then at Kew, and the first that ever flowered was at Sion House, but the seeds never germinated. Murray, *App. Medicam.* iv., p. 227, mentions that the green tea-plant was, in 1778, sold in London for ten shillings and sixpence, but the black or bohea tea-plant for one guinea. The green tea-plants are much more hardy than the black in this climate, being kept out in the open air with little protection during the winter, as at Kew, at Messrs. Loddiges, and even as far north as Forfar.

T. Bohea is a smaller plant than *T. viridis:* its branches are stiff and straight, its stem erect, the leaves not above half or two-thirds of the size of the former species, elliptical oblong, perfectly flat, more coriaceous, of a dark green colour, with small and even serratures; they are numerous, and have in their axils two or three flowers, of 5 sepals and 5 petals, these are smaller and have a slight fragrance, and flower later in the season than T. viridis. The plant is much more tender than the green tea-plant, and unable to stand the cold of an English climate. It is supposed by some to yield the leaves which are converted into black tea, and, notwithstanding contrary statements, leaves similar to those of this plant may be recognised on infusing and spreading out the leaves of some of the black teas of commerce. A variety of this is sometimes called *T. stricta.* It is figured by Lettsom, ed. 2, p. 41, who considers it only a variety of the former. It is also figured by Loddiges, *Bot. Cab.*, t. 226, who, as well as Sir W. Hooker and Dr. Royle, considers it to be a distinct species.

The Assam tea-plant, which has lately attracted so much attention, seems to partake of the characters of both the foregoing. The Calcutta Tea Committee say, in 1835, 'We are now enabled to state with certainty, that not only is it a genuine tea, but that no doubt can be entertained of its being the identical tea of China, which is the exclusive source of all the varieties and shades of the tea of commerce.' To this it may replied, that there are considerable doubts whether the teas of commerce are all derived from one species of plant. Mr. Griffith says, in the size both of the plant and of the leaves, as well as in the texture of these last, and in its stations, the Assamese plant approaches to the green tea-plant of China; in its geographical distribution, so far as latitude is concerned, it approaches to the black tea. The inflorescence of the Assamese plant varies, but perhaps its usual state is to have the flowers solitary in the axils of the leaves, but the number of flowers varies from one to five. The plants introduced into this country have their leaves much larger and thicker than those of the green tea-plant, and Messrs. Loddiges find that it requires a much greater degree of heat, in fact that of the hot-house, while the others are in the open air for a great part of the year.

Two other species, described by Loureiro, are little known, as *T. Cochinchinensis*, about eight feet high, having lanceolate leaves, flowers of 3 to 5 sepals and 5 petals, solitary, terminal; found wild in the north of Cochinchina, where it is also cultivated, being used medicinally by the natives as a diaphoretic. *T. oleosa* is also a shrub of eight feet high, found in the fields in the neighbourhood of Canton, and named from its seeds yielding a large quantity of oil, which is used for burning and as an article of diet. The leaves are lanceolate, the flowers of 6 sepals and 6 petals, pedunculs 3-flowered axillary; fruit stated to be indehiscent, rather a berry than a capsule.

The species of Camellia, which are so closely allied to those of Thea, have already been mentioned under CAMELLIA, as *C. Japonica, maliflora, reticulata. C. Sasanqua,* and *Euryoides* are other Chinese species. *C. drupifera* is a native of Cochinchina; while C. Kissi and Caudata, with oleæfolia and Scottiana, two doubtful species, are found in the mountains near Munnipore, Pundua, and Silhet, and in those surrounding the valley of Nepaul. A third genuine species occurs on the Naga range, towards the eastern extremity of the valley of Assam. It is well known to the Assamese and Singphos by the name of Bun Fullup, or jungle tea, being used by them as a medicine. A fourth species was found by Dr. Wallich about Tingrei.

Besides the characters of the several species of Thea, we have to notice the parts of the country where the cultivated species are found, as many practical questions of considerable importance are connected with the subject. But here it is difficult to be precise in our statements, because we are without positive information from the tea districts of China, and also because it is still doubtful whether one or more species yield the teas of commerce in permanent varieties, or whether the differences in teas are owing solely to differences in manufacture. Tea is cultivated in China over a great extent of territory. Dr. Wallich mentions it as being cultivated in Cochin China, in 17° N. lat. We know it is cultivated in the southern provinces of Yunnan and of Canton. If we proceed north we find the principal cultivation of teas for the foreign trade is between 27° and 31° N. lat.: but tea is said to be produced in several places to the northward of 31°; even in 36°, and also in the Japanese Islands, which extend from 30° to 41° N. lat. It has been disputed whether the tea-plant is cultivated in plains or mountainous situations. It is generally stated to be cultivated in hilly situations. Grozier states that the songlo-tcha (our green tea) takes its name from the mountain Song-lo, situated in the province of Kiangnan, in 30° N. lat., while the bou-y tcha (bohea) takes its name also from a mountain called Bou-y, situated in the province of Fo-kien. Mr. Cunningham (when Chusan had formerly a British factory) collected specimens on the tops of mountains, where the tea-plant flourished along with pines. His specimens are still in the British Museum. The deputation sent into Assam to examine the sites of the tea, saw it growing in the valley of Assam, and were thus led to think that it must grow in similar situations in China: but even in Assam it is also found on hills; and there is no doubt it is found in both situations in China, and in many which must be moist. There is nothing improbable in a plant being so found which is so extensively diffused from north to south; but it is probable that the finest varieties of tea are cultivated in the drier soils, and in situations exposed to light and air: in fact, the Chinese tea-makers in Assam state that in China the teas from the sunny tracts are the best. Some soils in which the tea-plant is cultivated in China yielded, on analysis, in 200 parts—of silex, 135; alumina, 36; carbonate of magnesia, 6; carbonate of lime, 4; oxide of iron, 13; roots and fibres of

plants, 2; water of absorption, 4. Dr. Abel thought that the débris of granitic rocks would yield a fitting soil, and that the Cape of Good Hope would afford a suitable climate. The climate varies, no doubt, to a considerable extent in different parts of China, being warm in the southern and cold in the northern provinces. Snow is said to lie upon the ground for days together upon the green teas, and the green tea-plant is in this country able to bear a greater degree of cold than the black, which, in China, seems to be confined to the more southern provinces; but even in the Fokien hills M. Callery has mentioned to the writer of this article that he has walked on snow in the midst of the tea-plants. The culture of the tea-plant in China seems simple enough: the plants are raised from seeds, sown in the places where they are to remain. Several are dropped into holes four or five inches deep and three or four feet apart, shortly after they ripen; or in November and December, as they do not preserve well, from their oiliness. The plants rise up in a cluster when the rain comes on, and require little further care, except that of removing weeds, till they are three years old, when they yield their first crop of leaves. They are seldom transplanted, but sometimes four to six plants are put close together, so as to form a fine bush. After growing seven or ten years they are cut down, in order that the numerous young shoots which then spring out may afford a more abundant supply of leaves. In some districts the bushes grow unrestrained, in others they are regularly pruned, to keep them low. The gathering of the leaves is performed with great care: they are usually gathered singly, first in March or May (according to the district), when the young leaves are scarcely expanded; the second about two months later, or May and June; and the third in August, or about six weeks after the second; but the times necessarily differ in different districts, as well as the number of crops which are obtained, some avoiding the third, for fear of injuring the bushes. When the leaves are gathered they are dried in houses which contain small furnaces, on each of which there is a flat iron pan, and upon this, when heated, the leaves, partially dried by exposure to the sun, are thrown; the leaves require frequent shifting and turning. When all are properly dried, they are quickly removed either by the hand or with a shovel, and either thrown upon a mat or into baskets which are kept ready to receive them. They are then removed to a table where they are rolled and cooled, and the process is repeated; after which they are sifted and sorted into several varieties. The process has been very minutely described as practised in Assam and Java by the Chinese tea-makers. We may therefore refer to the accounts published by Mr. Bruce, as well as to those of the superintendent in Java, translated by Dr. Horstield.

The most difficult part of this question is to determine whether the green and black teas are produced by one or two distinct species of plants, as the statements of apparently equally well qualified judges are not only contradictory, but directly the reverse of each other. The difficulty is owing to no competent person having visited the tea districts of China, and also to the Chinese in the neighbourhood of Canton being able to prepare a tea which can be coloured and made up to imitate various qualities of green tea, and large quantities are thus yearly made up. The Chinese tea-makers in Assam and those in Java alike state that the black and green teas may be prepared from the same plant. But as there are plants of the genus Thea, of which the leaves resemble some of the black and green teas of commerce, and as these differ very considerably from each other in their powers of resisting cold, and as there are green tea and black tea districts (the former to the north of the latter), it seems probable that different plants are preferred for preparing the finer qualities of these different teas. Whether these plants are one species or well-established varieties can only be determined by botanists who have an opportunity of visiting China, or by experiments made in the tea nurseries of Assam and of the Himalayas, by sowing the seeds of each kind in different soils, aspects, and elevations, and comparing the plants which are produced with one another.

Tea having become so extensive an article of commerce, and a source of considerable revenue, various attempts have been made to introduce it into other countries, but the climates are very different in which the several experiments have been made, as in Rio Janeiro and the warm part of Brazil, and bitterly in the hilly parts of Java and Brazil, in Penang, Assam, and the Himalayas. Dr. Abel recommended the Cape of Good Hope. It is requisite to have not only a suitable soil and climate, but also cheap and abundant labour. Many have been of opinion that tea could be cultivated in the Himalayas, but the first published opinions seem those of Dr. Royle (*Illustr. Himalayan Botany*, p. 5 and 107, and *Productive Resources of India*, p. 259), where, from a consideration of a similarity in latitude, climate, and vegetation, as far as any information could be procured on those subjects, he was of opinion that tea could be successfully cultivated in the Himalayan mountains, 'for the different elevations allow of every variety of climate being selected, and the geographical distribution of this plant is sufficiently extended, and the natural sites sufficiently varied, to warrant its being beneficially cultivated.' He recommended experiments being made in the tract of the Himalayas, extending from Almora nearly to the Sutledge, at various elevations from the valleys up to 7000 feet, and thought that about 5000 feet of elevation would afford a suitable climate. Dr. Falconer formed similar opinions at the same time in a report to government. The correctness of these opinions has been clearly proved by the lately received reports on the success of the tea plantations established in the Kumaon and Gurhwal districts of these mountains, which were formed when the tea nurseries were established in Assam, and the seeds and plants sent up which had been obtained from China. In this report, forwarded by the Indian government to the Agricultural Society of Calcutta, we find that at elevations of 5000 and 6000 feet there are some hundreds of strong and healthy-looking plants and seedlings, but none as yet of a growth to yield seed. At Almorah, elevated 5000 feet, there are two gardens, one of three and the other of eleven and a half acres in extent, with 1500 full-grown trees yielding seed, and 700 layers, and upwards of 20,000 seedlings. At Bheemtal, lower in elevation and nearer to the plains, the results are equally favourable: 'On the whole the experiment, in as far as the possibility of rearing the tea-plant in the provinces of Gurhwal and Kumaon is in question, may be safely pronounced to have completely succeeded.' It is also said, 'Assam has doubtless a great advantage over Kumaon as to facility of export, but the latter province will probably be found to yield a produce of a superior quality.' The quality of the tea which can be prepared here can only be ascertained when China tea-preparers have been sent there, as they no doubt will be sent, as soon as the plantations are sufficiently extended.

The value of these facts can only be properly estimated in connection with the success of the tea-culture in Assam, which is several hundred miles distant from Kumaon and Gurhwal, and it is probable therefore that the whole of the intervening part of the Himalayas will be favourable to this culture: probably also some of the mountains of the peninsula, as in the Wynaad district and in Travancore, will be found favourable.

The Assam tea-plant first attracted public attention in 1834, in consequence of replies to the circulars which had been addressed to several gentlemen. Captains Jenkins and Charlton, in May of that year, wrote that a kind of tea-plant was undoubtedly indigenous in Assam. Since then it has appeared that several gentlemen were well aware of the fact, and also that Mr. David Scott had, in June, 1825, sent leaves and seeds of a plant discovered originally by Major Bruce, which he said the Burmese and Chinese conferred in stating to be wild tea. But the plant was thought to be a Camellia, and no further notice was taken of it. A scientific deputation, composed of Dr. Wallich and Messrs. Griffith and MacCleland, was sent for the proper investigation of Upper Assam. Some valuable information has been elicited, which was published in the 'Trans. of the Agric. Soc. of India,' and in the papers respecting tea cultivation in India, published by the House of Commons in 1839. Tea-plantations were subsequently established, and Mr. Bruce appointed their superintendent. At first only a few tea-tracts were discovered: Mr. Bruce in his latest account notices them as being no less than 120, some of them very extensive, both on the hills and on the plains. Mr. MacCleland states that they are found in Assam, first on the level plain and secondly on mounds or hillocks, and that the former situations have a porous structure which enables them to maintain a dry surface under exposure

to excessive moisture. As tea-plants are capable of bearing considerable varieties of temperature, tea may no doubt be cultivated in a variety of situations, and in Assam as well as elsewhere, but it is probable that hilly situations and the more open and elevated parts of Assam itself will be best suited for the production of the finer-flavoured teas. The tea which has been prepared in Assam has now been sent for four years to market, and in each year the quantities have increased and the qualities have improved. For the teas first sold in 1839, from the excitement and competition created by the novelty of the sale, extravagant prices were paid, as from 16*s.* to 34*s.* a pound. In 1840 the prices realized were from 6*s.* 10*d.* to 10*s.* 10*d.* The probable value was however from 2*s.* 11*d.* to 3*s.* 3*d.* The produce of 1841 in the government plantations has been sold in Calcutta, and that from the Assam Tea Company sent to this country. Very favourable reports have been published by brokers of the quality of this tea, and of the probability, from its strength, that it may easily be improved as its nature is better understood. Experimental nurseries continue to be carried on by the East India Company, and much useful information of a practical nature will no doubt be obtained and promulgated. So many authors have written on the subject of tea, that it is impossible to quote them. Dr. Lettsom, in his account of the tea-plant, has given a list of them. More recent information may be found in the travels of Abel, Staunton, Ellis, Barrow—and for scientific information see Royle, 'Illustr. of Himalayan Botany,' and 'Essay on the Productive Resources of India,' also the papers of Messrs. Griffith and MacClelland, in the 'Trans. of the Agric. Soc. of Calcutta,' which likewise contain the report of the brokers. For practical information on the manufacture of tea, the papers of Mr. Bruce give much valuable information, derived from the China tea-makers; also the 'Essay on the Cultivation and Manufacture of Tea in Java,' translated from the Dutch by Dr. Horsfield.

THEA. *Medical and Dietetical Properties of Tea.* This article, the use of which was for a long time confined to two countries of the East, China and Japan, has within the last two hundred years become known and almost indispensable in every civilized country of the globe. It is therefore interesting to enquire what are the properties it possesses, which have induced so large a portion of the human race to forsake other articles of diet, and what are the effects of its extensive consumption.

Whether obtained from one species only of the genus Thea, or from several, all the tea of China is in commerce brought under two distinct terms, *green* tea and *black* tea, or rather brown tea. These are also distinguished as *hyson* and *bohea*. The European name *tea* is borrowed from the common language of the province Fu-kian (Fokien of D'Anville), where this article is called Tiä in their patois: at Canton it is called Tscha or Tschai. Black tea is called He-tscha, green tea Lo-tscha. The best sort of the black kind has been long known in commerce under the corrupted name of Bou-ui-Tscha; hence by a transposition of the syllables, the Thea bohea of Linnæus, the Vou-y-Tscha of the Chinese, that is, tea from Vou-y-Schan, which is in the province of Fu-kian, in 27° 47′ N. lat. Hyson is chiefly obtained from Song-lo, which lies in the province of Kiang-nan, in 29° 58′ N. lat.

The subvarieties owe their names to other circumstances, the number of which is endless. Thus there occur in the catalogues of the Chinese merchants at least one hundred and fifty names, many of which are synonymes of other sorts, or names invented to impose on foreigners and obtain a high price. The distinguished Oriental scholar Klaproth gives a list of about forty genuine varieties, with an explanation of the terms applied to them. (*Journal Asiatique*, 1824, p. 121, and Abel Remusat, a Supplement to it, p. 186 of the same journal; or Fée, *Cours d'Histoire Naturelle Pharmaceutique*, i., p. 507.) Thus Pak-ho, corrupted into Pekoe, or even Pekin, merely means 'white down,' being the first sprouts, or yet hairy leaf-buds of young plants, three years old, after their first flowering. With us it is applied only to a black tea, but it is equally applicable to a green tea, and is by the Chinese applied to an expensive kind called *Loong-tsing*, literally *tea of the wells of the dragon*, 'which is never brought to Europe, as it is so delicate and slightly fired as to spoil by the least damp.' (Davis.) The true imperial tea, also called flos theæ, not that it is the flower-buds, as some suppose, but merely the perfection of tea, never reaches Europe, as the damp of the voyage and a northern climate would soon impair its qualities. That which is sold under the name of Imperial is Chulan, or Soulang, flavoured with the lan-hoa, which is the Chinese name for the Olea fragrans, Lin.

Though it is stated that black tea may be cured as green tea, and green tea as black, certain it is that the preparation of the respective kinds is carried on in different parts of the empire, and different practices pursued with the leaves from the first stage. In the green teas the leaves only are taken, being nipped off above the foot-stalk or petiole, while of the black teas the foot-stalk is always collected. 'Thus black tea contains much of the woody fibre, while the green is exclusively the fleshy part of the leaf itself; which is one good reason why it should be dearer.' (Davis, ii., p. 351.) Besides this, the constant removal of the young leaf-buds, by which the plant is prevented from being clothed with full-grown leaves, which alone can elaborate the sap, and contribute to the further growth of the shrub, causes it to perish earlier, and compels a more frequent renewal of the plantations. Indeed some cultivators restrict the gathering of the leaves to two harvests, instead of three, to save their plants.

Those of the third gathering are large and coarse, and often so rigid that they cannot be rolled. This yields a tea so inferior in quality that it is consumed only by the poorest of the natives, or, when very bad, is, as are some of the finer kinds when spoiled, used for dyeing.

Such are the pains taken to ensure the excellence of the finest sorts, that for two or three weeks before the harvest commences the collectors, who are trained to this business from a very early age, are prohibited from eating fish or other kinds of food reckoned unclean, lest by their breath they should contaminate the leaves. They are also made to take a bath two or three times a day, and not allowed to gather the leaves with the naked fingers, but always with gloves. The finest tea may, if the proper time for gathering it be neglected, be changed into an inferior tea in one night. It is necessary to roast the leaves the same evening that they are collected, for if kept till the following day they become black and lose much of their virtue. Previous to putting them into the iron pans or furnaces, which are heated by charcoal, some writers say that they are dipped for about half a minute into boiling water; others do not mention this. About half a pound or three-quarters of leaves are put into the pan at once, and diligently stirred, to prevent them from being burnt. They are then removed with a shovel and thrown on mats or into baskets, and while yet hot the soft leaves are rolled between the palms of the hands, during which operation a quantity of yellowish green juice exudes from them. This process of roasting and rolling is often repeated even to the sixth or seventh time. This method is called the *dry way;* but by the *wet way* the leaves are first exposed to the vapour of boiling water, after which they are rolled and dried on the iron pans like the others. Leaves prepared in the wet way have a bright green colour; those by the dry, a dark green verging to brown. From the green tea, when prepared in the dry way, less of the above-mentioned juice exudes, a circumstance to which the greater power of green tea is in some degree owing. The larger leaves are generally selected to be prepared in the wet way. By the process of roasting the leaves lose two-thirds of their weight; so that three pounds of fresh leaves dry into one pound of tea fit for preservation. It is by the process of roasting that the flavour is first developed, the leaves when fresh being as insipid as the bean of coffee before heat is applied. Siebold is of opinion that the agreeable violet-like flavour of tea is inherent in the leaves themselves, but most writers ascribe the different flavours of the choicer kinds of tea to the admixture of the flowers, leaves, or oils of a variety of different plants. The chief of these are the *Olea fragrans*, *Chloranthus inconspicuus*, *Gardenia florida*, *Aglaia odorata*, *Mogorium* (*Jasminum*) *Sambac*, *Vitex spicata*, *Camellia Sasanqua*, and *C. oleifera*, *Illicium anisatum*, *Magnolia Yulan*, and the *Rosa Indica odoratissima*, as well as with the root of the *Iris florentina*, and *Curcuma longa* or turmeric, and oil of *Bixa Orellana*. A variety of tea called Sonchi is often found to contain a large quantity of ferruginous dust, but whether by accident, as Mr. Davis thinks (*Chinese*, ii., p. 462), or a fraud to increase the weight, is doubtful. Its

presence may easily be detected by passing a magnet into a suspected sample, when some of the particles of iron will adhere to it.

The Chinese annually dry many millions of pounds of the leaves of different plants, to mingle with the genuine, such as those of ash, plum, &c., as the name Mei-Pian, applied to one of the varieties of tea from the province of Kiang-nan, imports; so that all the spurious leaves found in parcels of bad tea must not be supposed to be introduced into them by the dealers in this country. While the tea-trade was entirely in the hands of the East-India Company, few of these adulterated teas were shipped for this country, as experienced and competent inspectors with large salaries were kept at Canton, to prevent the exportation of such in the Company's ships; but since the trade has been opened, all kinds find a ready outlet, and, as the demand often exceeds the supply, a manufactured article is furnished to the rival crews.

The object of the drying and rolling is both to diminish the bulk and to enable the leaves to preserve their flavour. No tea is thought fit for use till it is a twelvemonth old; and the rich and luxurious Chinese keep the fine tea in jars, made of the finest porcelain, some of which are thought to communicate an additional aroma to the tea, and all of which have very narrow mouths (as may be observed in those brought to Europe, and sold at a high price), to retain the peculiar odour. If the tea contracts damp, it is taken out and roasted again.

The taste of tea is more or less astringent, and, before it is infused, unpleasantly acrid. To make the infusion, the Chinese pour boiling-water on a small portion of the leaves, but do not allow it to stand or macerate, as is done in England, but instantly pour it off again, by which they obtain only the more volatile and stimulating portion of its principles. The poorer Chinese indeed boil the very inferior and coarse leaves, which alone are within their reach, and drink the decoction repeatedly during the day. This is done not only to extract such virtues as the tea possesses, but to qualify the water, as little good drinking water is met with in China. Travellers find a supply of tea a very valuable accompaniment on long journeys, as it improves the most brackish waters. The exciting effects of fresh tea are such that it is rarely used till it has been kept twelve months, as already stated; and where indulged in, it produces great disturbance of the mind, almost resembling inebriation, like the action of the Erythroxylon Coca among the Peruvians, and inducing a tremulous motion of the limbs. This property is diminished by repeated roastings, but as green tea is less exposed to heat than black, it retains more of this power. Besides, the green tea for exportation undergoes some process, which changes its colour, giving it a bluish-green hue. The Chinese themselves do not consume those kinds of green tea which are prepared for exportation. (Davis, *Chinese*, ii. 468.) It is altogether a mistake to suppose that the colour of green tea is owing to its being dried on copper pans, as none such are used, and the most searching chemical analysis is unable to detect a trace of copper unless as a constituent of the vegetable. The chemical analysis of tea does not shed much light on its action on the human system. Frank and Sir H. Davy found more tannin in black than in green tea; but the results of Mr. Brande's researches, conducted on a more extensive scale, give a different result. 'Some years ago I examined the varieties of tea in common use (*Quarterly Journal*, xii. 201), and found that the quantity of astringent matter precipitable by gelatine is somewhat greater in green than in black tea, though the excess is by no means so great as the comparative flavours of the two would lead one to expect. The entire quantity of soluble matter is also greater in green than in black tea, but the extractive, not precipitable by gelatine, is greater in the latter.'

The following table shows the respective quantities of soluble matter in water and in alcohol, the weight of the precipitate by isinglass, and the proportion of inert woody fibre in green and black tea of various prices. It is given, not as throwing any important light upon the cause of the different qualities and effects of tea, but as containing the results of actual experiments. It will be remarked that when tea-leaves have been exhausted by water repeatedly affused, alcohol is still capable of extracting a considerable quantity of soluble matter: the alcoholic extract infused in boiling water, furnishes a liquid which smells and tastes strongly of tea, and which, were it not for the expense of the solvent, and the trouble attending its separation, might perhaps be profitably employed.

100 parts of Tea.	per lb.	Soluble in Water.	Soluble in Alcohol.	Precipit. with Jelly.	Inert Residue.

(Brande's *Manual of Pharmacy*, 5th ed., p. 121.)

The fall in the prices of tea does not much affect these results, as the same relative proportions are preserved.

The alkaloid-like principle of tea can scarcely be considered the cause of the peculiar action of tea; but it is very interesting from the circumstance of the identity of its composition with that of coffee, and of the guarana officinalis, as shown by Liebig:—

..	Caffeine. Pfaff and Liebig.	Theine. Jobst.	Guaranine. Martius.	Calculated. C_8, H_{10}, N_2, O_2.
Carbon .	49·77	50·101	49·679	49·798
Hydrogen .	5·33	5·214	5·139	5·082
Nitrogen .	28·78	29·009	29·180	28·832
Oxygen .	16·12	15·676	16·002	16·288

Bergma obtained an oil, but this, as well as the distilled water, he found to have little peculiar effect on several animals: which is in opposition to the experiments of Lettsom, who represents the distilled water of tea as a very powerful narcotic, paralysing the limbs of frogs, and even causing their death when applied to the exposed nerves.

Before attempting to estimate the action of tea on the human system, it is necessary to call to mind that some of the effects are due to the plants mixed with the real tea, several of which, such as the Chloranthus inconspicuus, are stimulants of the highest order; and in other instances deleterious chemical compounds are used by the Chinese to convert damaged black teas into saleable green teas. (Davis, *Chinese*, ii. 466.) For the effects of these, tea is not justly chargeable. A correct estimate of the action of tea is not easily formed; yet the most dispassionate inquirers regard it as a narcotic, the stimulating period of which is the most conspicuous and of longest duration. Tea has been preposterously praised by some writers, and unjustly accused by others as being productive of numerous diseases: above all it has been charged with causing an increase of nervous diseases. It would perhaps be more just to attribute the increase of such complaints to the more complicated state of our social relations, arising from an augmented population, and an advance in luxury, with the more frequent infringement of the natural laws, particularly turning night into day, and not seldom day into night, as is the practice of the votaries of fashion. That the universal employment of tea has displaced some other kinds of food is certain, but if a diminution in the number of inflammatory diseases be one of the consequences, it is much to its credit, as however distressing nervous diseases may be, they are by no means so fatal as those of an inflammatory kind. That tea should not suit all constitutions or all ages is not remarkable. It is less suited for young children than for adults; indeed for very young children it is extremely improper, producing, like all narcotics, a morbid state of the brain and nervous system. It is also unsuited for those of an irritable nature, and likewise for those of a leucophlegmatic constitution. Such persons can ill bear much liquid of any kind, particularly in the evening, and prosper best on a very dry diet, to which growing children of this constitution should be strictly confined. [DILUENTS.] It may not be true that the use of tea, as alleged by Dr. Lettsom, has been a main cause of the increase of scrophulous diseases, still as diseases of this class are the only diseases which are proved by the reports of the registrar-general to be stationary, or perhaps more frequent than others, whatever impairs the nervous power and ultimately the digestive function in strumous children should be avoided. His advice is sound where he says, 'It ought by no means to be the common

diet of boarding-schools; if it be allowed sometimes as a treat, they should be at the same time informed that the constant use of it would be injurious to their health, strength, and constitution.' Those to whom it is most suited are the plethoric and sanguine. Upon the same principle it is a proper article of diet and perhaps the best common drink at the beginning of fevers and inflammatory complaints. In a peculiar state of brain, termed by Mr. Newnham (*Observations on Medical and Dietetical Properties of Green Tea*) *sthenic excitement*, a state clearly bordering on inflammation, especially if produced by alcoholic stimulants, or by intense and long-continued application of mind to any particular object of literary research, green tea acts as a salutary remedy. On the contrary, in states of diminished excitement, morbid vigilance and nervous disturbance follow its use. It is not an uncommon practice with ardent students, when pushing their studies far into the night, to resist the claims of nature for repose, and keep themselves awake by the frequent use of tea. That it answers the purpose at the time cannot be denied, but the object is often attained at a fearful price, the destruction of health and vigour both of mind and body being the penalty. Less injury results in these cases from the use of coffee. There is this difference between the morbid states of the nervous system produced by coffee and those resulting from tea: that the former generally subside or disappear entirely on relinquishing its use; those from the latter are more permanent, and often incapable of being eradicated. Nevertheless many persons have immediately found their health improved by entirely relinquishing the use of tea, or even omitting it only at breakfast, for which meal it is certainly less proper than for the evening beverage. Those for whom tea is unsuited will generally find weak cocoa the most proper substitute.

Persons of a gouty and rheumatic nature, above all, those prone to calculous diseases of the lithic acid diathesis, find weak tea the least objectionable article of common drink. They should take it without sugar, and with very little milk. (Prout, *On the Stomach*, p. 217.) Where the water is hard, the addition of a little carbonate of soda not only improves the tea, but renders it a more proper beverage for such persons. Tea should not be used till about four hours after any solid meal.

The medical uses of tea are not many. In fevers it is not only an excellent diluent at the commencement, but a tincture of tea made by macerating tea in proof-spirit, and adding a tea-spoonful of this to a small cup of water, and given at short intervals during the night, after the acute symptoms have subsided, is often of great service. For this purpose, in hospitals and workhouses, the leaves which have been used for the ordinary infusion may be macerated in alcohol (as suggested above by Mr. Brande), and a spirit of sufficient strength for this purpose obtained at a cheap rate.

In some forms of diseased heart tea proves a useful sedative. It is nearly as valuable an antidote to poisoning by opium as coffee is. Some cases of poisoning by arsenic and tartarized antimony have been prevented proving fatal by the immediate administration of tea in the form of a very strong infusion. Here its power as an antidote depends upon its tannin decomposing the poisonous substances. [Astringents.] But in poisoning by opium it is useful only in combating the secondary symptoms, and should not be administered till the stomach-pump or other means have removed the opium from the stomach. (*Lancet*, 9th November, 1833.) Some cases of severe nervous headache are relieved by a cup of strong green-tea, taken without milk or sugar. But this should be sparingly resorted to; it is a wiser plan to avoid the causes of such headaches. Tea has been looked upon as the great means by which intoxication was to be banished, but it is certain that to relieve the tremblings and other unpleasant effects of the abuse of tea, a little brandy or other alcoholic stimulant is occasionally added to the cup of tea, and so a habit is acquired which can never afterwards be relinquished.

Tea has frequently been denounced as a useless article of diet to the poor, as it is assumed to be devoid of nutriment, and the milk and sugar which are added supposed to be the only beneficial ingredients. Dr. Lettsom has given a calculation, partly his own, and partly taken from 'Essays on Husbandry,' to show how much is, in his view, unnecessarily expended by them in this way. But the observations of Liebig, if correct, and in all probability they are so, offer a satisfactory explanation of the cause of the great partiality of the poor not only for tea, but for tea of an expensive and therefore superior kind. 'We shall never certainly be able to discover how men were led to the use of the hot infusion of the leaves of a certain shrub (tea), or of a decoction of certain roasted seeds (coffee). Some cause there must be which would explain how the practice has become a necessary of life to whole nations. But it is still more remarkable that the beneficial effects of both plants on the health must be ascribed to one and the same substance, the presence of which in two vegetables belonging to natural families, and the produce of different quarters of the globe, could hardly have presented itself to the boldest imagination. Yet recent researches have shown, in such a manner as to exclude all doubt, that caffeine and theine are, in all respects, identical.

'Without entering minutely into the medical action of caffeine (theine), it will surely appear a most striking fact, even if we were to deny its influence on the process of secretion, that this substance, with the addition of oxygen and the elements of water, can yield taurine, the nitrogenized compound peculiar to bile:—

1 atom caffeine or theine	=	C8 N2	H5	O2
9 atoms water . .	=		H9	O9
9 atoms oxygen . .	=			O9
		C8 N2	H14	O20
= 2 atoms taurine .	=	2 (C4	NH9	O10)

To see how the action of caffeine, asparagine, theobromine, &c. may be explained, we must call to mind that the chief constituent of the bile contains only 3·8 per cent. of nitrogen, of which only the half, or 1·9 per cent., belongs to the taurine. Bile contains in its natural state water and solid matter, in the proportion of 90 parts by weight of the former to 10 of the latter. If we suppose these 10 parts by weight of solid matter to be choleic acid, with 3·87 per cent. of nitrogen, then 100 parts of fresh bile will contain 0·171 parts of nitrogen in the shape of taurine. Now this quantity is contained in 0·6 parts of caffeine; or $2\frac{8}{10}$ths grains of caffeine can give to an ounce of bile the nitrogen it contains in the form of taurine. If an infusion of tea contain no more than the $\frac{1}{10}$th of a grain of caffeine, still, if it contribute in point of fact to the formation of bile, the action, even of such a quantity, cannot be looked upon as a nullity. Neither can it be denied, that in the case of an excess of non-azotized food and a deficiency of motion, which is required to cause the change of matter of the tissues, and thus to yield the nitrogenized product which enters into the composition of the bile; that in such a condition the health may be benefited by the use of compounds which are capable of supplying the place of the nitrogenized substance produced in the healthy state of the body, and essential to the production of an important element of respiration. In a chemical sense—and it is this alone which the preceding remarks are intended to show—caffeine, or theine, asparagine, and theobromine, are, in virtue of their composition, better adapted to this purpose than all other nitrogenized vegetable principles. The action of these substances, in ordinary circumstances, is not obvious, but it unquestionably exists. Tea and coffee were originally met with among nations whose diet is chiefly vegetable.' (Liebig's *Animal Chemistry*, p. 178.) These facts show in what way tea proves to the poor a substitute for animal food, and why females and literary persons who take little exercise manifest such partiality for it. They also explain why the attempts, and they have been numerous, to find among other plants a substitute for tea have invariably failed of success. The first tea-leaves were procured from the Chinese in exchange for those of the Salvia officinalis, or garden sage, but they, like others, soon found out its inferiority, and refused to part with their own precious leaf except in exchange for solid coin. The poor Chinese make use of the leaves of a fern, and also of those of the Sagaretia (Rhamnus) theezans; but to this their poverty, not their will, consents.

Tea Trade.—The period when tea was first introduced into this country has already been noticed. How little was it possible at the time to have foreseen that it would one day become one of the most important articles of foreign production consumed in England. The first im-

portation by the English East India Company took place in 1669 from the Company's factory at Bantam. The directors ordered their servants to 'send home by their ships one hundred pounds weight of the best *tey* they could get.' In 1678, as already noticed, 4713 lbs. were imported, but in the six following years the entire imports amounted to no more than 410 lbs. The continuous official accounts of the trade do not commence before 1725; but, according to Milburn (*Oriental Commerce*), the consumption in 1711 was 141,995 lbs.; 120,695 lbs. in 1715; and 237,994 lbs. in 1720. The following is a

Table showing the Quantity of Tea retained for Consumption, and the Rate of Duty in each Year, from 1725 to 1834:—

Year.	lbs.	Rate of Duty. Customs.—Per Cent.	Excise.

For above a century and a half the sole object of the East India Company's trade with China was to provide tea for the consumption of the United Kingdom. The Company enjoyed this trade to the exclusion of all other parties, and were bound from time to time to send orders for tea, and to provide ships to import the same, and always to have a year's consumption in their warehouses. The teas were disposed of in London, where only they could be imported at quarterly sales, and the Company was bound to sell them to the highest bidder, provided an advance of one penny per lb. was made on the price at which each

lot was put up, which price was determined by adding together the prime cost at Canton and the bare charges of freight, insurance, interest on capital, and certain charges on importation; but by the mode of calculating these items, and the heavier expenses which always attend every department of a trade monopoly, the upset prices were greatly enhanced. The prices realised at the Company's sales were however in still greater proportion beyond the upset prices, a result easily produced by a body who monopolized the sole supply, as it was only necessary that the quantity offered for sale should not be augmented in proportion to the growing demand of a rapidly increasing population. The 18 Geo. II., c. 26, passed immediately after a large reduction of the duty had taken place, provided for such a contingency as this, by enacting that if the East India Company failed to import a quantity sufficient to render the prices as low as in other parts of Europe, it should be lawful to grant licences to other persons to import tea. This would have constituted a very efficient check if it had been acted upon; but eventually the mode of levying the duty gave the government almost the same interest in a restricted supply as the East India Company, the duties being collected *ad valorem* on the amount realised at the Company's sales; and thus the very circumstance which enhanced the price raised the total amount of duty. The duty was nominally 90 and 100 per cent. *ad valorem*, but being charged on a monopoly price, the difference on the cheaper teas consumed by the working and middle classes amounted to above 300 per cent. on the cost price of the same teas at Hamburg; and in 1830 the difference between the prices realised at the Company's sales and the Hamburg prices amounted to a sum of 1,889,975*l*. The sales in the last year of the East India Company's monopoly are shown in the following table:—

An Account of the Quantity and Prices of several sorts of Tea sold in England from May 1st, 1833, to May 1st. 1834:—

	lbs.	*s.*	*d.*
Bohea	6,170,963	1	10
Congou	18,653,835	2	1
Campoi	1,603	2	4
Souchong . . .	354,515	2	9
Pekoe	514,811	2	10
Twankay . . .	4,339,672	2	1
Hyson Skin . .	141,610	2	2
Hyson	987,052	3	6
Total . .	31,164,065		

The Company's sales were in March, June, September, and December, the latter being the largest. About 2,000,000 lbs. were offered belonging to the officers of the Company, who were allowed to import a certain quantity of tea on their own account. In 1839 there were only 122,312 lbs. offered for sale by the East India Company; and the change effected by the 3 & 4 Wm. IV., c. 93, which, on the 22nd of April, 1834, opened the trade to China, is now complete. The importation of tea is no longer confined to the port of London. In 1839 eighteen ships arrived inwards from China at different outports, ten of which were entered at Liverpool. In the four years ending 1834 the average annual number of ships entered inwards from China at the ports of the United Kingdom was 23, in the four following years the average was 66, and other commodities besides tea have been extensively imported, and a corresponding increase in the quantity and variety of the exports to China has taken place. The exports of tea from the United Kingdom, which formerly did not exceed a quarter of a million lbs. annually, amounted to 4,347,432 lbs. in 1841, and have averaged above three million lbs. a year since the opening of the trade, a fact which shows that prices here are no longer so much above those of the principal continental ports. The quantity retained for consumption has also considerably increased, although accompanied by an extraordinary increase in the use of coffee.

The tea-duty produces about one-thirteenth of the total revenue; and only three articles, spirits, malt, and sugar, yield a larger sum. The tariff of 1842 has made no alteration in the tea-duty. As it was foreseen that on the opening of the tea trade there would be a considerable reduction of price, and that an *ad valorem* duty would not, even with the increased consumption, be so productive as formerly, a fixed duty per lb. was imposed, which, from 1834, to July, 1836, varied according to the different kinds of tea; but as this mode of collection was attended with considerable trouble and difficulty, it was altered to an unvarying duty of 2*s*. 1*d*. per lb. on all kinds without distinction. Since March, 1836, the tea-dealers have been relieved from the vexatious interference of the excise, the duty being collected entirely as an import duty by the officers of the customs. Previously, each of the hundred thousand tea-dealers in the United Kingdom were visited once a month by the officers of excise, who took an account of their stock; and no quantity exceeding six pounds could be sent from their premises without a permit, of which above 800,000 were required in a year. In short, this system of supervision was very troublesome, costly, and answered no useful purpose. The number of tea-dealers in 1839 was 82,794 in England; 13,611 in Scotland; 12,774 in Ireland: total, 109,179. Tea is now sold by the importing merchants by public auction and private sales.

The following table shows the revenue which the tea duty has yielded in each year during the present century, and, to some extent, it is an index of the prices in each year:—

Net Amount of Duty collected upon Tea in the United Kingdom in each year from 1800 to 1841 inclusive:—

1801	£1,423,660	1822	£3,941,484
1802	1,632,467	1823	3,848,122
1803	1,929,613	1824	3,865,477
1804	2,599,738	1825	4,031,018
1805	3,336,523	1826	3,738,042
1806	3,446,670	1827	3,705,588
1807	3,525,173	1828	3,177,179
1808	3,905,295	1829	3,321,722
1809	3,592,705	1830	3,387,097
1810	3,647,737	1831	3,344,918
1811	3,752,111	1832	3,509,835
1812	3,822,979	1833	3,444,102
1813. Records burnt.		1834	3,589,361
1814	3,958,054	1835	3,832,432
1815	4,058,091	1836	4,674,535
1816	4,362,496	1837	3,223,840
1817	3,431,364	1838	3,362,035
1818	3,872,693	1839	3,658,803
1819	3,689,805	1840	3,473,964
1820	3,484,226	1841	3,978,158
1821	3,707,270		

Between 1831 and 1841 the population increased 14 per cent., and the increase in the consumption of tea was 16½ per cent. The low prices of 1836, and the general prosperous condition of the country, raised the quantity which paid duty for consumption to nearly 50,000,000 lbs. In 1840 prices were about 25 per cent. higher, large classes of consumers were in a distressed state, and the consumption fell to 32,000,000 lbs. In 1841 the distress still continued, but prices were lower, and the consumption rose to above 36,000,000 lbs. On the 5th of Jan., 1840, the stock of tea in London, Liverpool, Bristol, Glasgow, and Leith was 35,478,490 lbs.; and at the corresponding period in 1841 the quantity was 46,545,610 lbs. The proportion of black to green teas consumed in England is about as 5 to 1; but in the United States the use of green tea is greatest.

(*Papers issued by the Chinese and East India Association*; *Parl. Papers*, &c.)

The total export of tea from Canton to Europe and America exceeds 50,000,000 lbs. Russia is supplied with 6,500,000 lbs. *via* Kiakhta; the United States of America require about 8,000,000 lbs.; France about 2,000,000 lbs.; and Holland imports about 2,800,000 lbs. The green tea districts are about 700 miles, and those where the black tea is made about 200 miles from Canton. The article is brought from Canton by land carriage, chiefly by porters and by the canals; and the number of tea merchants who resort to Canton in the season when the trade is most active, that is, from October to March, is said to be about 700. The functions of the Hong merchants, through whom Europeans make their purchases, have been already explained. [Canton.] The trade has not been interrupted in consequence of the present dispute between England and China, nor is it likely to be, as it is one of the greatest importance to the Chinese; and whenever, in former disputes, it has been temporarily suspended, no difficulty has occurred in obtaining the usual supply through the traders of other nations at Canton.

THEATINS, or TEATINS, an order of monks founded at Rome in 1524, principally by Gianpietro Caraffa, who was then archbishop of Chieti, in Naples, the Latin name of which is Teate, and who afterwards became pope under the title of Paul IV. The institution was confirmed at the time of its foundation by the reigning pope, Clement VII.; and a final rule, or code of regulations, drawn up by a general chapter of the order, was authorised by Clement VIII. in 1604. The Theatins were principally established in Italy and in France, into which latter country, where they subsisted till the Revolution of 1789, they were brought in 1644 by Cardinal Mazarin, who bought them their house at Paris, near the Louvre, and at his death left them 800,000 crowns, with which they built a church. Their dress was a black cloak and cassock with white sleeves; and the principal peculiarity of their institution was that they affected to subsist not only upon alms, but upon alms bestowed upon them without being asked for. They procured however considerable support in this way, and they were at one time enabled to maintain missions in Georgia, Circassia, Mingrelia, and other parts of Asia. Their history has been written by John Baptist Tuffins, under the title of 'Annales Theatinorum.' There were also Theatin nuns (in French, *Theatines*), so called from having been placed by Pope Gregory XV. under the direction of the Theatin monks, their original and proper designation having been Sisters of the Immaculate Conception. They were divided into two classes: the one called Theatin nuns of the congregation, founded at Naples by Ursula Benincasa in 1583; the other, of later institution, called Theatin Nuns of the Hermitage. The latter were bound by vows of peculiar solemnity and strictness, professing to spend their whole time in solitude and prayer. The two societies however were intimately connected; their houses adjoined and communicated with one another, and the temporal concerns of those of the Hermitage were managed by those of the Congregation. In 1624 Urban VIII. withdrew these nuns from the jurisdiction or superintendence of the Theatin monks, and placed them under that of the Neapolitan nuncio; but the former state of things was restored by Gregory IX. in 1668. A notice of a controversy between the Theatins and the Jesuits, which was kept up for a great part of the seventeenth century, is given by Bayle, in a note to his article on 'Ignatius Loyola.'

THEATRE (from the Latin *theâtrum*, which is from the Greek θεάτρον, 'a place for seeing'), a word adopted in all modern languages to signify a building appropriated to dramatic representations. The oldest edifices of this class are those of the Greeks and Romans, for it was with them that the European drama originated, and, in point of magnitude, they surpassed the most spacious of their temples. The enormous extent of many of them, and the prodigious solidity of their construction, are attested by the numerous remains of such edifices, which have been explored not only in Greece and Italy, but also in Asia Minor. Of some of them indeed little can now be traced, but others are sufficiently perfect to convey a clear idea of the arrangement and general appearance of the structure in its original state; that is, however, merely as regards the space appropriated to the spectators, for scarcely anything remains to explain what is most difficult, and, as regards the dramatic exhibitions, most important of all to understand, namely, the stage itself, including under that term the whole space requisite for the accommodation of the performers, and for the preparation of the exhibition before the audience. Owing to the want of any evidence of the kind afforded by the buildings themselves, and to the very little that can now be gathered from the scanty notices of antient writers, we are ignorant of many things which can only be conjectured.

The very circumstances that are mentioned for our admiration, and in proof of the magnificence and sumptuousness of some of the antient theatres, also prove how destitute of anything approaching to scenic illusion and stage effect the performances must have been. Whether it be at all exaggerated or not, it is evident from what Pliny (*Nat. Hist.*, xxxvi., c. 15) says of the theatre of Scaurus at Rome, that the *scena* was a mere architectural façade, unmeaning in itself, though lavishly embellished with marble columns and statues, with no fewer than 360 of the former, arranged in three tiers, and 3000 of the latter, a most incredible number, surpassing that of a modern audience; for it is difficult to conceive how they could all have possibly been introduced. Pliny puzzles us still more when he says that the middle of the scena (meaning the second of the three orders) was of glass. Without stopping to inquire what can be meant by 'glass,' perhaps mosaic, we may remark, that such a background to the stage could have been no better than an extravagant absurdity, and that the actors must have appeared mere pigmies upon a stage of such enormous extent, with a number of statues behind them. This must always have been in some degree the case, since even in moderate-sized antient theatres the stage was enormously wide in comparison with what it is in the very largest modern theatres. The scena too was always a permanent architectural erection, incapable of change, and instead of having reference to the particular performance, it must frequently have been at variance with it. It has been supposed that, besides the permanent scena, the antients employed, occasionally at least, moveable painted scenes, capable of being let down before it. Yet while this can be only vaguely inferred, the presumption against it is founded both on its impracticability and its extreme improbability. How is it possible to have had painted moveable scenes on canvas, which on the average must have been 200 feet in width, especially where the stage itself was so shallow and confined at its sides, and without any space for apparatus or machinery over it? If again there was any such scenery, it would have given rise to a branch of painting of which the antients appear to have been nearly altogether ignorant. They seem to have had no idea of other than figure-painting, with scarcely any attempt at expressing background, whereas scene-painting entirely excludes figures, consists entirely of background, either landscape or architecture, and sky, and requires more than a moderate proficiency in linear and aërial perspective, in regard to both of which the antients appear to have been deficient. If we may judge from those specimens of their painting which have come down to us, they seem scarcely to have aimed at general pictorial effect, or at more than representing figures alone, without any scenic background to them. If, too, there had been anything resembling our modern scenery, more explicit mention would probably have been made of it, if only on account of the enormous magnitude of such paintings, whose surfaces must sometimes have contained a much greater number of square feet than the sides of the largest temples. Vitruvius does indeed make mention, in the proem to his seventh book, of Agatharchus as a scene-painter, and of Democritus and Anaxagoras as writers on scenography and perspective; but it is with his usual dryness and obscurity, and with such vagueness of expression, that it is difficult to draw any conclusion from his words. Of the former he merely says 'scenam fecit,' which probably means no more than that he was one of the first who introduced some sort of decoration on the scena, or back wall of the stage, where, if there was at any time painting at all, it could only have been very partial, and as accessory embellishment to that general façade,—perhaps in such pieces as the 'Philoctetes' something was done to give to the centre doorway of the scena the appearance of an entrance to a cavern,—just sufficient to indicate the locality intended to be expressed. The fixed arrangement of the scena itself, with three distinct entrances assigned to the performers according to their rank in the piece, the centre one being for the principal characters, the others for those supposed to arrive on one side from the port, on the other from the country, was not only a puerile and awkward conventionalism in itself, but an expedient which shows how imperfect the antient stage must have been, how destitute of all contrivance, notwithstanding its alleged magnificence. What there was of painted scenery at all must have been confined entirely to two *Versuræ* (περίακτοι) at the sides or ends of the stage, which served as 'wings,' and which were upright triangular frames made to revolve upon a central pivot, so that any of the three sides could be turned towards the audience; a very scanty change of scenery at the best, and exceedingly limited in effect, it being no more than sufficient to *hint* where the action was supposed to take place; whereas the scena itself bore no more resemblance to the intended locality of the piece, than do the proscenium and stage-doors in those modern playhouses where the latter are sometimes made use of by the performers.

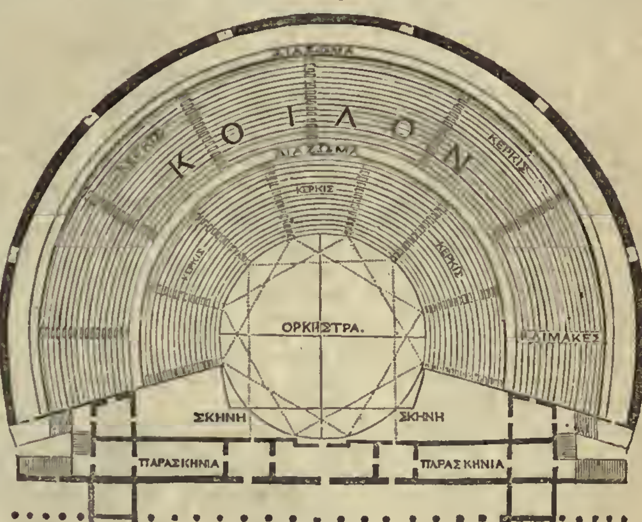
From the use of the term *Aulæa* it has been generally

concluded that the whole stage was concealed by a curtain both previous to the commencement of the performance and whenever it was requisite to make any change in the decorations. But we agree with Winckelmann, that such could not possibly have been the case, because in the first place it could hardly have been practicable, and in the next it was quite unnecessary as regarded the permanent scena or architectural façade. Whatever changes, says that writer, were made at all could have been only in the side-scenes or *versuræ*, and it was merely before them that curtains or aulæa were drawn at such times; which circumstance says nothing in favour of what little stage machinery there was. The notion of there being painted moveable scenes like ours, capable of being let down or drawn up at pleasure, is completely contradicted not only by one, but by every circumstance that can be mentioned. Admitting the possibility of having scenes of such prodigious size, how are we to reconcile with the use of them the bestowing so much decoration upon the scena, or wall at the back of the stage, behind them?—to what purpose would have been the entrances through that wall, for the performers to come upon the stage, if there had been a separate painted scene before it? The stage itself again was so exceedingly shallow, that it would hardly have borne to be further contracted in depth, by other scenes being let down before the permanent one; nor would there have been space for them and the *versuræ* also. There would also have been more explicit mention made of such scenes, and there would have been some particular term to distinguish them from what is now called the *scena*, if they had ever been used. What Vitruvius says upon the subject of stage decoration is not only very brief, but exceedingly obscure, and only proves his carelessness in omitting to describe or even mention much that is of real importance, while he goes altogether out of his way to give us a chapter De Harmonica, and to speak of many matters that have no connection whatever with theatres as a distinct class of buildings.

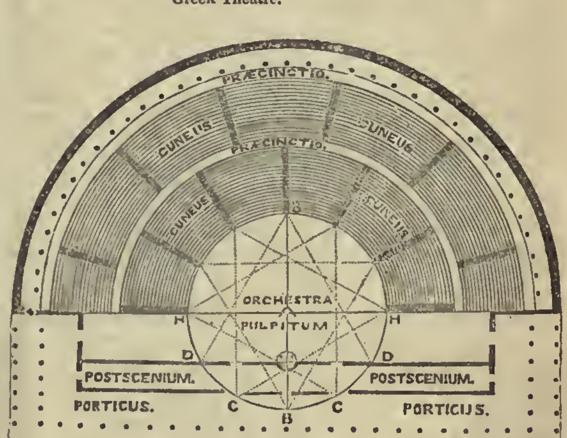
Even admitting that there was painted scenery, and that it was not at all inferior to that of our own theatres either in regard to truth of perspective or anything else, it still must have fallen very far short of the latter in effect, if only for the reason that the performances took place by daylight. At the best the illusion could have been but exceedingly imperfect—a strange mixture of the artificial with the real; and even what degree of effect there else might have been, must have been more or less counteracted by the sun shining on some part of the stage and scene, while shadows would be thrown upon them, in others, by the wall at either end or side. Or if the stage itself was at any time roofed in, all the upper part of the scene must have been thrown into shadow. The natural lights and shadows and the painted ones must frequently have been in strange contradiction to each other; nor was it possible to manage any effects of light, as in our theatres, by either increasing or diminishing it, or by concentrating it on any particular part of the scenery. The only thing in favour of the antient stage in this respect, is that there were no 'foot-lights,' and consequently the faces of the performers were not lighted from beneath. Yet even this comparatively unimportant advantage was nullified by the use of masks, some of them so extravagantly grotesque as to bear scarcely any resemblance to the human countenance. The most natural masks were in some degree distorted, and a fixed expression of countenance was substituted for what could properly be only a momentary one. Hence one great excellence in acting was entirely suppressed: the face was as rigidly inanimate as in wax-work. It is true this was of no very great consequence, because, owing to the vast extent of the theatres, the faces of the actors could hardly have been distinctly seen, or seen at all by the great majority of the spectators, more especially as such aids to vision as opera-glasses were then unknown. The whole space was so great, that in regard to it the actors could have been no more than as the figures put by a painter into a landscape. Neither does what is said as to their *cothurni*, or thicksoled buskins, being intended to make the actors appear taller, give us any very high idea of the effect so produced; for while the increase of stature could have been scarcely perceptible—or if it had, it would have caused the limbs to appear strangely disproportioned—the means employed for it were ill calculated to give ease and gracefulness to the performer's movements.

On considering the audience part, and the accommodation provided for the spectators, although there the arrangement of an antient theatre was nearly perfect, and in some respects preferable to that of modern ones, it was not free from many inconveniences. The most obvious one is, that as there was no roof, there was no shelter from the weather, on which account awnings were sometimes made use of to screen from the heat of the sun, while in case of sudden and heavy rain the spectators were obliged to take shelter in the corridors behind and beneath the seats, where there were any, and in the porticos at the back of the theatre. Besides interruption to the performance, this must have occasioned considerable confusion in so numerous an assemblage of persons. Beautiful too as the arrangement of all the seats in concentric rows is in itself, it is attended with some disadvantage, as will be perceived on referring to the annexed plans, for instead of being placed, as in the pit of a modern theatre, parallel to and immediately facing the stage, a considerable portion of the audience must have sat sideways to it, with part of it behind them; and those at the ends of the further or upper benches could hardly have had any view of the scena at all, at least not in the Greek theatre.

The Greek and Roman theatres so very nearly resemble



Greek Theatre.



Roman Theatre.

each other in their general form and principal parts, that it is only by comparing the plans, for the purpose of seeing wherein they vary, that the difference between them can be clearly understood. Such difference however is ex-

ceedlogly slight, the general arrangement and the essential parts being the same in both,—the *Cœlum* (Κοῖλον), *Orchestra* (Ὀρχήστρα), and *Scena* (Σκηνή) in the one, and the *Cavea*, *Orchestra*, and *Scena* in the other. The cavea was the general term for the whole of the space appropriated to the seats of the spectators, which were all concentric with the orchestra, and which were intersected, in one direction, by ascents or flights of steps (κλίμακες) dividiog the seats ioto so many compartments, termed κερκίδες, or *Cunei*, and separated into two or more 'flights' or 'tiers' by broader spaces or landing-places, called Διαζώματα, or *Præcinctiones*. The number of the κλίμακες, or ascents, and that of the Διαζώματα, or Præcinctions, and also the breadth of the latter, appear to have been regulated entirely according to the extent of the theatre and other circumstances. In general there seems to have been only one Præcinction between the seats, dividing them into two 'flights,' not however so as to give an equal number of rows of seats to each. In the theatre near Epidaurus, for instance, there were 54 rows of seats, divided by a single Præcinction, and 34 of them formed the *first* or lowest tier nearest the orchestra; while in that at Syracuse there were 62 rows, with only a single Præcinction between them, and 41 were given to the *second* or upper flight, farthest from the orchestra. In the theatre at Dramyssus, again, there were two Præcinctions, dividing the entire number of rows, 51, into 18, 16, and 20 respectively, reckoning from the orchestra. As regards the distinct 'flights,' or series of seats, there were two modes of disposing them: the more usual one was to break luto separate slopes, retiring from each other, like the 'flights' in an ascent of steps; the other was to place them in a continued slope from the lowest to the highest seats, whereby at each præcinction the next 'flight' was considerably elevated above the level of that landing, being raised upon a podium or wall, which showed itself between the lower and upper 'flight.' Besides the præcinctions *between* the seats, there was another surrounding the whole *cœlum*, or auditory of the theatre, forming either an upper uncovered terrace as a standing-place for spectators, or a covered gallery with columns, as is shown in the plan of the Roman theatre, where such portico was assigned to females.

Between the Grecian and Roman orchestra there was a very wide difference as regards the purpose to which that space was appropriated. In the Roman theatre it was merely a continuation of the rest of the auditory, being occupied with seats and spectators, with no other difference than that the spectators were senators and other persons of digoity, and that benches or chairs must have been raoged parallel to the stage. The Greek orchestra, on the contrary, was, as its name imports, made use of for the daocers, musicians, and singers, whose performances constituted so important a part of the entertainment; and so far nothing could have been better planned than the Greek theatre, for the orchestra was visible from every part, whereas the scena could not have been distinctly seen, or hardly seen at all by those on the upper seats at either extremity of the coelum. By referring to the plans it will be seen that while the Roman orchestra does not exceed half a circle, the Greek forms three-fifths of one, or an arc of 216 degrees, its proportions and the depth of the stage beiog ascertained by merely ioscribing a square withio a circle, taking one side of that square as the boundary of the stage, and drawing parallel to it a taogent to the circle, which tangent coincides with the seeoa or back of the stage. Such plao therefore is simple enough, complex as it may appear in the cut, where two other squares are also drawn within the circle, and the points of the three squares determine how far the seats extend, and the situation of the steps (κλίμακες) between the seats,—a fanciful operation, nothing more being required after the first one than to divide the arc or curved portion of the orchestra into as many equal parts as would he requisite according to the number of ascents. Io fact this last appears to have been the mode practised, for there are as many examples which differ from as agree with that established by Vitruvius for the Greek theatre. According to that, the divisions, the number of eunei aod steps betweeo theoi, would be uniformly the same, viz. seven of the former, and eight of the latter, including those next the stage, as shown in the cut. This however is so far froto being the case, that very material differenees occur in that re|pect. At Epidaurus, for instance, there are ten eunei in the lower tier, and eleven ascents, consequently an even number of the former and an odd one of the latter. At Dramyssus again there are nine eunei and ten ascents; and at Syracuse and Tauromenium the same. The Roman orchestra and scena were also defined by a circle, within which was inscribed an equilateral triangle, one of whose sides DD formed the scena, while the diameter HH of the circle, parallel to the scena, formed the boundary between the pulpitum or stage and the orchestra, the last being always a perfect semicircle. The other three triangles are merely for the purpose of determioing the points where the scalæ, or steps between the cunei, are to be, for which nothing more is requisite than to divide the semicircle of the orchestra into as many equal parts as there are to be cunei, whether the number be six or any other; and the diameter of the orchestra HH being given, the distance of the scena from it would be ascertained by making it equal to one-fourth of that line. After all, as has been remarked by Wetter io his work on theatres, there is something more whimsical than rational in such an arrangement. What advantage is it, or what particular harmony of parts is produced by the front of scena exactly coinciding with the base of an equilateral triangle inscribed withio a circle of which only one-half is visible, while the triangle itself is not visible at all. These arbitrary architectural fancies were rather defects, and they show how imperfect the art of scenic representation must have been. Io addition to the disadvantages already pointed out, as regards the want of moveable scenery, it was no slight inconvenience that the stage could never be occasionally extended in depth, shallow as it was. Taking 70 feet as the diameter of the orchestra alone, which dimensions are equal to the whole of the largest of our modern theatres, the depth of the stage in a Grecian theatre would be a little more thao 10 feet, or one-seventh of that diameter; and in a Roman one 17½ feet, or just one-fourth. While so confined a space would admit of very little dramatic action, it would scarcely admit of any change of scenery. Yet shallowness of the stage was in some measure matter of necessity, that the performers might be as near to the front of the stage as possible, separated as they were, in the Greciao theatre at least, from the audience by the intervening orchestra.

Strict as were the rules for proportioning the depth of the stage to the size of the orchestra, the relative size of the orchestra to the coelum or whole auditory does not appear to have been subject to any regulations: it varies considerably in different theatres, being in some nearly one-half, io others only one-fifth, or even little more than one-sixth of the entire diameter of the interior, as in the theatres of Epidaurus and Dramyssus, or Janina.

When it is said that the Grecian orchestra was considerably larger than the Roman, there is some ambiguity in the expression, for it might be inferred from it that it was larger than the other in proportion to the coelum, whereas the meaning is that the orchestra of the Greeks formed a larger portion of a circle, extending to 220 degrees, while the Roman was only 180 degrees, or an exact semicircle. In the Greek theatre, therefore, the orchestra cuts into the stage, and renders that part termed Logeion by the Greeks, and Pulpitum by the Romans, considerably narrower than the extremities, whereas in the Roman theatre the stage was of the same depth throughout, pulpitum being a mere technical distinction applied to that portion corresponding with the orchestra, and to which the actors confined themselves, in order that they might be better seen and heard * by the whole of the audience than would otherwise have been the case. The plans above given are not drawn to any particular scale, but supposing them to be upon the same scale, and the diameter of the orchestra in the Greek plan to be 100 feet, the diameter of the coelum or whole auditory will be 300 feet, the width of the stage and scena 180, and the depth of the logeion only 15 feet, while in the other the dimensions will be, orchestra 100, auditory 270, scena 195, depth of stage and pulpitum 25.

Another point of difference between the Grecian and Roman theatre is, that in the former the stage was consi-

* The antients also were obliged to have recourse to what seems a strange expedient for transmitting the actors' voice to the furthest part of the theatre, namely, that of placing in cavities for the purpose beneath the seats hollow metal or earthen vases, termed Echeia (ἠχεῖα), that is 'sounding thing,' which augmented the sound. Mr. W. Baukes discovered something of the kind in the theatre of Scythopolis in Syria, but what effect such Echeia, and the metallic mouth-pieces of the masks worn by the actors really produced, it is not possible now to judge.

derably elevated above the orchestra, 12 feet or upwards, consequently there was a wall of that height at the back of the orchestra, to which was given the name of Hyposcenium (ὑποσκήνιον), or Lower Scena, and which formed a sort of architectural basement to the stage, and was adorned with niches and statues. This however is little more than conjectural, for what is known relative to this and other accessory parts of the stage is derived not from any examples of them discovered in antient structures of the kind, but merely from such mention of the terms applied to them as is found in a few antient writers and commentators, whose explanations are all more or less obscure, and full of discrepancies. We shall not therefore attempt to say more relative to either the Greek or Roman stage and scena than we have already done. It seems to have been assumed that, because the theatres themselves were of extraordinary extent and solidity in their construction—that because there were columns, and marble, and statues—the stage exhibitions also must have been in the same degree superior to those in the comparatively small theatres of modern times. Yet the truth is, that capacious as the buildings were, being intended to accommodate nearly the entire population of a city at each performance, the stage itself was not at all in proportion to the rest. There was so little space attached to it either behind or at its sides, that spectacle and scenic contrivance and effect must have been almost impossible: when therefore we read that 'not unfrequently a magnificent compilation of machinery gradually descended with the divinities of Olympus,' though we do not doubt the fact of there being some contrivance for letting down performers from above—in which case, however, the stage itself must have been roofed in—we greatly question the 'magnificence,' and rather suspect that the contrivance must have been somewhat clumsy, and the effect almost ridiculous.

An experiment has lately been made (November, 1841) in the theatre of the new palace at Potsdam, towards reviving an antient dramatic performance, with rigorous attention to costume. The piece selected for the purpose was the 'Antigone' of Sophocles, and the theatre and all the arrangements were made to conform as nearly as possible to classical example. The pit was converted into an orchestra upon the Grecian model, and it was here that the persons who composed the chorus remained until they had to appear on the stage, when they ascended to it in the sight of the audience, and descended again in the same manner, so carefully was all the antient practice observed. Equal regard to precedent was shown in comparatively trifling matters: for instance, instead of the curtain being drawn up, it was let down, as was supposed to have been the case in the antient theatres, a circumstance which has already been questioned by us; and it is said that the effect of the upper part of the scene being disclosed before the lower was not a little striking. Indeed, if we may believe all that the Berlin journals have reported of this classical exhibition, it perfectly realized its prototype, and no doubt greatly surpassed it, if it were only because it took place by candle-light, and the actors did not wear masks.

Little more remains to be said on the subject of antient theatres, except to remark that the form of the orchestra also determined that of the exterior of the building; while the Roman theatres therefore did not exceed a semicircle, those of Greece had a greater curve. In the Greek theatres however the orchestra was not always extended beyond a semicircle, by the curve being continued, but sometimes by straight lines at right angles to the chord (or parallel to BB, in the plan of the Roman theatre, whose general form is so shaped, the external semicircle being prolonged by the colonnades). Grecian theatres were almost invariably built on the sloping side of a hill, so that, as regards the coelum, it was merely necessary to shape it out, and erect the seats; consequently there was no other architectural exterior than that formed by the Parascene (Παρασκήνη) and colonnade behind the stage; for which reason the degree of curvature did not manifest itself. The Roman theatres, on the contrary, were erected on level ground, and therefore the curved part of the exterior was confined to a semicircle, a form which unites better with the rectangular one and its straight lines.

The theatre at Athens (called that of Bacchus) was by no means so spacious as many others, its diameter being only 250 feet, and that of the orchestra 72, which are very moderate dimensions in comparison with those of some of the Asiatic theatres. The Odeion of Regilla, also at Athens, though similar in its general plan to the usual theatre, was a music-hall, and was covered in with a tent-like roof, with a semicircular *eye* or opening for light. Both structures were situated at no great distance from each other, on the south side of the Acropolis [Athens, Plan]; therefore the scena of the theatre had a northern aspect, and must have been in shadow while the performances took place.

The following is a list of such antient theatres as are known, together with the respective dimensions of their general diameter and of their orchestra; which we have for the most part taken upon the authority of a similar table given by Col. Leake, in his 'Tour in Asia Minor,' to which several other examples are here added.

	Diam.	Orchestra.
Anemurium	197 feet.	
Aspendus	400	25 rows of seats.
(scena Ionic and Corinth.)		
Athens, Theatre of Bacchus	250	72 ft.
,, Odeion	90	36
Cnidus	400	
Delos	175	
Dramyssus, or Joannina	440	78
Ephesus	660	240
Epidaurus	370	55
Herculaneum	180	16 rows of seats.
Hierapolis	346	100
Laodicea, Great Theatre	364	136
Limyra	195	not known
Mantineia	227	not known
Miletus	474	224
Myra	360	120
Nicopolis (in Epirus)	360	120
Orange (scena only remaining, 336 ft. wide, 114 ft. high.)		
Patara	265	96
Perga		25 rows of seats.
Phellus	400	Scena 150.
Pola, about	200	68
(destroyed 1636, but plan preserved by Scamozzi)		
Pompeii	190	62
Pompeiopolis	219	138
Rome, theatre Marcellus	517	172
Sardes	396	162
Selinus (in Cilicia)	114	
Sicyon	313	100
Side	390	120
Sparta	453	217
Stratonicea	390	106
Syracuse	440	
Tauromenium	330	width of scena 132
Teos	285	70
Tralles	540	150

Of some of these theatres scarcely anything remains, little more than their general shape and extent being now distinguishable; accordingly the statements of their dimensions are not to be strictly relied upon, though they are sufficient to enable us to estimate their comparative size.

Fortunately the antient theatre was not taken as a model for modern structures of the kind. The revival of theatrical representations took place before anything was known relative to that branch of architectural archæology, and under very different circumstances. Dramatic entertainments were then either partly religious, and performed within churches, convents, and colleges; or were acted for the amusement of princes and nobles on occasions of state and festivity, in halls merely temporarily fitted up for that purpose; consequently spacious and permanent structures, as public theatres, were not required until long afterwards, when the drama had become a distinct profession. In the meanwhile a taste for scenic display had developed itself, which required a very different arrangement of the stage and its apparatus from that of the antients. Imperfect as they were in many respects, the dramatic pageants and recitations performed before Leo X. were 'got up' with great magnificence, and some of the greatest artists were employed upon the decorations; among others Baldassare Peruzzi [Peruzzi], whose skill in architecture and perspective carried scene-painting almost to perfection at once. Even in the preceding century dramatic exhibitions had been produced at Florence in a style then unprecedented; and we are told that the first Italian theatre

was one erected in that city by Bernardo Buontalenti in 1581; but it does not appear to have been a public theatre, nor could it have been very spacious, as it now forms merely a saloon in the building called the Ufizi. Theatres on the present system were not built until the early part of the seventeenth century: just before which time an attempt had been made to restore the form of the antient theatre and stage, with the permanent architectural scena and its entrances, by Palladio, whose celebrated Teatro Olimpico at Vicenza is one of those things which have gained a traditional reputation far beyond their real merits. Admired at first, because then superior to anything of the kind, it has continued to be admired since, partly on account of the character attached to it, which few care to dispute; and partly perhaps on account of its singularity, and because it shows the peculiarities of the antient theatre. By no means however is it a very accurate imitation, though its chief merit lies in being a mere imitation; it is semi-elliptical instead of semicircular, with the stage on the longer axis of the ellipse; wherefore it looks too much squeezed up one way, and stretched out the other, and produces the same kind of disagreeable effect as would arise from placing the stage on the longer side of a parallelogram of the same extent (96 × 45 feet). It is said that the space to which the architect was restricted compelled him to adopt that form, yet it hardly appears so from the published plans of the building, for it would not be difficult to show how a semicircle might have been brought in. With regard to the scena, for which unlimited admiration is claimed, nothing can be more tasteless: it abounds in almost as many architectural barbarisms and soleecisms as could well be brought together. Even Robert Adam spoke of it as mere 'gingerbread;' and another architect, Woods, says, 'The scene, which is the part most admired, borders upon trumpery;' and that although the building 'is too celebrated to be omitted, for him it might have slept in oblivion.' It is not however so much the scena or facciata itself, as the avenues seen beyond it through the centre arch and other openings which attract notice, and have been extolled by some as greatly superior to the 'flimsy' painted decorations upon canvas used in modern theatres. Those avenues represent as many streets, the fronts of the buildings being modelled or carved in relief, and attempted to be shown in perspective by the floor and ceiling sloping very much upwards and downwards, and the other horizontal lines accordingly, and by the passages themselves being narrower at the further end. The contrivance is puerile at the best; and instead of being more deceptive or natural than painted scenery, the imitative perspective becomes distorted when viewed from any other situation than the centre of the theatre and the level of the stage. It is also difficult to understand how these narrow enclosed passages could have been properly lighted at the time of a performance; and although they are, in stage language, 'practicable,' hardly could they have been made use of, at least not for their whole extent, because at their further end an actor would appear gigantic. This structure is nevertheless entitled to notice as an example of a very defective and faulty system, and because it has been frequently mentioned for the purpose of recommending, on the imposing authority of the name of Palladio, what ought not to be imitated.

We are not aware of more than one other attempt to revive the antient theatre in all its strictness, which was that built in 1588 at Sabbionetta, for the Duke Vespasiano Gonzaga, by Scamozzi, who completed the Teatro Olimpico after Palladio's death. Temanza, who gives a description of the structure, speaks of it as then no longer remaining; but Tiraboschi points this out as a mistake, saying that the building still existed, though very much out of repair. How far the theatre at Sabbionetta differed from that at Vicenza in size, Temanza has not stated; but it was superior to the latter in its plan, the spectatory being semicircular, and the orchestra somewhat more. There was likewise, as at Vicenza, a Corinthian loggia or colonnade around the upper part above the seats, but in much better taste, all the intercolumns, except one at each end containing a niche, being open; whereas in the other building the centre intercolumns are closed. Yet whatever improvement Scamozzi may have made upon his predecessor's work in these respects, he attempted none where it was most of all wanted, but copied the permanent scena, with its avenues of mock perspective in relief. We do not say that the antient theatre offers nothing for imitation, or capable of being applied to modern ones. On the contrary, the general form of the spectatory is the most elegant and commodious that can be devised; the absurdity lay in adopting, together with that, the antient scena and stage, than which nothing can be more ill-contrived, defective, and inconvenient. In fact the antient model supplies no stage at all in comparison with what is now required for one, but merely a proscenium; and such *avant scene*, with merely a stationary architectural 'drop' [SCENE-PAINTING], would answer every purpose of dramatic representation, just as well as the Logeion of the Greeks, the Pulpitum of the Romans, and Palladio's 'classical' architectural background, which will not endure the slightest comparison with the drop-scene at Covent Garden. For the plan of a complete theatre, the modern stage, with its extensive and complex scenery and mechanism, should be combined with the form and arrangement of the antient spectatory, though not without very considerable modification. This was done by Quarenghi in the Theatre of the Hermitage at St. Petersburg; in another private theatre in Prince Besborodko's palace, and in a design for a public theatre intended to be erected at Bassano. After all, such plan and disposition of the seats are by no means well adapted for a modern public theatre and mixed audience: unless many inconveniences were to be submitted to, great loss of space, or what would be considered such, would be incurred, and the number of spectators would be much less in proportion to the width of the 'house' and stage. On the other hand, the form of the antient theatre may be applied to a concert-room with such very slight alteration, that it is rather surprising it should not have been taken as a model for public rooms of the kind. There a permanent scena, either of painted or real architecture, behind the orchestra and singers, would be appropriate, because not intended to have any immediate reference to the performance itself.

In claiming a decided superiority for the modern theatre over that of the antients, we speak only as regards the respective systems; and as Ugoni, in his Life of Milizia, observes, to prefer the Grecian theatre, with all its inconveniences and the awkward expedients resorted to in it, as being of more classical and dignified character than our own comparatively small and fragile yet greatly improved structures of the kind, is to wish to limit art and science within their first bounds. There certainly was good reason at one time for exclaiming against modern theatrical architecture as very defective in regard to the audience portion of the 'house.' Till within a comparatively late period, scarcely any study was bestowed on beauty and convenience of plan. The accommodations were hardly so good as those in many very ordinary playhouses, where for want of space, there are no other seats than what directly face the stage. The 'house' was usually an oblong, either rectangular or elliptical, so that the greater part of the audience,—at least those in the boxes,—were placed quite on the sides. Where the 'house' contracted towards the proscenium, as was frequently the case, the side-boxes were actually turned *from* the stage; and whether such was the case or not, they were allowed to encroach upon the stage itself in such manner, that when the actors advanced to the front of the stage or beyond the line of the curtain, they may be said to have mingled with the audience, and those in the boxes on the *avant-scene* were actually behind them. If we may judge from the plans and other drawings of them, the two principal theatres in London were, even less than a century ago, both as inconvenient and as ugly as can well be imagined. The approaches, too, used formerly to be exceedingly bad; not only mean and inconvenient, but in many places most dangerously narrow. Such is strikingly the case in most of the modern Roman theatres, for instead of the box-corridors following the curve of the 'house,' and being of the same width throughout, they are so contracted where the other is widest, that more than two persons cannot pass.

Very great reforms have now taken place, yet there is still room for further improvements, obvious, though not likely to be adopted so long as it is considered a matter of course that the space before the curtain must be made to contain as many persons as can possibly be packed into it, and that an audience must be piled up around the whole house to the very ceiling. We do not say that modern theatres are too lofty; the error does not lie there,

but in carrying up the boxes, tier after tier, to such a preposterous height that the uppermost box is several feet above the top of the curtain or stage-openings, and the back seats of the upper-gallery are actually on a level with the ceiling over the pit. Such accumulation of diminutive stories gives a crowded appearance to the whole, and leaves no space for architectural decoration around the upper part. No doubt a very striking appearance of a different kind presents itself from the pit and from the stage, when the house is entirely filled to the very top; and if we consider merely the coup-d'œil from such points, it may be allowed to be imposing. But then, as regards that part of the audience who occupy the upper part of the house, the arrangement is bad. From the seats which are at all above the level of the top of the curtain, there is only a bird's-eye view of the stage and the scenery, and that only from the front seats, and also facing the stage, for from those on the side of it it is impossible at that height to obtain a sight of the scene or even the actors, unless when they come forward towards the foot-lights. There should be no seats at a greater height than midway that of the curtain, or the level of what is now the second tier of boxes in our large theatres; for, as the scenery can be painted only to one horizon,—generally that of the stage itself,—its perspective effect is more or less impaired when it is seen from either very much above or below that level. No less preposterous is the practice of continuing the side-boxes up to the proscenium, and sometimes (as in the Opera-house at London) quite up to the very curtain, so that there is no proscenium at all, unless the space on the floor of the stage, between the curtain and foot-lights can be so called. While those so seated lose the scenery altogether, they have the disadvantage of seeing between the wings on the side opposite them; and although the positive inconvenience resulting from such arrangement is felt only by a portion of the audience, the bad effect occasioned by it extends to the whole theatre. Not only ought there to be a distinct proscenium, serving as an architectural frame to the stage and its scenery, dividing that part of the theatre from the rest, but it ought to be of much ampler proportions than are now given it. It should extend so far as to leave some interval—a sort of neutral ground—between the curtain and the boxes, so as to remove the nearest spectator in them to a tolerable distance for properly viewing the stage as a picture; for it is possible to be as inconveniently near the stage as distant from it. Where, in order to contract the stage, or to render the pit and general diameter of the house considerably greater than what is required for the width of the curtain, the plan is made to approach a circle (as is the case in nearly every theatre built within the last twenty years), the boxes should be confined to the semicircle facing the stage; and, so far from being a blank, the curved space on each side between them and the curtain might be made to contribute very much to the architectural appearance of the whole house. This would not take away anything from the pit, and if it materially diminished the number of the boxes and seats in them, it would be only where there ought to be nothing of the kind. The banishing of boxes from such situations, and making also no more than two tiers, would certainly greatly abridge the present capacities of theatres: a house of the same size would not contain the same number of persons as at present, when a large part of the audience are put where they cannot well see the performance. It is likely, therefore, to be objected that such a system would be too expensive, since a large house would be requisite for a comparatively moderate audience; but curtailments might very well be made elsewhere, for at present the whole building is frequently very much larger and more costly than actual necessity requires, the 'house' itself, be its dimensions what they may, taking up a comparatively small area of the entire plan, while the rest is occupied by stately approaches and saloons, which, where economy rendered it expedient, might be greatly abridged, and much plainer in style, and some of them omitted altogether as superfluous appendages.

In some of the modern continental theatres, the pomp displayed in such accessory parts of the building far exceeds anything of the kind in this country. In that at Berlin, besides several other spacious apartments, is a music-saloon 38 feet high, 44 wide, and 106 feet in length in its upper part, where there is a screen of six Ionic columns at each end; the whole highly decorated, and forming one of Schinkel's richest pieces of interior architecture. The theatre at Münich has two staircases to the boxes, with flights of marble steps 13 feet wide; and besides two saloons for the public (each 82×31 feet), there is a very magnificent one communicating with the royal box—not a mere anteroom, but what would be termed a noble room even in a palace, its dimensions being 46×44 feet, and 25 in height. In both these theatres, and in that of Genoa, the royal or state box is itself a room of some size, about 15 by 18 feet, more or less; and according to the general custom of the continental theatres, this box (which occupies the height of two tiers, and is adorned with caryatides in front) is directly in the centre of the house, facing the stage, consequently in the very best situation of all; whereas the situation assigned to royal visitors in our theatres is almost the very worst, as far as seeing the stage and the performance is concerned.

In regard to the form of the 'house,' a decided improvement has taken place of late years; and the circular plan, or one approaching to it (either extended by the curtain being a tangent to the circle or somewhat beyond it, or reduced by the curtain intersecting and forming a chord to the segment), may now be considered the one established as being the most pleasing and commodious—that which is best adapted for affording a distinct view of the stage to the majority of the audience. But there is considerable difference of opinion as to its being the best form in regard to hearing. In fact, the science of acoustics is not yet brought to exactness as regards practical purposes in building: it is easy enough to ascertain beforehand how much of the stage will be visible from different parts of the theatre, but not so what will be the result as to sound, since that will depend upon a variety of circumstances, some of them counteracting each other, and not every one of them to be guarded against or foreseen. The shape of the house is but one of them out of many; much will also depend upon size, much upon the depth of the boxes and galleries, and also upon accidental and such trivial matters, that any defect or advantage so occasioned is not likely to be traced to them. Here the chief guide is experience; and experience seems at present to be in favour of, at least not at all against, the circular form; for the new theatres at Mayence, Dresden, and other places where it has been adopted, are said to be perfectly satisfactory in regard to the actors being distinctly heard in every part.

While in their internal embellishment and fitting up theatres afford very great scope to the architect, though not so much as they might do, they also afford opportunity for accomplishing much in regard to characteristic external design. Magnificent as are the exteriors and façades of the theatres at St. Petersburg, Berlin, Münich, Bordeaux, and Nantes, with their porticos and colonnades, there is nothing in them that very clearly expresses their particular purpose, because nothing that corresponds with or indicates the form of the 'house' itself within. Moller, we believe, was the first who made the internal plan discover itself from without, by making the auditory, at least the corridors and saloon surrounding it, project out as a spacious semicircle, in the façade of the theatre at Mayence. The same form of exterior has been given by Semper to the new theatre at Dresden, which is also remarkable for the display it makes of sculpture.

After all it is the stage itself, with its multifarious contrivances and complex mechanism, its scenery and pictorial effects, which manifest the extraordinary perfection to which the moderns have carried the scenic, if not the dramatic art; nor can we exclude the latter, unless we choose to blot out the name of Shakspere. It does not enter into our purpose however to speak of stage mechanism, which is a subject and study by itself, and not otherwise connected with theatres and their architecture than as being made use of in the former. Those who seek for information of the kind will meet with many plates showing the stage construction and mechanism of Plymouth theatre, in Foulstone's 'Public and Private Buildings;' and, with more general and complete instructions, in Stephenson's work on the machinery of theatres. Neither can we make any additions here to what has been already said on the subject of Scene-Painting. We will only observe that very great improvements and numerous contrivances for producing stage and scenic effects had been introduced into theatres at the commencement of the seventeenth century.

Table of Modern Theatres.

ITALY.

	Architect.	Date.	Width of Curtain.	From Curtain to Back of Pit.	Greatest Breadth of Pit.	Height from Floor of Pit.	Stage.	
Bologna . . .	Ant. G. Bibbiena		49 ft.	77 ft.	59 ft.	62 ft.		
Genoa	Carlo Barabino	1826-8	46	88½	64	59	82 ft. deep 69 ft. wide	Entire building 314 by 158 feet. Hexastyle, Doric portico, six tiers of boxes, royal box, oval in plan; two tiers in height, with anteroom 21 by 13½ feet, and Saloon 62 by 46½ feet, and 39 feet high.
Imola	Cos. Morelli	About 1780	22	68	42	38	24 deep 68 wide	Remarkable for singular arrangement of proscenium, with three separate openings.
Milan, La Scala .	Gius. Piermarini	About 1775	44	90	67	75		Six tiers of boxes. Saloon 100 by 24 feet.
Naples, San Carlo	Gior. Metrano; restored, &c. Ant. Niccolini	1735 1817	50	83	73	80	88 deep 110 wide	Burnt 1816, rebuilt 1817. Six tiers of boxes, in all 181. Spectators 2800.
Parma, Great Theatre	Giam. Aleotti, Bernini	1619	36	148	50	85		On the first floor of the Ducal Palace. Not used since 1733.
Parma, New Theatre	Canonica and Nic. Bettoli	1822-3	30	75 to back of boxes				
Rome, T. Aliberti	Ferd. G. Bibbiena		39	66	52		46 by 72	Shape very bad, and staircases and corridors dangerously narrow.
Rome, La Argentina	Marq. Teodoli		39½	66	54	43	54 deep 79 wide	No other proscenium than a decorated pilaster face between boxes and curtain. Six tiers of boxes. Pit floor quite level.
Rome, Teat. della Valle . . .		Restd. 1766	30	47	40		13 deep	No proscenium, the boxes coming quite up to curtain. Stage unusually small and confined, but capable of being extended 19 feet more in depth.
Rome, T. Tordinona	C. Fontana, but since altered		43	51	56		75 deep 72 wide	Six tiers of boxes.
Turin, Opera-House	Ct. Bened. Alfieri	1740	40	78	53	53	105 deep 78 wide	
Venice, La Fenice	Ant. Selva	About 1790	42	76 to back of boxes	62	49	46 deep 91 wide	Burnt down 1835, but since restored. Five tiers of boxes.
Vicenza, T. Olimpico	Palladio	About 1580	78 width of scene	56	115 greatst width of salle	49	22 depth of stage before scene.	

FRANCE.

Paris, L'Odéon .	Baraguey, restored	1820	42½	62		51	66 deep	An insulated structure, about 172 × 118 feet, originally built by De Wailly and the elder Peyre.
Paris, Français .	Louis, partly rebuilt by Fontaine	1790 1822	39	59		54		
Paris, Académie Roy. de Musique, or Opera . .	Debret	Opend. Augt. 1821	52½	67		61	95 deep	Saloon 98 by 21, and 21 feet high.
Paris, Ventadour .	Huvé		49	57		64		Insulated structure, 172 by 114 feet. Exterior two orders, Doric and Ionic, in arcades. Saloon 98 × 21, and 21 high.
Paris, Feydeau .	Legrand and Molinos	About 1790	49	49			32 deep 78 wide	Front curved.
Versailles, in Palace			34	60	50	44	70 deep 48 wide	

	Architect	Date.	Width of Curtain.	From Curtain to Back of Pit.	Greatest Breadth of Pit.	Height from Floor of Pit.	Stage.	
Bordeaux . . .	Louis	Fin. 1780	39½ ft.	64 ft. includ. boxes	62½ ft. ditto	57½ ft.	70 ft. deep	This splendid theatre restored and refitted up by Bonfin, 1832.
Besançon . . .	Ledoux	About 1777	49	64		52	36 deep 65 wide	Insulated, about 124×100 feet.
Lyon	Soufflot	1754–6	32	63 to back of boxes	36	35½	68 deep 50 wide	Insulated building, 180×130 feet. This theatre has been rebuilt after a different design.
Nantes . . .	Crucy	About 1810	37½	62	49	51	47×65	Portico, Corinthian octastyle before tetrastyle in antis.
Germany and Belgium.								
Berlin, Opera-house	Von Knobelsdorff	1740–3	26	64	42	58	50 deep 52 wide	An insulated building, 214×78 feet. Principal front, Corinth. portico, hexastyle monoprostyle, on low basement.
„ Great Theatre	Schinkel	1816	43	62		44	66 deep 86 wide	A magnificent structure, with Grecian Ionic hexastyle portico on a lofty flight of steps.
Dresden . . .	Semper	1837–1841						
Hamburg . . .	Schinkel	1826–7	40	69 to back of boxes	50	56	60 deep 80 wide	Plan of auditory nearly circular, *i.e.*, a circle of 66 feet diameter, to which the curtain is a tangent. Four tiers of boxes, and amphitheatre formed by a colonnade of 22 pillars.
Mannheim . . .	Ant. G. Bibbiena		30	46			71 deep	
Mayence . . .	Moller	Fin. 1833	54	74		60	56 deep 80 wide	Insulated, about 250×140 feet, with semicircular projection, 140 feet diameter on one of longer sides or façade.
Münich	K. von Fischer	Open. 1818	39	78	62	64	91 deep 94 wide	Burnt Jan. 14, 1823; restored 1824-25. Octastyle Corinth. portico, including boxes, the auditory, a circle 72 feet diameter, between which and curtain is a space of 9 feet. Five tiers of boxes.
Wolfenbüttel, in the palace . . .	Ottmer	1836–7	28	44 includ. boxes	29	27	36 deep 56 wide	Private theatre, fitted up in Gothic style, but detail in poor taste.
Ghent	Roelandt	1837–9	37	59	42		60 deep 78 wide	Façade 300 feet. Oval saloon 91×59, making, with smaller saloon and concert-room, an extent of 270 feet.
Russia.								
St. Petersburg, Great Theatre . . .	Tischbein; Thomond	1782–3 1803	52	60	50	52	95 deep 70 wide	Insulated building, 150×270 feet, with octastyle Ionic portico. Saloon 125×30 feet.
„ Theatre of 'Hermitage'. .	Quarenghi	1780	36	60	60	42	70 deep 70 wide	Theatre a semicircle, without boxes, but surrounded by a Corinthian colonnade of 13 intercolumns, with seats.
England.								
London, Opera-house	Novosielsky	1790	40	84	60	51	35 deep 80 wide	No proscenium. Corridors, &c. very mean.

Several theatres, all more or less worthy of notice, have been erected within the present century, but are omitted in the table, as we cannot specify the respective dimensions. The subjoined list of them, with their architects' names, may however be useful:—

Brescia; Canonica.
Ferrara; Ant. Foschini.
Florence, Teatro Goldoni; Gius. del Rosso, 1817.
„ Theatre after antient plan; Anton. Corazzi.
Mantua; Canonica.
Trento; Ducati, 1823.
Baden; Weinbrenner.
Breslau; Langhans, opened November, 1841.
Carnstadt; Ludw. Zanth, begun 1839.
Carlsruhe; Weinbrenner, 1807-8.
Coblentz; Von Krahe.
Darmstadt; Moller and Heger, 1818-19.
Gotha; Semper, 1837-9. Opened May, 1840.
Münich, Isar-thor Th.: Dericoyen, 1811.
St. Petersburg; Alexandrinsky Theatre; Rossi. Opened August, 1832.

THEATRE. Before the reign of Elizabeth theatrical representations appear to have been subject to no legal restraint beyond the liability of those who conducted them to the vagrant laws. Until the middle of the seventeenth century, players were always attached to the establishment either of the court or of some wealthy subject, whose badge and livery they wore, and whose superintendence was presumed to control any excesses which might be injurious to the public; but when their services were not required by those to whom they especially belonged, it was usual for such persons to wander about the country, exhibiting their performances for gain, and thus becoming strollers, and even mendicants. In the reign of Henry VII. an instance is recorded of a gratuity given by that king to some 'players that begged by the way.' The chief restrictions to which such persons were liable previously to the statute of Elizabeth in which they were expressly mentioned, were measures of police for preventing tumults and breaches of the peace by the assemblage of large numbers of people at their representations. Occasionally however these popular exhibitions attracted the animadversion of the government by holding up matters of state to public censure or ridicule. Thus in 1556, when the unpopular marriage of Queen Mary with Philip of Spain had created great excitement throughout the country, the council direct the attention of the lord president of the North to 'certain lewd persons naming themselves to be servants of Sir Francis Lake, and wearing his livery or badge on their sleeves, have wandered about these north parts, and representing certain plays and interludes reflecting on the queen and her consort and the formalities of the mass.' (Strype's *Ecclesiastical Memorials*, vol. iii., Appendix, p. 185.) Excesses of a similar character, occurring at the beginning of the following reign, and directed against the Protestant religion, were checked by the stat. 1 Eliz., c. 2, s. 9, which inflicted a penalty of 100 marks upon 'persons who in plays or interludes declared or spoke anything in derogation, depraving or despising of the Book of Common Prayer.'

But although players, as such, were in those days subject to no general legal restrictions, it is probable that the practice of granting licences from the crown to such persons prevailed as early as the reign of Henry VIII. It appears too, from a curious paper published by Malone, in his 'Historical Account of the English Stage,' that in the reign of Elizabeth strolling players, though belonging to some great person, usually applied for a licence to the local authorities of any town in which they meant to perform. 'When players of interludes come to the city of Gloucester,' says this document, 'the manner is, as in other like corporations, that they first attend the mayor to inform him what nobleman's servants they are, and so to get licence for their public playing.' The earliest theatrical licence from the crown now extant is that granted by Queen Elizabeth, in 1574, to James Burbage and four other persons, 'servants to the earl of Leicester,' which contains a proviso that the performances thereby authorised, before they are publicly represented, shall be seen and allowed by the queen's master of the revels; a stipulation analogous to the licence of the lord chamberlain under the Licensing Act at the present day. These licences from the crown were originally nothing more than authorities to itinerate, which exempted strolling players from being molested by proceedings taken under the laws or proclamations against vagrants, and also superseded the necessity of licences from local magistrates. The statute 39 Eliz., c. 4, went a step farther, and by implication authorised noblemen to license players, by enacting that 'all common players of interludes wandering abroad, other than players of interludes belonging to any baron of this realm, or any other honourable personage of greater degree, to be authorised to play under the hand and seal of arms of such baron or personage, should be adjudged rogues and vagabonds.' This statute has been frequently misrepresented as denouncing all players as rogues and vagabonds (Prynne's *Histriomastix*; Howell's *State Trials*, vol. iii., p. 567); whereas it is obvious that the enactment applies only to *strolling* players.

Although theatrical representations became much more general in the reigns of James I. and Charles I., no laws were expressly enacted for their regulation, with the single exception of the stat. 1 Car. I., c. 1, which suppressed the performance of 'interludes and common plays' upon the Lord's Day. An ordinance of the Long Parliament, in 1648, was directed to the suppression of all stage-plays and interludes, but though occasionally enforced with much rigour, it failed to abolish these entertainments. The stat. 12 Ann., stat. 2, c. 23, in general terms, classed players of interludes as rogues and vagabonds; but the stat. 10 Geo. II., c. 28, s. 1, expounded the former statute by enacting that 'every person, who should for hire, gain, or reward, act, represent, or perform any play or other entertainment of the stage, or any part therein, if he shall not have any legal settlement where the offence should be committed, without authority by patent from the King, or licence from the Lord Chamberlain, should be deemed a rogue and vagabond within the stat. 12 Ann.' But this provision is now repealed by the stat. 5 Geo. IV., c. 83, and players as such, whether stationary or itinerant, are at the present day not amenable to the law as rogues and vagabonds. By the 2nd section of the above statute, 10 Geo. II., c. 28, which, with the exceptions just mentioned, is still in full operation, and forms the law of the metropolitan theatres, it is enacted generally, that 'every person who shall, without a patent or licence, act or perform any entertainment of the stage for hire, gain, or reward shall forfeit the sum of 50*l*.' By the 3rd section it is declared, that 'no person shall for hire, gain, or reward act, perform, or represent any new interlude, tragedy, comedy, opera, play, farce, or other entertainment of the stage, or any parts therein; or any new act, scene, or other part

added to any old interlude, tragedy, comedy, opera, play, farce, or other entertainment of the stage, or any new prologue or epilogue, unless a true copy thereof be sent to the Lord Chamberlain of the King's household for the time being, fourteen days at the least before the acting, representing, or performing thereof, together with an account of the play-house or place where the same shall be, and the time when the same is first intended to be first acted, represented, or performed, signed by the master or manager.' The 4th section authorizes the Lord Chamberlain to prohibit the performance of any theatrical entertainment, and subjects the persons infringing this prohibition to a penalty of 50*l.* and the forfeiture of their patent or licence. The 5th section provides, that 'no person shall be authorized by patent from the Crown or licence from the Lord Chamberlain to act, represent, or perform for hire or reward any interlude, tragedy, comedy, opera, play, farce, or other entertainment of the stage, in any part of Great Britain, except in the city of Westminster and within the liberties thereof, and in such places where the King shall personally reside, and during such residence only.' The 7th section enacts, that 'if any interlude, tragedy, comedy, opera, play, farce, or other entertainment of the stage, or any act, scene, or part thereof, shall be acted, represented, or performed in any house or place where wine, ale, beer, or other liquors shall be sold or retailed, the same shall be deemed to be acted, represented, and performed for gain, hire, and reward.' Within a few years after the passing of this act of parliament, the clause which restricted the power of granting patents by the Crown to theatres within the city of Westminster and places of royal residence, was found to be productive of inconvenience; and special acts of parliament were passed exempting several large towns, in which such entertainments were desired, from the operation of that clause, and authorizing the King to grant letters for establishing theatres in such places. Instances of statutes of this kind occur with respect to Bath in stat. 8 Geo. III., c. 10; with respect to Liverpool in the stat. 11 Geo. III., c. 16; and with respect to Bristol in the stat. 18 Geo. III., c. 8.

A further relaxation of the rule established by the stat. 10 Geo. II., c. 28, for the regulation of theatrical performances, was effected by the statute 28 Geo. III., c. 30, in favour of places which could not be expected to bear the expense of a special act of parliament. By this latter statute, the justices of the peace at general or quarter sessions are authorized to license the performance of any such tragedies, comedies, interludes, operas, plays, or farces as are represented at the patent or licensed theatres in Westminster, or as have been submitted to the Lord Chamberlain, at any place within their jurisdiction not within 20 miles of London, Westminster, or Edinburgh, or 8 miles of any patent or licensed theatre, or 10 miles of the king's residence, or 14 miles of either of the universities of Oxford or Cambridge, or 2 miles of the outward limits of any place having peculiar jurisdiction.

The penalties imposed by the stat. 10 Geo. II., c. 28, being found in practice insufficient to prevent the performance of theatrical entertainments without licence, and great evils being experienced from the resort of the lower orders in London to such entertainments, the legislature in the year 1839 gave additional powers to the metropolitan police for their prevention. By the 46th section of the stat. 2 and 3 Vict., c. 47, 'the Commissioners of police are empowered to authorize a superintendent, with such constables as he may think necessary, to enter into any house or room, kept or used within the metropolitan police district, for stage-plays or dramatic entertainments into which admission is obtained by payment of money, and which is not a licenced theatre, and to take into custody all persons who shall be found therein without lawful excuse.' The same clause enacts that 'every person keeping, using, or knowingly letting any house or other tenement for the purpose of being used as an unlicenced theatre, shall be liable to a penalty of 20*l.*, or, in the discretion of the magistrate, may be committed to the House of Correction, with or without hard labour, for two calendar months; and every person performing or being therein without lawful excuse shall be liable to a penalty of forty shillings.'

It may be desirable in this article to refer to a statute which was passed in the year 1833 for the protection of dramatic literary property, and which placed such property upon the same footing as the copyright of published books. The stat. 3 & 4 Will. IV., c. 15, enacts that the author of any tragedy, comedy, play, opera, farce, or any other dramatic piece or entertainment, shall have as his own property the sole liberty of representing the same at any place of dramatic entertainment; and that the author of any such production, published within 10 years before the passing of the act, or his assignee, shall, from the time of publication until the end of twenty-eight years, and, if the author be living at the end of that period, during the residue of his natural life, have as his own property the sole liberty of representing such production. The infringement of this right is forbidden under a penalty of 'forty shillings for every unauthorized representation of such production, or the amount of the benefit derived from such representation, or of the injury sustained by the author therefrom, whichever shall be the greater damages.'

THEATRE, HINDU. [SANSCRIT LANGUAGE AND LITERATURE.]

THEBAIA. [PARAMORPHIA.]

THEBAID, or THEBAIS (Θηβαΐς, sc. *χώρα*, *Thebais*), signifies the territory or district belonging to Thebes, and is consequently applied to the whole territory subject to the city of Thebes in Boeotia. [THEBES IN BOEOTIA.] In a similar, though a much wider sense, the name was given to the whole of Upper Egypt, the modern Said, of which Thebes was the principal city. This territory extended from Hermopolis Magna southward as far as the first cataracts of the Nile, or to Philæ; or, according to others, as far as Hiera Sicamina. This great province was, according to Strabo (xvii., p. 787), originally divided into ten nomes (*νομοί*); but Pliny (*Hist. Nat.*, v. 9) enumerates eleven, and others mention fourteen — the nomos Lycopolites, Hypseliotis, Aphroditopolites, Tinites, Diospolites, Tentyrites, Phaturites, Hermonthites, Apollinopolites, Antaeopolites, Panopolites, Coptites, Ombites, and the nomos Dodecaschoenus. Respecting the nature of these nomes and the physical features of the Thebaid, see EGYPT.

THEBES (Θῆβαι, Thebae). Towns and cities of this name occur in several parts of the antient world, but the two which are most renowned in history are the Egyptian and the Boeotian Thebes, of which we shall speak separately, and subjoin a list of the other places of this name.

THEBES IN EGYPT, in the Bible called No, or No Ammen, was situated in the central part of Upper Egypt, which derived from this city the name of Thebais. [THEBAID.] This city consisted of two main parts, which were divided by the Nile, one occupying the eastern, and the other the western bank of the river, and each extending from the river to the foot of the hills which enclose the valley of the Nile. This gigantic city, whose ruins still excite astonishment, was believed to be the most antient town of Egypt, and the original metropolis of Egypt. Its foundation was ascribed by some to Osiris, who named it after his mother (Diodorus Sic., i. 15), and by others to the last king of the house of Busiris. (Diodorus Sic., i. 45.) According to other authorities, Thebes was an Ethiopian colony. Its original circumference is stated to have been 140 stadia. Its most flourishing period appears to have been about 1600 B.C., when it was the capital of all Egypt, and when, according to Herodotus and Aristotle, the whole country of Egypt bore the name of Thebes (Θῆβαι). During that period, which probably comprises several centuries, Thebes was the residence of the Egyptian kings, whose tombs are still extant in the rocks on the western side of the city, and extend even to the borders of the desert. (Strabo, xvii., p. 816, ed. Casaub.) Homer (*Iliad*, ix. 381, &c.) speaks of the splendour, greatness, and wealth of Thebes, and calls it 'the city with a hundred gates,' each of which sent out two hundred men with horses and chariots. During the invasion of Egypt by the Persians under Cambyses, Thebes, like other towns, suffered very severely, especially the private dwellings, which were for the most part constructed of wood, while the great architectural works defied the flames as much as they have defied the slower influence of time. (Diodorus Sic., i. 46; Herodotus, iii., 25; Pliny, *Hist. Nat.*, xxxvi. 9.) After this catastrophe the city appears never to have recovered her former greatness. During the time of the Ptolemies, when the seat of government was in the northern extremity of the country, Thebes appears to have been neglected by

the Egyptian kings. In the reign of Ptolemy Lathyrus, about B.C. 86, it revolted, and after a siege of three years it was taken and plundered by the Greeks. As early as the time of Strabo, when its name Thebes had been changed by the Greeks into Diospolis (Διὸς πόλις, Diospolis Magna, that is, the great city of Jove), and the circuit of the city, which could still be traced, amounted to eighty stadia, the place consisted of a number of villages, and what remained of the antient city consisted chiefly of temples. Under the Roman dominion something appears to have been done to restore or preserve the venerable city; but new calamities broke in upon it when Christianity was introduced into Upper Egypt, and the Christians in their religious zeal destroyed and appropriated to themselves as much as they could of the works of the antient idolaters. At present the site of the city is occupied by four prineipal villages, Luxor and Carnac on the eastern, and Gournou and Medinet-Abou on the western side of the river. The buildings and sculptures still extant are the most antient of any that exist in Egypt, and are the best and most genuine specimens of Egyptian art and architecture, for we have every reason to believe that by far the greatest part of them were executed before Egypt had yet experienced the influence of the Greeks, that is, long before the Persian invasion. (B.C. 525.) The ruins, chiefly consisting of temples, colossi, sphinxes, and obelisks, occupy nearly the whole extent of the valley of the Nile, a space of six miles from east to west; and on the western side, where the ruins of the city end, there begins, as it were, the city of the dead, the tombs in the rocks, with their paintings, which are still as fresh as if they had been made only a few days ago. For an account of these remains, see the articles EGYPT, CARNAK, LUXOR; and more especially the British Museum, 'Egyptian Antiquities,' 2 vols.; and Wilkinson's 'Topography of Thebes,' in his work 'On the Manners and Customs of the Antient Egyptians,' chap. v.

THEBES IN BOEOTIA, one of the most antient and most important cities of Greece, was situated in the plain between Lake Hylice on the north, and a range of low hills on the south. The Acropolis of the city, built upon an eminence in this plain, was said to have been founded by Phœnicians under Cadmus, whence it was called Cadmea (Καδμεία; Strabo, ix., p. 401; Pausanias, ix. 5, 1; Stephanus Byz., s. v. Καδμεία). Around this citadel the city arose at a later time, and was so disposed, that the greater portion of it occupied the part north of the citadel. According to an antient legend, the city was fortified by Zethos, and Amphion, the wonderful lyre-player, who, by his music, made the stones move and form the walls round the city. (Pausanias, ix. 5, 4, &c.; Homer, *Odyss.*, xi. 262, &c.) Previous to the Trojan war the city was destroyed by the Epigoni, that is, the descendants of the seven Argive heroes who had been defeated by the Thebans, and from this destruction it does not appear to have recovered before that war, as it took no part in the expedition against Troy. In the time of Homer however, who calls it 'a city with seven gates (ἑπτάπυλος),' and gives it the attribute of εὐρύχορος, on account of the extensive plain which formed its territory, it appears to have again been in a flourishing condition. The names of the seven gates of Thebes are still preserved in Æschylus, Pausanias, Apollodorus, and Statius. In 335 B.C. Thebes was destroyed a second time, by Alexander the Great. On his accession to the throne of Macedonia it had revolted, and attempted to shake off the Macedonian yoke. Of the lower city nothing was left on this occasion except the gates, the temples, and the house of Pindar the poet: 6000 inhabitants were killed, and 30,000 sold as slaves. Cassander rebuilt the city in B.C. 316, with the generous aid of the Athenians, Messenians, and Megalopolitans. (Pausanias, ix. 7.) The city suffered a third time in B.C. 291, under Demetrius Poliorcetes. (Plutarch, *Demetr.*, 39, &c.; Diodorus Sicul., *Fragm.*, xxi., p. 273, ed. Bip.) Dicaearchus, who saw Thebes about this time or shortly after, has left us an interesting description of it. This city, says he, is about seventy stadia in circumference; its form is nearly circular, and its appearance somewhat gloomy. It is plentifully provided with water and pastures, and the gardens around it are better than any in Greece. It is most agreeable in summer, on account of the plentiful supply of cool and fresh water, and the beautiful gardens: in winter however it is very unpleasant, because it is destitute of fuel, and exposed to floods and cold winds. At this season heavy falls of snow were frequent, and the city was very dirty. (Dicaearchi Messenii, *Quae supersunt*, p. 143, &c., ed. Fuhr.) Its population about this time is supposed to have been between fifty and sixty thousand. After the Macedonian time however the city declined still more, and Sulla seems to have given it the last blow by depriving it of half of its territory, which he assigned to the Delphians (Pausanias, ix. 7, 4); and Strabo remarks that in his time it had scarcely the appearance of a village (ix., p. 403, ed. Casaub.). In the time of Pausanias the citadel, then called Thebes, was still inhabited, but the lower city was entirely abandoned; and he only saw the walls, gates, and temples, of which he gives a description. The place which now occupies the antient Cadmea is called Theba, or Pheba, and in Turkish, Stiva; and here, as well as in the surrounding plain, there are many remains of antient buildings, sculptures, and inscriptions. The inhabitants of antient Thebes were distinguished above all the other Greeks for rusticity, fierceness, and passion. Hence a Theban was always ready to settle any dispute, either with a fellow-citizen or with a foreigner, by fighting rather than by the ordinary course of justice. The women were celebrated for their gentleness and beauty. (Dicaearchus, as above.)

In early times Thebes was governed by kings, who play a more prominent part in the mythical traditions of Greece than the chiefs of any other part of the country. The last of these kings, Xanthus, was slain in single combat by Andropompus. After this event the government of Thebes became an aristocracy, or rather an oligarchy. (Pausanias, ix. 5, 8.) This form of government, although it was frequently restored for a short time, gave way to a democracy. When we read that no one was allowed to hold any public office unless he had, at least for ten years, not been engaged in any trade, this rule seems to refer to the oligarchic period. (Aristot., *Polit.*, iii. 3, p. 80; vi. 4, p. 209, ed. Göttling.) During the time of the Persian invasion, the government is again called an oligarchy; but it is added that this was not the constitution which the Thebans had inherited from their fathers. (Thucydides, iii. 62; Plutarch, *Aristid.*, 18.) The democracy, which must have been restored soon after, was again abolished after the battle of Oenophyta, in B.C. 457. (Aristotle, *Polit.*, v. 2, p. 155.) In the Peloponnesian war we again find mention of an oligarchy at Thebes (Thucydides, iv. 76; v. 31; Diodorus Sic., xii. 69); but this appears to refer only to the influence of the magistrates, for throughout that time, as well as afterwards in the time of Epaminondas and Pelopidas, it was the assembly of the people which decided the most important political questions, such as those relating to war and peace. (Xenophon, *Hellen.*, iii. 5, 8.) Henceforth the democratical constitution appears to have continued at Thebes down to the time that Greece fell into the hands of the Romans, and a shadow of it remained even afterwards. Along with the assembly, which, at least in later times, was as tumultuous as that of Athens (Polybius, vi. 44), Thebes also had a senate; and the magistrates, who were elected annually by ballot, bore the name of polemarchs. As a state Thebes was not confined to the city and its immediate neighbourhood, but comprised the whole territory between the eastern coast of Lake Copais and Mount Cithaeron, and extended to the north as far as the little river Cephissus, which empties itself in the sea between Euboea and the mainland. This whole territory was called Thebais, and contained a great number of towns which were subject to Thebes. Among the fourteen confederate states of Boeotia, Thebes was the first, whence it is generally called the capital of Boeotia, which, in the strict sense of the word, it certainly was not. [BOEOTIA.]

Besides the Egyptian and Boeotian Thebes, the following towns of this name are mentioned by antient writers:—

1. Thebes in Phthiotis in Thessaly (Θῆβαι αἱ Φθιῶτιδες, Thebae Phthioticae, or Thebae Phthiae) was an important commercial town with a good harbour. (Strabo, ix., p. 431, 433, 435; Livy, xxxix. 25; xxxviii. 7, &c.)

2. Thebe (Θήβη) in Troas in Asia Minor was celebrated as a fortified place as early as the Trojan war. It was situated north of Adramyttium, and taken and destroyed by Achilles. The plain in which the town had been situated was known down to the latest times as the Plain of Thebe (τὸ Θήβης πεδίον; Homer, *Iliad*, i. 366; vi. 397; Strabo, xiii., p. 584, &c.; Herodotus, vii. 42).

3. Thebes, in that part of Arabia Felix which was called the country of the Cinaedocolpitae.

4. Thebes in Lucania in Italy. (Pliny, *Hist. Nat.*, iii. 15.) Stephanus of Byzantium (s. v. Θῆβαι) mentions several other towns of this name, of which however nothing is known.

THECA, a term in vegetable anatomy. It was applied by Grew to that part of the stamen which contains the reproductive granules and which is now generally called the anther. [Anther.] It is also extensively employed in cryptogamic botany. Among the ferns, it is applied, in common with the terms capsule, conceptacle, and sporangium [Sporangium], to those little granules which constitute the masses called sori. In the Equisetaceæ it expresses the assemblage of cases, which are attached to scales arranged in a conical manner.

The same term is used to indicate the kidney-shaped two-valved cases that contain the reproductive matter of Lycopodiaceæ and also the urn-like organs that enclose the sporules of mosses. It is by some writers still further extended, and used to express the parts that contain the sporules in Lichens and Fungi.

THECA (in Anatomy) is a term commonly applied to the strong fibrous sheaths in which certain soft parts of the body are enclosed. Thus the *theca vertebralis* is the sheath of dura mater in which the spinal chord is enclosed; and the canals through which many of the long tendons of the muscles of the hand and foot run are called thecæ. These last are always lined by a synovial membrane, and contain a small quantity of fluid [Synovia], by which the sliding of the tendons is facilitated.

THECADACTYLS, Cuvier's name for those *Geckos* which have the toes enlarged throughout their length, and furnished below with transverse scales, which are divided by a longitudinal furrow, where the claw may be entirely hid. [Gecko.]

THECI'DEA, or THECI'DIUM. [Brachiopoda, vol. v., p. 313.] Mr. J. E. Gray arranges the *Thecideidæ* as the fourth family of the *Brachiopoda*, placing it between the *Productidæ* and the *Craniadæ*, and making it consist of the single genus *Thecidea*.

THECODONTOSAU'RUS. [Thecodonts.]

THECODONTS. Professor Owen, in his 'Report on British Fossil Reptiles,' observes that among the inferior or squamate saurians there are two leading modifications in the mode of attachment of the teeth, the base of which may be either anchylosed to the summit of the alveolar ridge, or to the bottom of an alveolar groove, and supported by its lateral wall. These modifications are, he remarks, indicated respectively by the terms 'acrodont' and 'pleurodont.' A third mode of fixation is presented by some extinct saurians, which, in other parts of their organization, adhere to the squamate or lacertine division of the order, the teeth being implanted in sockets, either loosely or confluent with the bony walls of the cavity: these Professor Owen has, in his 'Odontography,' termed the *Thecodont Lacertians*, the most antient of all saurians belonging to this group.

Commencing with the *Thecodontosaurus* of Dr. Riley and Mr. Stutchbury, described by them in the 'Geological Transactions' of 1836, from remains found in the dolomitic conglomerate of Redland, near Bristol, the oldest or lowest division of the new red sandstone series, Professor Owen remarks that this reptile is allied to the typical *Varanian Monitors*, but differs from them in having the teeth imbedded in distinct sockets; but that the *Varani*, among the squamate saurians, approach to this condition in the shallow cavities containing the base of their teeth along the bottom of the alveolar groove.

But, in the extinct genus now under consideration, the sockets are, he states, deeper, and the inner alveolar wall is nearly as high as the outer one; the teeth are arranged in a close-set series, slightly decreasing in size towards the posterior part of the jaw; each branch of the lower jaw is supposed to have contained twenty-one teeth, which are conical, rather slender, compressed and acutely pointed, with an anterior and posterior finely serrated edge, the serratures being directed towards the apex of the tooth, as in G. Fischer's genus *Rhopalodon;* the outer surface is more convex than the inner one; the apex is slightly recurved; and the base of the crown contracts a little to form the subcylindrical fang. He then goes on to remark that the pulp-cavity remains open in the base of the crown; that, in their microscopic structure the teeth of the *Thecodontosaurus* closely correspond with those of *Varanus*, *Monitor*, and *Megalosaurus;* that the body of the tooth consists of compact dentine, in which the calcigerous tubes diverge from an open pulp-cavity at nearly right angles to the surface of the tooth; that they form a slight curve at their origin, with the concavity directed towards the base of the tooth; then proceed straight, and, at the periphery, bend upwards in the contrary direction. The diameter of the calcigerous tube he gives as 1-30,000th of an inch, and the breadth of the interspace of the tube as 1-8000th of an inch. The crown of the tooth is invested with a simple crown of enamel. This microscopic examination, which Professor Owen was enabled to make by the kindness of Mr. Stutchbury, satisfactorily establishes, in the Professor's opinion, the distinction between the saurian of the Bristol conglomerate and *Labyrinthodon*. [Salamandroides.]

Of Palæosaurus Professor Owen states that its tooth is compressed, pointed, and with trenchant serrated margins; but that its breadth, compared with its length, is much greater than in *Thecodontosaurus*. The vertebræ associated with these teeth were biconcave, with the middle of the body more constricted, and terminal articular cavities rather deeper than in Teleosaurus; but, the Professor adds, they are chiefly remarkable for the depth of the spinal canal at the middle of each vertebra, where it sinks into the substance of the centrum, and thus the canal is wider vertically at the middle than at the two ends of the vertebra: an analogous structure, he observes, but less marked, obtains in the dorsal vertebræ of the *Rhynchosaurus* from the new red sandstone of Shropshire.

Professor Owen then points out that besides deviating from existing lizards in the thecodont dentition and biconcave vertebræ, the antient saurians of the magnesian conglomerate also differed in having some of their ribs articulated by a head and tubercle to two surfaces of the vertebra, as at the anterior part of the chest in *Crocodiles* and *Dinosaurs*. The shaft of the rib, he tells us, was traversed, as in the Ichthyosaur and Rhynchosaur, by a deep longitudinal groove; and some fragmentary bones indicated obscurely that the pectoral arch deviated from the Crocodilian, and approached the Lacertian or Enaliosaurian type in the presence of a clavicle, and in the breadth and complicated form of the coracoid. The humerus, he observes, appears to have been little more than half the length of the femur; and to have been, like that of the *Rhynchosaurus*, unusually expanded at the two extremities.

After quoting the description of the femur by the discoverers of the present thecodont reptiles, Professor Owen remarks that the tibia, fibula, and metatarsal bones manifest, like the femur, the fitness of the thecodont saurians for progression on land. The ungual phalanges, he observes, are subcompressed, curved downwards, pointed, and impressed on each side with the usual curved canal.

The Professor draws the following conclusions from the knowledge at present possessed of the osteology of *Thecodontosaurus* and *Palæosaurus*, whose antiquity the discoverers of these genera regard as being greater than that of any other vertebrated animals, excepting fishes:—

In their thecodont type of dentition, biconcave vertebræ, double-jointed ribs, and proportionate size of the bones of the extremities, they are nearly allied to the *Telcosaurus;* but they combine a lacertian form of tooth and structure of the pectoral and probably pelvic arch with these crocodilian characters, having distinctive modifications, as the moniliform spinal canal, in which however the almost contemporary Rhynchosaur participates.

Professor Owen adds that it would be interesting to ascertain whether the caudal vertebræ are characterized, as in the Thuringian Protosaur, by double diverging spinous processes.

Cladyodon, Owen.—'In the new red sandstone (keuper?) of Warwick and Leamington,' says the Professor, 'there occur detached, pointed, trenchant, recurved teeth, the crowns of which are sometimes 1 inch 4 lines in length, and 5 lines across the base: they have been found in the same quarries as those containing the remains of *Labyrinthodon*. In their compressed form, anterior and posterior serrated edges, sharp points, and microscopic structure, these teeth agree with those of the Saurian reptiles of the

Bristol conglomerate. In their breadth, as compared with their length and thickness, they are intermediate between the *Thecodontosaurus* and *Palæosaurus platyodon;* but they are larger, with longer and more recurved crowns, and thus more nearly approach the form characteristic of the teeth of the *Megalosaurus*. From these teeth however they differ in their greater degree of compression, and in a slight contraction at the base of the crown; I therefore indicate the genus, of which, as yet, only the teeth are known, by the name of *Cladyodon*, and the species from the Warwickshire sandstones by the name of *Cladyodon Lloydii*, in testimony of the friendly aid of Dr. Lloyd of Leamington, to whose zealous co-operation I owe the materials for the description of the teeth of the present genus, and the still more remarkable ones of the British species of *Labyrinthodon*, with which the teeth of the *Cladyodon* are associated.

In conclusion, Professor Owen refers to a tooth of *Cladyodon* figured by Mr. Murchison and Mr. Strickland in their paper on the Warwick sandstones. (*Geol. Trans.*, 2nd series, vol. v.)

THECOSO'MATA, M. de Blainville's name for his first family of *Aporobranchiata*, the first order of his second section of his second subclass (*Paracephalophora Monoica*).

The *Aporobranchiata*, according to M. de Blainville, consist of those *Malacozaria*, or Mollusks, which have the body of a slightly variable form, but constantly provided with natatory appendages which are equal and lateral, without any foot properly so called, and which often have the organs of respiration but little evident.

The following genera are arranged by M. de Blainville under the family of *Thecosomata*:—

Hyalæa: Cleodora, divided into two sections; 1, depressed species, Ex., *Cleodora Brownii;* 2, conical and not depressed species (genus *Vaginella*, Daud.), Ex., *Vaginella depressa; Cymbulia:* and *Pyrgo* (fossil).

The principal forms of this family are treated of under the article HYALEIDÆ.

Mr. J. E. Gray, who makes the *Thecosomata* the first order of the class (4th) PTEROPODA, divides the forms which, in his opinion, should be arranged under that order, into the following families and genera:—

Fam. 1. Cleodoridæ.

Genera:—*Hyalæa: Diacria; Cleodora; Balantium; Pleuropus; Vaginella; Creseis; Brochus; Psyche; Euribia.*

Fam. 2. Limacinidæ.

Genus, *Limacina.*

Fam. 3. Cuvieridæ.

Genera:—*Cuvieria; Tripteres.*

Fam. 4. Cymbuliadæ.

Genus, *Cymbulia.*

THEDEN, JOHANN CHRISTIAN ANTON, a celebrated German surgeon, was born Sept. 13, 1714, at Steinbeck, a small village not far from Wismar, in the duchy of Mecklenburg. His family had been ruined by the disasters of war, and his father died when he was young, which two melancholy events had an unfavourable influence upon his education and his first entrance into life. He had hardly received the bare elements of education, when, at the age of thirteen, he was reduced to the necessity of hiring himself out as a servant; but this occupation was so revolting to his feelings, that he determined to learn a trade. Accordingly his elder brother, who was a tailor, received him as an apprentice; but Theden did not find this employment more suited to his taste and talents than his former one, and, as he got nothing but reproofs from his brother, he finally determined to devote himself to the study of medicine. He was first placed by his friends with a surgeon at Butzow, where he spent four years in a barber's shop without any real advantage; and as soon as his apprenticeship was finished, he went to Rostock, Hamburg, Lübeck, and Danzig. In this last city he at length succeeded in obtaining some employment in the troops of the king of Prussia, and was attached as surgeon to a squadron of cuirassiers. The zeal and punctuality with which he performed all his duties in this post soon gained him the esteem and friendship of his superior officers: the jealousy however of the chief surgeon (*chirurgien-major*) prevented his profiting by the good-will shown him by king Frederick William I. at a review at Riesenburg, and the death of this prince put an end to all the hopes of promotion which he had at first entertained. In 1742 he went to Berlin, where the celebrated Schaarschmidt, who justly appreciated his talents, honoured him with his friendship, and procured for him the post of chief surgeon during the second war in Silesia. At the end of three years he returned to Berlin, and devoted himself with unremitting attention to the study of anatomy and surgery. The Seven Years' War afterwards furnished him with numerous opportunities of displaying the skill that he had acquired, and also the excellent qualities of his heart. Frederick the Great raised him gradually from one post to another, till he became at last his chief military surgeon. Theden, in this eminent position, improved all the branches of the service, and displayed an activity which contributed still more to gain him the good opinion of his sovereign. The successor of Frederick honoured him equally with his confidence, and Theden continued to enjoy to the end of his life an esteem and respect for which he was indebted only to his real merit and eminent services. He died, October 21, 1797, at the age of eighty-three. The continual fatigue and agitation of war did not prevent his drawing up and putting in order the observations which an immense field of action had given him an opportunity of collecting. His works are not numerous, but they bear the stamp of experience, and one recognises in them the firm and bold touch of a man who did not venture to take up his pen till after thirty years of most extensive practice. From this eulogium we must however except all the theoretical parts of his writings, which, unfortunately, hold a prominent place in them, and which are only based upon the foundation of the antiquated principles of the humoral theory. The following is the list of his works mentioned by M. Jourdan in the 'Biographie Médicale,' from which work the preceding account has been taken:—'Neue Bemerkungen und Erfahrungen zur Bereicherung der Wundarzneykunst und Medicin,' Berlin and Stettin, 1771-1795, 8vo.; 'Unterricht für die Unterwundärzte bey Armeen,' Berlin, 1774, 8vo., and 1782, 8vo.; 'Sendschreiben an Richter, die neu erfundenen Catheter aus der Resina elastica betreffend,' Berlin, 1777, 8vo.

THEFT. [LARCENY.]

THEIN, or Theina, the peculiar principle of tea, which was procured and analysed by M. Jobst of Stuttgard. He prepared it by boiling tea-leaves in water, filtering and concentrating the solution, and adding to it acetate of lead as long as precipitation occurred; after filtration the excess of lead was precipitated by hydrosulphuric acid, and by subsequent evaporation crystals of thein were deposited which possessed the following properties after purification: they were soft, acicular, snow white, much more soluble in hot than in cold water, alcohol, or æther; they dissolved readily in acids, and were decomposed when heated either in sulphuric or nitric acid. Thein has no effect on vegetable blues; alkalis do not precipitate it from solution in acids, and when boiled in a strong solution of potash it is decomposed, and ammonia is evolved; it contains water of crystallization, which it loses at 212°. Thein may be sublimed.

According to the analysis of Jobst, thein is composed of

Hydrogen	5·22
Carbon	49·60
Oxygen	16·27
Azote	28·91
	100·

It is to be remarked that this analysis very closely resembles that of Caffein as given by Liebig.

THELICO'NUS, Mr. Swainson's name for a subgenus of CONUS. Ex., *Conus nussatella*. (*Malacology.*)

THELIDERMA, Mr. Swainson's name for a subgenus of *Unio*. (*Malacology.*) [NAIADES.]

THELI'DOMUS, a form placed by Mr. Swainson under his family *Trochidæ*, in the subfamily *Rotellinæ*, with the generic name at the head of this article.

Example, *Thelidomus Braziliensis.*

Mr. Swainson thus describes it. 'We have placed the *Trochidæ* next to the *Helicidæ* under the belief that they followed each other, although the links of connection were wanting. It is clear that of all the types of the *Trochidæ*, *Rotella* is that which by its general form makes the nearest approach to *Helix;* while the thickening of the inner lip, which spreads over the umbilicus, is found also, but in a less degree, in many of the land volutes, *Lucer-*

nnæ. But a singular discovery recently made has thrown an entirely new light upon this interesting question. Among a considerable number of freshwater *Planorbi*' (sic) 'all of one species, which were sent to us from Brazil, we picked out two helix-looking shells, so precisely of the same olive-brown colour, and of the same size, as the others, that none but a conchologist would have been led to examine them. They appeared in fact like two little land-snails of the subgenus *Zonites*, that had fallen into the water where the *Planorbi*' (sic) 'had been found, their outside being discoloured, and covered with little particles of dirt and sand. On placing them however under the magnifier, a conchologist alone can judge of our astonishment at finding that the whole of the shell was actually composed of little stones and grains of sand only, agglutinated together, yet with so much skill by the animal, that the regular turns of the volutions of the spire, and the form of the umbilicus, were most accurately preserved; they were, in short, freshwater carriers—absolute counterparts of their marine brethren, *Onustus*. As we can find no notice nor even allusion to such an extraordinary genus of shells in any writer, we have considered it new, and affixed to it the name of *Thelidomus*. In regard to its affinity, we suspect that it fills the same situation among the *Rotellinæ* which *Onustus* does among the *Trochinæ*: this will make it the most aberrant type and consequently that which comes nearest to the *Helicidæ*, whose form it actually possesses. The annexed figures are taken from the only two specimens, in our cabinet, which we have either seen or heard of. Thus, there is ground for supposing that the passage from the marine *Trochidæ* to the terrestrial snails is marked by one or more fluviatile types; just as is the passage, on the other side, of the *Helicidæ* marked by the *Limnacinæ*. The accidental discovery also of this extraordinary shell will probably induce naturalists to a more accurate examination of the fossil turbinated univalves; for it is clear that although *Thelidomus* opens the path to the *Helicidæ*, there must be several other forms between the two, either extinct or undiscovered.' (*Malacology: Cubinet Cyclopædia*, 1840.)

This so-called shell, which is twice figured and described as that of a *mollusk* in the work quoted, is the case of an insect.

We notice the error, that a mistake in a useful book bearing the authority of a name so generally known and deservedly respected as Mr. Swainson's, may not mislead.

THELI'DON'TA, a genus of pulmoniferous gastropods, which Mr. Swainson apparently places among the *Lucerninæ*, or *Land Volutes*, as he terms them: but we do not find it in the 'Natural Arrangement' at the end of his vol. on *Malacology*, unless *Thelidomus*, which appears there for the third time, following *Pusiodon* at the end of the subfamily *Lucerninæ*, be a misprint for it.

THELLUSSON, PETER. He was the son of Isaac de Thellusson, ambassador from Geneva to the court of Louis XV. He fixed his residence in London about the middle of the eighteenth century, and accumulated an immense fortune as a merchant. He died on the 21st of July, 1797. His name has been rendered remarkable by the extraordinary nature of his will. The capricious and extensive use of the power of disposing of his property, which the law, as then existing, placed in his hands, led to the restraints subsequently imposed upon testamentary dispositions.

The property which was the subject of his will consisted of a landed estate of about 4000*l*. a year, and of personal property to the amount of about 600,000*l*. This property he devised and bequeathed to trustees upon trust for accumulation and investment in the purchase of lands during the lives of his sons, grandsons, and the issue of sons and grandsons living, or *in ventre sa mere*, at the time of his death, and the lives of the survivors and survivor of them; and after that period, to be conveyed to the lineal descendants of his sons in tail male.

It had been long understood to be the rule of law that the absolute ownership of property might be suspended, and consequently the property rendered inalienable, during lives in being at the time of the creation of the trust, that is, where the trust is created by will, at the time of the death of the testator. This period was afterwards extended so as to allow for the cases of infancy, and of a child *in ventre sa mere*; but it was for some time questioned whether a term of twenty-one years might in all cases be added to the period of suspension, though it has since been determined that it may. [SETTLEMENT.] Restraint on the accumulation of income was unknown to the common law, except in so far as the rule against perpetuities necessarily prevented accumulation from being carried beyond its limits; and Mr. Thellusson's will, by confining the restriction to existing lives, escaped the question which then existed as to the allowance of an absolute term of twenty-one years in addition to a life or lives in being at the time of the creation of the trust.

This will, which, in the events that happened, had the effect of postponing the usufructuary enjoyment of the bulk of the estate till the expiration of nine lives in being at the time of the testator's death, was, after many hard struggles, occasioned rather by the immense value of the property implicated (which it was computed would have amounted, with the expected accumulations, to upwards of 18,000,000*l*.), than by any new difficulty in the principle, finally established by the decision of the House of Lords on the 25th of June, 1805. (*Thellusson* v. *Woodford*, 11 Ves., 112.)

The case of Thellusson *v.* Woodford gave rise to the act of the 40 Geo. III., c. 98, 'for restraining all trusts and directions in deeds or wills whereby the profits or produce of real or personal estates shall be accumulated and the beneficial enjoyment thereof postponed beyond the term therein limited.' By the provisions of this act no person can settle or dispose of property by deed, will, or otherwise, so as to accumulate the income thereof, either wholly or partially, 'for any longer term than the life or lives of any such grantor or grantors, settlor or settlors, or the term of twenty-one years from the death of any such grantor, settlor, devisor, or testator, or during the minority or respective minorities of any person or persons who shall be living or in *ventre sa mere*, at the time of the death of such grantor, devisor, or testator, or during the minority or respective minorities only of any person or persons, who, under the uses or trusts of the deed, surrender, will, or other assurances directing such accumulations, would for the time being, if of full age, be entitled to the rents, issues, and profits, or the interest, dividends, and annual produce so directed to be accumulated. And in every case where accumulation shall be directed otherwise than as aforesaid, such direction shall be null and void, and the rents, issues, profits, and produce of such property so directed to be accumulated shall, so long as the same shall be directed to be accumulated contrary to the provisions of this act, go to and be received by such person or persons as would have been entitled thereto, if such accumulation had not been directed.' Sect. 2 provides, 'that nothing in this act contained shall extend to any provision for payment of debts of any grantor, settlor, or devisor, or other person or persons, or to any provision for raising portions for any child or children of any person taking any interest under any such conveyance, settlement, or devise, or to any direction touching the produce of timber or wood upon any lands or tenements; but that all such provisions shall be made and given as if this act had not passed.' Sect. 3 provides that the act shall not extend to dispositions of heritable property in Scotland.

It has been sometimes thought that periods specified in the act might be taken accumulatively, and that accumulation might be directed for them all successively. The language of the statute however is disjunctive, and therefore seems to give the option of selecting one only of the designated periods. (9 Ves., 136.) And it has been determined that the clause respecting the minority of persons entitled under the limitation in the instrument does not authorize a trust for accumulation extending over the minority of an unborn person to whom at majority the accumulated fund with the principal from which it arose is given. (4 Madd., 275.)

It is now settled upon this statute that a trust for accumulation reaching beyond the allowed period is good for the period allowed by law. (12 Ves., 295; 4 Russ., 403.)

THELPHU'SA. [THELPHUSIANS.]

THELPHU'SIANS, M. Milne Edwards's name for a tribe of brachyurous crustaceans belonging to his family of *Catometopes*, having, as he observes, considerable analogy with the *Cancerians*, and evidently forming the passage between them and the *Gecarcinians*, or Land Crabs. [GECARCINUS.] The general form, in fact, he remarks, of many of the *Thelphusians* differs but little

from that of Eriphia, and the disposition of the organs of generation is the same as in the two preceding families*; but the structure of their respiratory apparatus and other characters place them at a distance from those natural groups, and do not permit their separation from the *Catometopes*. Thus, he observes, each of the branchial cavities occupies about a third of the carapace and is elevated into a vault at a very considerable distance from the branchiæ. Sometimes the lining membrane is covered with spongy vegetations. The branchiæ are, it is true, nine on each side, namely, two reduced to the state of vestiges and fixed to the jaw-feet, and seven lying on the vault of the sides as in the *Cyclometopes*; but their texture is softer, and they are directed backwards so as to cover nearly the whole of the vault of the sides, a disposition which is only met with in the family of the *Catometopes*.

The *carapace* of the *Thelphusians* has but little or no convexity, and is wider than it is long: its anterior border is straight, and occupies about two-thirds of its transversal diameter: its lateral borders describe a regular curve. The *front* is remarkably wider than the buccal frame, and more or less curved downwards. The *eyes* have a stout and short peduncle, the length of which is never more than double the diameter, and its lower surface is occupied by the cornea for about half its length. The orbits are oval, and always present at their internal angle a narrow gap filled by the external antenna. The *internal antennæ* are horizontal, and, in general, nearly entirely hid by the front. The basilary joint of the *external antennæ* penetrates into the gap which occupies the internal angle of the orbit and separates this cavity from the antennary fossets; it is but little developed, and the moveable stem which springs from it in the same gap is very small. The *epistome* is nearly linear, and placed on the same level as the lower border of the orbit. The *buccal frame* is nearly as large before as behind, and the fourth joint of the external jaw-feet is inserted sometimes at the internal angle, sometimes at the middle of the anterior border of the preceding joint, and sometimes at its external angle. The anterior *feet* are much stronger and nearly always longer than the succeeding ones; they are but little, if at all, compressed. The third pair of feet are the longest of all, but they are not twice the length of the post-frontal portion of the carapace, and they terminate, like the others, in a styliform tarsus. The second joint of the *abdomen* of the male covers the corresponding portion of the sternal plastron throughout its width, and extends to the basilary joint of the posterior feet. The abdominal appendages of the second pair in the male are filiform towards the end, and at least as long as those of the first pair. (M. E.)

Habits of the Tribe.—These are very remarkable. All the known species live in the earth near the banks of rivers or in humid forests; bearing a strong analogy to the Land-Crabs. (M. E.)

M. Milne Edwards divides the tribe into three sections:—

1. Third joint of the external jaw-feet nearly square, and giving insertion to the succeeding joint by a notch in its internal angle.

Genus, *Thelphusa* (Latreille).

Generic Character.—*Carapace* wider than it is long, narrowed behind and very slightly convex above. The regions generally scarcely separated, but the *stomachal region*, when it is distinct, is extremely wide forwards. The fronto-orbital or anterior border of the carapace occupies about two-thirds of its transversal diameter, and its lateral borders are very much arched in their two anterior third portions: the posterior border is equal in width to the half or two-fifths of its transversal diameter. The *front* is very little inclined, nearly straight, and wider than the buccal frame. The *orbits* are oval; they present no fissures above, and are furnished with a large vertical tooth which rises from their lower wall near the internal canthus of the eye. The *antennary fossets* are very narrow. The basilary joint of the *external antennæ* varies in its form, but only reaches a little, or not at all, beyond the tooth of the lower orbital wall against which it is applied. *External jaw-feet* elongated, and their third joint, nearly quadrilateral, carrying the succeeding joint at its internal angle, which is truncated: *Sternal plastron* nearly as long as it is wide, and approaching in its form that of the *Cancerians*. Anterior *feet* always much longer than the second pair, and unequal in size: the hands slightly curved inwards, and the claw which terminates them pointed, very much elongated, and finely dentilated. Succeeding feet all slightly channelled above; their tarsus is quadrilateral and armed with very strong horny spines; the second pair are much shorter than the third, the length of which last does not quite equal twice the length of the carapace. *Abdomen* composed of seven joints in both sexes. (M. E.)

There are several species, and the *Geographical Distribution* appears to be wide. The form is found in Italy, Greece, Egypt, and Syria. On the Coromandel coast; at the Cape of Good Hope; and at Pondicherry.

Example, *Thelphusa fluviatilis*. Length 2¼ inches. Colour yellowish.

Localities.—South of Italy, Greece, Egypt, and Syria.

This species is generally considered to have been well known to the antients, and to be that noticed by Hippocrates and Aristotle: these *Thelphusæ* are supposed to be the Heraeleotic Crabs (οἱ Ηρακλεωτικοὶ καρκίνοι) of the latter (*Hist. Anim.*, iv. 2); and to be those represented on antient medals.

Thelphusa fluviatilis burrows in the earth on the banks of rivers.

Thelphusa fluviatilis (reduced).
a. External jaw-foot of same.

2. Third joint of external jaw-feet nearly square, and giving insertion to the succeeding joint towards the middle of its anterior border.

Genus, *Boscia* (Edwards; *Potamia*, Latreille).

Generic Character.—General form nearly the same as in some of the *Thelphusæ*; but the *front*, which is sharply bent downwards, is vertical, and the third joint of the *external jaw-feet*, instead of being square and having the ordinary form existing in the *Cancerians*, is narrowed forwards and carries the succeeding joint on the middle of its anterior border. (M. E.)

M. Milne Edwards remarks that this genus is terrestrial, like the *Thelphusæ*,* and inhabits also the banks of rivers. He states that a dissection of an individual well preserved in spirit by M. Andouin and himself, discovered to them a very remarkable disposition in the branchial apparatus of this crustacean: the cavities which enclose the breathing organs are elevated far above the upper surface of the branchiæ, and present a great vacant space, the walls of which are lined with a tomentose membrane covered with vegetations.

Example, *Boscia dentata*, the only known species. Length about 2 inches.

Localities.—The Antilles and South America.

3. Third joint of the external jaw-feet having nearly the form of a reversed triangle, and giving insertion to the succeeding joint by its external angle.

Genus, *Trichodactylus* (Latreille).

Generic Character.—*Carapace* nearly horizontal above and much less wide than in *Thelphusa*. *Front* wide, lamellar, and simply inclined; *orbits* nearly circular; lateral borders of the carapace curved. *Antennæ* disposed nearly as in *Thelphusa*; but the form of the *external jaw-feet* is very different, their third joint is nearly triangular, with its summit directed inwards, and it is articulated with the succeeding joint by its anterior and external angle.

* These appear to be the *Oxyrhynchs* and *Cyclometopes*.

* But see post, p. 307.

Boscia dentata, reduced one-third.
1, Antennary region; 2, external jaw-foot.

Feet nearly of the same form as in the preceding genera. (M. E.)

Example, *Trichodactylus quadratus*, the only known species. Length about 1 inch.

Locality.—Brazil.

M. Milne Edwards is of opinion that this species establishes the passage between the preceding genera and the tribe of *Grapsoidians*. [GRAPSUS.]

Mr. W. S. MacLeay, in his interesting paper 'On the Brachyurous Decapods of the Cape' (Smith's *Illustrations of the Zoology of South Africa*), in a note to the sixteenth species (*Thelphusa perlata*, M. E.), remarks that this crab is common in all the rivers of Southern Africa, and grows to the size of nearly three inches long. 'The male,' says Mr. W. MacLeay in continuation, 'has a much more convex shell than the female, and in aspect resembles much a *Gegarcinus*. The pearly tubercles of the anterior margin of the shell are also still more small and evanescent than in the female. I may take this occasion to observe, that in my cabinet I separate those species of *Thelphusa* which, like the present, have a transversal crest in front of the shell, and call them *Potamonautes*. They are easily distinguished from true *Thelphusæ*, of which the type is the European species *Thelphusa fluviatilis*.

THELWALL, JOHN, son of Joseph Thelwall, a silk-mercer, was born on the 27th July, 1764, in Chandos-street, Covent Garden, London. He was the youngest of three children, two sons and a daughter. At an early age he manifested so much talent for drawing, that he was intended for an artist, but his father's decease changed his prospects before he had completed his ninth year. He received the ordinary education of a tradesman's son, but as he was rather slow in acquiring knowledge and was removed from school at thirteen years of age, his attainments must necessarily have been limited.

The widow continued to carry on her deceased husband's business, and placed her son John in the shop, where he remained three years, but spent his time chiefly in reading, which was of a miscellaneous character, consisting of poetry, history, the drama, moral philosophy, metaphysics, and divinity. A distaste for the business, joined to family discord, induced him to leave it, and although he earnestly desired to be an artist or an actor, he yielded to his mother, who apprenticed him to a tailor, with whom however he remained only a short time. At the suggestion of Mr. Holt of the Chancery bar, who had married his sister, he turned his attention to the law, but after several years' study he abandoned it in consequence of doubts arising in his mind on the morality of a hired advocate pleading to support a cause rather than to discover the truth; and now, in his 22nd year, he embraced literature as a profession.

In 1787 he published by subscription poems on several subjects, in 2 vols., which introduced him to some valuable friendships and to the editorship of a magazine. He was now a rising and prosperous man, and on the 27th July, 1791, he married Miss Susan Vellum, of Rutlandshire, who was then 17 years of age. He took a house near the Borough hospitals, and ardently studied anatomy, physiology, and chemistry, under Mr. Cline, Dr. Haighton, and Dr. Babington.

He began his career as an orator, before he was twenty years of age, at the Society of Free Debate held at Coach-makers' Hall. He had been educated a churchman in religion and a tory in politics, but on both subjects his opinions were changing, and he now joined in the political struggles of the period by becoming a member of the Corresponding Society, where his boldness and fluency of speech attracted the notice of the leading men of the day. With Thomas Hardy and John Horne Tooke [HORNE TOOKE] he was tried for high treason, and acquitted. Thelwall's trial lasted five days. On his acquittal he lectured on politics and political history for several years, when, after a retirement of two years in Wales, made in order to disconnect himself from public affairs and to escape from extra-judicial persecution, he began his career in 1801 as a lecturer and tutor in elocution, and in the application of elocutionary science to the cure of stammering and other impediments to speech. His knowledge of anatomy and physiology, his habits of recitation, his practice of public speaking, and his accuracy of observation, eminently qualified him for his new profession, and his success was great. He communicated papers to the 'Medical and Physical Journal,' on defective and difficult utterance, and to the 'Monthly Magazine,' on elocution and its kindred sciences.

In 1816 Mrs. Thelwall died, leaving a family of four children, two of whom are sons, and both are in the church. Mr. Thelwall afterwards married Miss Cecil Boyle, by whom he has left one son. He died at Bath after a few hours' illness, of disease of the heart, to which he had been long subject, on the 17th February, 1834, in his 70th year.

The researches of Steele, Herries, and Walker, on human speech, had left little room for new and brilliant discovery, although much accurate observation was yet necessary to give exactness and fulness to their knowledge. Thelwall, unaware of Steele's researches, found himself anticipated on rhythmus. Steele had given the inquiry a musical direction, which Thelwall ardently followed out, and the extent and precision of his observations may be estimated by the fact that he anticipated nearly all that is new and valuable in Dr. Rush's 'Philosophy of the Human Voice.' Mr. Thelwall's immature ideas were first sketched out in the syllabus of his lectures on elocution.

Thelwall was of a mild and amiable disposition, of domestic habits, open-hearted and generous, of high moral feeling, and of inflexible integrity. His sentiments were exalted by poetic feeling, and he was buoyed up by hope.

Besides magazine contributions and pamphlets, he wrote poems on several subjects, in 2 vols., already mentioned; 'Poems written in the Tower and in Newgate,' 1 vol.; 'The Tribune,' 3 vols., and 'Political Miscellanies,' 1 vol.; 'A Letter to Mr. Cline, on Stammering,' 1 vol.; 'The Peripatetic,' 3 vols.; and a novel, entitled 'The Daughter of Adoption.'

THE'MEON. [FORAMINIFERA, vol. x., p. 348.]

THEMIS (Θέμις), a Greek divinity, was, according to Hesiod and Apollodorus, a daughter of Uranus (Heaven) and Gaea (Earth), or, according to Tzetzes, a daughter of Helios. She was a favourite of Zeus, and bore him several daughters,—the Horæ, Eunomia, Dice, Eirene, and the Moerae. (Hesiod, *Theog.*, 135, 901, &c.; Apollodorus, i. 3, 1.) These personified abstractions, which are represented as her daughters, show the ideas which the antients had formed of her character, and consistently with these ideas she appears in Homer as a personification of the order of things sanctioned by usage or by law, and as the goddess who rules in the assemblies of the people. (Homer, *Odyss.*, ii. 68, &c.) According to the same poet she lived with the other great gods in Olympus, was on good terms with Hera, and occasionally assembled the gods at the command of Zeus. (Homer, *Iliad*, xv. 87, &c.; xx. 4, &c.) Diodorus (v. 67) states that she was believed to have made men acquainted with the will of the gods, the mode of their worship, and to have instituted laws, religious as well as civil. As a deity revealing the future she was believed to have been in possession of the Delphic oracle after her mother Gaea, and previous to the time that it came into the hands of Apollo, whence the act of giving an oracle was, even in later times, frequently called by a word derived from her name (*θεμιστεύειν*). She was worshipped as the goddess of law and order in various parts of Greece, as at Thebes, Olympia, Athens, Tanagra, and Troezen. She is frequently represented on coins in a form

resembling that of Athena, but carrying the horn of plenty in one hand and a pair of scales in the other.

THE'MISON (Θεμίσων), an antient physician, who is probably best known to most persons from Juvenal's somewhat equivocal line (*Sat.*, x., v. 221)—

'Quot Themison aegros autumno occiderit uno;'

but who was in reality the founder of a celebrated medical sect, and one of the most eminent physicians of his time. He was born at Laodicea in Syria, in the first century before Christ, and, from Juvenal's line above quoted, may be conjectured to have practised at Rome. He was a pupil of Asclepiades, from whose opinions however he afterwards dissented, and finished by founding a new medical sect, called the Methodici. (Pliny, *Hist. Nat.*, lib. xxix., cap. 5, ed. Tauchn.; Galen, *Introd.*, cap. 4, tom. xiv., p. 683, 684, ed. Kühn; Cramer,* *Anecd. Gr. Paris.*, vol. i., p. 395, l. 26.) The following is the analysis of the opinions of this school, which is given by Celsus in the historical introduction to his work:—'They assert that the knowledge of no cause whatever bears the least relation to the method of cure; and that it is sufficient to observe some general symptoms of distempers; and that there are three kinds of diseases, one bound, another loose,† and the third a mixture of these. For that sometimes the excretions of sick people are too small, sometimes too large; and sometimes one particular excretion is deficient, while another is excessive. That these kinds of distempers are sometimes acute, and sometimes chronic; sometimes increasing, sometimes at a stand,‡ and sometimes abating. As soon then as it is known to which of these classes a distemper belongs, if the body be bound, it must be opened; if it labours under a flux, it must be restrained; if the distemper be complicated, then the most urgent malady must be first opposed. And that one kind of treatment is required in acute, another in inveterate distempers; another when diseases are increasing; another when at a stand; and another when inclining to health. That the observation of these things constitutes the art of medicine, which they define as a certain way of proceeding, which the Greeks call *method* (μέθοδος), and affirm it to be employed in considering those things that are common to the same distempers: nor are they willing to have themselves classed either with the rationalists (*i.e.* the Dogmatici), or with those who regard only experiments (*i. e.* the Empirici): for they dissent from the first sect, in that they will not allow medicine to consist in forming conjectures about the occult things; and also from the other in this, that they hold the observation of experiments to be a very small part of the art.' (Futvoye's *Translation.*) What we know of his mode of treating diseases does not give us a very high idea of his skill in therapeutics. He thought he could cure the most violent attacks of pneumonia by means of oil and baths; in pleurisy he permitted the use of wine mixed with sea-water (Cael. Aurel., *De Morb. Acut.*, lib. i., cap. 16, p. 62, 63); he recommended also violent exercise in several acute diseases. (Id., *ibid.*, lib. ii., cap. 29, p. 144.) He is said by Sprengel (*Hist. de la Méd.*) to have been the first person who made use of leeches. (Id., *De Morb. Chron.*, lib. i., cap. 1, p. 286.) He is also said to have been himself attacked with hydrophobia, and to have recovered. (Id., *De Morb. Acut.*, lib. iii., cap. 16, p. 232; Dioscor., *Theriac.*, cap. 1, p. 423.) He wrote several medical works, of which nothing but the titles remain. (Cael. Aurel., *De Morb. Chron.*, lib. i., cap. 1, p. 285; i. 4, p. 323; ii. 7, p. 387, &c.) His followers were very numerous, of whom the most eminent were Soranus [SORANUS], Thessalus [THESSALUS], Caelius Aurelianus, whose work 'De Morbis Acutis et Chronicis' is one of the most valuable of antiquity; and Moschion, author of the work Περὶ τῶν Γυναικείων Παθῶν, 'De Mulierum Passionibus.'

(Sprengel, *Hist. de la Méd.*; Fabricius, *Biblioth. Graeca*; Haller, *Bibioth. Medic. Pract.*; *Biogr. Médicale*; *Dict. of Greek and Roman Antiq.*, art. 'Methodici.')

* In this last passage the name is written Μεθήσων, which error is left unnoticed by the editor, but may readily be accounted for by recollecting that the vowels ε and η have in Romaic exactly the same sound, and that for many centuries past Greek words have been pronounced by the Greeks according to the *accent* and not according to the *quantity*; so that a transcriber might easily confound two names so much alike as Themēson and Methēson.

† The word in the original is *fluens*, that is, a disorder attended with some discharge.

‡ Our author means here the ἀκμή of a disease, after which it increases no more.

THEMISTIUS, of Paphlagonia, was a distinguished orator in the fourth century after Christ, and was surnamed Euphrades, on account of his skill in his profession. He was much favoured by the Roman emperors. Constantius made him a senator; Julian appointed him prefect of Constantinople in 362, and corresponded with him by letters; and although he was a heathen, he was intrusted by Theodosius the Great with the education of his son Arcadius. In the year 384 he was appointed, for the second time, prefect of Constantinople; and during a period of almost forty years he was repeatedly employed in embassies and other state business. He was the teacher of Libanius and Augustin, and kept up a friendly intercourse with Gregory Nazianzen, who calls him in his letters 'the king of arguments' (βασιλεὺς λόγων).

Themistius had deeply studied the writings of Plato and Aristotle; and he taught the Peripatetic philosophy, as well as rhetoric, at Rome and Constantinople.

Of thirty-six orations composed by him which were known to Photius, thirty-three have come down to us in the original Greek, and one in a Latin translation. They have reference for the most part to public affairs, and several of them are panegyrics upon the emperors by whom the orator was patronised.

Editions of some of the orations were published by Aldus (fol. 1534), H. Stephens (8vo. 1562), Remus (4to. 1605), Petau (8vo. 1613, and 4to. 1618). The most complete edition is that of Harduin (Paris, 1684, fol.), which contains thirty-three orations, thirteen of which had not been printed before. Another oration was discovered by Angelo Mai, and published by him at Milan, 1816, 8vo. W. Dindorf also published, in 1830, two orations of Themistius, corrected from a Milan MS.

The philosophical works of Themistius consist of commentaries, in the form of paraphrases, on some of Aristotle's works, in Greek, and two Latin translations of commentaries, one upon the work 'On Heaven,' and the other upon the twelfth book of the 'Metaphysics.' The paraphrases were first published in a Latin version by Hermolaus Barbarus, 1481, which has been several times reprinted: the Greek text of them forms part of the Aldine edition of Themistius. The two commentaries in Latin were printed at Venice in 1558, 1570, and 1574. There are some letters by Themistius in the collection of H. Stephens, 8vo. 1577.

(Schöll, *Geschichte der Griech. Litt.*, iii. 96, 388.)

THEMISTO, M. Guerin's name for a genus of *Amphipodons Crustaceans*, placed by M. Milne Edwards in the tribe of *Ordinary Hyperines*, the second tribe of his family *Hyperines*.

Example, *Themisto Gaudichaudii*.

Locality.—Found by M. Gaudichaud at the Falkland Islands.

N.B.—M. Milne Edwards distinguishes from this species *Themisto Gaudichaudii* of Ross (*Suppl.* to Sir John Ross's Voyage), naming it *Themisto arctica*. Capt. James Ross, R.N., found the northern species near the west coast of the peninsula of BOOTHIA.

THEMI'STOCLES (Θεμιστοκλῆς) was born about the year B.C. 514. He was the son of Neocles, a Athenian of moderate fortune, who however was connected with the priestly house of the Lycomedæ; his mother, Abrotonon, or, according to others, Euterpe, was not an Athenian citizen; and, according to most authorities, not even a Greek, but either a native of Caria or of Thrace. The education which he received was like that of all Athenians of rank at the time, but Themistocles had no taste for the elegant arts which then began to form a prominent part in the education of Athenian youths; he applied himself with much more zeal to the pursuit of practical and useful knowledge. This, as well as the numerous anecdotes about his youthful wilfulness and waywardness, together with the sleepless nights which he is said to have passed in meditating on the trophies of Miltiades, are more or less clear symptoms of the character which he subsequently displayed as a general and a statesman. His mind was early bent upon great things, and was incapable of being diverted from them by reverses, scruples, or difficulties. The great object of his life appears to have been to make Athens great, in order that he himself might be great. The powers with which nature had endowed him were quickness of perception, an accurate judgment of the course

which was to be taken on sudden and extraordinary emergencies, and sagacity in calculating the consequences of his own actions; and these were the qualities which Athens during her wars with Persia stood most in need of. His ambition was unbounded, but he was at the same time persuaded that it could not reach its end unless Athens was the first among the Grecian states; and as he was not very scrupulous about the means that he employed for these ends, he came into frequent conflict with Aristides the Just, who had nothing at heart but the welfare of his country; and no desire of personal aggrandizement. In the year 483 B.C., when Aristides was sent into exile by ostracism, Themistocles, who had for several years taken an active part in public affairs, and was one of the chief authors of the banishment of his rival, remained in the almost undivided possession of the popular favour, and the year after, B.C. 482, he was elected archon eponymus of Athens. The city was at that time involved in a war with Aegina, which then possessed the strongest navy in Greece, and with which Athens was unable to cope. It was in this year that Themistocles conceived and partly carried into effect the plans by which he intended to raise the power of Athens. His first object was to increase the navy of Athens; and this he did ostensibly to enable Athens to contend with Aegina, but his real intention was to put his country in a position to meet the danger of a second Persian invasion, with which Greece was threatened. The manner in which he raised the naval power of Athens was this. Hitherto the people of Athens had been accustomed to divide among themselves the yearly revenues of the silver-mines of Laurion. In the year of his archonship these revenues were unusually large, and he persuaded his countrymen to forego their personal advantage, and to apply these revenues to the enlargement of their fleet. His advice was followed, and the fleet was raised to the number of 200 sail. (Herodot., vii. 144; Plutarch, *Themist.*, 4.) It was probably at the same time that he induced the Athenians to pass a decree that, for the purpose of keeping up their navy, twenty new ships should be built every year. (Böckh, *Public Economy of Athens*, p. 249, Engl. transl., 2nd edit.) Athens soon after made peace with Aegina, as Xerxes was at Sardis making preparations for invading Greece with all the forces he could muster. At the same time Themistocles was actively engaged in allaying the disputes and hostile feelings which existed among the several states of Greece. He acted however with great severity towards those who espoused the cause of the Persians, and a Greek interpreter, who accompanied the envoys of Xerxes that came to Athens to demand earth and water as a sign of submission, was put to death for having made use of the Greek tongue in the service of the common enemy. After the affairs among the Greeks were tolerably settled, a detachment of the allied troops of the Greeks was sent out to take possession of Tempe, under the command of Themistocles of Athens and Euaenetus of Sparta; but on finding that there they would be overwhelmed by the host of the barbarians, they returned to the Corinthian isthmus. When Xerxes arrived in Pieria, the Greek fleet took its post near Artemisium, on the north coast of Euboea, under the command of the Spartan admiral Eurybiades, under whom Themistocles condescended to serve in order not to cause new dissensions among the Greeks, although Athens alone furnished 127 ships, and supplied the Chalcidians with twenty others; while the Spartan contingent was incomparably smaller. When the Persian fleet, notwithstanding severe losses which it had sustained by a storm, determined to sail round the eastern and southern coasts of Euboea, and then up the Euripus, in order to cut off the Greek fleet at Artemisium, the Greeks were so surprised and alarmed, that Themistocles had great difficulty in inducing them to remain and maintain their station. The Euboeans, who perceived the advantages of the plan of Themistocles, rewarded him with the sum of thirty talents, part of which he gave to the Spartan Eurybiades and the Corinthian Adimantus to induce them to remain at Artemisium. (Herodot., viii. 4, 5; Plutarch, *Themist.*, 7.) In the battle which then took place, the Greeks gained considerable advantage, though the victory was not decided. A storm, and a second engagement near Artemisium, severely injured the fleet of the Persians, but the Greeks also sustained great losses, as half of their ships were partly destroyed and partly rendered unfit for further service. When at the same time they received intelligence of the defeat of Leonidas at Thermopylæ, the Greeks resolved to retreat from Artemisium, and sailed to the Saronic gulf. Xerxes was now advancing from Thermopylæ, and Athens trembled for her existence, while the Peloponnesians were bent upon seeking shelter and safety in their peninsula, and upon fortifying themselves by a wall across the Corinthian isthmus. On the approach of the danger the Athenians had sent to Delphi to consult the oracle about the means they should employ for their safety, and the god had commanded Athens to defend herself behind wooden walls. This oracle, which had probably been given at the suggestion of Themistocles, was now also interpreted by him as referring to the fleet, and his advice to seek safety in the fleet was followed. He then further moved that the Athenians should abandon the city to the care of its tutelary deity, that the women, children, and infirm should be removed to Salamis, Aegina, or Troezen, and that the men should embark in the ships. The fleet of the Greeks, consisting of 380 ships, assembled at Salamis, still under the supreme command of Eurybiades. When the Persians had made themselves masters of Attica, and Athens was seen in flames at a distance, some of the commanders of the fleet, under the influence of fear, began to make preparations for an immediate retreat. Themistocles and his friend Mnesiphilus saw the disastrous results of such a course, and the former exerted all his powers of persuasion to induce the commanders of the fleet to maintain their post: when all attempts proved ineffectual, Themistocles had recourse to threats, and thus induced Eurybiades to stay. The example of the admiral was followed by the other commanders also. In the meantime the Persian fleet arrived in the Saronic gulf, and the fears of the Peloponnesians were revived and doubled, and nothing seemed to be able to keep them together. At this last and critical moment Themistocles devised a plan to compel them to remain and face the enemy. He sent a message to the Persian admiral, informing him that the Greeks were on the point of dispersing, and that if the Persians would attack them while they were assembled, they would easily conquer them all at once, whereas it would otherwise be necessary to defeat them one after another.

This apparently well-meant advice was eagerly taken up by the enemy, who now hastened, as he thought, to destroy the fleet of the Greeks. But the event proved the wisdom of Themistocles. The unwieldy armament of the Persians was unable to perform any movements in the narrow straits between the island of Salamis and the mainland. The Greeks gained a most complete and brilliant victory, for they only lost forty ships, while the enemy lost two hundred; or, according to Ctesias, even five hundred. Very soon after the victory was decided, Xerxes with the remains of his fleet left the Attic coast and sailed towards the Hellespont. The battles of Artemisium and Salamis occurred in the same year, 480 B.C. [SALAMIS.]

Coin of Salamis.
British Museum. Actual Size. Silver

When the Greeks were informed of the departure of Xerxes, they pursued him as far as Andros without gaining sight of his fleet, and Themistocles and others proposed to continue the chase. But he gave way to the opposition that was made to this plan, and consented not to drive the vanquished enemy to despair. The Greek fleet therefore only stayed some time among the Cyclades, to chastise those islanders who had been unfaithful to the national cause. Themistocles, in the meantime, in order to get completely rid of the king and his fleet, sent a message to him, exhorting him to hasten back to Asia as speedily as possible, for otherwise he would be in danger of having his retreat cut off. Themistocles availed himself of the stay of the Greek fleet among the Cyclades for the purpose of enriching himself at the cost of the islanders, partly by extorting money from them by way of punishment, and partly by accepting bribes for securing them impunity for their conduct. His fame, however, spread over all Greece, and all acknowledged that the country had

been saved through his wisdom and resolution. But the confederate Greeks, actuated by jealousy, awarded to him only the second prize; at Sparta, whither he went, as Herodotus says, to be honoured, he received a chaplet of olive-leaves,—a reward which they had bestowed upon their own admiral, Eurybiades,—and the best chariot that the city possessed, and on his return 300 knights escorted him as far as Tegea in Arcadia.

When the Persian army had been again defeated at Platææ and Mycale, in B.C. 479, and when the Athenians had rebuilt their private dwellings, it was also resolved, on the advice of Themistocles, to restore the fortifications of Athens, but on a larger scale than they had been before, and more in accordance with the proud position which the city now occupied in Greece. This plan excited the fear and jealousy of the rival states, and especially of Sparta, which sent an embassy to Athens, and under the veil of friendship, which ill concealed its selfish policy, endeavoured to persuade the Athenians not to fortify their city. Themistocles, who saw through their designs, undertook the task of defeating them with their own weapons. He advised his countrymen to dismiss the Spartan ambassadors, and to promise that Athenian envoys should be sent to Sparta to treat with them there respecting the fortifications. He himself offered to go as one of the envoys, but he directed the Athenians not to let his colleagues follow him, until the walls, on which all hands should be employed during his absence, should be raised to such a height as to afford sufficient protection against any attack that might be made upon them. His advice was followed, and Themistocles, after his arrival at Sparta, took no steps towards opening the negociations, but pretended that he was obliged to wait for the arrival of his colleagues. When he was informed that the walls had reached a sufficient height, and when he could drop the mask with safety, he gave the Spartans a well-deserved rebuke, returned home, and the walls were completed without any hindrance. He then proceeded to carry into effect the only thing which remained to be done to make Athens the first maritime power of Greece. He induced the Athenians to fortify the three ports of Phalerum, Munychia, and Piræus, by a double range of walls, and to connect the Piræus by long walls with the city of Athens. [ATHENS.]

When Athens was thus raised to the station on which it had been the ambition of Themistocles to place it, his star began to sink, though he still continued for some time to enjoy the fruits of his memorable deeds. He was conscious of the services he had done to his country, and never scrupled to show that he knew his own value. His extortion and avarice, which made him ready to do anything, and by which he accumulated extraordinary wealth, could not fail to raise enemies against him. But what perhaps contributed more to his downfall was his constant watchfulness in maintaining and promoting the interests of Athens against the encroachments of Sparta, which, in its turn, was ever looking out for an opportunity to crush him. The great men who had grown up by his side at Athens, such as Cimon, and who were no less indebted to him for their greatness in the eyes of Greece than to their own talents, were his natural rivals, and succeeded in gradually supplanting him in the favour of the people. They also endeavoured to represent him as a man of too much power, and as dangerous to the republic. The consequence of all this was, that in 472 B.C. he was banished from Athens by the ostracism. He took up his residence at Argos, where he was still residing when, in the same year B.C. 472, Pausanias was put to death at Sparta for his ambitious and treacherous designs, and his fate involved that of Themistocles. [PAUSANIAS.] The Spartans, in their search to discover more traces of the plot of Pausanias, found a letter of Themistocles, from which it was evident that he had been acquainted with his plans. This was sufficient for the Spartans to ground upon it the charge that Themistocles had been an accomplice in his crime, and ambassadors were forthwith sent to Athens to demand that he should suffer the same punishment as Pausanias. This charge was no less welcome to his enemies at Athens than the discovery of his letter had been to the Spartans. Orders were consequently issued to arrest and convey him to Athens. But he had been informed in time of the proceedings at Athens, and foreseeing that his destruction would be unavoidable if he should fall into the hands of his enemies, he fled to Coreyra, and thence to the opposite coast of Epirus, where he took refuge at the court of Admetus, king of the Molossians. On his arrival, the king was absent, but his queen Phthia received him kindly, and pointed out to him in what manner he might win the sympathy of Admetus. When the king returned home, Themistocles, seated on the hearth and holding the child of Admetus in his arms, implored the king not to deliver him up to his persecutors, who traced him to the court of the Molossians. It is stated that Themistocles was here joined by his wife and children. The king not only granted his request, but provided him with the means of reaching the coast of the Ægean, whence he intended to proceed to Asia, and seek refuge at the court of the king of Persia. From Pydna he sailed in a merchant ship to the coast of Asia Minor. At Ephesus he received such part of his property as his friends had been able to wrest from the hands of his enemies at Athens, together with that which he had left at Argos. A few months after his arrival in Asia, Xerxes was assassinated (B.C. 465), and was after a short interval succeeded by Artaxerxes. Various adventures are told of Themistocles before he reached the residence of the Persian king. On his arrival he sent him a letter, in which he acknowledged the evils he had inflicted upon his predecessor, but at the same time claimed the merit of having saved him from destruction by his timely advice. He added that his present exile was only the consequence of his great zeal for the interests of the king of Persia. He did not ask for an immediate interview with the king, as he was yet unacquainted with the language and the manners of the Persians, to acquire which he requested a year's time. During this period, he applied himself so zealously and with such success to these studies, that at the close of the year, when he was presented to the king, he is said to have excited the jealousy of the courtiers, and was most kindly received by the king, to whom he held out prospects of conquering Greece by his assistance. The king became so attached to him, that Themistocles was always in his company. After he had spent several years at the court, he was sent to Asia Minor, to wait there for an opportunity of carrying his promises into effect. A pension was now bestowed upon him after the Oriental fashion: three towns were given him, of which Magnesia on the Maeander was to provide him with bread, Myus with meat, and Lampsacus with wine. He took up his residence in the first of these towns, where he lived with a sort of princely rank. But death overtook him at the age of sixty-five, before any of his plans were carried into effect. Most of the ancient writers state that he put an end to his life by poison, or, according to another strange story, by drinking the blood of a bull, because he despaired of being able to fulfil his promises to the king. The motive for his suicide is very questionable. Reflections on his past life and upon the glory of his former rivals at Athens are much more likely to have rendered him dissatisfied with life. Before he took the poison he is said to have requested his friends to convey his remains secretly to Attica, and in later times a tomb which was believed to contain them existed in Piræus. In the market-place of Magnesia a splendid monument was erected to his memory, and his descendants in that place continued to be distinguished by certain privileges down to the time of Plutarch.

THEMISTO'GENES. [XENOPHON.]

THENARDITE—(*Anhydrous Sulphate of Soda*)—occurs crystallized. Primary form a right rhombic prism; cleavage parallel to the primary planes; colour white or reddish; transparent; translucent; opaque; soluble in water; effloresces on the surface; specific gravity 2·73.

It occurs in crystalline coatings at the bottom of some lakes, at a place called Les Salines Espartines, about five leagues from Madrid; it is used in the preparation of carbonate of soda. According to the analysis of Casaseca it is composed of

Sulphate of soda . .	99·78
Carbonate of soda . .	0·22
	100·

THENUS, Dr. Leach's name for a genus of macrurous

crustaceans, formed at the expense of *Scyllarus* or authors. [Scyllarians, vol. xxi., p. 144.]

THEOBALD, LEWIS, was born at Sittingbourne, in Kent. We have no record of the date of his birth. His father was an attorney, and he was bred to his father's business. His first literary production was 'Electra,' a tragedy, which appeared in 1714. As the writer of twenty very indifferent plays, he is utterly forgotten. Those productions belong to an age in which the true spirit of dramatic poetry was for the most part lost, and Theobald possessed none of those brilliant qualities which could impart a lengthened existence to his attempts in portraying the manners of his age. But he has attained a celebrity of another description. He is most commonly known as the unhappy dunce whom Pope assailed with the most inveterate ridicule; but, after a century of prejudice against his name, he is now pretty generally acknowledged to have deserved an honourable reputation as an editor of Shakspere, having brought to that task diligence, knowledge, and judgment, beyond comparison superior to the critical talents of his rival the author of the 'Dunciad.' His 'bad eminence' as the original hero of that poem was earned by a pamphlet in which he pointed out many of the errors of Pope's Shakspere. 'Shakespear Restored, or Specimens of Blunders committed and unamended in Pope's Edition of this Poet,' was published in 1726. The first notice which Pope took of this pamphlet was in his second edition of Shakspere, which appeared in 1728. 'Since the publication of our first edition, there having been some attempts upon Shakspeare published by Lewis Theobald (which he would not communicate during the time wherein that edition was preparing for the press, when we, by public advertisements, did request the assistance of all lovers of this author), we have inserted in this impression as many of 'em as are judged of any the least advantage to the poet; the whole amounting to about twenty-five words.' In the same year came out the 'Dunciad.' The revenge of Theobald was the severest that could be inflicted, and it was unexceptionable. In 1733 he produced an edition of Shakspere which utterly destroyed that of Pope. It has been asserted that of Theobald's edition, which was in seven volumes, 8vo., nearly thirteen thousand copies were sold. (Steevens's 'Shakespear,' 1793, vol. i.) In his preface Theobald thus notices the attacks of his distinguished rival: 'It is not with any secret pleasure that I so frequently animadvert on Mr. Pope as a critic, but there are provocations which we can never quite forget. His libels have been thrown out with so much inveteracy, that, not to dispute whether they should come from a Christian, they leave it a question whether they could come from a man. I should be loth to doubt, as Quintus Serenus did in a like case,

"Sive homo, seu similis turpissima bestia nobis
Vulnera dente dedit."

The indignation, perhaps, for being represented a blockhead, may be as strong in us as it is in the ladies for a reflection on their beauties. It is certain I am indebted to him for some flagrant civilities; and I shall willingly devote a part of my life to the honest endeavour of quitting scores; with this exception, however, that I will not return those civilities in his peculiar strain, but confine myself, at least, to the limits of common decency. I shall ever think it better to want wit, than to want humanity; and impartial posterity may perhaps be of my opinion.' It is to be feared that it was rather a new hatred than a sense of justice, however tardy, which induced Pope in 1743 to dethrone Theobald from the heroship of the 'Dunciad,' setting up Colley Cibber in his place. In the subsequent year both Pope and Theobald were at peace; death had for ever silenced their controversy. Theobald died in September, 1744. On the 20th of the following October, his library, which included 295 old English plays, was sold by auction. He had collected these productions, now so rare and highly valued, at a time when our early drama was neglected, if not despised; and he made a judicious use of them in his edition of Shakspere. When we speak of his edition with commendation, we of course look at those things which are of permanent value in it; and we pass over those ebullitions of offended pride, venting itself in self-commendation and acrimonious objection, which were natural to one who had been so hunted by satire as Theobald had been. Dr. Johnson says that Theobald, 'by the good luck of having Pope for his enemy, has escaped and escaped alone with reputation from this undertaking [the undertaking of editing Shakspere]. So willingly does the world support those who solicit favour against those who command reverence, and so easily is he praised whom no man can envy.' This, we think, is mere phrase-making, and does not represent the world's opinion of any man at any period: reputations are not made upon the compassion of the world. Johnson has, a little before, stated the case with greater correctness, although not wholly correct. 'Pope was succeeded by Theobald, a man of narrow comprehension, and small acquisitions, with no native and intrinsic splendour of genius, with little of the artificial light of learning, but zealous for minute accuracy, and not negligent in pursuing it. He collated the ancient copies, and rectified many errors. A man so anxiously scrupulous might have been expected to do more, but what little he did was commonly right.' The great merit of Theobald as an editor is that he did not attempt too much, that he did not 'do more,' and that *therefore* he was 'commonly right.' The great fault of nearly all the editors of Shakspere has been that they set themselves up above their author; that they would exhibit their own 'native and intrinsic splendour of genius' in the improvement of what they did not understand, and the adaptation of the verse of Shakspere to the standard of another age. The most happy emendations of Shakspere, almost the only admissible ones, have been produced by the caution of Theobald. In his own preface he says, 'I have not by any innovation tampered with his text, out of an ostentation of endeavouring to make him speak better than the old copies have done;' and then he adds, 'Where, through all the former editions, a passage has laboured under flat nonsense and invincible darkness, if, by the addition or alteration of a letter or two, or a transposition in the pointing, I have restored to him both sense and sentiment, such corrections, I am persuaded, will need no indulgence.' All subsequent editors have a debt to Theobald which has not always been acknowledged. Johnson himself says, 'I have sometimes adopted his restoration of a comma, without inserting the panegyric in which he celebrated himself for his achievement.'

There is a curious matter connected with the history of Theobald, which needs here only a slight mention. In his edition of Shakspere in 1728, he printed a play, 'The Double Falsehood,' as an original by William Shakspere, it having been a short time before produced on the stage. The play was stated to have been found in manuscript. One passage, which is certainly not in the manner of Shakspere, is said to have been particularly admired:—

'Strike up, my masters;
But touch the strings with a religious softness:
Teach sound to languish through the night's dull ear,
Till melancholy start from her lazy couch,
And carelessness grow convert to attention.'

The admiration was too much for the vanity of Theobald: he came forward to state that he certainly had written those lines, but that all the rest was genuine Shakspere. Dr. Farmer holds that 'The Double Falsehood' was not Shakspere's because the word *aspect* was wrongly accentuated, that is, not as aspect, according to the usage of Shakspere and of his time; and he holds the play to be Shirley's. It is not worthy even of that writer. The probability is that Theobald had a greater hand in the matter than he was subsequently willing to acknowledge. The restless vanity and love of notoriety which, according to his own account, impelled Psalmanazar to his impostures, has perhaps in nearly every case been the great motive to literary forgery. Theobald was the author of a Life of Sir Walter Raleigh; and he also wrote the greater part of the periodical papers entitled 'The Censor,' which appeared as a separate work in 1717, having been previously published in Mist's 'Weekly Journal.'

THEOBALDUS, a bishop who probably lived in France, and whose name is sometimes written *Tebaldus* or *Tibaldus*, the reputed author of a didactic and theological poem entitled 'Physiologus de Naturis Duodecim Animalium.' It is written in hexameter, sapphic, and other kinds of verse, and describes first some one or more of the natural habits of twelve different animals, and then draws from each some moral and religious reflections. The twelve animals chosen are the lion, eagle, serpent, ant, fox, stag, spider, whale, siren and centaur, elephant, dove, and panther; and the whole poem appears to be borrowed in a great measure

from the little work in prose by Epiphanius on the same subject. The poem begins thus:—

> 'Tres leo naturas et tres habet inde figuras,
> Quas ego, Christe, Tibi bis seno carmine scripsi.
> Altera divini memorant animalia libri,
> De quibus apposui quæ rursus mystica novi,
> Tentans diversis si possem scribere metris.
> Nec numerum nostrum complent simul addita solum,
> Nam leo stans fortis super alta cacumina montis,' &c.

And ends thus:—

> 'Cœlos ascendens ubi regnat cum Patre præsens
> Quem gentes cunctæ sic sunt credendo secutæ
> Aut fugit atque latet nec in ipso tempore paret
> Serpens antiquus, qui nobis est inimicus;
> Namque palam nullos licet audet fallere multos
> Nos hinc defendet, qui sæcla per omnia regnat.
> Carmine finito sit laus et gloria Christo,
> Cui si non alii placeant hæc metra Tibaldi.'

The last two verses are not to be found in the old editions, but only in Beaugendre's edition of the works of Hildebert. With respect to the author of the poem, as it is found in a Paris manuscript of the thirteenth century, containing the works of Hildebert, archbishop of Tours (who lived in the twelfth century), and has also been ascribed to Hildebert himself, he may be supposed to have lived some time in the twelfth century, or even as early as the eleventh, if he is the person meant in an epitaph on *Magister Theobaldus Dervensis*, written by Hildebert. (Hildebert, *Opera*, p. 1322, edit. Beaugendre.) The first edition of this work to which a date is attached is that of Antwerp, 1482, 4to., but five others are enumerated by Choulant (*Handbuch der Bücherkunde für die Aeltere Medicin*), which were probably printed before this year. The last edition, in a separate form, was published at Leipzig, 1510, 4to.; but it is inserted in 'Hildeberti Cenomanensis Episcopi, Turonensis Archiepiscopi, Opera,' edit. Ant. Beaugendre, Paris, 1708, fol., and erroneously attributed to Hilbebert. The *Proœmium* and the chapter *De Elephante* are inserted by Freytag in the 'Analecta Litteraria de Libris Rarioribus,' Lips., 1752, 8vo. In some of the old editions there is appended to the poem a theological commentary, written in the style of the scholastic philosophy of the middle ages: the author is unknown, but it was not composed by Theobaldus himself. (Choulant, *loco cit.*)

THEOBRO'MA (from Θεός and βρῶμα, the food of gods), the name of a genus of plants belonging to the natural order Stereuliaceæ, the species of which yield the cocoa of commerce. They are trees with large simple leaves and with the flowers in clusters. The calyx is composed of 5 sepals; the petals are 5, lengthened into a strap-like form at the apex; the stamens are 5, each with double anthers and a horn-like appendage between each filament; the style is filiform, with a 5-parted stigma; fruit a 5-celled capsule without valves; seeds embedded in a soft pulp; no albumen, and thick oily wrinkled cotyledons.

T. Cacao, Common Cacao or Chocolate-nut tree, has entire, elliptic, oblong, acuminate, quite smooth leaves, and oblong smooth fruit. This tree is indigenous in South America, and is generally found at a height of 600 feet above the level of the sea. It is however extensively cultivated in the West Indies, and in the tropical parts of Asia and Africa. The Mexicans call the tree *chocolalt*, hence our word chocolate for the prepared seeds. The capsules of the fruit are large, and contain each about 25 seeds; the pulp in which these are enveloped has a sweet and not unpleasant taste, and is frequently eaten where the tree is grown. The trees are evergreens, and bear fruit and flowers all the year through, but the usual times for gathering the fruit are in June and December. The cotyledons of the seeds contain a large quantity of oily albumen, which has an agreeable flavour, and on this account they are not only used as a principal article of diet by the natives of the countries in which they grow, but are now used for the same purpose throughout the civilized world. The composition of these seeds, in which amylaceous matter is combined with oil, and a principle probably similar in its constitution to Thein and Caffein, is well adapted, when combined with sugar, to form a valuable article of diet. The consumption of them for this purpose is already on the increase, and under the present greatly decreased rate of duty will probably go on in a greater ratio. The following are the quantities consumed in this country since 1835:—

1836	.	.	1,130,168 lbs.
1837	.	.	1,416,613
1838	.	.	1,601,787
1839	.	.	1,606,800
1840	.	.	2,045,478
1841	.	.	1,930,764

Before the alteration of the tariff in 1842, the duty on cocoa from British possessions was 2*d.*, and from foreign countries 6*d.* per lb.; now reduced to 1*d.* and 4*d.* On husks and shells the duty was ½*d.* and 1*d.*, and remains unaltered. The duty on cocoa paste and chocolate, which was 4*d.* per lb. from British possessions, and 4*s.* 4*d.* from foreign countries, has been reduced in the former case to 2*d.*, and in the latter to 6*d.* per lb. The duty on foreign cocoa under the old tariff was nearly prohibitory.

The chocolate of different countries varies according to its mode of preparation and the ingredients contained in it. The most common form however in which they are consumed in this country is what is called cocoa, which consists of the seeds pressed into flakes or reduced to a paste. It is to this paste whilst hot that the honey, sugar, and other things are added, which constitute it chocolate. The paste is frequently adulterated. Hogs' lard and sago are added to make up weight, and red lead to give it a colour. On this account the flake-cocoa is the best to be used.

The largest quantity of the seeds that are used in this country are brought from the West Indies, and of these the Trinidad nuts are considered the best. Of the 1,600,000 lbs. of cocoa consumed in 1839, 959,000 lbs. came from the West Indies, 375,000 from Columbia, 186,000 from Brazil, and 133,000 from Chili.

The oil contained in the seeds is sometimes obtained separately, and called cocoa butter. It may be obtained easily by expression, especially if hot water is added. It is said to be very nutritive, and to act as an anodyne. It is particularly recommended for making ointments. (Ersch and Gruber, *Allgem. Encycl.*, art. 'Cacao.')

In the cultivation of the Cacao a wet soil must be selected, as, wherever planted, if it has not a large quantity of water it perishes. The plants also require shade, and on this account in Trinidad and other islands of the West Indies the seeds are placed between rows of the Erythrina umbrosa, one, two, or three rows of the Cacao being planted between the Erythrinas. In sowing them the seeds are placed two or three together in the soil, at about two yards distant in the rows; and when the plants are about two feet high, all except the strongest are removed. In rearing them the only further care necessary is that all weeds are removed. If this be not attended to, the plants will not flourish.

There are several other species of Theobroma, yielding seeds possessing the properties of the above, but they are not cultivated or employed to the same extent. They are all of them natives of South America, and used by the inhabitants where they grow as food. The *Theobroma Guazuma* of Linnæus, the Bastard Cedar or Ormie d'Amerique, now the *Guazuma ulmifolia*, is a native of the West Indies, and is a handsome tree resembling the elm. It has ovate, oblong leaves, smooth on both surfaces. In Jamaica cattle eat its leaves when fodder is scarce. Its pods have a sweet flavour like green figs, and are frequently eaten in the West Indies. Its wood is much used by coachmakers on account of its lightness. Its leaves and bark yield a mucilaginous decoction, which is reputed of much value in elephantiasis and in diseases of the chest. (Don's *Miller's Dictionary*; *Dictionnaire des Sciences Naturelles*; *Parliamentary Reports.*)

THEOBRO'MA. (*Cocoa and Chocolate.*) The species of this genus which yield articles of nutriment are chiefly natives of South America and the West Indies. They are also found in the Philippine Isles. It is customary to refer cocoa to the species described by Linnæus under the name Theobroma Cacao (*Theobroma sativa*, Lamarck), but this yields only a small portion of this most widely consumed article, and none of that used in Mexico, where the T. Cacao does not even grow. Besides this species, the following furnish some of the different kinds, viz.: T. speciosum, Wildenow; T. subincanum, Mart.; T. sylvestre, Mart. The Mexican cocoa is conjectured by Decandolle to be yielded by T. angustifolia and ovalifolia, as well as from some undescribed species. That of Guatemala is certainly from an undescribed species. The Columbian is yielded by a species called by the natives *montaras* or

symoron, which is cultivated like the T. Cacao. The cocoa of Guiana is yielded by the T. Guianensis. (Aublet.)

The fruits are collected both from wild and cultivated plants; from the latter two harvests are obtained, from the former one only. The cultivation is easy and unexpensive. The tree begins to bear about the age of seven or eight years, and one slave can superintend a thousand plants, the produce of which however is not more than from 1500 to 1600 lbs. of seeds. The statement of Labat is an exaggeration—that a tree in full vigour will produce 150 lbs. of seeds. Notwithstanding the small return from each tree, it is a very lucrative branch of culture. The produce is always greatest after the greatest floodings of the rivers. The seeds from the wild plants are termed by the native Brazilians *cacao bravo* or *cacao do Mato*.

The fruits of the different species vary in size, form, and the number of the seeds they contain. The seeds, which are the only part employed, vary in size and quality according to the species from which they are obtained. The general number is from twenty-five to thirty in each fruit, being more abundant, as well as of better quality, in the cultivated than in the wild plants. They vary much in bitterness and in the quantity of oil they yield, not only according to the species from which they are obtained, but the manner in which they are treated after being gathered and taken out of the pulpy fruit. In some instances they are buried in the earth in heaps, and allowed to ferment for thirty or forty days; a process which greatly improves them, and destroys the germinating power of the seed. The different kinds met with in commerce derive their names either from the place where they grew or from some corruption of the native designation. The average size of good beans is that of a sweet almond, but somewhat thicker. The most esteemed of the known sorts is that termed *Soconuzco*, or Mexican, with very small beans, with a remarkably fine flavour, and scarcely any acrid taste. These beans are always buried. This sort never comes to Europe. The next most valuable comes from Esmeraldas, and has a very agreeable flavour: the chocolate prepared from it has a golden colour; it is seldom met with out of Mexico. The Guatemala cocoa consists of very large beans, very convex, often angular, and very much pointed at the one end. They contain much oil, and are mild, with a pleasant flavour. The beans from Guayaquil, which are three times as large as those of Soconuzco, are less prized than those of Guatemala.

The Caracas or New Granada cocoa, which is among the more highly prized kinds that reach Europe, is obtained from the Theobroma bicolor (Humboldt, *Pl. Aequin.*, t. 30), called by the natives Bacao, and cultivated at Carthago. The beans are of medium size, and very oily. But chocolate made of these alone is not very agreeable, and another kind is commonly mixed with them, which are much smaller and harder. Berbice cocoa beans are not unfrequently mingled with those of Granada. These are also smaller and thinner, but in other respects difficult to distinguish; the shell separates very easily from the kernel, which is reddish-brown, and has a strong smell, but a pleasant flavour.

The Surinam and Essequibo cocoas are not unlike that from New Granada, but are harder, thicker, and not so sweet.

All the foregoing are earth-dried: the following are called sun-dried, being merely collected in heaps, and often turned over in the sun; they are consequently much cheaper.

Brazilian, called also of Para, and of Maranham, is very extensively employed: the beans are small, smooth, long, somewhat flattened, externally reddish-brown, with a bitter astringent taste: it is only worth half the amount of the former. The West Indian, called Cocoa des Iles or des Antilles, is still less valuable, and is employed to form the low-priced cocoas and chocolates.

Lampadius has analyzed the West Indian kernels, and found them to consist of, in the 100 parts, besides water, 53·1 of fat or oil, 16·7 of an albuminous brown matter, which contains all the aroma of the bean, 10·91 of starch, ·75 of gum or mucilage, 0·9 of ligniue, and 2·01 of a reddish dye-stuff, somewhat akin to the pigment of cochineal. These proportions vary very much in the different sorts, the West Indian kinds containing far more of the oil or butter of cocoa than the kind from New Granada. It is therefore most advantageous to employ the latter to form cocoa or chocolate for nutriment, and the other to yield this solid oil, to form candles, soap, or pomades. This oil contains a large proportion of stearine, and is therefore solid at the ordinary temperature of the air, but it melts at 122° Fahr. When purified by long boiling in water, it is perfectly white, and does not readily become rancid. It is perfectly soluble in æther, a means of detecting adulterations with beef-fat, suet, marrow, or almond oil, wax, &c. It is however less employed in this country than in France. Nevertheless it is a most valuable material, and a soap made with it and soda, which is preferable to potass, forms an article for the toilet of great service to those who are troubled with a rough harsh skin or chapped hands. The soap sold in this country under the name of *cocoa-nut oil* must not be confounded with that just spoken of, as this is obtained from the Cocos nucifera. The cocoa-nut-oil candles are likewise prepared from the latter.

The kernels of the Theobroma are used as an article of nutriment either in the natural state as they are received from America or prepared in various ways. The simplest and best form is that of the seeds roughly crushed, termed *cocoa-nibs*, which however require two hours boiling, as, owing to the peculiar nature of the endosperm, or inner seed-coat, which passes down into the substance of the cotyledons, the prolonged application of heat and moisture is necessary to dissolve the contents. Flake cocoa is merely the seeds crushed between rollers. When chocolate is to be made, the beans, after being carefully picked so as to free them from mouldy or worm-eaten ones, are to be gently roasted over a fire in an iron-cylinder, with holes in the ends to allow the vapour to escape. When the aroma begins to be well developed, the process is considered complete. The beans are then turned out, cooled, and freed by fanning and sifting from their husks. The husks, which often amount to 20 or 25 per cent. of the beans employed, should not be thrown away, as they contain half their weight of soluble matter of a mucilaginous nature, which furnishes a tolerable nutriment for the poor. The seeds are then to be converted into a paste, either by trituration in a mortar heated to 130° Fahr., or now almost universally by a machine impelled by steam. (See Ure's *Dictionary of Arts*, &c., p. 293.) The paste is then put into moulds and sent into the market. It always improves by keeping. The colour is said to be owing to the addition of arnotto, but this is probably a mistake, for if the South American contain as much colouring-matter as the West Indian, any extraneous pigment is unnecessary. When the kernels alone are used, or only a little sugar added, the chocolate is termed 'Chocolat de santé.' But vanilla, cloves, cinnamon, and other aromatics are frequently added; as are also rice, almonds, starch, &c. Simple chocolate is mostly preferred in Britain, the perfumed sorts in France, Italy, and Spain, in which countries the consumption is immense. For invalids the plain chocolate is best, the perfumed being too heating. Where tea and coffee disagree, cocoa or choeolate is the best substitute. It is complained that it proves heavy and disturbs the stomach, and not unfrequently causes headaches. In almost all instances this arises from making the beverage too strong. The printed directions order far too much of the substance to be employed. Half the quantity is sufficient. The Spaniards do not reckon chocolate very nutritious, and even permit the priests, who should fast for many hours before saying mass, to drink it. But this is a very convenient mistake. Schrader, who analyzed cocoa, regarded the bitter principle as similar to *caffein*. The analysis of Theobromine by Woskresensky shows how nearly he was correct, and also that this article, being one of the most highly azotised vegetable compounds, must be highly nutritious. Liebig considers that this principle contributes to the formation of bile, like thein. [THEA; THEIN.]

THEOCRACY (*θεοκρατία, a government by God*) is a term applied to the constitution of the Israelitish government, as established by Moses, on account of its being under the direct control of God. Michaelis enumerates the following particulars as those in which the theocratic form of government is most remarkable:—1. The laws of the Israelites were given by God. 2. The judges are represented as holy persons, and as sitting in the place of God. 3. The judges were usually taken from the tribe of Levi, and the chief expounder of the law was the high-priest. 4. In difficult cases of law, relating both to

government and war, God was to be consulted by Urim and Thummim. 5. In matters which concerned the welfare of the state, God often made his will known by prophets, and the people were of course bound in duty to obey their voice. 6. God bound himself by promises and threatenings to reward them with prosperity, victory, and plenty, if they kept the law of Moses, and to punish them with defeat, and other public calamities, if they disregarded it.

In fact, in the earliest form of the Israelitish constitution, *God was their king;* and the desire of the people to have a king at the time when Saul was raised to that office is expressly declared to be an act of rebellion on their part. (1 *Sam.*, viii. 7.)

The theocracy did not supersede the establishment of a visible human government, consisting of judges and other officers, but all these officers were considered as subordinate to God as the only supreme ruler of the state. [Compare Moses, p. 439-441.]

(Michaelis, *Commentaries on the Laws of Moses*, sec. 35, Eng. trans.)

THEO'CRITUS (Θεόκριτος) was a son of Simichidas, or, according to others, of Praxagoras and Philinna. He was a native of Syracuse, where he also spent the greater part of his life. He is said to have been connected with Philetas of Cos and Asclepiades of Samos, and to have been their pupil, whence we may infer that he visited these islands. He was on very intimate terms with Aratus the poet, and it is highly probable that he formed this acquaintance in the island of Cos. (Wüstemann, *Argument. ad Theocrit. Idyll.*, vii.) His exact period is not known, and we can only say that he lived in the reign of Ptolemaeus, the son of Lagus, and Ptolemaeus Philadelphus, and that the time of his greatest reputation was about the year B.C. 277. Some years before this time, probably about B.C. 284, he had visited Alexandria, and the influence of the court of that city is manifest in several of his poems. It has further been supposed that he spent some time at Croton in Southern Italy, because the scene of three of his poems is laid in that place. Beyond these circumstances, which are little more than probabilities, we know nothing of the life of Theocritus. The Alexandrine grammarians valued his works very highly, and assigned to him the second place in the pleiad of the seven miscellaneous poets, which comprised Lycophron, Theocritus, Callimachus, Aratus, Apollonius Rhodius, Nicander, and one Homer, the son of Moero of Byzantium. Several Greek grammarians also wrote commentaries on the works of Theocritus, some fragments of which are still extant in the scholia on his poems. There is extant by Theocritus a collection of various poems, which are written in what the Greek grammarians call the new Doric dialect, which is softer than the old Doric, and the softness of this new Doric is still increased in the poems of Theocritus by the admixture of epic and Ionic or Aeolic forms. The particular species of poetry by which he has acquired most celebrity are the Bucolics (μέλη Βουκολικά). This pastoral poetry was very popular in Sicily, and having been originally cultivated by shepherds and rustics, was raised to a really artistic rank by several poets before Theocritus. He however brought this kind of poetry to perfection, and the antient critics regard him as the model of bucolic poetry, and Virgil for this reason calls this poetry Syracusan (*Eclog.*, vi. 1). But the number of real bucolic poems still extant in the collection which bears the vague name of Idyls (εἰδύλλια), is only ten; the remaining twenty poems are either epic poems (such as idyl xiii., xxii., xxiv., and xxv.), or imitations of mimes (such as idyl ii. and xv.), or are of a mixed nature, and belong either to the lyric kind, or are mere exercises of a poetical imagination. Nine of these poems, xii., xvii., xviii., xix., xx., xxvi., xxvii., xxix., and xxx., and some portions of others, have been considered by modern critics not to be the work of Theocritus: as to some there can be no doubt that they are spurious, though they are not without great poetical merit, if we except idyl xxx. Besides these thirty idyls, there is a fragment of one poem called 'Berenice,' and twenty-two epigrams, which are ascribed to Theocritus.

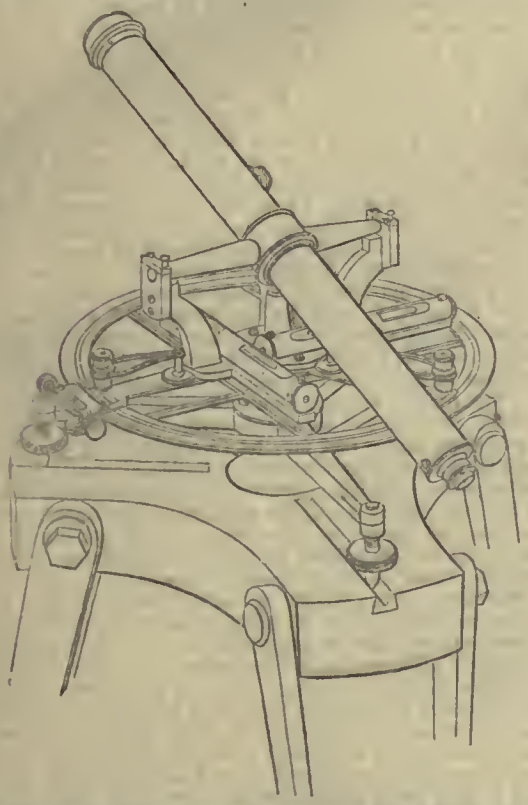
All the poems which are genuine productions of Theocritus show him to have been a perfect master of his art. His power over the language is not less wonderful than his taste for the simple beauties of nature, and the skill with which he handled his subjects. His poems are indeed founded upon the national shepherd songs of Sicily in the form of dialogues, but he has added features of his own, and idealized his persons, without depriving them of their natural simplicity. We do not know whether Theocritus himself ever published a collection of his poems, but from an epigram in the 'Anthologia Graeca' (ix., n. 205), we might rather suppose that the collection was made by Artemidorus, the author of that epigram. It is however a curious fact that none of the MSS. of Theocritus contain all the poems which are published in our modern printed editions under his name. The editio princeps, which appeared at Milan in 1493, fol., only contains eighteen idyls of Theocritus, with the works of Hesiod and Isocrates. The most important among the subsequent editions are those of J. J. Reiske, with a Latin translation, the Greek scholia and notes, Leipzig, 1765, 2 vols. 4to.; Thomas Warton, with additional scholia and notes, Oxford, 1770, 2 vols. 4to.; Valckenaer, Leyden, 1779 and 1781. The edition of Valckenaer, which also contains the poems of Bion and Moschus, is still valuable. In 1773 Valckenaer had published an excellent edition of select idyls of Theocritus. His complete edition was reprinted at Berlin, 1810, 2 vols. 8vo., with additional notes by Brunck and Toup. After these followed the editions of Schaefer (Leipzig, 1811, fol.), Kiessling (Leipzig, 1819), and J. Geel (Amsterdam, 1821, 8vo.). The last edition, which is very useful to students, is by E. F. Wüstemann, Gotha and Erfurdt, 1830, in one vol. 8vo. The introductory essay gives a good account of the literature of Theocritus. The works of Theocritus have been translated into all the languages of modern Europe. There is an English translation by Fawkes, 8vo., 1767, and a translation, including Bion and Moschus, by Polwhele, 4to., 1786, and in 2 vols. 12mo., 1811. The best French translation is that of J. B. Gail, with explanatory and critical notes, Paris, 1808, 3 vols. 4to. The best German translations are those of J. H. Voss (Tübingen, 1808, 8vo.) and Witter (Hildburghausen, 1819, 8vo.). Respecting the character of the poems of Theocritus, see Eichstädt, *Adumbratio Quaestionis de Carminum Theocriteorum ad Genera sua Revocatorum Indole ac Virtutibus*, Lipsiae, 1793, 4to.; and Reinhold, *De Theocriti Carminibus Genuinis et Suppositiis*, Jena, 1819, 8vo.

THEODOLET, or THEODOLITE (the word is found in both forms), is the name generally given to the instrument used for measuring horizontal angles. In its simplest form the theodolet consists of a divided circle, which is to be set parallel with the horizon, and a telescope which has so much motion in a vertical plane as to enable the observer to view any object which he may require above or below the horizon. The derivation of the word is obscure, although the instrument and its name are comparatively of recent date. The earlier observers did indeed use divided circles, which they called astrolabes, armillas, &c., for the purposes of surveying, but these were, generally speaking, very rude. The quadrant was employed in all accurate surveys up to the latter half of the last century, although Roemer had shown by reason and example the superiority of the entire circle. [Circle.] The first instance of a survey conducted with an entire circle, on a considerable scale, was, so far as we recollect, the Survey of Zealand by Bugge,* in 1762-8. The horizontal circle was two feet in diameter, and constructed by the Danish artist Ahl.

Ramsden finished his great theodolite in 1787, the circle of which is three feet in diameter. This was used for a triangulation, to connect the Observatories of Greenwich and Paris. A very full description of it is given in *An Account of the Operations carried on for accomplishing a Trigonometrical Survey of England and Wales*, London, 1799, pp. 107-130, with four plates; a reprint, in a great measure, from the 'Phil. Trans.,' vol. 80 et seq. The principal triangles of the English, Irish, and Indian surveys have been observed with this instrument or with those nearly identical in size and construction; and though several minor additions and improvements have been made, the great theodolite is still considered by the officers of the survey as a most efficient and almost infallible instrument. We believe that the high reputation of the great theodolite depends in a great degree on the *superstitious* care with which it has been used and preserved: it is undoubtedly a very fine, well-divided in-

* See Bugge's 'Observationes Astronomicæ,' p. 54, where he refers to a description of this instrument in Danish, and p. 61, where he states its merits.

strument, but in common hands its want of solidity and firmness would probably have been felt. It would be impossible as well as useless to give an account of the various constructions of different artists at home and abroad. The general properties of a theodolite, that it should be firm, well balanced, &c., will be easily recognised by a person who knows how to make good use of the instrument, and we shall advert in the course of this article to some of the qualities which are, and to others which are not, essential.



We have given here a sketch of the theodolite in its simplest form, such as would be proper for the secondary triangulation of a national survey, or for the most accurate private survey. The tripod which carries the instrument rests with three foot-screws in brass notches let into the top of a wooden stand. The legs of the stand are not fully represented, but the two parts of which each is composed end below in a strong and sharply-pointed metal socket. The circle is fixed, and the upper works, telescope, verniers, levels, &c., turn on a centre, which may be seen just under the cross of the telescope. The adjustments are very simple. The wooden stand is first set down with a good opening of the legs, and the top nearly horizontal. The foot-screws are placed in their notches, the plumb-line hung from its hook, below the centre of the circle, and the telescope turned round till one level is parallel to the line joining two foot-screws, while the other level is in a line from the third foot-screw to the centre. Bring the bubble of the first-mentioned level into the middle by raising one of the two foot-screws and depressing the other, and then adjust the cross-level by raising or depressing the third foot-screw alone. Now turn the telescope round 180°, and if the bubbles are not in the middle, bring them half way there by touching the foot-screws, and the other half by screws which adjust the levels themselves. When this has been nicely done, the bubbles will remain in the middle in every position of the telescope. If the objects to be observed lay all in the horizon, or in a plane parallel to it, the above adjustment would be sufficient; but when the objects are out of the horizontal plane they must be referred to it by a perpendicular, that is, the plane described by the telescope must be a great circle, and must also pass through the zenith. There are generally two wires at least in the focus of the telescope, one horizontal and the other vertical. Place the eye-piece to give sharp vision of the wires, and turn the milled screw, seen towards the object-glass, until the objects you are going to observe are distinct. Place the vertical wire on any well-defined object, making the bisection near the crossing of the wire; raise or depress the telescope until the object is nearly at the bottom or top of the field; if it is still bisected, the wire is rightly placed, but if not, twist the tube carrying the eye-piece so as to effect a bisection. To make the telescope describe a *great* circle, select some well-defined object near the horizon, and bisect it: now take the telescope *very carefully* out of its Y's, reverse it, and look again at the object. If it is still bisected, there is no error; but if not, the bisection is to be effected half by the tangent-screw of the instrument and half by the screws which carry the wire-plate, screwing up one and releasing the other. Restoring the telescope to its first position, it will be seen whether the adjustment is correct, and if not, the process must be repeated until the bisection is the same in both positions of the telescope, the clamp and tangent-screw remaining fixed. For the adjustment of the axis of the telescope a level would be convenient, but in this instrument the axis is supposed to have been correctly placed by the maker, and the only mode of correcting any error is by filing the Y's. It may be ascertained whether the axis is tolerably correct as follows:—Bisect an object as far above or below the horizon as the motion of the telescope will allow. Reverse the telescope, and if the object is still bisected, the pivots of the telescope are the same size; if not, the observer must deduce the difference of the pivots from the altitude and the error observed, which is not difficult. When this has been satisfactorily executed, bisect, as in the last instance, an object as far as possible from the horizon, and read off the verniers. Turn the instrument round 180°, return the telescope *end for end*, bisect the object again, and read off the verniers. If the mean readings differ exactly 180°, the axis is horizontal; but if they do not, the observer will have sufficient data from this, and the altitude or depression, for determining the quantity and direction of the error, which he may correct by the file or by calculation, according to his pleasure. There is a much easier method of examining the position of the axis by observing an object directly and as seen by reflexion from a fluid, as mercury, oil, or water. The axis is truly horizontal when the vertical wire bisects the object and its reflected image without moving the tangent-screw. It must be recollected that the adjustments of the horizontal circle already described must be previously and very scrupulously performed before attempting the examination or adjustment of the cross-axis.

As the objects in a survey are at very different distances, an adjustment is required for forming the image exactly on the wires. The use of the milled screw, seen towards the object-end of the telescope for this purpose, has already been mentioned.

In use, this theodolite should be placed on a repeating table or tripod, such as is to be found figured and described in Repeating Circle, and the repeating-tripod upon the stand. This was not done in the present plan for the sake of clearness. To adjust the repeating tripod, place the levels as described in the first adjustment, and clamp the theodolite. Bring the foot-screws of the theodolite over the foot-screws of the repeating-tripod by the motion of the tripod, and then by touching the foot-screws of the tripod or theodolite set the level-bubbles in the middle. Turn the upper plate of the tripod half-round, and again bring the bubbles into the middle, half by the tripod foot-screws, half by those of the instrument, and repeat the operation until the revolution of the repeating-table does not alter the position of the level-bubbles. The repeating-stand is now clamped, and the instrument itself is to be adjusted exactly as we have described above.

The course of observation after the instrument is adjusted is very simple. The problem is to measure the horizontal angle between two objects. Turn the telescope two or three times round in the direction in which you intend to observe, then bisect one of the objects, read off the verniers, and take a mean; bisect the second object, read the verniers, and take a mean. The difference between the two means is the angle required. This is all that can be done by the instrument as usually mounted; but with a repeating-table the operation is continued thus. Bring the telescope back on the first object, by the motion of the repeating-table, using its clamp and tangent-screw, and by the motion of the instrument bring

the telescope on the second object. It is clear the motion of the repeating-table has merely restored the telescope to its original direction, without altering the readings of the circle; and that if the telescope be turned on the second object by its motion alone, without distributing the circle, the difference between the mean of these new readings and the preceding mean will also be the angle required. By continuing the process, the angle may be measured as often as the observer pleases. It is evident that all readings-off, except the first and last, are superfluous, save as checks, or as giving the means of estimating the accuracy of the final result. The series should terminate after a whole number of revolutions as nearly as possible, when the excentricity of the repeating-table will be eliminated, a matter of possible importance if the objects are near and the repeating-table carelessly made, or, if the objects are pretty distant and this caution superfluous, when the verniers are nearly at the divisions at which you set out, which gets rid of or at least diminishes any errors of division. The latter condition is however rather a speculative than a practical one. As the error of division is divided by the number of observations, and the casual error of observation only by the square-root of the same number, it is evident that a moderate number of repetitions in our excellently-divided circles will reduce the error arising from mal-division to a much smaller quantity than that which belongs to the class of casual error of observation.

The essential condition of repetition is, that the motion of the theodolite shall not disturb the repeating-table. The motion of the latter therefore should be as heavy as will admit of nicety in the tangent-screw, while the motion of the parts which move with the telescope should be as light and free as is consistent with firmness. There is, we believe, no difficulty whatever in effecting both these points; but lest any error should arise from repetition, we should recommend a careful observer to determine his angles by two series,—one by always moving the telescope and its tangent-screw forward, and the repeating-stand and its screw backwards; and another, by reversing the process. If the two results agree, as they should do within the limits of casual observation, the mean is probably free from all other error; and if they do not, the observation should be repeated and varied until the quantity and probable law of the error is ascertained. We should then be able to say decidedly where, when, and under what precautions repeating was a safe as well as a convenient and economical process, which at present is rather a *vexata quæstio*, unless the decision be supposed to be against all repetition, to which we do not bow.

The foregoing description has been confined to a form of theodolite which is not in ordinary use, though from its simplicity and power it is well adapted to the purpose of explanation. The common theodolite is generally carried by a pair of parallel plates, fixed on a three-legged staff. The lower of these circular plates is screwed upon the staff, and has an aperture above the screw. The upper plate has a strong descending shank which passes loosely through this aperture. A button of a spherical form is fixed on the end of the shank, the curvature uppermost, and rubs against the under surface of the lower plate, which is dome-shaped to fit it. Four strong screws pass through the upper plate and abut with their lower ends against the lower plate. When the screws are turned the plates are separated until the button and the spherical surface on which it rubs are brought into squeezing contact. To level the theodolite, set the levels each parallel to a diagonal pair of screws of the parallel plates. Then screw one pair until you come to a bearing, and by releasing one screw and screwing up the other, but not very tight, set the corresponding level horizontal; leaving this pair and taking hold of the other pair set the second level also right, and if the first level is deranged, as it probably will be a little, restore its position by screwing up the proper screw. Turn the telescope half round and correct the error, half by the parallel plate-screws, and the other half by the level-adjustments themselves. It is desirable that, when the final adjustment is made, the screws should bite pretty hard, otherwise there is a great chance that the upper plate will turn a little during the observation. This objection would seem fatal to the use of parallel plates where great nicety is required: they are however very convenient and of very ready use, and perhaps if the screws are strong and the observer is careful to give the telescope three or four turns round in the direction he means to observe, before starting, and always to move the telescope the same way, serious error may be avoided. The first object observed should always be observed at the end of the service, in order to see whether there has been any change in the original position. If one of the screws rest in a notch, perhaps the tendency to twist may be wholly overcome.

Another contrivance which is to be found in almost all theodolites is much more objectionable. The surveyor wishes to save himself addition or subtraction, and requires an adjustment by which he can turn the whole circle about and bring the telescope upon the first object, the verniers being previously set to zero. There is therefore a motion with a clamp and tangent-screw for this purpose, which, as the clamp has usually a very short bearing, is particularly liable to yield and so to destroy all accuracy. To remedy this unnecessary evil, a second or watch telescope, as it is called, is attached to this part of the instrument and brought to bear upon a well-defined object. Any motion or wriggling of the zero-clamp is betrayed by the watch-telescope, and when an angle is taken, it must be first ascertained whether the watch-telescope keeps its position, and the position if disturbed must be restored to the zero tangent-screw, before the observation is finally made. In some theodolites made for the Indian survey, under the direction of Colonel Everest, the zero and slow-motion clamp take the form of a repeating-table, and may be so applied. It would be safer to have this motion made considerably heavier than in the patterns we have seen, and if the instrument is likely to fall into clumsy hands the watch-telescope might easily be added for greater caution. Such a theodolite would, so far as we can judge, have no limit to its accuracy, except that depending on the diminutive telescope.

For many purposes of surveying it is desirable that the telescope should allow of being considerably elevated or depressed, and that means should be given for measuring this angle with considerable accuracy. A circle, or portion of a circle, is then fixed upon the telescope axis, and the necessary verniers and level may be secured by a tail-piece or otherwise to the support. If the vertical angles are to be measured as accurately as the horizontal angles, the instrument becomes an altitude and azimuth circle. [Circle.] But such instruments are rarely applied to the measurement of terrestrial angles. The direction of the meridian was determined in the Ordnance Survey by observing Polaris at its greatest elongations E. and W., and taking the middle of the two readings for the direction of the north. Hence the telescope required all the transit adjustments except that for azimuth [Transit], and was considerably elevated above the circle. Though the results were upon the whole satisfactory, yet we greatly doubt the prudence of ascertaining this fundamental and delicate point from such an instrument, or of risking the steadiness of the telescope supports by raising them so much above the body of the instrument. It would have been better, we conceive, to have determined the direction of the meridian by a series of careful transit observations, using more optical power with greater steadiness, and to have kept the theodolite to its proper office, that of measuring horizontal angles, greatly reducing the height of the telescope supports. The great theodolite had originally a semicircle fixed to the axis of the telescope, for measuring altitudes and depressions. This has since, very properly, been removed, and a whole circle substituted.

Where a theodolite is merely used for surveying, the telescope requires only a moderate vertical range. Mr. Troughton fixed a portion of a circle (which may be more properly called a slice than a sector) to one or two of his 12-inch theodolites, and this construction is often found in other makers. The telescope is thus kept lower, the instrument is firmer, and the larger radius gives the portion of the circle a seeming advantage over the entire circle of smaller radius. There is however something very unsatisfactory in a portion of a circle, and we should prefer a sort of compromise, giving the supports such an elevation as would allow a vertical circle of about half the dimensions of the horizontal circle: if the direction of the meridian is to be determined by this instrument, the supports must be at least so high as to see 2° or 3° above the latt-

tude of the place, and the vertical circle may be increased accordingly.

It is perhaps requisite to give some description of the mode of adjusting the vertical circle. Where the supports are high enough to allow the telescope to pass when turned round in a vertical plane, all the adjustments are the same as in the altitude and azimuth circle. [CIRCLE.] When the telescope is too long for this, the circle must be lifted out of its Y's in order to bring the line of sight again upon the object to be bisected, and then set down again. The operation is in fact the same, whatever be the nature of the vertical arch, and the adjustment is to be effected either by altering the level or the horizontal wire until the reading is the same in both positions of the telescope. If the observer has a Y level or collimator, he can set the cross of his level-wires horizontal, and this being bisected by the telescope of the theodolite, the vernier must be made to read zero, and the bubble of the level be brought to the middle by its proper screws. Or if the observer possess two stands (and there is a great convenience in having more stands than one in surveying), he may place the stands at a considerable distance from each other, and, fixing the instrument on one stand and a mark of exactly the same height as the telescope-axis on the other, observe the mark, noting its elevation or depression. Now exchanging the instrument and mark, he must reobserve the depression or elevation exactly as before. On drawing the figure, it will be seen that if light move in a straight line, 90° − elevation at lower station = 90 − depression at higher station + the angle between perpendiculars to the earth's surface at each station, which last quantity is known from the distance between the stations, and may be easily calculated, *i.e.* depression − elevation = a known angle. But if the zero is wrong, depressions will be increased while elevations are diminished, and *versâ vice*, so that depression observed − elevation observed − the known angle, instead of being = 0, will be ± 2 error of the vernier, which may be corrected accordingly either by the adjustment of the level or of the horizontal wire. Or, lastly, if the telescope has so much motion as that a star can be observed directly and by reflexion from mercury or any other fluid, the index-error of the vertical circle may be most accurately determined thus. Take any star in the meridian, and having observed it directly, observe it immediately after by reflexion. If great nicety is required, the observations should be repeated alternately several times, and the partial results reduced to the meridian. The mean reading between the meridian altitude and meridian depression is the reading which corresponds to the horizon, and the difference of this from 0, or 90°, according as the circle reads altitudes or zenith distances, is the error of the instrument, which may either be corrected or allowed for. This method, though very accurate, requires some knowledge of the time, and is rather restricted by the choice of stars. It is nearly as safe to observe a star not far from the east or west point, first directly, then by reflexion, and lastly directly, making the contacts at following whole minutes, or at even or odd minutes if the interval of a minute is not sufficient. As the stars rise nearly uniformly in this part of the heavens, the mean of the first and third observations should give an altitude equal to the depression observed midway; the discrepancy between these results will be the double index-error as before, which may be corrected or allowed for. By some of these methods, the index-error of the verticle circle or sector is to be found.

In some of the older theodolites the telescope rides in Y's at the top of the vertical arch, and is reversible as a level. The horizontal position of the telescope Y's can therefore be found as in any other level, and the verniers of the vertical circle set to zero when the telescope is horizontal. The vertical angles measured by these instruments are not however to be greatly depended on. They are usually greatly out of balance in all positions of the telescope, except the horizontal position, and therefore they make better levels than altitude instruments. This error may be partially got rid of by having a second level fixed to the instrument which is parallel to the plane of the vertical circle, and adjusted to the telescope level when that is horizontal. If this supplementary level is pretty well graduated, it will show the tilt which is given the plane of the instrument by want of balance, and so give the correction required.

It may be as well to mention here that the principal adjustment being that of setting the plane of the theodolite horizontal, or, more correctly speaking, the principal axis vertical, any horizontal level anywhere placed is sufficient for the purpose, though the cross-levels are a little handier. A box-level is convenient, if a stand and repeating-table are used, to bring the planes nearly horizontal, and to make both ends of the bubbles visible at first.

Many surveyors give themselves and the instrument-maker a great deal of unnecessary trouble by being very difficult on the chapter of excentricity, which they confound with error of division. The English dividing-engines, up to the present time, do not divide the circles upon their centres; and therefore it frequently happens that the point round which the circle turns is not the point round which it is divided. When this error is not absolutely monstrous, the only effect is that one vernier gains what another loses, and that the mean of two opposite, or of three, four, or more equidistant readings, is precisely the same as if there were no excentricity. The advantage of a *little* excentricity is, that it gives you the benefit of an unbiassed reading at every vernier as well as the first: again, if all the verniers are recorded, it is a check on the dishonest observer, who might read one vernier and set down the rest. The instrument-maker must please his ignorant customer, and so either hammer his circle after it is divided, which may deform his work, or have an adjustment, which injures its solidity.

In Ramsden's great theodolite, and several others which have been made, the circle is read off by micrometer microscopes. Sometimes the microscopes revolve with the telescope (as the verniers do in our figure); sometimes the microscopes are fixed, and the circle revolves with the telescopes, as in Ramsden's theodolite.

Ertel of Münich has made several *astronomical* theodolites in which the rays entering into the telescope are reflected along the horizontal axis by a prism. The observer therefore looks in at the end of the horizontal axis, whatever the position of the star may be. The eye and body of the observer are more satisfactorily placed, and the supports are kept close and snug to the horizontal circle. The instrument is well adapted to one of its principal objects, observing stars at their passage over the prime vertical [TRANSIT]; but there is some trouble in finding an object when you have no better direction to look for it than your eye affords. Excellent latitudes have been determined by instruments of this class used in the prime vertical, and even the small vertical circle seems from some accounts to possess more power than from its dimensions we should have thought probable. As a general rule, the greater the number of readings, the less the effect of bad division, but beyond a limited number, the trouble and difficulty of reading-off is found in practice to counterbalance the advantage. Two opposite readings annul the effect of excentricity; three or four equidistant readings destroy such an error as would arise from the circles becoming elliptic after it was divided, or any error which follows the same law. In small stoutly-made theodolites we think two the most convenient number, and they can be much more conveniently read off than a larger number. When the circle is so much as 8 inches in diameter and the telescope good, we should prefer three or four readings. The vertical circle or sector may have two opposite readings. For many matters connected with surveying on the most extensive and accurate scale, see the memoirs published and to come of the English, Scotch, and Irish Trigonometrical Survey; and the 'Base Métrique,' or account of the French measurement of an arc of the meridian, although that survey was conducted by a different instrument. Similar operations have been carried on in many countries during the last half-century, and the memoirs which relate to these surveys contain the best information which can be had on the subject.

THEODO'RA. [JUSTINIAN.]

THEODORE OF CORSICA. [CORSICA.]

THEODORE, or THEODORUS, *of Mopsuestia*, a learned bishop of the Oriental church. He was descended from a rich and distinguished family at Antioch, and was the brother of Polychronius, who became bishop of Apamea. He studied rhetoric, together with his friend John Chrysostom, under Libanius, who resided at Antioch from the year A.D. 354. His teacher of philosophy was Andragathus. After having finished his studies, he intended to marry a

lady of Antioch (about 360), but his friend Chrysostom, who was then a monk, persuaded him to choose the monastic life. Theodore was for some time a priest at Antioch, and afterwards bishop of Mopsuestia, an antient town of Cilicia (394). In the same year he was present at the council of Constantinople. He died in 429, at a very advanced age, and after he had discharged his episcopal functions during thirty-five years. During fifty years he was known as one of the most distinguished writers of the Greek church, especially by his works against the Nestorians, Pelagians, and other sectarians. His zeal however for the Catholic faith did not save him from the charge of being an adherent of the doctrines of the Nestorians, and he 'was obliged to make a public apology.' After his death the Nestorians continued to quote his works, and to call him the support of their faith; and this was the cause of his works, or perhaps only part of his works, being condemned by the fifth Council (553). Theodore of Mopsuestia is said to have written largely on divinity and morals. Few of his writings have come down to us: others exist in Syriac and Latin translations, and of the greater part there are only fragments. A treatise on the Magi of the Persians, and his commentaries on the Psalms, the Book of Job, and the Song of Solomon, are lost: his commentary on the twelve greater prophets is preserved in MS., according to Fabricius, under the title of Θεοδώρου Ἀντιοχέως ἑρμηνεία εἰς τοὺς Προφήτας. A catalogue of the works which contain fragments of him is given in Fabricius, and the Syriac translations are mentioned in Assemannus's 'Bibliotheca Orientalis.' Theodorus of Mopsuestia is still one of the first theological authorities among the Syrian Christians.

(Fabricius, *Bibl. Graeca*, x., p. 346-362; 346, note a; 347, note o; 352, note gg; 355, note kk; p. 748: Tillemont, *Memor. Eccles.*, vol. xii.; Cave, *Script. Eccles.*, vol. ii.)

THEODORETUS, or THEODORITUS, a theologian and church historian, was born about 393 A.D. He was brought up under the care of a pious mother, to whom he acknowledges his obligations in his writings; and he had instruction from Theodore of Mopsuestia and John Chrysostom in a monastery, to which he was sent to receive his education when not quite seven years old, and where he had for his fellow-pupils Nestorius and John, who were afterwards patriarchs of Constantinople and Antioch. Theodoret became a deacon in the church at Antioch, and in the year 423 he was chosen bishop of Cyrus, a city in Syria, near the Euphrates. His diocese abounded with Marcionites and persons who held heretical opinions concerning the Trinity. Against the opinions of these heretics he directed his efforts with so much success, that, according to his own statement, he baptized ten thousand Marcionites.

In the year 431 Nestorius was condemned by the council of Ephesus [NESTORIANS], whose decision gave great offence to many of the Oriental Christians, who, without being avowed followers of Nestorius, were supposed to be not unfavourable to his opinions. Among these was Theodoret, who was a personal friend of Nestorius; and he was one of those who assembled after the council of Ephesus had broken up, and condemned its proceedings. A reconciliation was however effected between Cyril, patriarch of Alexandria, the great enemy of Nestorius, and John, patriarch of Antioch, the leader of the Oriental party, who signed an agreement by which Cyril approved of John's statement of the controverted point of doctrine, while John gave his approval of the sentence passed on Nestorius. With this agreement Theodoret and others of the Oriental party were greatly dissatisfied. Theodoret approved on the whole of the doctrinal statements in the agreement, but he warmly protested against John's consent to the condemnation of Nestorius, as an act of unmitigated injustice. He expressed these feelings in a letter to Nestorius. But when John, armed with an imperial edict, proceeded to take measures against the more decided partisans of Nestorius, Theodoret considered himself bound to submit, both for the sake of the peace of the church, and because of his own approval of the doctrine which it was John's object to enforce. He therefore used every means in his power to induce the friends of Nestorius, namely, Meletius, bishop of Mopsuestia, Alexander of Hierapolis, and Helladius of Tarsus, to submit to John; and, upon their rejection of his advice, he offered no opposition to their being deposed. But when, in the year 435, new and severe edicts were issued against the Nestorians, Theodoret refused to carry his submission any further; and, by his firmness he incurred the hatred of Cyril, to whom he had already been opposed in this controversy, and between whom and Theodoret such a bitter feeling existed, that when Cyril died, in 444, Theodoret made no secret of his joy at the event.

If, as we are bound to conclude from the character of the man and from the Christian spirit with which he elsewhere speaks of Cyril's death, Theodoret's joy on this occasion sprung from a belief that the divisions which had been kept alive by Cyril would die with him, and peace be restored to the church, he was doomed to bitter disappointment. Cyril was succeeded by Dioscurus, a man as haughty and impetuous as himself, and quite as unscrupulous. The new bishop followed up his predecessor's plan of enforcing upon the whole Eastern church the doctrine of the coalescence of the Deity and humanity into one nature in the person of Christ; and perhaps he also kept in view the object of obtaining a kind of supremacy for the see of Alexandria. Determined to admit of no compromise, he made his first attack upon the moderate party in the Syrian churches, which was headed by Theodoret. Dioscurus was supported by a large party in Syria, chiefly consisting of monks, whose leader was an abbot named Barsumas; and at Constantinople many monks, the most remarkable of whom was the abbot Eutyches, were strongly in favour of the Cyrillian doctrine, on the ground that it alone was consistent with the simple letter of Scripture, 'the Word became flesh,' and other similar expressions.

These Constantinopolitan monks were a most important party in the dispute, partly from their close connection with the anti-Nestorian monks of Syria, and still more from their great influence with the emperor Theodosius II., whom they had induced from the very first to espouse the party of Cyril. Theodoret was, as usual, slow to take up the controversy. He wrote to Dioscurus in the hope of effecting a reconciliation between the two parties. In this attempt he failed; and then, looking upon the doctrine of Dioscurus and his allies as the sure road to the various heresies which denied the true humanity of Christ, he wrote a book against them in the year 447, entitled 'The Beggar, or the Many-shaped' (ἐρανιστής, or πολύμορφος). By this title he meant to imply that the Eutychian doctrine (as the views held by Cyril, Dioscurus, Barsumas, Eutyches, and the monks, are generally named for the sake of brevity) was borrowed from a variety of antient heresies. The work consists of three dialogues: in the first, entitled ἀτρεπτος, he treats of the impossibility of the divine essence undergoing a change; in the second, ἀσύγχυτος, of the impossibility of the two natures (the divine and human) being mingled into one; and in the third, ἀπαθής, of the impossibility of the divine nature suffering or dying. This work displayed great learning and power, together with a moderation which drew upon Theodoret the reproaches of the zealots of his own party. His opponents, however, saw in his doctrines nothing less than a revival of Nestorianism; and Dioscurus accused him before Domnus, the patriarch of Antioch, of dividing the one Lord Jesus Christ into two sons of God, and wrote also a severe letter to Theodoret, making the same charge. Theodoret replied with great mildness and moderation, conceding as much of the disputed doctrine as he could conscientiously, and praying Dioscurus to consult for the peace of the church rather than for the views of a party. This letter only the more incensed Dioscurus, who permitted monks publicly to anathematize Theodoret in the church, while he himself confirmed their anathemas. He also sent ambassadors to Constantinople to accuse the whole Eastern church of Nestorianism before the emperor. Domnus also sent deputies to clear his church of this charge, and Theodoret wrote with the same object to some of the most powerful ecclesiastics and statesmen. No immediate decision of the dispute took place, but the emperor ordered Theodoret, as a troubler of the church, to confine himself within the limits of his own diocese. Theodoret bitterly complained of being thus condemned unheard.

In the meantime the two parties grew more violent, and the imperial court itself became the scene of their disputes. In the year 448 Eutyches, in his zeal against Nestorianism,

incurred the charge of an opposite heresy, of which he was condemned by the synod held by Flavianus at Constantinople, but again acquitted by the second Council of Ephesus, under the presidency of Dioscurus (A.D. 449). [EUTYCHIANS.] In convening this council every care was taken to exclude the anti-Eutychian party. With respect to Theodoret, the emperor commanded that he should only be admitted in case his presence should seem good to the whole assembly. The hint was taken, and he was excluded. The emperor carried his dislike to Theodoret still further, and intimated to the council that such men as Theodoret should not only have no voice in it, but that they ought rather to be visited with its censures. Accordingly the council deposed Theodoret from his bishopric, and he was compelled, by an imperial edict, to retire into the monastery where he had been educated. As he had been peaceful and moderate in prosperity, so he was resigned and cheerful in adversity: indeed his amiable spirit, and his firmness in obeying the dictates of his conscience, form a most agreeable relief to the strife and ambition which mark the character of most of the ecclesiastics of the age.

The only check to the triumph of Dioscurus and the Eutychians was the influence of Leo the Great, the then bishop of Rome, who had been already appealed to by Eutyches, after his condemnation by the synod of Constantinople, and whose aid was now sought by the opposite party. Flavianus and Theodoret wrote letters to him, proposing to submit the whole controversy to an œcumenical council to be convened in Italy. To this arrangement the emperor (Theodosius II.) refused his consent, but his death in the following year (450) changed the state of affairs. In the next year (451) an œcumenical council was assembled, first at Nicæa, but very soon removed to Chalcedon, to which Theodoret was summoned, and in which he was received by his friends with the greatest enthusiasm. He petitioned the council for restoration to his bishopric: at the eighth sitting his petition came on for hearing: he rose to plead his cause; but the party of Dioscurus exclaimed that he must first condemn Nestorius. Theodoret had never been a Nestorian, but had all along held a middle course between the parties of Nestorius and of Cyril; but he hesitated to pronounce the required condemnation till some clear definition of Nestorianism should be given. The bishops of the opposite party interrupted him with the shout 'He is a heretic: he is a Nestorian: thrust the Nestorian out!' Upon this Theodoret exclaimed:—'Anathema on Nestorius and on every one who denies Mary to be the mother of God, and who divides the only begotten Son into two sons. I have subscribed the confession of faith, and the letter of the bishop Leo; and this is my faith—Farewell.' He was pronounced to have established his orthodoxy, and the unanimous vote of the council restored him to his bishopric.

In this transaction we perceive that Theodoret's firmness had at length given way before the furious zeal of the Eutychians; and his courage appears never to have revived, for in his latest work, which was a history of heresies (*αἱρετικῆς κακομυθίας ἐπιτομή*), he speaks of his former friend Nestorius in the harshest terms.

After the council of Chalcedon, Theodoret returned to his diocese, where he devoted the rest of his life to literary labours. He died in the year 457. Even after his death he was looked upon as a formidable enemy by the Monophysites and the Origenists, who procured the condemnation of his writings against Cyril by the council of Constantinople (A.D. 553).

His works were:—1, 'A History of the Church,' in five books, from 325 to the death of Theodore of Mopsuestia in 429. Gennadius, a Latin writer, at the end of the fifth century, says that Theodoret's history consisted of ten books, and came down to the year 457, but no other writer mentions more than five books. It is a work of great learning and impartiality. 2, *Φιλόθεος ἱστορία*, an account of the lives of thirty celebrated hermits, ten of whom were his contemporaries and in some degree personally known to him. 3, The work against the Eutychians, already mentioned. 4, 'The History of Heresies,' also mentioned above. It is sometimes entitled, 'Against all Heresies, or a discrimination of falsehood and truth' (*κατὰ πασῶν τῶν αἱρέσεων, ἢ ψεύδους καὶ ἀληθείας διάγνωσις*). It consists of five books, and relates almost exclusively to the heresies respecting the person of Christ. 5, 'Ten Orations against the Heathen;' an 'Apology for Christianity;' besides 146 letters and commentaries on most of the books of the Old Testament and on all the epistles of Paul.

The best edition of his works is that of Schulze, in 5 vols. 8vo., Halle, 1768-74.

(Mosheim's *Ecclesiastical History*, by Murdock and Soames, i., p. 443; Neander's *Geschichte der Christl. Relig. und Kirch.*, ii., passim; Schöll's *Geschichte der Griech. Litt.*, iii. 318.)

THEODORIC or THEODERIC I., king of the Visi-Goths, was the elected successor, but was not the son, of king Wallia, who died A.D. 419. During the latter years of the reign of the emperor Theodosius II., Theodoric invaded Gaul, and in 425, just after the accession of Valentinian III., he laid siege to the city of Arles. Aëtius however relieved this town, and made peace with the Goths, who were obliged to come to terms because they were threatened by the Vandals, and they marched against the Vandals together with the Romans. After a peace of ten years, a new war arose between the Romans and Theodoric, who in 436 besieged the city of Narbonne, which was only relieved in the following year, 437. The issue of this war proved unfortunate for the Romans, the inhabitants of their provinces in Gaul being reduced to despair by heavy taxes and other kinds of oppression, and the Goths being superior to the Romans in courage. Aëtius therefore enlisted several thousand Huns, in order to employ them against the Goths; but these auxiliaries were more destructive to the inhabitants than their enemies. A body of the Romans, together with these Huns, commanded by Litorius, the best of the generals of Aëtius, having made some progress, laid siege to Toulouse in 439. Theodoric proposed to conclude a peace, but Litorius, remembering his former victories over the Armoricans, refused all terms. Upon this the Goths made a sally; the Romans were entirely beaten, and Litorius himself was made a prisoner, and carried in triumph through the streets of Toulouse.

The whole country as far as the Rhône was now open to the Goths, and the inhabitants being well-disposed, Theodoric made fresh conquests. The remainder of the Roman army was disorganized and in the greatest consternation. Nevertheless Avitus, who was then Præfectus Prætorio in Gaul, found means to make peace, which was certainly favourable to the Goths, though the conditions are not known. In 450 Gaul was invaded by Attila with his Huns and a numerous body of Teutonic auxiliaries. Attila pretended that his object was only to attack the Visi-Goths, but the Romans also took arms, and the united forces of Aëtius and Theodoric met the Huns at Châlons-sur-Marne (451). Theodoric commanded his army in person, and he was accompanied by his two sons, Thorismund and Theodoric. The battle was short, but bloody and disastrous for Attila, who fled on the following day, and thus escaped total destruction. King Theodoric was killed at the beginning of the battle. Prince Thorismund was proclaimed king in the camp of his father, whom he caused to be interred on the field of battle with great pomp. [ATTILA.] (Maseov, *History of the Antient Germans*, ix. 11, 14, 27, 28.)

THEODORIC, or more correctly THEODERIK, surnamed 'the Great,' king of the Ostro-Goths, was the son of king Theodemir by his concubine Eralieva (Ehrlieb). He was born in 455, and he was seven years old when he was sent to Constantinople to the court of the emperor Leo Magnus (457-474) as a hostage, peace having just been concluded between this emperor and Theodemir, who had engaged to assist the Romans for an annual payment of two thousand pounds of gold. Theodoric received his education at Constantinople, and returned to his father in 472.

Without any orders from his father, he attacked and subjugated some Slavonian tribes on the Danube, and he afterwards accompanied Theodemir in his expedition to Thessaly, which was undertaken for the purpose of obtaining a larger territory for the Goths. This happened at the same time as the death of Leo (January, 474); and Zeno Isauricus the elder, who became emperor in the month of February, hastily made peace with the Goths, and ceded to them the country of Pautalia, that is, the south part of Pannonia and the south-west part of Dacia (474). Theodemir died in 475, and Theodoric became king of the Ostro-Goths.

Zeno having been deposed by another Theodoric, the

son of Triarius, a Gothic prince who had great influence in the Byzantine empire, king Theodoric marched to his assistance, and by his aid Zeno was again acknowledged as emperor (476–477). It seems that Zeno did not show himself so grateful as he ought, for serious differences broke out between him and the Goths. Theodoric, on the contrary, was loyal and generous, and he continued to be a faithful ally when the emperor had satisfied his just claims. He proved so serviceable, that Zeno created him Patricius and Magister Militiæ Præsentis in 483, and subsequently promoted him to the consulship in 484, a year which is still distinguished in the annals by his name. Jornandes affirms that Zeno adopted him as his son, and caused an equestrian statue to be erected in honour of him before the imperial palace. (*De Rebus Gothicis*, c. 57.)

Notwithstanding the honours which Zeno conferred upon the king of the Goths, Zeno showed his insincerity wherever he saw an opportunity. To avenge himself, Theodoric invaded Thrace (in 488), dispersed the imperial troops, and besieged Zeno in Constantinople. It is said that Zeno saved himself by ceding to his adversary Italy, or his right to Italy, which was then in the hands of Odoacer, the chief of the Rugians. Perhaps he ceded only his claims on this country, hoping thus to get rid of a neighbour and friend whom he had changed by his own misconduct into a dangerous enemy. However this may be, the conditions of agreement are obscurely known. The Greeks afterwards pretended that Zeno had sent the Goths to Italy to re-annex that country to the empire: the Goths, on the contrary, affirmed that he surrendered Italy to their king. (Procopius, *De Bello Gothico*, i. 1.) Theodoric had certainly formed the plan of conquering Italy, and he was bent on carrying it into execution. If therefore he found it advisable to use the name of Zeno, he probably did so for the purpose of gaining those among the Romans who, although they detested foreigners, would submit to any conqueror whom they could consider as a delegate of the antient legitimate authority.

Theodoric assembled his nation (489), that is, that part of the Ostro-Goths which obeyed the kings of the house of the 'Amali,' of which Theodoric was a descendant. Some Gothic tribes only remained in Thrace and in the Tauric Chersonese. A whole nation, men, women, and children, carrying all their moveable property with them, left their homes and took the road to Italy, following the Danube as far as the tract which lies between that river and the lake of Balaton in western Hungary. Trapstila, the king of the Gepidæ, appeared with an army to prevent them from passing through his dominions; but he was routed by Theodoric on the river Ulca (the present Szala), which flows into the western corner of the lake of Balaton. Enduring hardships of all kinds, and fighting their way through the armed inhabitants, the Goths traversed the western part of Pannonia, crossed the Julian Alps, and reached Isonzo, where they met with the army of Odoacer, who was beaten in three battles—on the Isonzo, at Verona, and on the Adda (490). Odoacer, who fled to Ravenna, was forsaken by his best general, Tufa, and Frederik, a prince of the Rugians, and Epiphanias, bishop of Pavia, also came to Milan to pay homage to the king of the Goths. Odoacer was blocked up in Ravenna by one part of the Goths, and Theodoric, with another part, took possession of the whole peninsula of Italy, leaving Sicily, Sardinia, and Corsica to the Vandals. The siege of Ravenna lasted three years; but at last Odoacer surrendered to Theodoric, who, notwithstanding his oath to spare the life of his prisoner, ordered him to be put to death in his own palace (493). Odoacer's son and his whole family shared the same fate.

Theodoric was now acknowledged as king of Italy by the emperor Anastasius, the successor of Zeno, who gave him the furniture of the palace at Ravenna, which Odoacer had sent to Constantinople. Theodoric did not assume the imperial title although he adopted the name of Flavius. In 500 he went to Rome and celebrated a triumph; he convened the senate 'ad palmam auream,' confirmed the immunities of the Romans, and gained the affection of the lower classes by his liberality and by the exhibition of magnificent spectacles.

Theodoric had already confirmed his power by alliances with the neighbouring kings. Gundobald and Godegisel, the kings of the Burgundians, having made an invasion into Italy and carried away many of the inhabitants, Theodoric sent Epiphanias, bishop of Pavia, and Victor, bishop of Turin, as ambassadors to Burgundy. They succeeded in delivering the captives, and concluded an alliance between these kings and Theodoric, who gave his daughter Ostrogotha in marriage to Sigismund, the son of Gundobald. He likewise kept peace with the Vandals, and gave his sister Amalfrida, then the widow of a noble Goth, in marriage to their king Thrasimund. His eldest daughter, Theodichusa, was married to Alaric II., king of the Visi-Goths; and his niece, Amalaberga, became the wife of Hermanfrid, the last king of the Thuringians. Theodoric himself took for his second wife Andofleda, the sister of Clovis, king of the Franks.

In 504 Theodoric was at war with Trasaric, king of the Gepidæ, who, after many defeats, ceded his southern provinces as far as Sirmium, now Mitrowiez on the Save, near its junction with the Danube. The inhabitants of the eastern part of the Alemannian kingdom, which had been destroyed by Clovis [ALEMANNI; TEUTONIC NATIONS—*Alemanni*,] acknowledged Theodoric as their protector, who summoned Clovis to desist from any further violence against the Alemanni. (His letter is contained in Cassiodorus, *Variar.*, ii. 41.)

Meanwhile a war had broken out between Clovis and Alaric II., king of the Visi-Goths. Alaric fell in the battle of Vouglé in 507, in consequence of which the greater part of the dominions of the Visi-Goths in Gaul came into the hands of the Franks. Alarie's only legitimate son was a child named Amalarie, whom he had by his wife Theodichusa. As there was danger of all Spain being invaded by the Franks, the Visi-Goths intrusted the guardianship of their young king to Theodoric, who thus became the ruler over the Ostro-Goths and the Visi-Goths, or over Spain, southern Gaul, Italy with the dependent province of Illyricum, and parts of Rhætia, Noricum, and Pannonia. Theodoric had previously sent an army into Gaul, commanded by Iba, who delivered Arles, which was besieged by the Franks (508); and the same general made a prisoner of Gesalic, the natural son of Alarie II., who was a dangerous rival of young Amalaric. Clovis was compelled to content himself with the northern and larger part of the Visi-Gothic dominions in Gaul. From this year, 511, is dated the regency of Theodoric in the kingdom of the Visi-Goths, who however styled himself king, and the councils which were held during his government are dated according to the years of his reign. He took possession of the cities of Provence, perhaps under the pretext of the expenses which he had been put to in saving the Visi-Gothic kingdom. He appointed Liberius his lieutenant in Gaul, and Theudis in Spain.

The relation between Theodoric and the emperors of Constantinople was maintained to the satisfaction of both parties, until Justin published a severe edict against all who were not of the Catholic church (523), and soon after deprived the Arians of their churches. About the same time this emperor had engaged with some members of the Roman Senate in designs against the Gothic dominion in Italy. Boëthius, then one of the first men in Italy, was charged with being a principal conspirator. He was imprisoned in 522, and during his captivity he wrote his Treatise on the Consolation of Philosophy. The conspiracy proved abortive, Boëthius was put to death in 524, and Symmachus, his father-in-law, shared the same fate in the following year at Ravenna. With regard to religious affairs, Theodoric, who was an Arian, like all the Goths, ordered Pope John with several bishops to go to Constantinople and to obtain better conditions for the Arians in the Eastern empire. The pope reluctantly obeyed, but it seems that in Constantinople he spoke rather according to his conscience than in favour of the Arians; for he was imprisoned at his return, by order of Theodoric, and died not many days after, on the 18th of May, 526. On Theodoric's recommendation, Felix was elected pope, and his election was confirmed by Athalaric, the successor of Theodoric. This fact proves the great influence which Theodoric had in the affairs of his time. Not having obtained favourable conditions for the Arians in the East, Theodoric was about to retaliate on the Catholics in his dominions, when he died suddenly on the 26th of August, 526, in the 72nd year of his age. His contemporaries have invented many fables about the sudden death of this great king. Procopius ('De Bello Gothico,' i. 1) says that the head of a large fish being served up at table, he fancied it to be

the head of Symmachus, whom he had put to death, and whose participation in the conspiracy against Theodoric had not been proved; it is added that he was so terrified by his imagination, that he fell into a fever and shortly afterwards died. Others pretend that his death was the consequence of a divine judgment, because he had deposed and imprisoned Pope John: this story savours of its origin. Others dreamt that the ghosts of Pope John and Symmachus had cast the soul of Theodoric into the burning crater of a volcano. The ashes of Theodoric were deposited in a porphyry urn, which still exists in the wall of the castle of Ravenna, and under it is an inscription on marble, bearing the date 563, which states that the urn once contained his remains. Theodoric having left no male issue, Athalaric, the son of his daughter Amalaswinth, succeeded him on the throne of Italy, and Amalaric became king of the Visi-Goths.

Theodoric generally kept his court at Ravenna, as the Roman emperors had done after the time of Honorius, and thus Ravenna became a centre of the arts and sciences, of no less importance than Rome. Among the high officers of Theodoric there were several very distinguished men, such as Cassiodorus, who was his private secretary, and Ennodius, who has written a eulogy of his master, which however is far from containing all the truth. He was celebrated as a hero in the old Teutonic songs, and in the 'Niebelungen-Lied' he appears as Diederich of Bern, that is, Verona.

Theodoric was not only a conqueror; he was also a legislator. [TEUTONIC NATIONS, *Goths*.] It is his greatest glory that he was a friend of peace, of toleration, and of justice; a glory, however, which is somewhat obscured by some acts of rashness and violence. Whenever a war between Teutonic kings was threatening, he tried to prevent it by mediation; a fact which is proved by his letters to the kings of the Franks, of the Visi-Goths, of the Thuringians, of the Burgundians, of the Heruli, and of the Warni. He always reminded them that they were of one common origin, and that they ought to maintain peace and friendly intercourse. Theodoric was especially vigilant in preventing Clovis from invading the states of his neighbours; he protected the Thuringians and the remnant of the Alemanni, and he saved the kingdom of the Visi-Goths from destruction.

(Ennodius, *Panegyricus Regis Theodorici*, ed. Chr. Cellarius, 1703, 8vo.; and also in his *Opera*, ed. Jac. Sirmondus, Paris, 1611, 8vo.; Jornandes, *De Rebus Gothicis*; Isidorus, *Chronicon Gothorum*, &c.; Procopius, *De Bello Gothico;* Cochlaeus, *Vita Theodorici Reg. Ostrogoth.*, ed. Peringskjöld, Stockholm, 1699, 4to. Cochlaeus has written without any just criticism; and Peringskjöld has shown no historical ability in his additions, which however contain very interesting matter relative to the language and the antiquities of the Goths. Manso's *Geschichte des Ost-Gothischen Reiches in Italien*, Breslau, 1824, 8vo., is a very valuable work.)

THEODORIC, a bishop and celebrated surgeon of the thirteenth century, was a pupil of Hugo of Lucca. He at first belonged to the order of the Preaching Friars (*Frères Prêcheurs*); afterwards he became chaplain to the Bishop of Valentia, and penitentiary to Pope Innocent IV.; and he was at last made bishop of Bitonti and Cervia successively. Towards the end of his life he settled at Bologna, where he died in 1298. He was especially distinguished from his contemporaries by not resting content with imitating his predecessors; on the contrary, he appears to have carefully studied the cases that presented themselves to his notice, and to have recorded in a great measure the results of his own observations. He also introduced several useful innovations in the practice of surgery, and was the first person who ventured to lay aside the cumbrous and frightful machines which had hitherto been used in the reduction of fractures and luxations. He left behind him a surgical work, entitled 'Chirurgia Secundum Medicationem Hugonis de Luca,' which was published at Venice in 1490 and 1519, in folio. (Haller's *Biblioth. Chirurg.*; Sprengel's *Hist. de la Méd.*; *Biographie Médicale.*)

THEODO'RUS (Θεόδωρος), a native of Cyrene, was a philosopher of the Cyrenaic school, who lived towards the end of the fourth century B.C. He was a pupil of Arete, the daughter of Aristippus, and afterwards became the successor of Anniceris. His philosophical system, which was a kind of medium between that of Aristippus and Anniceris, appeared so dangerous to his fellow-citizens, among whom he had been held in very high esteem, that they banished him from their city. Theodorus went to Athens, where he would have experienced worse treatment if Demetrius Phalereus had not interposed and saved him; for here too his doctrines soon came into disrepute, and a public accusation was brought against him of moral and religious indifference. After the fall of Demetrius Phalereus, Theodorus thought it advisable to withdraw from Athens, and he went to Egypt, where he soon gained the confidence of Ptolemaeus Soter, who, on one occasion, sent him as his ambassador to Lysimachus. On this mission Theodorus is said to have shown much courage and a strong feeling of independence towards Lysimachus, who taunted him for having been obliged to leave Athens. The time of his death is unknown.

We do not possess a complete view of the philosophical system of Theodorus, but he appears to have been one of the forerunners of Epicurus. His ideas of the deity were explained in a book which he wrote on the gods (περὶ θεῶν), and which earned him the name of atheist, though it is doubtful whether this opprobrious name was given him because he really denied the existence of gods, or merely because he was above the common prejudices of his countrymen. The following doctrines are especially mentioned as characterising his views of human affairs:—wisdom and justice are desirable, because they procure us the enjoyment of pleasure: friendship, on the other hand, has no real existence; for, in a person who is not wise, it ceases as soon as he ceases to feel the want of it, and a wise man is in want of nothing beyond himself. Patriotism is not a duty, because it would be absurd to make it incumbent upon a wise man to sacrifice himself for the ignorant, who form by far the majority of a state. His followers, who constituted one of the three branches into which the Cyrenaic school was divided, were called Theodorians.

(Diogenes Laert., ii. 86; vi. 97; Cicero, *Tusculan.*, i. 43; v. 40; *De Natura Deorum*, i. 1, 23, 43; Suidas, s. v. Θεόδωρος.)

From the philosopher Theodorus of Cyrene we must distinguish Theodorus the mathematician, who was a native of the same place, and is mentioned among the teachers of Plato. (Xenophon, *Memorab.*, iv. 2, 10; Maximus Tyrius, *Dissertat.*, 22.)

THEODO'RUS PRISCIA'NUS, the author of a Latin medical work, which is still extant, and which sometimes goes under the name of *Octavius Horatianus*. He was a pupil of Vindicianus, and is supposed to have lived at the court of the emperors of Constantinople in the fourth century after Christ. He belonged to the sect of the Empirici, but appears to have also mixed up some opinions of the Methodici, and even of the Dogmatici. His work, which is not of much value, is entitled 'Rerum Medicarum Libri Quatuor,' and is written in a barbarous Latin style. The first book treats of external disorders, the second of internal, the third of female diseases, and the fourth of physiology, &c. It was first published in 1532, fol., at Strassburg, and also in the same year at Basle, 4to.; of these two editions, the former is the more complete, the latter the more correctly printed. A new edition was undertaken by J. M. Bernhold, of which the first volume was published in 8vo., without place or date, at Ansbach in 1791; but which, in consequence of the editor's death, has never been completed. Another work, entitled 'Diaeta, seu de Salutaribus Rebus Liber,' has been attributed to Theodorus Priscianus, but (as Choulant thinks) incorrectly. It was first published together with 'Hildegardis Physica,' Argentor., 1533, fol. It first appeared in a separate form at Halle, 1632, 8vo., edited by G. E. Schreiner, and was afterwards inserted in Rivinus's collection of antient physicians, Leipzig, 1654, 8vo. (Haller's *Biblioth. Medic. Pract.*; Sprengel's *Hist. de la Méd.*; Choulant's *Handbuch der Bücherkunde für die Aeltere Medicin.*)

THEODO'RUS, or DIODO'RUS, OF TARSUS, of a noble and very distinguished family, lived in the fourth century of our æra, and was most probably born at Antioch. He studied under Sylvanus Tarsensis; and after having taken orders, he first became priest, and then Archimandrita at Antioch. The Catholic churches of this town having been shut up by order of the emperor Valens (A.D. 364-378), who was an adherent of Arianism, Theodorus

preached in the fields round the town, and he was always surrounded by a numerous congregation of Catholics. He also defended the orthodox faith with great intrepidity against the attacks of the Arians and the tyranny of Valens. Immediately after the death of Valens, he was appointed bishop of Tarsus (378), Gratianus, the successor of Valens, being a zealous Catholic. In 381 Theodorus was at the Council of Constantinople. The year of his death is not known, but as Phalerius was chosen bishop of Tarsus in 394, it is probable that he died in this year. Theodorus was much esteemed by his contemporaries for his plain and lucid eloquence, but though he was known as the most zealous defender of the Catholic faith, he was accused of having shown himself favourable to the heretical doctrines of Nestorius. The same charge was made against his contemporary Theodorus of Mopsuestia. Theodorus of Tarsus wrote numerous works on theology and morals, none of which have come down to us. It is said however that one of his works on Politics, which Fabricius believes to be identical with another work on Providence, exists in a Syriac translation.

(Cave, *Script. Eccles. Historia Literaria*, vol. ii., p. 266, 267; Fabricius, *Bibl. Græca*, p. 380, 381.)

THEODO'RUS I., a native of Greece, and son of Theodorus, patriarch of Jerusalem, was elected bishop of Rome after the death of John IV., A.D. 641. Constans II. was then emperor of Constantinople, and Rotaris was king of the Longobards in Italy. The heresy of the Monothelites was disturbing the church, and it was supported by the emperor Constans, and by Paulus, patriarch of Constantinople. Theodorus held a council at Rome in 648, in which Paulus was excommunicated. It does not seem proved however that Theodorus condemned, as some have asserted, the typus or edict of the emperor Constans, in which he forbade all his clergy from disputing on the subject of the two wills in Christ, the Monothelites asserting that there was only one will in him. [EUTYCHIANS.] Theodorus built several churches at Rome. He died in 649, and was succeeded by Martin I. (Muratori, *Annali d'Italia;* Panvinio, *Vite dei Pontefici.*)

THEODORUS II., a native of Rome, was elected pope after the death of Romanus, in August, 897, and died three weeks after his election, and was succeeded by John IX.

THEODO'RUS LA'SCARIS, emperor of Nicaea, was descended from an antient and noble Byzantine family, the early history of which is unknown. In 1198 he married Anna Angela-Comnena, the widow of Isaac Comnenus Sebastocrator, and the second daughter of the emperor Alexis III., Angelus-Comnenus, who usurped the throne of Constantinople, after having blinded and thrown into a prison the emperor Isaac Angelus (1195). Alexis, the son of Isaac, fled to Italy and implored the protection of the Western princes, who, in 1203, were assembled at Venice for the purpose of a new crusade. They promised him assistance, and sailed to Constantinople with a powerful fleet, commanded by Dandolo, the doge of Venice. They laid siege to Constantinople, but although Theodore Lascaris prepared a vigorous resistance, Alexis III., who was of a mean and cowardly character, secretly left his capital and fled to Conrad, marquis of Monteferrato, in Italy, who had married his sister Theodora. Assailed by bold and experienced troops, and abandoned by their emperor, the Greeks were struck with alarm: they surrendered their capital, and did homage to the blind Isaac and his son Alexis IV. (19th of July and 1st of August, 1203), who reigned together under the protection of the Latin princes. However, Alexis Ducas Murzuphlus had made a party among the Greeks, who were enraged at the haughtiness of their foreign protectors. He murdered Alexis IV., Isaac died of grief, and Murzuphlus was proclaimed emperor under the name of Alexis V. (28th of January and 8th of February, 1204). The Latins immediately laid siege to Constantinople, to avenge the murder of their ally and friend; and although the new emperor, assisted by Theodore Lascaris, defended the capital with skill and energy, the fall of this city became imminent. Suddenly Alexis V. fled with his treasures (April, 1204), and the consternation which had reigned after the flight of Alexis III. once more discouraged the Greeks, and led to anarchy. During a period of six months, four, and as Isaac reigned twice, five emperors successively occupied the throne; and such was the passion for ruling among the Greek nobles, that in this critical moment, when the very existence of the empire was at stake, two candidates presented themselves to the people for the purpose of obtaining the crown.

These candidates were Theodore Lascaris and Theodore Ducas, who was of Imperial descent. Lascaris was proclaimed emperor, but fearing some sudden opposition from the adherents of the fugitive emperors, he declined the Imperial title, and declared he would content himself with that of 'despote' until he had re-established tranquillity. However, while he encouraged the people to resist the besiegers, the Latins made an assault and succeeded in taking the town, the Greeks having cowardly abandoned their posts. During the confusion of plunder and violence, Theodore Lascaris escaped with his wife Anna, and fled to the opposite shore of Asia. The Latins chose Baldwin, count of Flanders, emperor of Constantinople, and gave him the capital and one-fourth of the empire; the remaining three-fourths were divided between Venice and the Frankish barons.

Meanwhile Theodore succeeded in raising troops in Asia, and, assisted by the Turks of Koniah, or Iconium, he made himself master of the important town of Nicaea and the greater part of Bithynia, proclaiming that he acted only as despote, and in the name of his father-in-law, the fugitive emperor Alexis III. (Autumn, 1204). His conquests were soon taken from him by Louis, count of Blois, who, in the division of the empire, had received Bithynia, and who defeated Theodore at Pæmanene, on the frontiers of Mysia and Bithynia (6th of December, 1204). Theodore retired to Brusa, one of the few towns which had not fallen into the hands of the count of Blois; but he was pursued and obliged to fight with Henry, count of Flanders, the brother of the emperor Baldwin, who defeated him.

Theodore would have been ruined but for the victories of the king of the Bulgarians and the revolted Greeks over the troops of the emperor, who was obliged to call for the assistance of the count of Blois and the Latin troops in Bithynia. Theodore again became master of this country, and his father-in-law, Alexis III., being then kept a prisoner by the marquis of Monteferrato, he himself assumed the title of emperor. He styled himself Βασιλεὺς καὶ Αὐτοκράτωρ Ῥωμαίων, which was the title of the emperors of Constantinople, and he thus showed that he considered himself as the only legitimate emperor of the East, having a right to the crown by his wife Anna, the daughter of Alexis III., who was prevented from ruling on account of his captivity, and all the other emperors of Greek extraction being then dead. In order to solemnize his accession to the Imperial throne, Alexis convoked a general assembly of the Greek bishops, who met at Nicaea. The new patriarch, Michael Autorienus, presided, who had been chosen patriarch for the special purpose of crowning Theodore, the patriarch Didymoticus having resigned.

Meanwhile several Greek nobles, profiting by the deep hatred of the Greeks against the Latin conquerors, had made themselves independent in Asia. Theodore, called Morotheodorus, reigned at Philadelphia, and Manuel Maurozomus, supported by Ghaïyáth-ed-din, sultan of Koniah, became powerful in Phrygia; but they were both defeated by the emperor of Nicaea, as Theodore Lascaris is generally called. A third and more dangerous adversary was Alexis Comnenus, who had reigned as emperor at Trebizond from the year 1204, and whose brother David overran Asia Minor as far as the Propontis and the Ionian Sea. Theodore and David were equal in military skill, in activity, and in perseverance: neither of them was discouraged by defeats, nor made less vigilant by sudden success. After their first encounter, David, appreciating the character of his adversary, concluded an alliance with Henry of Flanders, emperor of Constantinople, who had succeeded his brother Baldwin. Theodore however defeated them both, and some time afterwards David was again completely beaten by Guido Andronicus, the general of the emperor of Nicaea. After the truce between Theodore and Henry in 1210, David, who had hitherto carried on the war with various results, was compelled to give up all hopes of keeping the field any longer. He lost all his conquests, and his brother Alexis was obliged to cede them to Theodore (1214), who thus became master of the greater part of Paphlagonia.

The truce between Theodore and Henry was the con-

sequenee of various victories obtained by Theodore over the troops of Henry. In 1207 the emperor of Nieaea was besieged by the Franks in Nicomedia, but in a sally he made prisoner Count Thierry de Los, or more correctly Diedrik van Looz, a powerful baron from the Low Countries, and a deseendant of the first dukes of Lower Lorraine. Henry ransomed the count by surrendering several fortified towns to the emperor of Nicaea, and arrangements were made which led to the truee of 1210. In this year the old emperor Alexis III., who had escaped from the marquis of Monteferrato, fled to Asia, to the court of Sultan Ghaïyâth-ed-dîn, and persuaded him to support his claims to the throne of Nieaea, or of any other part of the Eastern empire. The sultan summoned Theodore to restore his father-in-law to the throne, and left Koniah at the head of 20,000 men. He was attacked in the neighbourhood of Antioch by Theodore, who had only 2000 men, but who charged the Turks with such impetuosity that their lines were broken, and they were entirely defeated. Ghaïyâth-ed-dîn himself was killed by Theodore, and old Alexis was made a prisoner (1210). He was confined to a monastery at Nieaea, where he died some years afterwards. Although Theodore had acted in his father-in-law's name while he was only despote, he had aseended the throne in his own name and at his own risk. Theodore's wife, Anna, the daughter of Alexis, was then dead.

It is said that in 1214 Theodore fell into the hands of Az-ed-dîn Key-kaus, the successor of Ghaïyâth-ed-dîn: but this is an error, and Fallmerayer, in his work cited below, has shown that it was Alexis of Trebizond who was made prisoner by the sultan. Exeept one short campaign against Henry in 1213, which was followed by a truee in 1214, Theodore reigned the last ten years of his life in peace, beloved by his friends and respected hy his enemies. After the death of Anna he married Philippa, an Armenian prineess, whom he repudiated after she had borne him a son; and in 1220 (?) he ehose for his third wife Maria, the daughter of Peter of Courtenai (Kortryk), emperor of Constantinople after Henry, who was sister to Robert, the son and successor of Peter. Theodore wished to give his daughter Eudoxia in marriage to Robert, who was of a very mild and amiable eharaeter, but this marriage was strongly opposed by the Greek patriarch Manuel, because the two emperors were brothers-in-law, and it was not carried into effect.

Theodore died in 1222, being between forty-five and fifty years old, in the same year with Alexis I. of Trebizond. Although he left a son, his suceessor was his brother-in-law John Vatatzes. One of Theodore's daughters, Maria, was married to Andreas, king of Hungary.

THEODORUS, Senlptor. [SCULPTURE.]

THEODO'SIUS of Bithynia or of Tripolis in Lydia, for it appears that both these descriptions are applied to him (though there is another Theodosius of Tripolis, the author of an obscure poem), was a mathematician, of whom there is some question whether he lived about fifty years before Christ, or some eenturies after. Strabo and Vitruvius both mention a Theodosius: the latter speaks of him as the inventor of a dial for every elimate (or latitude): if this be the subject of our article, he must have lived before Christ. But on the other hand: Ptolemy does not mention him (though this tells little either way); and Suidas, enumerating under the head of Theodosius the works we shall presently mention, adds that he was also a commentator on some parts of Theudas: if this be the case, he must have lived after Christ. The balance of authorities seems to he in favour of the former supposition: if the writings only were looked at, there would be little reason to doubt that they were composed before the time of Ptolemy.

We have left of Theodosius—1, Σφαιρικά, Spherics, in three books; 2, περὶ νυκτῶν καὶ ἡμερῶν, in two books; 3, περὶ οἰκήσεων. The first is a profound and accurate work on what we should now call spherical geometry; the second and third simply describe astronomieal phenomena as they appear in different parts of the world. It is hardly a matter of certainty that the three works have the same author: the second and third add nothing to the fame of the author of the first.

The Spherics were translated by the Arabs, and from their version a Latin one (of little worth) was made at Veniee in 1518, but whether it was published is not stated (Heilbronner). Another Latin version, probably also from the Arabie, was published by Vogelinus at Vienna, 1529, with scholia. John Pena gave the first Greek text, with Latin, Paris, 1557; and Barrow gave a Latin edition in 1675. But the best edition is the Oxford one, Greek and Latin, 8vo., 1707. The other works were published by Dasypodius, in Latin, Strassburg, 1572, 8vo. Joseph Auria published the third work in Latin, Rome, 1587; and (*Biogr. Univ.*) the second, also in Latin, Rome, 1591 (1587, according to Fabricius); but Heilbronner does not mention this last. (Weidler; Heilbronner; Delambre.)

THEODO'SIUS I., FLA'VIUS, surnamed the Great, was the son of the general Theodosius who had signalised himself greatly during the reign of Valens and Valentinian in Britain and Africa, but was put to death in A.D. 376 at Carthage through the envy of the courtiers. The Theodosii were an illustrious family of Spain, of the town of Italiea, near the modern Seville. The great Theodosius was born in A.D. 345, and was edueated by the ablest men of the time, while his father, himself one of the greatest generals, instructed his son in the art of war, and accustomed him to the strictest and severest diseipline. He took him with him in his eampaigns in Britain, Germany, and Africa, and made him acquainted with all kinds of warfare, so that the boy became early aeeustomed to the enduranee of hardship. The various oceasions on whieh he distingnished himself were not overlooked, and he was raised to the rank of duke of Moesia, with an independent command. Here again he distinguished himself above all the other military commanders. He vanquished the Sarmatians, and it was only owing to his intrepid character that the province was not lost altogether. (Ammianus Marcel., xxix. 6; Zosimus, iv., p. 219, &c.) After the death of his father, in A.D. 376, he obtained permission to withdraw from public affairs, and retired to Cauca in Spain, where he devoted himself to agrieultural occupations on his extensive estates, and won the affeetion and esteem of all who eame in eontaet with him, for he possessed no less the virtues of social and domestie life than the talents of a general. But he did not remain long in the enjoyment of his quiet happiness: his virtues and talents had made too deep an impression to be forgotten in the hour of need; and on the 16th of January, 379, the emperor Gratian raised Theodosius at Sirmium to the dignity of Augustus, with the eommand over Illyrieum and all the eastern provinees of the empire. The immediate object of this elevation was the hope that he would save the empire from the Goths, who in the preeeding year had totally defeated the Roman army near Adrianople, and were now ravaging the country. Theodosius established his head-quarters at Thessalonica in Maeedonia, strengthened the garrisons in those parts of the empire, and restored discipline among the troops; but he only ventured upon partial engagements with the enemy, and only on such oceasions when he was sure of suceess. He thus convineed his soldiers that the barbarians were not invineible, and revived their eourage and their confidence. The Visi-Goths were thus gradually and without any great battle driven out of Thraee. While at Thessalonica, Theodosius was seized with a severe illness. He was of a Christian family, but had not yet been baptized, and he now eelebrated this solemnity by the adviee of his friends, in the hope that it would contribute to his recovery. When his illness had disappeared, he went to Constantinople, and the first acts of his administration were to expel all the Arians from the capital, to assign the ehurches they had occupied to the orthodox Christians, and to appoint Gregorius Nazianzenus arehbishop of Constantinople (A.D. 380). His persecution of the Arian sect was conducted with such zeal, that orthodoxy was soon restored throughout his dominions. He then held a eouneil at Constantinople of 150 bishops to complete the system, the foundation of whieh had been laid at the eouncil of Nicaea, and a number of edicts were suecessively issued, inflicting the severest punishments upon all kinds of hereties. The example of these rigid persecutions was imitated in the west by Gratian, and subsequently in the north also by the usurper Maximus.

As regards his Gothic enemies, Theodosius was indebted as much to his good fortune as his military talents; for

after the death of Fritigern dissensions and hostilities broke out among the Gothic tribes themselves, and he succeeded even in engaging some of their chiefs in the service of the empire. The greater part however of the subjects of Fritigern, tired of their state of anarchy, made Athanaric their king, who concluded a treaty with Theodosius at Constantinople (A.D. 381). Athanaric indeed did not long survive the conclusion of this peace, but his subjects, who were pleased with the kind treatment they had received from Theodosius, willingly submitted to him, and numbers of them enlisted under the Roman standard. The treaty of the king and the submission of his army was followed by successive separate treaties of the Visi-Gothic chiefs, who promised to become the faithful allies of the Romans. Lands were then assigned to the Visi-Goths in Thrace and Lower Moesia (A.D. 382). The Ostro-Goths on the banks of the Danube were conquered several years later (A.D. 386), and received settlements in Phrygia and Lydia. The conditions on which the Goths became subjects of the Roman empire are imperfectly known: thus much only is certain, that they acknowledged the sovereignty of Rome without submitting to her laws or the jurisdiction of her magistrates; their chiefs also still continued to have the command of their respective tribes in peace and war, and an army of 4000 Goths was maintained for the perpetual service of the empire. Theodosius, although he had felt obliged, for the safety of his dominions, to make several concessions, yet succeeded in persuading the Goths that all were the voluntary acts of his own sincere friendship towards them. The conduct of the emperor, certainly the wisest that he could adopt under existing circumstances, was praised by some and blamed by others. There was certainly every reason for placing little confidence in the professions of the barbarians, although they called themselves the confederates of the Romans. Their whole nation soon became divided into two parties: the one, faithful to the empire, was headed by Fravitta; the other, which was only waiting in secret for an opportunity to revolt, was headed by Priulf, who, after he had disclosed his secret in the presence of Fravitta, was slain by him. Had it not been for the firm but temperate character of the emperor himself, the indomitable spirit of the barbarians could not have been restrained. On him alone the public safety depended.

In the year 383 Theodosius raised his son Arcadius to the rank of Augustus: in the same year his benefactor Gratian was murdered in a rebellion. Maximus, supported by the troops in Britain, had set himself up as emperor, and had conquered Gaul. Theodosius, who for the present was unable to carry on a war, concluded a peace with him, and left him in possession of the countries which he was occupying north of the Alps, on condition that he should not disturb Valentinian, the brother of Gratian, in his rule over Italy, Africa, and western Illyricum. The empire was thus divided among three emperors. But Maximus had no intention to keep the peace, and his ambition stimulated him to make himself master of Italy also. In A.D. 387 he broke in upon Italy, and took Milan, the residence of Valentinian, by surprise. The young emperor, his mother Justina, and his sister Galla, fled to Thessalonica, to implore the protection of Theodosius. The emperor of the East received the fugitives kindly, and as his own wife Flacilla had died, he married Valentinian's sister Galla, and thus established a direct interest for himself in protecting the exiled family. The opportunity of chastising the faithless Maximus was very welcome to him, and preparations for war were made throughout the whole extent of his dominions. In order to secure his empire on its south-eastern frontier, a treaty was concluded with Persia. A large fleet assembled in the ports of Epirus and Greece, and Theodosius placed himself at the head of a well-disciplined army, with which he marched into Pannonia to meet the enemy, who had pitched his camp in the neighbourhood of Siscia, on the Drave. A battle was fought, in which the Huns, Alani, and Goths, who served in the army of Theodosius, greatly distinguished themselves. Maximus was defeated and put to flight. Theodosius, determined to get possession of his enemy either alive or dead, pursued him as far as Aquileia, in which town Maximus shut himself up. The usurper, who had no hold on the affections of the people, was dragged forth from his palace into the hands of the conqueror, who gave him up as a victim to the rage of the soldiers. Victor, the son of Maximus, was killed in Gaul by the hand or at the command of Arbogastes, the Frank, who made himself master of Gaul (A.D. 388).

After having thus easily and quickly terminated a war which had threatened the empire with long and serious calamities, Theodosius stayed for three years in Italy to regulate the state of the western provinces, and it was in this period that he showed his great and amiable character in the most brilliant light. He not only spared the lives of the friends and relatives of Maximus, but afforded them every support in their misfortunes, while, on the other hand, he restored to the oppressed people of the west their lands, and gave them compensation in money for the losses that they had sustained. In the year 389 he entered Rome in triumph, together with his son Honorius and Valentinian.

During the period of his stay in Italy an insurrection broke out at Antioch, in which the people demanded redress of several grievances, especially a diminution of their heavy taxes. When these demands were haughtily refused by the imperial officers, the populace destroyed the statues of Theodosius, his wife Flacilla, and of his sons Arcadius and Honorius. The insurrection however was soon put down, and when Theodosius was informed of the occurrences, he sent Hellebricus and Caesarius to inflict the most severe punishment upon the city. But when messengers came soliciting a milder treatment, and assuring the emperor that the people sincerely repented of their crime, he generously granted them a general pardon. But this generous act was followed by another which was as rash as it was cruel. In A.D. 390 another insurrection broke out at Thessalonica, in which Botheric, the commander of the garrison, and several other officers, were cruelly murdered by the people, because they refused to give up a handsome boy to the unnatural lust of some dissolute favourite of the people. Theodosius was at first uncertain whether he should take vengeance upon the city or exercise clemency as he had done towards Antioch. Rufinus induced him to do the former, and commissioners were accordingly sent to punish the criminal inhabitants. Theodosius however soon regretted his step, and countermanded his orders; but it was too late: a general and indiscriminate massacre took place in the devoted city, in which no less than 7000 lives were sacrificed to the manes of Botheric. When Ambrose, the archbishop of Milan, was informed of this cruel massacre, he was seized with indignation and grief; and eight months later, when the emperor, on Christmas-day, wanted to attend the service in the great church of Milan, he was stopped in the porch by Ambrose, and was not admitted until he had promised to do public penance for his monstrous cruelty. [AMBROSE.] It was not till after the lapse of eight months from that day that the emperor, who had performed all the acts of public penance which the archbishop had imposed upon him, was restored to the communion of the faithful. An edict was at the same time issued that no capital punishment should henceforth be inflicted on any one till thirty days after it had been pronounced. During his stay in Italy Theodosius acted as a kind of guardian of the young emperor Valentinian, whom he might have deprived of his empire with the greatest facility and perfect impunity if he had been less magnanimous. When he left Italy for Constantinople in A.D. 391, he left Valentinian in the apparently secure possession of the western part of the empire. It was one of the characteristic features of Theodosius to carry into effect his great plans with the utmost vigour and energy, but when the object was attained he sank into a state of indolence, and gave himself up to the enjoyment of pleasures which, although harmless in themselves, in many cases prevented him from deriving all the advantages from his successful undertakings that he might have done. This was also the case after his return to Constantinople. The most important occurrence in the year of his arrival there was the final and total abolition of paganism throughout the Roman empire. In the following year (392) Valentinian was murdered at Vienna, in Gaul, by Arbogastes, who raised Eugenius, a rhetorician, to the imperial throne, in whose name he himself hoped to wield the sceptre. Theodosius, who had allowed himself to be deceived by the professed faithfulness of Arbogastes, was deeply moved when he heard of the fate of his brother-in-law and of

the elevation of Eugenius. But he was at that moment not prepared for a civil war, and the ambassadors of Eugenius were consequently received with apparent favour and dismissed in a friendly manner. Preparations for war however, which lasted for almost two years, were immediately commenced, and Stilicho and Timasius were charged with recruiting and disciplining the forces. In the spring of the year 394 Theodosius set out from Constantinople against Eugenius. The armies met in Pannonia, and, after a long and dubious contest, Eugenius was defeated on the banks of the Cold River, near Aquileia. Eugenius was put to death, and Arbogastes in despair put an end to his own life. Theodosius was now sole emperor of the Roman world, and was cheerfully acknowledged by all the provinces, even by those which had recently paid homage to Eugenius. The empire might now look forward to a period of peace and happiness under the administration of Theodosius. But he was suffering from dropsy, and his health was rapidly declining. He died on the 17th of January, 395, at Milan, whence his body was conveyed to Constantinople, and buried there. His two sons Arcadius and Honorius had been raised to the rank of Augustus, and the father had shortly before his death given to Honorius the empire of the West, while Arcadius was to occupy the throne of the East. The Roman empire henceforth remained divided into the Western and the Eastern empire. [Rome, p. 110.]

(S. Aurelius Victor, *Epitome*, c. 48; Orosius, vii. 34, 35; Sozomen, vii. 2; Paulus Diacon., ii.; Compare Gibbon, *Hist. of the Decline and Fall*, c. 26, 27, and 28.)

THEODO'SIUS II., or the Younger, was the son of Arcadius, and grandson of Theodosius the Great. He was born on the 10th of April, 401. His father died in 408 at Constantinople, and left his son, then a child seven years old, at the head of the Eastern empire. There is a statement that Arcadius in his will made Jezdegerd, king of Persia, the guardian of his son and regent of the empire during his minority. (Jornandes, *De Bell. Pers.*, i. 2.) This isolated account however scarcely deserves credit, and it is a fact that Anthemius, the præfectus prætorio, from the very first assumed the government of the Eastern empire in the name of the young prince, and carried it on in a praiseworthy manner down to the year 414, when he voluntarily resigned it to Pulcheria, the sister of Theodosius, who was only two years older than her brother, and had shortly before received the title of Augusta. This woman continued to exercise the sovereignty in the name of her brother, not only after he had grown up to manhood and down to his death, but even three years later, until she herself died. During the early part of Theodosius's life Pulcheria herself conducted and superintended his education; but the prince seemed to possess no ambition, and not to aspire to the glory of a monarch: he passed his whole life in a perpetual infancy, surrounded by women and eunuchs, and he idled away his time in hunting, painting, carving, and making elegant transcripts of sacred books. The whole government was carried on in his name; but whether its acts deserve praise or blame, he can have no share in either, as he blindly acquiesced in all that his sister did. She also persuaded him, in A.D. 421, to marry Eudocia (before her baptism her name was Athenais), the daughter of Leontius, an Athenian sophist. This woman, who was no less distinguished for her beauty than for intellectual powers, soon gave birth to a daughter, Eudoxia, after which she was raised to the rank of Augusta. She lived with her husband till the year 444, when, after having drawn upon herself suspicion of some improper conduct, she was obliged to quit the court, and withdrew to Jerusalem.

In 421 a war broke out with Varanes, king of Persia, which was successfully concluded by Ardaburius, a general of Theodosius, and a peace was concluded for a hundred years, which lasted at least for thirty. With this exception, the long reign of Theodosius was one of almost undisturbed peace. It was only during the last years of his life that the European parts of the empire were harassed by Attila and his Huns. [Attila.] The Asiatic provinces, by far the most extensive, continued to enjoy a profound and permanent repose. Theodosius died on the 28th of July, 450.

(Paulus Diacon., iv.; Zonaras; Socrates, *Histor. Eccles.*, vii. 1, &c. Compare Gibbon, *History of the Decline and Fall*, c. 32, 33, 34.)

The reign of Theodosius II. is memorable in the history of jurisprudence through the collection of laws that was made in it, and bears the name of Codex Theodosianus.

THEODO'SIUS III., surnamed Adramytenus, emperor of Constantinople. He succeeded Anastasius II. in the year A.D. 715, being proclaimed emperor in the fleet of his predecessor near Adramyttium in Troas. He was a man of obscure birth, and accepted the throne with reluctance. He is praised for his unblemished conduct, and for the protection he afforded to the orthodox faith. He had not enjoyed his elevation much more than one year, when Leo III., a man of superior abilities, was proclaimed emperor. Theodosius willingly withdrew, and spent the remainder of his life, together with his son, in a monastery. (Theophanes, *Chronographia;* Georgius Cedrenus, *Compendium Historiarum;* Zonaras.)

THEODOSIAN CODE. In the year A.D. 429 Theodosius II. appointed a commission of eight persons, at the head of whom was Antiochus, to form a code out of all the constitutions and other laws which had been promulgated since the time of Constantine the Great. The code was to be formed on the model of the private compilations respectively called the Codex Gregorianus and the Codex Hermogenianus. Either nothing was done by this commission, or, for some reason, a renewal of it was thought necessary, and this renewed commission received its instructions in the year A.D. 435. This second commission consisted of sixteen members, with the same Antiochus at its head. In remodelling their materials the commission was empowered to omit the superfluous, insert the necessary, change the ambiguous, and reconcile the incongruous.

The code was completed and promulgated as law in the Eastern empire in the year A.D. 438; and it was declared that the laws enacted since the time of Constantine should only be in force so far as they were incorporated into this code. It was further declared, as it had been on the occasion of naming the first commission, that all the general constitutions which were made by the emperors of the East and West should be sent from the one to the other, but that each of them should have full power to adopt for the use of his own subjects, or to reject, what the other sent. The code was forwarded in the year 438 by Theodosius to his son-in-law Valentinian III., who confirmed it and laid it before the Roman senate, by whom it was received. In the year 448 Theodosius forwarded to Valentinian other constitutions which he had made since the completion of the code, as circumstances had arisen; and these new constitutions were promulgated in the Western empire in the same year. The new constitutions were called Novellae, and all such new constitutions which were interchanged between the East and West, and had reference to the code of Theodosius, were called by the name Novellae. This interchange subsisted as long as the empire of the West continued: the last constitution of the kind that we know is one of Anthemius, who was contemporary with Leo I. in the Eastern empire: it belongs to the year 468, and relates to Bona Vacantia.

This code consists of sixteen books, which are divided into titles, and the titles are subdivided into sections. The arrangement of the matter differs from that in the subsequent compilation of Justinian, also called the Code. The code of Theodosius treats of Jus Privatum in the first part, and especially in the second and fourth books, both included, and in the beginning of the fifth: the following books treat chiefly of Jus Publicum. The first book treats of offices, and the sixteenth book treats of matters pertaining to the Christian church. The code of Theodosius was the first great compilation of the kind, and it was much used in the compilation of the code of Justinian. It also forms the basis of the code of the Ostrogoths, called the Edictum Theoderici: it was incorporated into the code of Alaric II., commonly called the Breviarium, in an abridged form, accompanied by a continual interpretation or explanation; and it was used in the compilation of the Lex Romana of the Burgundians, which is often incorrectly called Papiani Liber Responsorum.

The greater part of the Theodosian code and of the Novellae Constitutiones exist in their genuine state: the first five books of the code and the beginning of the sixth are chiefly found only in the Breviarium. The excellent edition of J. Gothofredus (6 vols. fol., Lyon, 1665, re-edited by J. D. Ritter, fol., Leipzig, 1736-1745), and also the edition of the Jus Civile Antejustinianeum, Berlin, 1815,

have followed the text of the Breviarium for the first five books and the beginning of the sixth. But Clossius and Peyron have subsequently made additions to the first five books, and particularly to the first; the former from a Milan MS. of the Breviarium, and the latter from a Turin palimpsest of the Theodosian Code. (*Theodos. Cod. Genuina Fragmenta*, &c., W. F. Clossius, Tüb., 1824, 8vo.; *Cod. Theodos. Fragment. inedd.*, &c., Annad. Peyron, 1823, 4to.) Hänel has also added to the later books. (Zimmern, *Geschichte des Röm. Privatrechts.*)

THEODOTION, of Ephesus, the author of a Greek version of the Old Testament, was an Ebionite, and lived in the former part of the second century after Christ. He is quoted by Justin Martyr, in his dialogue with Tryphon (A.D. 160), and by Irenæus (A.D. 177). His version appears to have been undertaken for the purpose of furnishing the Ebionites with a more exact translation of the Hebrew text than that of the Septuagint, and one therefore which would render them more service than the Septuagint in their disputes with the Jews. It agrees almost exactly with the Septuagint, except that it supplies the deficiencies of that version, and omits those parts of it which are not in the Hebrew text. Theodotion had not a competent knowledge of Hebrew. He has retained certain Hebrew words which appear to have been in use among the Ebionites. Theodotion's version of Daniel was substituted by the antient church for the Septuagint version of that book.

This version occupied one column of Origen's 'Hexapla.' [ORIGENES.]

THEODOXIS, or THEODOXUS, Montfort's name for a division of the genus *Nerita*, type *Theodoxus Lutetianus*; Syn. *Nerita fluviatilis*, Felix de Roissy.

THEOGNIS (Θέογνις), an elegiac poet of Megara, the capital of the small state of Megaris, was living at the close of the sixth century B.C.; and it appears from his own writings that he lived to the date of the battle of Salamis, B.C. 480. In one of those revolutions which frequently occurred in the small Grecian states, the democratic body at Megara overpowered the aristocratic, to which Theognis belonged. Theognis, who was then absent from his country, lost his landed property in this revolution, which, with the rest of the Megarian territory, was partitioned among the successful party. It appears that he lived in exile at Thebes. The fragments of Theognis abound in allusions to the revolution by which he had suffered, and he expresses in bitter language his complaints against that base class which had usurped the station and property of the body to which he belonged. He had also the mortification of seeing a rich rival of mean birth preferred to him by the parents of a girl whom he courted. Yet he was in some measure indemnified for his loss by retaining the affections of the girl after she had married his ignoble rival.

It appears from his verses that he had been in Sicily, Euboea, and Sparta; and it was in Sicily that he wrote one of his elegies which was addressed to the Sicilian Megarians, who were a colony from his native state. There seems no reason to doubt that his elegies were composed on various occasions and on particular subjects, and that so far they resembled the elegies of Tyrtæus, Archilochus, and Solon. But as these elegies contained numerous general maxims or lessons for conduct, it is conjectured that in the course of time nearly everything was omitted from them which had a particular application, and thus the elegies of Theognis were formed into that general collection of gnomæ such as we now have it, consisting of above fourteen hundred hexameter and pentameter verses. It is observed that nearly all the passages in this collection which have a political reference are addressed to a person named Cyrnus, the son of Polypas. Cyrnus appears to be a youth of noble family for whom Theognis has a tender regard, and whom he exhorts to the practice of virtue, to prudence in conduct, and to the enjoyment of life.

The verses of Theognis contain many allusions to the symposia, or entertainments, of the Greeks, in which it was usual, after the libation had been duly performed, for some of the guests to sing a poem, accompanied by the flute. This poem, or elegy, was addressed either to all the company, or, as appears to have been always the case with the elegies of Theognis, it was addressed to a single person.

The fragments of Theognis have been often printed. They were first printed in the Collection of Gnomic poets by Aldus, Venice, 1495; and they are contained in Gaisford's 'Poetae Minores Graeci,' Oxford, 1814-20. One of the latest and best editions is by F. T. Welcker, Frankfort-on-the-Main, 1826. They were translated into German verse, with short notes, by G. Thudichum (1828); and also by W. E. Weber (1834).

(Müller, *History of the Literature of Antient Greece*, vol. i.; Hoffmann, *Lexic. Bibliograph.*: Fabricius, *Bibliotheca Græca*, vol. i.)

THEOLOGY (Θεολογία, the science which relates to God).

In order to guard against any misconception of the object of this article, it seems advisable to state in the outset that it is designed to treat the subject of theology purely in a scientific and historical point of view. Any discussion of the doctrines of Christian theology, or any attempt to frame a system of Christian theology, would be inconsistent with the plan of this work.

I. DEFINITION OF TERMS.

All that men know of the nature of God, considered absolutely, of the relations between God on the one hand, and themselves and other beings on the other, together with the consequences resulting from those relations, and the duties arising out of those relations:—all this knowledge is described by the word *religion*. To reduce this knowledge to a systematic form, is the province of the science of *theology*; and the truths of religion, when arranged in a scientific form, constitute *a system of theology*. Theology stands to religion in the same relation as that in which every other science stands to its subject: for instance, natural philosophy to matter, metaphysics to the mind, philology to language. By many writers the words *theology* and *religion* are used as synonymous terms; but such a usage of them is incorrect. [Compare RELIGION.]

The above definition applies to the word as it has been understood for some centuries; but its earlier use was somewhat different from this. The Θεολογία of the antient Greeks was φιλοσοφία περὶ τῶν θείων, the philosophy of divine existences; and it included all questions relating to the origin, the nature, and the service of the gods. As relating to the origin and mode of existence of the gods, Aristotle uses the verb Θεολογέω (*Metaphys.*, i. 3); and Cicero the noun *theologus* (*De Nat. Deor.*, iii. 21). In a wider signification the word is used by Varro (Augustin., *De Civitat. Dei*, vi. 5; compare Euschius, *Praeparat. Evang.*, iv. 130), who distinguishes three different kinds of theology: (1) μυθικόν, or *fabulosum*, mythical or legendary]; (2) φυσικόν, or *naturale* (physical, or relating to the nature of the gods); (3) πολιτικόν, or *civile* (political or popular). Of these the first is the theology of poets, the second that of philosophers, the third that of the people; or, as Varro expresses it, 'The first is chiefly adapted to the theatre, the second to the universe (*ad mundum*), the third to the city.

In the New Testament the word is not used. (The title of the Apocalypse, in which the word Θεόλογος is applied to the author, is much later than the book itself. [APOCALYPSE.] The simpler terms *knowledge* (γνῶσις) and *faith* (πίστις) are those which approach most nearly to the meaning of the word *theology*; but the fact being that theology, as a system, is not taught in the New Testament, there is nothing surprising in the absence of the word.

In the early Christian church the word was sometimes used in the general etymological sense of the science which relates to God and divine things; but we also find it employed at a very early period in a peculiar sense. In the controversies respecting the nature of Christ, the orthodox party adopted as a kind of motto the dogma of the Evangelist, Θεὸς ἦν ὁ λόγος ('the Word was God,' *John*, i. 1), and the meaning which they attached to that sentence was transferred by them to the word θεολογία, which therefore, in this use of it, may be defined as the doctrine concerning the divinity of the Word. [LOGOS.] It is in this sense that the epithet Θεόλογος is applied to the author of the Apocalypse. In a short time the word acquired a meaning somewhat more extended, and was used to describe the whole teaching of the church concerning the Trinity.

Lastly, the modern usage of the word, as expressed in

the above definition, was first adopted by Peter Abailard (ob. 1142), who drew up a system of scholastic divinity, to which he gave the title of 'Theologia Christiana.'

It should be remarked that instead of the Greek word *theology*, the Latin word *divinity* is often used to describe the science of religion.

II. Foundations of the Science.

Like every other science, theology consists in the application of the human reason to certain ascertained truths. These truths are, as is plain from the definition, the truths of religion. If therefore the existence of God, of attributes belonging to him, and of relations subsisting between him and men and other beings can be proved, the foundations of theology are laid. Now all mankind, with the exception of a most insignificant minority (if indeed, which has often been doubted, the existence of a real *atheist* be possible), believe either that these subjects are within the natural compass of human knowledge, or that some kind of revelation respecting these subjects has been made by God to men. [Religion; Revelation.] Therefore, according to the general sense of mankind, theology is a possible science, founded upon knowledge derived from nature, or from revelation, or from both these sources.

Now, it is true that attempts have been sometimes made to frame a system of theology entirely out of the religious truths which may be learned from natural sources, that is, from the constitution of the human mind, and from the phenomena of the mental and material universe. Such truths constitute *Natural Religion*, and form the subject of the science of *Natural Theology*. But the vast majority of religious systems are founded on the supposed existence of a divine revelation; and for this reason the science of theology is generally understood to have reference to *Revealed Religion*. Moreover, if it be true that a divine revelation has been given from God to man, it will follow that that revelation cannot possibly be contradictory to any of the truths of natural religion: also many reasons might be urged to show that such a revelation, when completed, would contain in itself at least all the truths of natural religion, and, as a matter of fact, all the alleged revelations in existence claim to teach everything which might be learned from nature concerning God; and hence the theology which is founded on revelation must include within itself the theology which is founded on natural religion. For this reason the grand foundation of theology is usually understood to be revelation, to which natural religion is a valuable but not necessary auxiliary; and it has even been disputed whether it is an essential part of a theologian's duty to establish the consistency between the doctrines of natural and revealed religion.

Hence, with reference to the Christian religion, theology is founded entirely upon the canonical books of the Old and New Testament.

III. Divisions of the Science.

1. With reference to its foundation, it is divided, as explained in the preceding paragraph, into *Natural* and *Revealed*, or *positive*. The latter word is used to indicate that the foundations of revealed theology are the *expressed will* of God; just as we speak of *positive* laws.

The term *positive theology* is also used to describe any system of theology which rests upon authority, as, for example, the system embodied in the formularies of a particular church. See below, under the head of *Dogmatic Theology*.

2. According to the method of treating the subject, it is divided into *popular* or *biblical*, and *systematic* or *scholastic* theology.

3. According to the part of the subject which is treated of, it is divided into *theoretical* and *practical* theology. Of these the former includes—(1) The knowledge of the documents which contain the revelation, the proof of their authority, and the explanation of their meaning, that is, *Exegetical Theology*; (2) the investigation, arrangement, and discussion of the truths so revealed, that is, *Systematic Theology*; (3) the workings and changes of religion among those who have professed it, or *Historical Theology*. *Practical Theology* has for its subjects the duties of practical religion, and the various modes of enforcing them on men; and with reference to the latter, it is divided into (1) *Homiletics*, or preaching; (2) *Catechetics*, or teaching; (3) *Liturgics*, or worship and the administration of the sacraments, and (4) *Pastoral theology*, or the care and government of a church.

IV. Of Dogmatic Theology, or Dogmatics.

This is a very useful term, which is chiefly employed by German writers. It may be defined as the science of exhibiting clearly, and of tracing to their results, the doctrines taught by revelation. It means more than the term *systematic theology*. The province of the latter is simply to give to the scattered truths of revelation the scientific form of a connected system, in whatever manner may seem most convenient to the framer of the system; but dogmatic theology aims at forming a system which shall be accepted as binding by a large body of religionists, and then views all religious truth in the light of that system: it is systematic theology, with the idea of *authority* superadded.

This may perhaps be made clearer by a reference to other branches of science. The natural philosopher, for example, observes certain phenomena, which he soon finds to have in them some points of connection or similarity; and by arranging the phenomena with reference to those points, he has reduced his knowledge of natural philosophy to a sort of system. He may have been deceived in his observations; the analogies he thinks he has detected may not really exist: but still the system he has framed may be for him a convenient classification of the observed phenomena: his system is a *theory*. But suppose him to proceed further, and to detect (in his own opinion) the real causes of the observed phenomena, and to trace them to further results: suppose that he frames a system of natural philosophy upon the principles which he has thus detected; and that this system is received by a number of men as furnishing a true explanation of the observed phenomena: then his theory has gained the element of *authority*, and it may be called a *dogmatic theory*. The former kind of theory may serve as an illustration of what is meant by *systematic theology*; the latter, of what is meant by *dogmatic theology*.

Now, in the case of the Christian revelation, it is a remarkable fact that the documents which contain it present no systematic form. The truths revealed in them, considered separately, may be called *dogmas*, since they all contain the element of authority; but as they are not systematically arranged, they do not form a *system of dogmatic theology*. But to such a system they might be reduced by a person who fully understood them in all their bearings; and supposing his qualifications for the task complete, his system would be a perfect system of dogmatics: absolutely true if the revelation were a true one; and therefore absolutely binding on all who accepted the revelation as true. Now, as a matter of fact, such an attempt has been made again and again: many systems of theology have been framed, each claiming to give an exposition of the word of God at once true and scientific. It is also a matter of fact that these systems have presented different and contradictory results: but many of them have been accepted as true by bodies of Christians; and they therefore form, to those who accept them, systems of *dogmatic theology*: and in many cases these systems are embodied in creeds, or confessions of faith, which then become for all future time the *dogmatics*, or *positive theology*, of those who accept them.

It has very naturally been usual for persons adopting a system of dogmatics to look upon their system not only as probably true, but as absolutely true; and hence they have given to it the title of *orthodoxy* (ὀρθοδοξία, the right belief), applying to every other system the name of *heterodoxy* (ἑτεροδοξία, another belief, *i.e.* than the right one). But it is deserving of notice that there are some subjects upon which a particular opinion has prevailed so extensively among Christians, that the word *orthodoxy* is applied to that opinion, for the sake of convenience, by persons who do not intend thereby to give their assent to the absolute truth of that opinion. Such a use of the word is found very convenient in ecclesiastical history. [Heresy.]

Illustrations of these remarks are furnished by the manner in which we commonly speak of the dogmas of the Roman and English churches, of Calvinistic and Arminian dogmas, of the orthodox and heterodox doctrines respecting the person of Christ.

Out of *Dogmatic Theology* springs *Controversial Theology*, or that mode of treating the subject of religion in

which some particular system of dogmatics is defended, or some other system attacked.

V. History of Theology.

It is by no means intended to give under this head a sketch of the history of the Christian church, considered with reference to the development and diversities of theological opinions within it. Such a statement would be, properly speaking, a history of theology, and indeed such a history is at present a great desideratum in our literature. But the information which would be given on this head will be found for the most part already scattered through this 'Cyclopædia' in separate articles, to which therefore the reader is referred. All that will be attempted here is to point out the characteristic elements out of which the prevailing theology of different periods has been formed. The first thing to be done, then, is to classify those elements.

In the widest sense of the word Theology, including both natural and revealed theology, we have among theologians who reject revelation the systems of (1) *Atheism*, or that doctrine concerning God which rejects his existence altogether; (2) *Deism*, or the system which teaches that God is the Creator of all things, but that having once created them and impressed upon them certain laws for the regulation of their future existence, commonly called the *laws of nature*, he has left them to the government of those laws, and concerns himself no more with his creation; or in other words, this system acknowledges the existence of God, but denies his providence. (3) *Theism*, the system which differs from Deism by acknowledging the providence of God. The systems of Deism and Theism suppose the existence of an Almighty Creator, whose existence is independent of the universe (*principium extramundanum*); but there is another system according to which the laws of nature are in themselves the eternal self-existent causes of all the phenomena of the universe, and there is no causative principle external to nature. This system takes two different forms: *Materialism*, which makes all the phenomena of nature to result from the physical constitution of matter itself; and the various shades of *Pantheism*, which suppose an intelligent principle (*anima mundi*) to be inseparably connected with everything that exists, and to pervade the whole creation.

There is another system which stands apart both from Naturalism and Revelation, namely *Scepticism*; the leading principle of which is that in metaphysical inquiries, or in short in all subjects which do not admit of mathematical demonstration, certainty is unattainable, and consequently that neither from nature nor from a supposed revelation can we derive a sure religious belief nor a rational system of theology. [Scepticism.]

These systems deserve notice in connexion with the history of theology, inasmuch as they relate to the same class of subjects as those which are embraced in theology; and they belong particularly to the history of Christian theology, inasmuch as at every period these systems have been brought more or less into direct collision with Christianity itself. But according to our more restricted definition of theology, as the science which is founded upon a divine revelation, and more especially as the science which has for its subject the religion of the Old and New Testaments, it will be found that the principal varieties in theological systems have arisen out of different opinions concerning that revelation itself, either with reference to the degree of its authority or to the mode of its interpretation.

1. With reference to the former point, the *authority of the Scriptures*, it would seem an axiom that every person who accepts them as a divine revelation must receive them as of full authority in matters of faith, and consequently that every system of theology must rest upon the admitted and unquestionable authority of the Scriptures. For this reason it would appear that all questions respecting the authority of the Scriptures are rather introductory to theology than a part of the science. But in point of fact different opinions are held on this matter by those who profess to receive the Christian religion, and therefore such opinions are considered to form a part of Christian theology.

Now with reference to this point every possible variety of theological opinion may be included under the two great divisions of *Supranaturalism* and *Antisupranaturalism* or *Rationalism*: the former word being used for that theology which rests professedly on a special, supernatural revelation from God, and the latter for that system which rejects all that is supernatural in such a revelation. The terms *Rationalism* and *Natural Theology*, though etymologically meaning the same thing, are employed to describe different theological systems. Both make the foundations of theology to rest upon the knowledge concerning God which may be learned by mere natural means; but in natural theology the idea of a revelation is not even entertained, while rationalism (in the modern sense of the word) professes to regard the Scriptures as possessed of *some* degree of authority, and indeed as upon the whole containing in some form or other the elements of religious truth.

The great question between supranaturalism and rationalism relates to the inspiration of the Scriptures. The adherents of the former system, though they differ respecting the mode in which supernatural information was conveyed to the minds of the sacred writers, agree in the great principle that they did receive such information as to preserve them from all error in the statement of religious truth. Rationalists, on the other hand, either reject the dogma of inspiration altogether, or understand by it nothing more than that by the ordinary providence of God the natural faculties of the writers were brought into the best state for exercise while they were composing the Scriptures. Generally speaking, the rationalists admit the writers of the Scriptures to have had better means of information on the subjects they wrote about than any other persons could acquire; and therefore, while reserving to themselves the liberty of choosing what they will believe and what they will disbelieve, they upon the whole accept the facts and opinions contained in the Scriptures as the basis of their theology. [Revelation.]

There is also a difference between supernaturalism and rationalism respecting the mode of interpreting the Scriptures: the former holding that the aid of the Spirit is still vouchsafed to the humble inquirer into religious truth; the latter denying the existence of any other means of understanding the Scriptures than the natural powers of the human mind.

Some of the many forms which rationalism has assumed during the last century are almost indistinguishable from some of the forms of naturalism. [Rationalism.]

2. Supposing the Scripture to be received as strictly a divine revelation, the questions arise:—By whom, and on what principles, are they to be interpreted?

The opposite opinions on this point may be called the *Protestant* and *Catholic*, or the *biblical* and *positive* systems of theology. The fundamental principle of the Protestant or biblical system is that the Scriptures are to be interpreted by each individual reader according to the ordinary laws by which the meaning of any other book is ascertained; while the Catholic or positive system supposes the existence of a positive mode of interpretation, handed down by a tradition in the visible church through all ages of Christianity, and forming in fact a system of dogmatic theology, from which no individual is at liberty to differ upon the evidence derived from his own research. The Protestant theology may be supranaturalistic or rationalistic, according as it admits or rejects the dogma of the divine assistance granted to the inquirer; and it also branches out into two great divisions, which may be called *popular* and *critical* theology. The popular theology professes to be derived from the obvious meaning of the letter of Scripture, without any external aid: the critical theology is based upon the principle that, although God has granted to every humble and diligent inquirer the power of learning from the Bible itself all religious truth which it may be necessary for his safety that he should know, yet that there is a body of religious truth in the Bible which can only be discovered by applying to its interpretation all the resources of human learning and of critical investigation, and therefore that these means must be employed in order to the construction of a complete system of theology.

One important difference between the Protestant and Catholic systems is in the use they make of the body of historical testimony to the doctrines of Christianity.

The Catholic system esteems it the privilege of the true church to be the certain possessor and the authorised expositor of religious truth. In many of the antient Chris-

tian writers it recognises members of the true church and authorised teachers in it; and therefore it regards the doctrines taught in their writings as the true doctrines of Christ. The obvious difficulty presented by the different opinions of various writers is removed in various ways. Vincent of Lirins has stated the Catholic dogma in the following form:—'That which has been held always, everywhere, and by all, is true.' (*Quod semper, quod ubique*, &c.) But who are the *all?* All the orthodox: and it is the province of the church to determine who are orthodox and who are heretics; and if the decision of the church on this point be doubtful, the appeal lies first to its authorised teachers individually, and then to their collective voice as given in the decrees of a general council.

On the other hand the Protestant system recognises in the early Christian writers nothing more than persons of various degrees of ability and information, whose statements and opinions are to be accepted or rejected entirely upon the grounds of ordinary criticism, and neither their teachings nor those of any other person whatever are allowed to have any authority beyond that due to their intrinsic worth and to their agreement with Scripture.

The application of these principles to the canon of Scripture is an important point of difference between the Roman Catholic and Protestant systems. The former rests upon the authority of those books which have been declared canonical by the voice of the church as expressed in general councils; the latter looks to historical and critical evidence to determine the genuineness and authenticity of the books of Scripture, and then it finds the evidence of their inspiration, and consequently of their authority, in the statements and claims of the writers themselves, which rest not merely on the established honesty of the writers, but chiefly on the attestation of the miracles they wrought. [CANON; MIRACLES.]

3. Another mode of interpretation leads to the systems of theology which are embraced under the name of *mysticism*, the great principle of which is, that within the mind of the true believer there exists a sense of truth which will always lead him to a surer and higher knowledge of religion than he could ever gain from his own critical inquiries or from the teaching of other men. [GNOSTICS; MYSTICS.]

4. To trace the relation of one set of truths to another, and to show the coincidence of the same truths when proved by different trains of reasoning, is one of the highest objects of true philosophy: and, on the other hand, an unwillingness to renounce a cherished belief when it is found opposed to a newly discovered truth, is one of the strongest tendencies of the human mind. Hence have arisen numerous theological systems according as men have brought the tenets of Judaism, the systems of heathen religion, and the reasonings of philosophy, into comparison with the statements of the New Testament. From the first of these processes arose the Judaizing sects of the first two or three centuries, from the second many of the early heresies, such as Manichæism [HERETICS; MANICHEES], and from the third the theology of the New Platonists and others of the early Alexandrian school, and that of the schoolmen of the middle ages.

5. Besides the classification, which we have thus attempted, of systems of theology, according to the fundamental principles on which they rest, there is another important division of them according to their actual differences of doctrine. On this subject, for the reasons above stated, the reader is referred to the several articles in which an account is given of the tenets and history of the principal doctrinal sects.

It only remains to give a slight sketch of the influence of these different systems in the history of Christianity. At the rise of Christianity the *popular biblical* system was that which naturally prevailed, with a partial intermixture of the *positive* system, arising out of the great deference always paid to the first teachers of a new religion by their disciples, and more especially out of the authority with which the apostles were invested. The novelty and simplicity of the religion impressed its truths clearly on the minds of the first believers, who had no historical difficulties to solve, no contending sects to decide between, and no leisure to speculate on the ultimate consequences of the doctrines they received, or on their relations to other supposed truths. If a difficulty arose, their teachers were at hand to solve it. And accordingly the language of the apostolic epistles invites the believers to examine the truth for themselves and to receive it in its simplicity, though it also gives hints of the existence of a consistent system of truth, and claims on the part of the apostles to be the teachers of that system. But they did not teach it *as a system*, and it is only in the later books of the New Testament, the writings of John and some of those of Paul, that any tendency to reduce Christian truth to a system becomes apparent. The degree of freedom thus left to believers was abundantly used, and before the close of the apostolic age different opinions had sprung up, exemplifying nearly all the principles above described. [HERETICS.] To restore unity to the church, and especially to settle the orthodox doctrine respecting the person of Christ, was the object of the Council of Nice, in the creed of which we find the first appearance of a system of *positive* theology. [NICE, COUNCIL OF; NICENE CREED.] The immediate consequence of this Council however was to exasperate the very controversy which it professed to settle, and which continued to rage during the following centuries. [ARIANS; NESTORIANS; THEODORETUS.] These and other controversies led to the frequent meeting of councils [ŒCUMENICAL COUNCILS], and to the settlement of the canon of Scripture about the end of the fourth century [CANON]; while at the same time the episcopal system became more and more firmly established; and from all these causes theology acquired more and more the form of a positive system, the most complete development of which is presented by the Greek and Roman churches. [CATHOLIC CHURCH; GREEK CHURCH.]

The positive system evidently leaves little liberty to the speculations of an active mind, or to the practice of scrupulous or turbulent individuals. Those of the former class sought for satisfaction in the scholastic philosophy; those of the latter made repeated attacks on the ruling system, which at last produced the Reformation in Germany and England. The scholastic philosophy was at its height from the 11th century to the 14th. It was for the most part a revival of the philosophy of Aristotle. The schoolmen were in profession firm believers of the Catholic doctrine, and generally succeeded in gaining rather praise than censure from the rulers of the church. But within the limits thus prescribed for them they pushed the application of their philosophy to theology to the utmost extent, and occupied themselves especially with the most subtle questions on the nature of God and angels, and on points of casuistry.

The Reformation was far from abolishing the positive system in Protestant countries. To hold their ground against the power of the church of Rome, the reformed churches strove to make for themselves a visible and united constitution, and for this purpose they adopted symbols of faith and worship, which constituted for them respectively bodies of positive theology. The various dissenters from these reformed churches, though generally leaving them on the ground that their theology was not purely Protestant, still preserved much that was positive in their theology, either by a tacit consent or by a formal confession of faith. And thus it has happened that, to the present day, theology is far less a system based upon and continuing to challenge scientific inquiry, than the exposition of a body of positive law.

Still there have always arisen individuals and parties who have claimed for themselves the utmost latitude of that right of private judgment which is the basis of the Protestant principle. Since the Reformation there has always existed, especially in England, a large amount of *biblical* theology, which has been chiefly of the *popular* school, but which, since the middle of the last century, has continually gained more and more of the *critical* element, both here, and still more in Germany; and it may be now safely affirmed, that with an admixture of the mystical theology, the adherents of which have always formed a considerable minority among Christians, the prevailing theological systems of the present day are the *catholic* and the *critical*.

It would be impossible within the limits of this article to give a list of even the best writers on theology. The following are taken at random as among the best, and as directing to other sources of information. The 'Institutes' of Calvin; the works of Turretin, Maestricht, Pictet, Doddridge, Bishop Watson, Richard Watson, Dwight, Ernesti, Bertholdt, Schleiermacher, Bretschneider, Nitzsch, and

other recent German writers, among which may be especially mentioned, as having been used in the composition of this article, Hahn's *Lehrbuch des Christlichen Glaubens*, Leipzig, 1828.

THEON, an eminent Greek painter, who was a native of Samos, and appears to have lived in the time of Philip and Alexander of Macedonia. He was reckoned one of the first masters of his age, on account of his powers of invention and the gracefulness of his execution. (Quinctilian, xii. 10, 6.) We know the subjects of only a few of his works, but the execution is spoken of in such a manner that the excellence of the artist cannot be doubted. Pliny (*Hist. Nat.*, xxxv. 40, § 40) mentions two of them, the one representing Orestes in the act of killing his mother (compare Plutarch, *De Audiendis Poet.*, p. 18, ed. Frankf.), and the other Thamyris playing the cithara. A description of a splendid painting by Theon representing a youthful warrior, who, animated by a martial spirit and eager to fight, is hastening to meet the enemy, is given by Aelian (*Var. Hist.*, ii. 44).

THEON, AELIUS, a rhetorician and grammarian of Alexandria, who, according to some critics, lived about A.D. 500, but, according to a more probable opinion, about A.D. 315. According to Suidas he wrote a commentary on Xenophon, on the orations of Demosthenes and Isocrates, a work on rhetoric, one on the structure of language, Progymnasmata, and several other books. With the exception of the Progymnasmata (προγυμνάσματα), or practical rules on rhetoric, derived from the examples of the best Greek orators, there is no work extant that can be ascribed to him with certainty. Theon's Progymnasmata excel those of Aphthonius in elegance, precision, and clearness, and were, like those of Aphthonius, long used as a text-book in schools. The first edition appeared at Rome, 1520, 4to.; that of D. Heinsius at Leyden, 1626, 8vo. Scheffer's edition, Upsala, 1670 and 1680, is incorrect. The best edition of the text, accompanied by Greek scholia, is in Walz's 'Rhetores Graeci,' vol. i., p. 145-262.

Kuster (on Suidas, ii., p. 182) ascribes to Theon also the still extant scholia on Aratus, Apollonius Rhodius, Lycophron, and Theocritus. The ἐπιστολικοὶ τύποι which are contained in Aldus's and Cujacius's collections of epistles, are likewise attributed by some writers to Theon, while others assign them to Libanius or Proclus. A separate edition of them appeared at Leyden, 1614, 12mo.

(A. Westermann, *Geschichte der Griech. Beredtsamkeit*, p. 230, &c.)

THEON. Theon, the Elder, of Smyrna, was the contemporary of Ptolemy (who cites one of his observations), but a little older. Theon, the Younger, of Alexandria, the commentator on Ptolemy, and father of Hypatia, lived in the latter half of the fourth century.

Of Theon the Elder, or Theon of Smyrna, we know nothing but that he was a follower of Plato, and has left a work entitled τῶν κατὰ μαθηματικὴν χρησίμων εἰς τὴν τοῦ Πλάτωνος ἀνάγνωσιν, or, on the parts of mathematics which are useful towards a knowledge of Plato. Other works have been mentioned written by some Theon (there are many of this name), but they are lost. This work consisted of four parts, treating on arithmetic, music, astronomy, and the harmony of the universe (περὶ τῆς ἐν κόσμῳ ἁρμονίας). Bouillaud (Gr. Lat., Paris, 4to, 1644) published the first two of these parts, or what he found of them, from a manuscript which came from De Thou's library; together with what he supposed to be a fragment of the third, from the King's library. Isaac Vossius assured Bouillaud that the third part was to be found in the Ambrosian library at Milan, but it has never appeared. Professor de Gelder, of Leyden, has recently (Gr. Lat., 8vo., Leyden, 1827) published the arithmetic, with ample notes and dissertations.

Of the private life of Theon the Younger (who was also a Platonist) we know nothing, except that he professed the ancient heathen doctrines, which led to the memorable fate of his daughter Hypatia (A.D. 415), a crime which will excite disgust and indignation to the end of time. The words of the ecclesiastical historian Socrates, from Wells's translation (1709) of the Latin of Valesius (Henry of Valois), are as follows; and his simple manner of narrating, in all its enormity, a circumstance which it was so much the interest of his party to conceal, or at least to soften, might have been a lesson to his successors in the task of writing history: 'There was a woman at Alexandria by name Hypatia. She was daughter to Theon the philosopher. She had arrived to so eminent a degree of learning that she excelled all the philosophers of her own times, and succeeded in that Platonic school derived from Plotinus, and expounded all the precepts of philosophy to those who would hear her. Wherefore, all persons who were studious about philosophy flocked to her from all parts. By reason of that eminent confidence and readiness of expression wherewith she had accomplished herself by her learning, she addressed frequently even to the magistrates with a singular modesty. Nor was she ashamed of appearing in a public assembly of men, for all persons revered and admired her for her eximious modesty. Envy armed itself against this woman at that time. For, because she had frequent conferences with Orestes,' the prefect of Alexandria, 'for this reason a calumny was framed against her among the Christian populace, as if she hindered Orestes from coming to a reconciliation with the bishop. Certain persons therefore, of fierce and over-hot minds, who were headed by one Peter, a reader, conspired against the woman, and observed her returning home from some place; and having pulled her out of her chariot, they dragged her to the church named Cæsareum, where they stripped her and murdered her with shells,' or broken crockery. 'And when they had torn her piecemeal, they carried all her members to a place called Cinaron and consumed them with fire. This fact brought no small disgrace upon Cyrillus,' the bishop [Cyril], 'and the Alexandrian church.' Damascius (the author of the Life of Isidore, in Photius) says, that Hypatia was the wife of this Isidore, and that Cyrillus was the instigator of the murderers. Some particulars are added in Suidas (Ὑπατία), who states that Hypatia was beautiful, and adds an anecdote which it is not desirable to repeat, but which, if true, entitles her to be called the most singularly straight-forward of women. He says she wrote commentaries on Diophantus, and the Conics of Apollonius, and also an astronomical canon. A fuller account of her may be found in Ménage's 'Lives of the Female Philosophers.'

Theon of Alexandria is known as the commentator of Ptolemy and the editor of Euclid. There is a commentary on Aratus which is said to have been his, but Grotius is of opinion that it is the work of several hands, for which he gives good reasons. The whole of the commentary on the Syntaxis is preserved, except one or two books. A full account of it is given in Delambre's History of Antient Astronomy, who observes that it helps but little in the understanding of the Syntaxis, and gives none of that additional information which is usually expected from a commentator. This commentary was first printed in Greek, in the Basle edition of Ptolemy (1538). [System, Ptolemaic.] J. Baptist Porta published two books only (Latin, Naples, first book 1588, first and second 1605), and Halma gave an edition of these same books (Greek and French, Paris, 1821, 2 vols. 4to.). Besides the commentary, we have the κανόνες πρόχειροι, or manual tables, described by Delambre from the manuscript, and since published by Halma (Greek and French, Paris, 1822-23, 2 vols. 4to.). They contain a description of the modes of astronomical calculation in use at the time.

It only remains to speak of Theon as a commentator on Euclid, a character which some still persist in giving him. The fact is, that Theon, as he himself informs us in the commentary on Ptolemy, gave an edition of Euclid, with here and there an additional proposition. [Geometry, p. 155.] Some manuscripts of Euclid call this a commentary, and our fathers of the middle ages got the notion that *all the demonstrations* were commentaries supplied by Theon, only the enunciations of the propositions being Euclid's. For instance, in the folio of 1516 (Stephens), in which the propositions are given twice, namely, Adelard's translation (called Campanus's) from the Arabic, and Zamberti's, from the Greek, in this work the enunciations are headed *Euclides ex Campano* and *Euclides ex Zamberto*, but the demonstrations are headed *Campanus* and *Theon ex Zamberto*. Again, in 'I quindici Libri degli Elementi di Euclide, di Greco tradotti in Lingua Thoscana,' Rome, 1545, we find nothing but the enunciations of the propositions. The editor has kept his word, and given all he believed to be Euclid's: had he meant to give demonstrations, his title would have been 'Euclid, with Theon's Commentary.' Many editions professing to give Euclid in Greek and Latin have the enunciations only in Greek, a necessary

warning to a person who wishes to buy Euclid in the original. Hence arises the pertinacious continuance of the assertion that Theon commented Euclid: so late as the article 'Theon' in the 'Biographie Universelle,' we find this statement made; and even more, namely, that the commentary by Theon was published at the end of the Basle edition of 1533, in Greek, that it was translated into Latin by Commandine, and has been often republished. Any one who looks into the Basle edition will see that the commentary at the end is by Proclus, not by Theon.

Robert Simson, and other editors who alter according to their own ideas of perfection, and then swear that they have restored Euclid, always lay the blame of the supposed alterations upon Theon: Simson's phrase is, 'Theon, or some unskilful commentator.' There is no reason to suppose that Theon altered Euclid: all that is known is, that he added occasionally, and, if we look at those additions which it is certain he made, judiciously.

THEO'PHANES, a native of Mitylene, was a contemporary and friend of Pompey the Great. During the war between Rome and Mithridates, when the Mitylenæans supported the king and delivered up to him the Roman general Manius Aquilius, Theophanes, who refused to take any part in the revolt, was expelled, and went to the camp of Sulla. (Velleius Pat., ii. 18.) In Italy Theophanes became acquainted with Pompey, formed an intimate friendship with him, and henceforth accompanied him in all his expeditions. After the termination of the war against Mithridates, Theophanes endeavoured to perpetuate the exploits of his friend. His history, which is now lost, appears to have been a work of no mean order, for Strabo calls Theophanes the most distinguished Greek of his age. Although he is not charged with having sacrificed the truth, yet he was undoubtedly anxious to wipe off any stain that was attached to the family of his friend. Pompey is said to have been so delighted with the performance, that he procured Theophanes the rights of a Roman citizen. (Cicero, *Pro Archia*, 10.) Although Theophanes had been exiled from Mitylene, he bore no grudge against his country, and on the return of Pompey from Asia he availed himself of his influence with the conqueror, and induced him to restore to the Lesbians their liberty and the privileges of which they had been deprived for having supported the king of Pontus. In B.C. 59 Theophanes was sent by the senate of Rome as ambassador to Ptolemaeus Auletes of Egypt, to carry to him the decree of the senate, which guaranteed him the sovereignty of his country. His conduct on this mission is blamed, because he is said to have endeavoured to direct events according to the secret wishes of Pompey. During the civil war Theophanes continued faithful to his friend, and supported him with his advice, and it was on his well-meant suggestion that after the battle of Pharsalus Pompey fled to Egypt, where he was murdered. After this event Theophanes returned to Rome, where he appears to have spent the last years of his life in retirement. After his death the Lesbians paid divine honours to his memory for the benefits which he had conferred upon them. His son, M. Pompeius Macer, held the office of praetor in the time of Augustus, and was afterwards appointed governor of Asia; but in the reign of Tiberius he and his daughter put an end to their own lives, in order to avoid the punishment of exile to which they had been condemned.

Theophanes was the author of several works, both in prose and in verse, but very little of them has come down to us. Plutarch's Life of Pompey is chiefly based on the historical work of Theophanes, and we may thus possess more of it than we are aware; but besides this we have four or five fragments of it in Strabo, Plutarch, and Stobaeus. The 'Anthologia Græca' (xv., n. 14 and 35) contains two epigrams of Theophanes, and Diogenes Laertius (ii. 104) mentions a work of his on painting, but of its nature and contents nothing is known.

(Sevin, in the *Mémoires de l'Académie des Inscriptions et Belles-Lettres*, vol. xiv., p. 143, &c.)

THEO'PHANES NONNUS. [NONNUS.]

THEO'PHILUS, a Constantinopolitan jurist, who lived in the reign of the emperor Justinian (A.D. 527-565). He was a distinguished teacher of jurisprudence at Constantinople (antecessor), and, at the command of the emperor, he was employed among those who compiled the 'Digest;' and afterwards he undertook, along with Dorotheus and Tribonian, to compose the 'Institutes,' that is, the elementary treatise on jurisprudence, which was part of Justinian's plan. This Theophilus is generally supposed to be the author of the Greek paraphrase of the 'Institutes,' though it is maintained that the paraphrase is not the work of Theophilus himself, but was taken down from his lectures by some pupils. It was discovered in the beginning of the sixteenth century by Viglius ab Aytta Zuichemius at Louvain, who published and dedicated it to the emperor Charles V. (Basle, 1534, fol.). The work was frequently reprinted during the same century, but the last and best edition is that of W. O. Reitz, in 2 vols. 4to., Hagæ, 1751. It contains a Latin translation and the notes of previous editors, together with those of Reitz; and also a very interesting dissertation on the obscure and much disputed history of Theophilus. Theophilus also wrote a commentary on the first three parts of the 'Digest,' which however is now lost, with the exception of a few fragments which are incorporated in Reitz's edition of the 'Paraphrase of the Institutes.' The value of the paraphrase of Theophilus in establishing the text of the 'Institutes' may be estimated by an examination of the edition of the 'Institutes' of Gaius and Justinian by Klenze and Böcking, Berlin, 1829.

(*Institutionum D. Justiniani Sacrat. Princip. Proœmium*; P. B. Degen, *Bemerkungen über das Zeitalter des Theophilus*, Lüneburg, 1808, 8vo.; Zimmern, *Geschichte des Röm. Privatrechts.*)

THEO'PHILUS PROTOSPATHA'RIUS (Θεόφιλος Πρωτοσπάθαριος), the author of several Greek medical works, which are still extant, and some of which go under the name of 'Philotheus' and 'Philaretus.' Everything connected with his name, his titles, the events of his life, and the time when he lived, is uncertain. He is generally styled 'Protospatharius,' which seems to have been originally a military title given to the colonel of the bodyguard of the emperor of Constantinople (*Spatharii*, or σωματοφύλακες). Afterwards however it became also a civil dignity, or at any rate it was associated with the government of provinces and the functions of a judge; they possessed great authority, and were reckoned among the Magnifici. (Further information respecting this office may be found in Brisson, *De Verb. Signif.*; Calvinus, *Lex Jurid.*; Du Cange, *Gloss. Med. et Inf. Graecit.*; id., *Gloss. Med. et Inf. Latinit.*; Carpentier, *Gloss. Nov. ad Script. Med. Aevi*; Goar, Note on Georg. Codin., p. 29; Guidot, Note on Theoph., *De Urin.*, pp. 142, 143, 145; Meursius, *Gloss. Graeco-Barb.*; Prateius, *Lex Juris Civ. et Canon.*; Suicer, *Thes. Eccles.*) In some manuscripts however he is called 'Philosophus' (Lambec., *Biblioth. Vindob.*, lib. vii., p. 352, ed. Kollar.); in others, 'Monachus' (id., *Ibid.*, lib. vi., p. 244, 494); 'Archiater' (Codd. MSS. Theoph. *De Puls.* ap. Ermerins, *Anecd. Med. Gr.*); or 'Iatrosophista' (Ἰατροσοφιστοῦ περὶ Οὔρων, ed. Fed. Morell., Paris, 1608, 12mo.)

Of his personal history we are told nothing: if, as is generally done, we trust the titles of the manuscripts of his works, and so try to learn the events of his life, we may conjecture that he lived in the seventh century after Christ; that he was the tutor of Stephanus Atheniensis (Lambec., *Ibid.*, lib. vi., pp. 198, 223 492; lib. vii., p. 352), who dedicated his work, 'De Chrysopoeia,' to the emperor Heraclius (Fabricius, *Biblioth. Græca*, vol. xii., p. 695, ed. vet.); that he arrived at high professional and political rank, and that at last he embraced the monastic life. It must however be confessed that all this is quite uncertain, for, in the first place, Freind, in his 'History of Physic' (*Opera*, pp. 448, 449, ed. Lond., 1733), after remarking how little credit is sometimes due to the titles prefixed to manuscripts, doubts whether Theophilus was ever tutor to Stephanus, and thinks, from the barbarous words that he makes use of (such as φιάλιον, στομομάνικον, *De Corp. Hum. Fabr.*, p. 177, l. 1, 2, ed. Oxon.; ἐποχή, τράνα, *Ibid.*, p. 181, l. 11, 12; ἀπακία, *Ibid.*, p. 193, l. 11; χυμένη, ὠμόβρασος, *De Urin.*, c. 6, p. 266, l. 34, ed. Ideler), that he probably lived later. And, secondly, even if Theophilus was the tutor of a person named Stephanus, still it seems probable that this was not the alchemist of that name. [STEPHANUS ATHENIENSIS.] His date is equally uncertain. Some persons ('Chronologia inconsulta,' as Fabricius says, *Biblioth. Græca*, vol. xii., p. 648 n., ed. vet.) think he was the person mentioned by St. Luke; others place him as early as the second century after Christ, and others again as late as the twelfth. He is generally supposed to have lived in the time of the emperor Heraclius, who reigned from A.D. 610

to 641; but this opinion rests only on the conjecture of his having been the tutor of Stephanus Atheniensis. The Oxford editor thinks, from the barbarous words quoted above, that he may possibly be the same person who is addressed by the title Protospatharius * by Photius (*Epist.*, 123, p. 164, ed. Montac., Lond., 1651), and who therefore must have lived in the ninth century. He was a Christian, and a man of great piety, as appears from almost all his writings; in his physiological work especially, he everywhere points out with admiration the wisdom, power, and goodness of God as displayed in the human body. (See *De Corp. Hum. Fabr.*, pp. 1, 2, 25, 89, 127, 153, 185, 272; *De Urin.*, Præf., p. 262; c. 10, p. 273; c. 23, p. 283; *De Excrem.*, c. 19, p. 408; *De Puls.*, in fine, p. 77.) He appears to have embraced in some degree the Peripatetic philosophy. (*De Corp. Hum. Fabr.*, pp. 2, 3, 4, 103, 105, 222, &c.; Mart. Rota, Pref. to Philothei *Comment. in Hippocr. 'Aphor.'*)

Five of his works remain, of which the longest and most interesting is an anatomical and physiological treatise, in five books, entitled Περὶ τῆς τοῦ Ἀνθρώπου Κατασκευῆς, *De Corporis Humani Fabrica*. It contains very little original matter, as it is almost entirely abridged from Galen's great work, 'De Usu Partium Corporis Humani,' from whom however he now and then differs, and whom he sometimes appears to have misunderstood. In the fifth book he has inserted large extracts from Hippocrates, 'De Genitura,' and 'De Natura Pueri.' He recommends in several places the dissection of animals, but appears never to have examined a human body; in one passage he advises the student to dissect an ape, or else a bear, or, if neither of these animals can be procured, to take whatever he can get, 'but by all means,' adds he, 'let him dissect something.' The work was first translated into Latin by J. P. Crassus, and published at Venice, 1536, 8vo., together with Hippocrates, 'De Purgantibus Medicamentis.' This translation was frequently reprinted, and is inserted by H. Stephens in his 'Medicae Artis Principes,' Paris, 1567, fol. The manuscript from which Crassus made his translation is probably lost; but, though defective, it was more complete than that which was used by Guil. Morell in editing the original text, which was published at Paris, 1555, 8vo., in a very beautiful type, but without preface or notes. This edition is now become scarce, and was reprinted, together with Crassus's translation, by Fabricius, in the twelfth volume of his 'Biblioth. Græca,' p. 783, sq., Hamb., 1724 and 1740. Two long passages which were missing in the fourth and fifth books were copied from a manuscript at Venice, and inserted by Andr. Mustoxydes and Demetr. Schinas in their collection entitled Συλλογὴ Ἀποσπασμάτων Ἀνεκδότων Ἑλληνικῶν μετὰ Σημειώσεων, Venet., 1817, 8vo. The last and best edition of this work is that by Dr. Greenhill, which has lately been printed at the Oxford University press, Gr. and Lat., 8vo., 1842. The editor says in the preface that he has taken as the basis of his edition the manuscript at Venice mentioned above, as being more complete than any other that he had met with; that three other manuscripts at Paris have been collated; that several passages have been corrected by referring to the original parts of Galen and Hippocrates from which they were copied; that Crassus's Latin version has been retained, as representing the readings of a manuscript no longer in existence; and that the notes are intended rather to illustrate and explain the Greek technical terms, than to correct all the anatomical errors and supply the deficiencies of the author.

Another of the works of Theophilus is entitled Ὑπόμνημα εἰς τοὺς Ἱπποκράτους Ἀφορισμούς, *Commentarii in Hippocratis Aphorismos*, which also seems to be taken in a great measure from Galen's Commentary on the same work. It was first published in a Latin translation by Ludov. Coradus, at Venice, 1549, 8vo., under the name of 'Philotheus.' The Greek text appeared for the first time in the second volume of F. R. Dietz's 'Scholia in Hippocratem et Galenum,' Regim. Pruss., 8vo., 1834.

His treatise Περὶ Οὔρων, *De Urinis*, contains little or nothing that is original, but is a good compendium of what was known by the antients on the subject, and was highly esteemed in the middle ages. It first appeared in a Latin translation by Pontius (or Ponticus) Virunius (or Virmius), in several early editions of the collection known by the name of the 'Articella.' It was first published in a separate form at Basle, 1533. 8vo., translated by Albanus Torinus, together with the treatise 'De Pulsibus;' and this version was reprinted at Strassburg, 1535, 8vo., and inserted by H. Stephens in his 'Medicae Artis Principes.' The Greek text was published without the name of Theophilus, under the title 'Iatrosophistae de Urinis Liber Singularis,' &c., at Paris, 1608, 12mo., with a new Latin translation by Fed. Morell, which edition was inserted entire by Chartier in the eighth volume of his edition of the works of Hippocrates and Galen. The best edition is that by Thom. Guidot, Lugd. Bat., 1703, 8vo., Gr. and Lat.; and again with a new titlepage, 1731. The text is much improved by adopting the readings of a manuscript in the Bodleian Library at Oxford: there is a new Latin version by the editor, and also copious and learned prolegomena and notes. The Greek text only, from Guidot's edition, is inserted by J. L. Ideler in his 'Physici et Medici Graeci Minores,' Berol., 1841, 8vo.

A short treatise, Περὶ Διαχωρημάτων, *De Excrementis Alvinis*, was first published by Guidot, in Greek, with a Latin translation by himself, at the end of the edition 'De Urinis' mentioned above: the Greek text alone is inserted by Ideler in his 'Physici et Medici Graeci Minores.'

The last of the works of Theophilus that remains is a treatise, Περὶ Σφυγμῶν, *De Pulsibus*, which first appeared in a Latin translation, under the name of 'Philaretus,' in several of the old editions of the 'Articella.' It was first published in a separate form at Basle, 1533, 8vo.; translated by Albanus Torinus, together with the treatise 'De Urinis' mentioned above. It was reprinted at Strassburg, 1535, 8vo., and inserted by H. Stephens in his 'Medicae Artis Principes.' The Greek text was first published by F. Z. Ermerins in his 'Anecdota Medica Graeca,' Lugd. Bat., 8vo., 1840, together with a new Latin translation. The text is taken from one manuscript at Leyden and four at Paris, and differs very considerably from the older Latin translation going under the name of Philaretus.

(Guidot's Notes to Theoph. *De Urinis*; Fabricius, *Biblioth. Graeca*; Freind's *Hist. of Physic*; Haller's *Biblioth. Anat.* and *Biblioth. Medic. Pract.*; Sprengel's *Hist. de la Méd.*; Dietz's Preface to the second volume of his *Scholia in Hippocr. et Gal.*; Ermerin's Preface to his *Anecd. Med. Gr.*; Choulant's *Handbuch der Bücherkunde für die Aeltere Medicin*; Greenhill's Notes to Theoph. *De Corp. Hum. Fabr.*)

THEOPHRASTA, the name of a genus of plants dedicated to Theophrastus. It was originally called Eresia by Plumier, but afterwards altered by Linnæus. It belongs to the natural order Myrsinaceæ, and is a small tree with a simple unbranched stem, furnished with a tuft of long evergreen leaves at top, giving it a resemblance to a palm-tree. The flowers are of a white colour, and are arranged on terminal racemes, which are very short, and hidden amongst the leaves of the plant. The calyx is campanulate and cartilaginous. The corolla is also campanulate, with a short tube, and has a dilated throat, girded by an elevated angularly-lobed, fleshy, arched ring: the limb is spreading. The stamens are five, combined with the tube of the corolla; anthers horned. The fruit is a crustaceous spherical berry, about the size of a crab-apple, with the seeds half-immersed in the placenta. There is but one species, named after Jussieu, *T. Jussieui*. This plant is the same as the *T. Americana* of Linnæus. It is a native of the mountains of St. Domingo, and is much cultivated on account of its long handsome holly-like leaves. It may be propagated by cuttings, and grows well in a soil of peat, loam, and sand.

THEOPHRASTUS was born at Eresus, in the island of Lesbos, but the year of his birth is uncertain: some writers state it to be B.C. 371; others place it much earlier. According to Hieronymus (*Epist.*, 2, ad Nepotianum) he died in the year B.C. 285, and, as some say, at the age of 85 (Diogenes Laert., v. 40), or, according to others, at the age of 106 years. These different accounts of his age leave the date of his birth uncertain. When a youth his father Melantas sent him to Athens for the purpose of studying. Here he was first a pupil of Plato, and became an intimate friend of Aristotle, who, charmed with his talents and his beautiful pronunciation, is said to have given him the name of Theophrastus (one who speaks di-

* In *Epist.*, 193, p. 292, he is called Ἀσπαθάριος, but this is merely a mistake of the transcriber, and means Πρωτοσπαθάριος; for Du Cange tells us (*Gloss. Med. et Inf. Graecit.*, in v. πρῶτος) that the word πρῶτος, when prefixed to titles, and signifying the first or chief, is generally expressed in manuscripts by the letter α, with a short line above it, thus ᾶ.

vinely): his real name was Tyrtamus. (Quinctilian, x. 1, 83; Cicero, *Orator.*, 19.) After the death of Plato, when Speusippus had placed himself at the head of the Academy, Theophrastus, with a number of the former disciples of Plato, left the Academy. Plutarch has preserved a bare account of an event in the life of Theophrastus, which must perhaps be assigned to the time which he spent away from Athens after his withdrawal from the Academy. Plutarch says that he and Phidias delivered their country twice from the oppression of tyrants. After the battle of Chaeronea, Theophrastus returned to Athens, from which he had been absent for many years; and as Aristotle had then just opened his school (the Lyceum), Theophrastus ranged himself among the hearers of his friend, and cultivated most zealously all the departments of philosophy and science of which Aristotle was then the great master. When Aristetle himself withdrew, Theophrastus became his successor in the Lyceum, and acquired great reputation in his new sphere, not because he created any new system of philosophy, but because he combined the knowledge and profundity of Aristotle with the fascinating eloquence of Plato. The number of his pupils on one occasion is said to have amounted to two thousand (Diogenes Laert., v. 37), who flocked around him from all parts of Greece. This popularity, and the influence which it gave him in the public affairs of Greece through the practical character of his philosophy, roused the indignation and envy of those who saw in him an obstacle to their designs. The consequence was that Agnonides, who probably acted on behalf of many others, brought against him a charge of impiety. Theophrastus pleaded his own cause before the Areopagus with his usual eloquence, and convinced that court of his innocence. His accuser would have fallen a victim to his own calumny, if Theophrastus had not generously interfered and saved him. After this event he enjoyed undisturbed peace for several years, and he saw his school, which was visited by the most eminent men of the age, daily increase. The tranquillity which he enjoyed was however chiefly owing to the influence of Demetrius Phalereus, who had himself been a pupil of Theophrastus. After the fall of Demetrius the persecutions began afresh; and, in 305 B.C., Sophocles, son of Amphiclides, carried a law which forbade all philosophers, under pain of death, to give any public instruction without permission of the state. (Diogenes Laert., v. 38; Athenaeus, xiii., p. 610; J. Pollux, ix. 5.) Theophrastus left Athens; but in the following year, the law being abolished, and the mover condemned to pay a fine of five talents, Theophrastus and several other philosophers returned to Athens, where he continued his labours without any interruption until his death. The whole population of Athens is said to have followed his body to the grave. His will, in which he disposed of his literary and other property, is preserved in Diogenes Laertius. His library was very valuable, as it contained the works of Aristotle, which this philosopher had bequeathed to Theophrastus. Theophrastus bequeathed them, together with his other literary property, to Neleus of Scepsis.

Theophrastus, as already observed, did not develop a new system of philosophy, but he confined himself to explaining that of his master Aristotle. With this view he wrote numerous works on various branches of philosophy and on natural history. His philosophical works may be divided into works on philosophy, in the narrower sense of the word, works on historical subjects, and works on certain arts, such as oratory, poetry, and the like. It is to be lamented that most of his writings on these departments are now lost, and more especially those on politics (Πολιτικά), on legislators (*περὶ νομοθετῶν*), on laws, a work of which Cicero made great use, and his works on oratory, of which Theophrastus himself was so distinguished a master. A list of the lost books of Theophrastus is given in Fabricius (*Biblioth. Graeca*, iii., p. 445, &c.). Andronicus of Rhodes, a Peripatetic philosopher of the time of Lucullus, made a list of all the works of Theophrastus, and arranged them in systematic order. The following philosophical works of Theophrastus are still extant:—

1. 'Characters,' or *ἠθικοὶ χαρακτῆρες*, consisting of thirty, or, according to Schneider's arrangement, of thirty-one chapters. In this work the author gives thirty characteristic descriptions of vices, or rather, of the manner in which they show themselves in man. The descriptions however are mere sketches, and form a gallery of bad or ridiculous characters. Many modern critics have maintained that the work in its present form is not to be regarded as a production of Theophrastus, but that it is either an abridgement of a greater work of this philosopher, or a collection of descriptions of vicious characters, compiled either from the writings of Theophrastus, or from those of others. Neither of these opinions is incompatible with the statement of Diogenes Laertius, Suidas, and other late writers who mention *ἠθικοὶ χαρακτῆρες* among the works of Theophrastus; for the 'Characteres' which we now possess may have been compiled and published under the name of Theophrastus long before their time. Either of these hypotheses would also account for the fact that nearly all the definitions of the vices that occur in the book contain some error, which, it must be presumed, would not have been the case if the work had been written by Theophrastus. Other critics, on the contrary, have vindicated the 'Characteres' as a genuine work of Theophrastus, and have attributed all its defects and inaccuracies to the bad MSS. upon which the text is based. This opinion has received considerable support from the discovery of a Münich codex, part of which was published by Fr. Thiersch in 1832, in the 'Acta Philologorum Monacensium' (vol. iii., fasc. 3). This MS. contains the titles of all the thirty chapters, but the text of only twenty-one. The first five chapters and the introduction, which were edited by Thiersch, are considerably shorter than the common text, the language is perfectly pure, and there is very little doubt that this is the genuine text of the work of Theophrastus, and that the common one is only a paraphrase, made perhaps by Maximus Planudes, who is known to have written a commentary on the 'Characters' of Theophrastus. The editio princeps of the 'Characteres' is by Wilibald Pyrckheimer, Nürnberg, 1527, 8vo. This edition, which contains only fifteen chapters, was reprinted with a Latin translation by A. Politianus, Basle, 1531, 8vo., and 1541, fol. Chapters 16 to 23 were first added by Camotius, who published the works of Theophrastus in the sixth volume of his edition of Aristotle (Venice, 1551-52). These twenty-three chapters were increased by five new ones from a Heidelberg MS. in the excellent edition of Casaubon, of 1599 (reprinted in 1612 and 1617, 8vo.). The last two chapters were added in the edition which appeared at Parma, 1786, 4to. A still more perfect, and in fact the first complete edition, is that of J. P. Siebenkees, which was edited by Goetz, Nürnberg, 1798, 8vo. In 1799 there appeared two new editions, the one by Coraes (Paris, 8vo.), and the other by Schneider (Jena, 8vo.). The last edition, which is very useful, is that of Fr. Ast, Leipzig, 1816, 8vo. The 'Characteres' have been translated into French by Jean de la Bruyère (Paris, 1696, 12mo., often reprinted, and lastly edited by Schweighaüser, Paris, 1802), and by Levesque (Paris, 1782, 12mo.). The best German translations are those of C. Rommel (Prenzlau, 1827, 12mo.), and of J. J. Hottinger (München, 1821, 8vo.). The rare several English translations: the latest is by F. Howell, London, 1824, 8vo. That by Eustace Budgell, London, 1713, 8vo., is generally called the best. There is also a translation into modern Greek by Larbaris, Vienna, 1815, 8vo.

2. A fragment of a work on Metaphysics, which consists of one book entire (*Τῶν μετὰ τὰ φυσικὰ ἀποσπασμάτιον· ἢ βιβλίον α'*). This book was not mentioned by Andronicus of Rhodes in his catalogue of the works of Theophrastus, but it is ascribed to him by Nicolaus Damascenus. It is printed in all the early editions of the works of Theophrastus in connection with those of Aristotle, as in those of Venice (1497), Basle (1541), Venice (1552), and in that of Sylburg (Frankfort, 1587). The last edition is that of Ch. A. Brandis, who annexed it to his edition of Aristotle's 'Metaphysics' (Berlin, 1823, 8vo.).

3. A Dissertation *περὶ αἰσθήσεως*, that is, on the Senses and the Imagination. There is a paraphrastic commentary on this work by Priscian, the Lydian, who lived in the sixth century of our æra. It was first edited by Trincavelli, Venice, 1536, fol., with Priscian's paraphrase, and 'Quaestiones' by Alexander Aphrodisiensis. It is also printed in the above-mentioned collections of the works of Theophrastus, and in that published by Schneider, Leipzig, 1818-21.

The fragments of other philosophical works are too brief and numerous to be noticed here.

The 'History of Plants,' by Theophrastus, *περὶ φυτῶν*

ἱστορίας, is one of the earliest works on botany that was written with anything like scientific precision. The work is divided into ten books, of the last of which only a fragment is preserved. The matter is arranged upon a system by which plants are classed according to their modes of generation, their localities, their size as trees or shrubs and herbs, and according to their uses as furnishing juices, potherbs, and seeds which may be eaten. The first book treats of the organs or parts of plants; the second of the reproduction of plants, and the times and mode of sowing. Here he mentions the sexes of plants, and describes the mode of reproduction in palms, and compares it with the caprification of figs. The third, fourth, and fifth books are devoted to a consideration of trees, their various kinds, the places they come from, and the economical uses to which they may be applied. The sixth book treats of undershrubs and spiny plants; the seventh of potherbs; the eighth of plants yielding seeds used for food; and the ninth of those plants that yield useful juices, gums, resins, or other exudations. In this work there is much original and valuable observation, but at the same time it is intermixed with many absurd statements with regard to the functions and properties of plants. It is probable that much of the valuable matter recorded in this work was the result of his own observation, as he is known to have travelled about Greece, and to have had a botanic garden of his own, whilst he was probably dependent on the statements of soldiers and others connected with the armies of Alexander for his information on Indian, Egyptian, and Arabian plants.

Theophrastus wrote also another work, 'On the Causes of Plants,' περὶ φυτῶν αἰτιῶν. This work was originally in eight books, six of which remain entire. It treats of the growth of plants; the causes which influence their fecundity; of the times at which they should be sown and reaped; the modes of preparing the soil, of manuring it, and of the instruments used in agriculture; of the odours, tastes, and properties of many kinds of plants. In this, as in the history of plants, the vegetable kingdom is considered more in reference to its economical than to its medical uses, although the latter are occasionally referred to. In both works there is much valuable matter that deserves the attention of the botanist, and a very little knowledge of botany will enable the reader to separate the chaff from the wheat. Both Haller and Adanson complain of the errors which translators and editors of these works have fallen into for want of botanical knowledge. Both works have gone through several editions; they were printed together by the sons of Aldus at Venice, in 1552, 8vo.; and again by Heinsius at Leipzig, in 1613. The 'History of Plants' has been published separately more frequently than the 'Causes.' The best edition is that of Bodæus à Stapel, which was published by his father after his death. It contains a preface by Corvinus; the Greek text, with various readings; the commentaries and remarks of Constantinus and J. C. Scaliger; the Latin translation of Gaza; very careful commentaries by Stapel; a very copious index, and the whole is illustrated by woodcuts. The cuts however are very inferior, and are copies of those in the works of Dodonæus, which seem to have been copied into nearly all the works published on botany at this period. It appeared at Amsterdam in 1644, folio. The latest edition of this work was published at Oxford, in 1813, by Stackhouse. This edition is accompanied with a Syllabus of the genera and species of the 500 plants described by Theophrastus, also a glossary, and notes, with a catalogue of the editions of the botanical works of Theophrastus. The 'History of Plants' was translated into German by Kurt Sprengel, and published at Altona, in 1822, 8vo.

Besides his botanical works Theophrastus wrote many others on various subjects of natural history, which are enumerated with his philosophical works in Diogenes Laertius (v. 42, &c.). One of them, on Stones (περὶ λίθων), from which Pliny, in his account of stones, derived the greatest part of his information, is still extant. De Laet has prefixed it, with a Latin translation and notes, to his work, 'De Gemmis et Lapidibus,' Leyden, 1647, 8vo. A separate edition, with an English translation, was published by Hill, London, 1746, 8vo.; another, with a French translation, appeared at Paris, 1754, 8vo.; and a third, with a German translation, by Baumgärtner, Nürnberg, 1770, 8vo. The last edition is that of Schneider, Freiburg, 1807, 8vo.

Of his two books on Fire (περὶ πυρός), only one is now extant; of his other works on natural history, which are now lost, we possess a considerable number of fragments.

The editio princeps of all the works of Theophrastus is that of Aldus, Venice, 1495-98, printed, together with the works of Aristotle, in 5 vols. fol. Theodorus Gaza published a Latin translation, which was made from the same MS. from which the Aldine text was taken. The first edition of this translation is without date or place; a second appeared at Tarvisium in 1483. The last and best edition is that of Link and Schneider, Leipzig, 1818, 4 vols. 8vo.

Plant.;* Fabricius, *Biblioth. Graec.*, iii., p. 408, &c.; Ritter, *History of Philosophy;* Krug, *Geschichte der Philosophie*, § 99.)

THEOPHYLACTUS SIMOCATTA, of Loeri, an historian, sophist, and natural philosopher, who was living about 610-629 A.D. He wrote a 'Universal History' (ἱστορία οἰκουμενική), in eight books, from the death of the emperor Tiberius II., in 582, to the murder of Maurice and his children by Phocas, in 602. This work is known by the Latin title of 'Historiae Rerum à Mauritio gestarum Libri VIII.' It was printed, with a Latin translation, by J. Pontanus, at Ingolstadt, 1604, 4to. An improved edition was published by Fabrotti, Paris, 1648, fol., reprinted 1729. It is also contained in Niebuhr's collection of the Byzantine writers.

He also wrote 85 short letters, 'Epistolae Morales, Rusticae, et Amatoriae,' which were published in the collections of Aldus, Cujacius, and Henry Stephens; and a work entitled 'Problems in Natural History' ('Απορίαι φυσικαί, Quaestiones Physicae), which was published at Leyden, 1596, and at Leipzig, 1653. The two last-mentioned works have been recently edited by Boissonade, Paris, 1835.

(Fabricius, *Bibliotheca Graeca;* Schöll, *Geschichte der Griech. Litt.*)

THEOPHYLACTUS, a native of Constantinople, was archbishop of Achris, the chief city of Bulgaria, about the year 1070 or 1077. He wrote a work on the 'Education of Princes' (παιδεία βασιλική), for the perusal of Constantinus Porphyrogennetus, the son of Michael VII. and the empress Maria. This work forms a part of the collections of Byzantine writers.

Theophylactus is better known by his valuable commentaries on the twelve minor prophets and the greater part of the New Testament, which are chiefly compiled from the works of Chrysostom. He also wrote 75 epistles and several tracts. These works were printed in Greek and Latin, at Venice, 1754, fol.

(Fabricius, *Bibl. Graec.*, vii., p. 765; Lardner's *Credibility*, pt. ii., c. 163; Schöll, *Geschichte der Griech. Litt.*, iii. 286.)

THEOPOMPUS, an eminent Greek historian, was a native of the island of Chios, son of Damasistratus, and brother of Caucalus, the rhetorician. He was born about B.C. 380, and was instructed in rhetoric by Isocrates during his stay in Chios. (Plutarch, *Vit. dec. Orat.*, p. 837 C; Photius, *Cod.* 260, p. 793.) Photius in another passage states that Damasistratus and his son were obliged to quit their native island on account of their partiality towards Sparta: this seems to have occurred about B.C. 360, when Chios was distracted by two parties, the popular and the most powerful one being in favour of Thebes, while a small number of aristocrats supported the interest of Sparta. To the latter belonged Theopompus and his father. The influence of the instruction of Isocrates on Theopompus appears to have been very great, for although he did not apply his oratorical powers to politics or to speaking in the courts of justice, yet he wrote, like his master, a considerable number of orations, which were recited at rhetorical contests, and in which he is said to have even excelled his master. When he was obliged to leave Chios, he went with his father to Asia Minor, where he spent several years in travel and study, and acquired great celebrity for his eloquence. At the age of forty-five he obtained leave to return to his country through the interference of Alexander the Great. After this event he took an active part in the political affairs of his native island,

and by his talents he became one of the principal supports of the aristocratic party. So long as Alexander the Great lived, his adversaries could not venture anything openly against him; but no sooner had the king died than the popular party again expelled Theopompus. He now took refuge in Egypt under the protection of Ptolemaeus, the son of Lagus, during whose reign he remained unmolested. But his successor Ptolemaeus Philadelphus was ill disposed towards him, and if Theopompus had not been advised by some friends to quit the country, he would have been put to death. Whither he now fled, what were his subsequent fortunes, and where he died, are questions to which no answer can be given, though it is highly probable that he died about or shortly after 308 B.C.

The loss of the works of Theopompus, of which we now only possess numerous fragments, is one of the greatest that antient history has sustained. The following list contains the works he is known to have written:—

1. An abridgement of the work of Herodotus (Ἐπιτομὴ τῶν Ἡροδότου ἱστοριῶν). This epitome is mentioned by Suidas and several other grammarians. Modern critics think it highly improbable that Theopompus should have undertaken such a task, and that it was probably the work of some grammarian, who published it under the name of the historian. The reasons adduced for this opinion are not satisfactory, and it is not improbable that Theopompus may have made this abridgement as a first attempt at historical composition. A few fragments of it are still extant.

2. A more important work was a history of Greece (Ἑλληνικαὶ ἱστορίαι, or Σύνταξις Ἑλληνικῶν). It took up the history of Greece where Thucydides breaks off, B.C. 411, and carried the events down to the battle of Cnidus, B.C. 394. The work consisted of twelve books, and many fragments are still preserved.

3. The history of Philip of Macedonia and his time (Φιλιππικά, or simply Ἱστορίαι). It contained in 58 books the history of Greece from the accession of Philip, or more properly from the foundation of Philippi, down to his death. Five books of it were lost as early as the time of Diodorus Siculus (xvi. 3), and they were probably the same which Photius (*Cod.*, 176, p. 390) mentions as being lost in his time, viz. books 6, 7, 9, 20, and 30. This voluminous work not only embraced the history of Greece in the widest sense of the word within the period mentioned, but also treated of those earlier parts of Greek history and of the history of such barbarous nations as he had occasion to mention. These things formed numerous and long digressions in the work, and of their extent we may judge from the fact that Philip III. of Macedonia, after cutting out these digressions, reduced the work from 58 to 16 books. (Photius, *Cod.*, 176.) We still possess many fragments of the work, which the antient writers refer to and quote.

Besides these historical works, Theopompus wrote many orations, and we know that he also composed Panegyrics on Mausolus, Philip, and Alexander. As regards his character as an historian, the antients praise him as a lover of truth, but they also state that he was extravagantly severe in his censure, and unbounded in his praise. His ardent and vehement temper did not allow him to preserve that calmness which becomes the historian. He is also charged with having been too fond of the marvellous, and with having for this reason dwelled too much upon the mythical stories of Greece wherever he had occasion to mention them.

The fragments of Theopompus have been collected by Wichers: 'Theopompi Chii Fragmenta, collegit, disposuit, et explicavit, ejusdemque de Vitâ et Scriptis Commentationem praemisit,' &c., Lugduni Batavorum, 1829, 8vo. They are also contained in C. and J. Müller's 'Fragmenta Historicorum Graecorum' (Paris, 1841), p. 278-333. Compare F. Koch, *Prolegomena ad Theopompum Chium*, Stettin, 1803, 4to.; A. J. E. Pflugk, *De Theopompi Chii Vitâ et Scriptis*, Berlin, 1827, 8vo.; Aschbach, *Dissertatio de Theopompo Chio Historico*, Frankfort, 1823, 4to.

THEORBO, a musical instrument of the lute kind, which has long fallen into disuse. The latest employment of it that we can trace was in Handel's oratorio of *Esther* (1720), where it is introduced, with the harp, as an accompaniment to the air 'Watchful Angels.' This instrument has been called the *Cithara Bijuga*, its two heads having been erroneously considered as two necks: and it was commonly known under the name of Arch-lute on account of its magnitude. The upper and middle strings were attached to the lower head or nut; the lower, or base strings, to an upper or additional one. According to *Maister Mace* (1676), the Theorbo was the old English lute very much enlarged, and used chiefly, if not only, as an accompaniment to the voice. [LUTE.]

THEOREM (Θέωρημα) means properly a thing to be looked at or seen; and is used in mathematics to signify any proposition which states its conclusion or makes any affirmation or negation; as distinguished from a PROBLEM, which demands or requires a conclusion to be arrived at, without so much as stating whether that conclusion is even possible. Thus, 'Required to draw a tangent to a circle at a given point,' is a problem; but 'If a straight line be drawn at right angles to a diameter from its extremity, that straight line is a tangent to the circle,' is a theoerm. The problem asks discovery both of method and demonstration; the theorem asks demonstration only.

This distinction, as noticed in detail in PROBLEM, was not made by the older Greek geometers; Theodosius is the first, as far as we know, who uses the word theorem, but none of his propositions are problems: Pappus is the first who uses both terms in the distinctive sense.

THEORIES OF MOLECULARITY. This important branch of science is directed to connect the known mechanical, dynamical, and hydrodynamical laws with those which govern the crystallization of solids, the operation of heat in producing liquidity and gaseity, the action of capillary tubes on fluids, and several other phenomena of constituted matter. The laws which regulate the motions of great masses taken as continuous bodies have been explored with success to an astonishing degree by the genius and labours of such men as Newton, D'Alembert, and Laplace. On the contrary, those laws which govern the constitution or elementary arrangement of such bodies are to a great extent absolutely unknown. The ordinary senses of sight, touch, &c. are sufficient to take cognizance of the facts from which the former laws are deduced; but for the latter it is necessary to apply the most delicate instruments supplied by nature, namely, heat, light, and electricity. The minute world is of more difficult research than the great, the plane sections of a crystal than the elliptic orbits of the planets, the infinitely small than the infinitely great.

It is not therefore wonderful that this branch of science, which should connect on one uniform basis the phenomena of chemistry, of crystallography, and of the mechanical action of masses, should have attracted the attention of the most able philosophers from the sixteenth to the nineteenth century; from Boyle to Berzelius, from Newton to Navier and Poisson; and the present unsatisfactory state of our knowledge on this subject must to a great degree be attributed to the neglect of the inductive method, to the substitution of hypotheses for the results of observation.

The first theory on this subject may be thus stated, that the particles of matter possess the attraction of cohesion, but are repulsed by the action of heat or caloric: when the former preponderates, the body is solid; when both are equal, it is in a fluid state; and when the latter exceeds the former, the body is a gas, and prevented from total dispersion only by the action of gravitation. This is purely hypothetic, and forms no more ground for mathematical calculation in relation to the phenomena alluded to above, than does the definition of a straight line in Euclid's Elements for the properties established in geometry. The second hypothesis, which of late has been more generally received both by chemists and mathematicians, is that the particles of matter are mutually attractive by a law analogous to that of gravitation, but are surrounded by atmospheres repulsive one of the other, in the same manner as the particles of elastic fluids. From this hypothesis the equations of equilibrium and of progressive and rotatory motions are deducible; but as the constitution of such atmospheres may be modified very much at the will of the calculator, so as still to obtain the same mechanical results (in the manner in which the distribution of the fluid of light in crystallized bodies has been by those analysts who have developed the undulatory theory), it seems probable that it will be long before the phenomena of crystallization, liquefaction, &c. will from this hypothesis be explained, and the absence of all external action in solids, with the exception of gravitation. The difference of the calculations of Navier and

Poisson show how much this hypothesis may be adroitly stretched. A third method of viewing the phenomena of matter is more strictly inductive, and is similar to that employed in the investigation of the distribution of latent electricity, in Mr. Murphy's 'Treatise on Electricity,' &c. Here we start from the fact that forces sufficiently powerful to prevent the penetration of solids by other solids, and which prevent their being torn asunder without great force being employed, are yet insensible to bodies at very minute distances from them. Here we have ample data for analytical calculation, the chief difficulty lying in the imperfect state of analytical calculation relative to definite integrals; nevertheless enough can be deduced to show the distribution of attractive and repulsive forces within the variously-formed bodies. It however requires the highest strength of analysis of a nature somewhat similar to that employed by Laplace on the figure of the earth and the tides.

The best test of the truth of any theory on this subject is that which, with the forces supposed to exist, shall show that the locus of the points of least resistance, commencing from a given point, shall be a plane surface, or several plane surfaces, as exhibited by crystals.

(Dr. Young's *Lectures on Natural Philosophy;* Various Papers in the *Mémoires de l'Institut;* and Poisson's *Traité sur l'Action Capillaire.*)

THEORY, THEORY AND PRACTICE. If articles upon the mere meaning of words be admissible, it is the consequence of the manner in which they are used. Of all the fallacies which infest society, the most common is that of applying to one sense of a word ideas or associations derived from another; and of all the words in use, there are few which are more often subjected to such process than those which stand at the head of this article.

By theory, properly speaking, is meant the mode of making seen and known the dependence of truths upon one another: a theory is a connected body of such truths belonging to one or more common principles. The use of this word has enlarged with the boundaries of the sciences. For example, before the discovery of universal gravitation, all that was known of any one planet was the empirical formula for one or two of its inequalities. This constituted the theory of the planet (then so called): thus the theory of the moon consisted in the statement of the laws of the inequalities called the equation of the centre, the evection, &c. In our day the point of view is changed; it is no longer the mere exhibition of these inequalities which constitutes the theory, but the deduction of them, as necessary consequences, from the principle of gravitation. The theoretical astronomer now starts from this principle, and, taking only one position and velocity for his numerical data, finds out every inequality of the planetary motions, those which were previously known from observation and more, and shows how to form them into tables. The practical astronomer makes these tables, computes places from them for the current year, compares these places with the results of observation, and returning the comparison into the hands of the theorist, enables him, if need be, to correct the original numerical data to which he applied his methods. The process is now deductive; but before the time of Newton it was the other way. The observer had the first task; the inequalities were to be collected from comparison of observations, and their laws, reduced to their simplest form, were the data for future tables.

Again, before the introduction of the undulatory hypothesis, the theory of light consisted in the exhibition of the laws of reflexion and refraction, with a certain extent of explanation from the emanatory hypothesis of Newton. Since that time the theory of light has become, though at a distance, a resemblance of the theory of gravitation in its character: prediction has commenced, that is to say, the phenomena which would appear under certain new circumstances have been announced before any experiments were made to discover them: and correctly announced. This is the end to which theory ought to be constantly tending; namely, the discovery of laws of action in so complete a manner that the necessary consequences of these laws never fail to make their appearance, so that every thing which is seen is found to be a consequence of the laws when examined, and every consequence of the laws is seen in phenomena when looked for. Whatever fulfils these conditions may be called a perfect theory, or a perfect *mathematical* theory.

The next step in the chain of discovery is one which may in most cases be incapable of attainment. For example, nothing is more certain than that the assumption of every particle of matter attracting every other particle, according to the Newtonian law, leads to the complete deduction of the celestial motions, and gives the complete power of prediction just alluded to. But whether this ATTRACTION does actually take place, or whether any intermediate agent is employed, though it matters nothing *at present* to the mathematical theory, is the next object of inquiry. Could this point be ascertained, it is more than probable that the knowledge of the constitution of matter to which it would lead, would open hundreds of important consequences even in the application of science to the arts. [CAUSE; HYPOTHESIS.]

Before coming to the distinction between theory and practice, we must observe that theories may be divided into two classes, the more perfect and the less perfect. We cannot say that any theory is absolutely perfect; but there are some of which the defects are hardly perceptible, and others in which the contrary is the case. For example, the theory of the statics and dynamics of *rigid* bodies is tolerably perfect; but that of bodies composed of particles acted on by molecular forces is in its infancy. We know a great deal more of the connection of the planetary worlds with each other than we do of the particles which, when connected together, form a bar of iron or of oak. We know that the bar is not perfectly rigid; that it bends and breaks: and the degree of bending which a given force will cause, and the amount of pressure necessary to produce fracture, must be sought for in experiments, from which, imperfect as they are, the laws which would follow from a good theory, if we had one, are to be deduced. In such a subject our theory, instead of being an all-sufficient guide, is only a help, the services of which are to be used to an extent which discrimination derived from practice and experience must point out. Many a person who thinks he is proceeding upon experience only, is really making use of a mixture in which there is theory, though his own knowledge of the process he uses, and of its history, may not be sufficient to inform him of it.

A person who uses an imperfect theory with the confidence due only to a perfect one, will naturally fall into abundance of mistakes: his predictions will be crossed by disturbing circumstances of which his theory is not able to take account, and his credit will be lowered by the failure. And inasmuch as more theories are imperfect than are perfect, and of those who attend to anything, the number who acquire very sound habits of judging is small compared with that of those who do not get so far, it must have happened, as it has happened, that a great quantity of mistake has been made by those who do not understand the true use of an *imperfect* theory. Hence much discredit has been brought upon theory in general; and the schism of theoretical and practical men has arisen. Fortunately there are many of the former who attend properly to the improvement of imperfect theory by practice; and many calling themselves practical who seize with avidity all that theory can do for them, and who know that step by step theory has been making her way with giant strides into the territory of practice for the last century and a half.

By practice, as distinguished from theory, is meant (not by us, but by those who contend for the distinction) the application of that knowledge which comes from experience only, and is not sufficiently connected with any general principles to be entitled to the name of a theory. The distinction of labourers in the field of science or art into theoretical and practical is not strictly a just one, for there is no theorist whose knowledge is all theory; and there is no practical man whose skill is all derived from experience. But the terms will do well enough to distinguish two classes whose peculiarities it might be difficult to define exactly.

The practical man, when he is really nothing more, is one who can just do what he has been taught to do, and who has acquired skill and judgment in a small range of occupations. All who pride themselves upon the title would be displeased at this definition, and we readily admit that many of them are entitled to a higher character; but only because the name by which they delight to describe themselves is a wrong one. They desire, under the name of a workman, to claim the qualities of a master. The term *theoretical* serves, as one of contempt, to designate any-

thing of which they disapprove; and as there never is any fallacy which is not carried to a fool's-cap extent by the lower order of users, it would not be difficult to make a most amusing selection of instances of the manner in which the distinction has been worked by the large number who are at the bottom of the class, and in whose heads it runs that their own *ignorance* is practical, and others' *knowledge* theoretical. We remember seeing a theorist, as he was called, endeavouring to make the managers of a certain undertaking comprehend that their profits could not exceed the excess of the gross returns over the outlay, after they had been trying to cheat the equation by inventing names for what they would have liked to have, but which the theorist assured them they would not get, for the preceding reason. The answer was, 'That is very true *theoretically*, but now let us look at it *practically*.' We shall say no more of the gross abuse of the terms, except to remark that were it worth while really to make a contest between theory and practice, it would be difficult to say on which side the balance of absurdity would incline; or whether the man who is too confident in his theory, or too confident in his experience, has done most mischief for the time being.

Coming now to the higher class of practical men, and speaking as of the balance between two methods, the value of both of which is admitted, we observe that there are obvious faults to which both parties are subject, both in conduct, and in argument respecting their pursuits. Great care is necessary to secure the theorist from pushing an imperfect theory too far, and neglecting causes of disturbance; but at least as much is necessary to prevent the practical man from generalising into theory from imperfect experience, or from restraining inquiry by a notion formed from practice. This is his besetting sin, to such an extent that we should almost be inclined to say that the fault of a practical man is a tendency to form false theory, as that of the theorist is to make false applications. We have often been surprised at the boldness with which the former assert generalities, upon evidence which would only make a pure theorist look for further information. Analogies are of all things the most deceptive.

In argument there is one mode which is common to both parties, and which is exceedingly detrimental. It is the selection of instances from the very highest minds of the two orders, to illustrate the effects of theory or practice upon the general mass of understandings: minds the superior calibre of which, and their power of adapting themselves to circumstances, and making the most of what they have, render them exceptions to all rules, and no proper examples of the most advantageous course of training. Every one likes, no doubt, to draw consequences about and concerning his own self from a contemplation of the minds and methods of the Newtons or the Galileos of a higher sphere of intellectual existence, or the Arkwrights or Telfords of a better state of power of adaptation. 'What is your theory good for?' says the tongue attached to some head which holds about the same weight of conceit that Telford's did of sagacity; 'Telford knew nothing of it, and I may do without it too.' The answer is, *Telford*. The opinion of Bacon was, that, 'the root of *all the mischief* in the sciences is, that, falsely magnifying and admiring the powers of the mind, we seek not its real helps,' a maxim full of meaning, and a lesson to him who rates theory too highly, and also to the one who thinks that the only use of his mind is to arrange the results of experience, his own or others. What are the majority of men, that they should look down upon any course of training, theoretical or practical?

Another fault of argument, but almost peculiar to the practical world, who have the force of numbers on their own side, is the habit of claiming all who are successful in application as instances of their own method and knights of their own order. Suppose that one individual should discover a mine, work it with his own hand, purify the ore, and beat the metal into a horse-shoe; which is he, a geologist, miner, furnace-man, or blacksmith? He has done the work of all, but the community of blacksmiths would hardly be allowed to claim him as peculiarly belonging to themselves. When a person who has mastered the difficulties of theory has also successfully applied them, he is free of both corporations; but those who attend to application only, never fail to appropriate his merits. Watt is a striking instance; he was a highly accomplished theorist on every point on which he worked: and yet his name has been frequently cited as a proof that theory could be dispensed with. And his career, when compared with that of Telford, will illustrate theory applied to practice, as distinguished from practice alone, however acute. It is impossible to contemplate the career of Telford without a feeling of high interest, created by the comparison of his apparently inadequate education with his startling successes. Looking at the individual himself, there is everything for his age to admire; and as long as his structures last, each of them is the *monumentum*, but not *ære perennius*. The time will come when his name shall be like that of the builder of the old London bridge, who was no doubt the Telford of the day, a stimulus to his contemporaries, useful and honoured, but not the remembered of succeeding ages. On the other hand, the discoveries of Watt, though equally startling in what is called the practical point of view, have the mind of the discoverer impressed upon them, and have been, and must be, the guide of his successors, not merely to repetitions of what he did himself, but to enlargement of ideas, and to the conversion of principles into forms useful in art. Take away the honourable qualities which enabled the two men to outstrip their contemporaries, each in his line, qualities which are the properties of the individual minds, and consider what is left, namely, their modes of proceeding: consider the effect of these two modes upon men in general, and there is nothing in that of Telford which would raise the workman above a workman, while in that of Watt there is the vital principle to which we owe all the mechanical triumphs of civilization and all the theoretical successes of philosophy.

This country has been long and happily distinguished for the great attention which has been paid to application; but it is a mistake to suppose, as some do, that our supremacy in practical matters has been coordinate with, still less owing to, neglect of theory. It would be easy to show that though the comparative neglect of theory alone, as a pursuit, added to its diligent cultivation on the Continent, has given to foreign countries a decided preponderance of theoretical inquirers and writers, yet that there has been no country in Europe in which a competent knowledge of the mathematics and their applications has been spread over so large a mass, or raised to so high an average. At any time since the beginning of the seventeenth century the total amount of theory in Britain has been larger than in any other European country, on account of the numbers who have possessed a useful amount of knowledge: the diffusion of education in Germany may have altered our position, but of this we are not sure. For ourselves we are perfectly satisfied, however little those most concerned may know it, that this greater diffusion of theory has been the original moving cause of the practical excellence to which we have alluded. If those who have become known for splendid achievements in the former are few, the same may also be said of the latter; but a country owes its excellence in either department, not to one or two of the highest, but to the mass of those who have competent knowledge, producing good habits of thought and action. It is a new thing to hear one branch set against the other, and would make our writers of a century back think that posterity had lost its senses. The only addition wanted has been some means of systematically nurturing the growth of theory, so that, well as we have done with what we have, we may do better with more. The efforts which are making on every side to extend education will, it may be hoped, do what is wanted in this particular; they will at least have the effect of making it clear that, whatever the force of genius may do for an isolated exception, the mass of mankind must place their best hope of progress in the union of theory and practice.

There is also a mode of viewing what we may call the action of theory, which is absolutely necessary to a true conception of the value of their labours who employ their time in its advancement. Watch the arguments of a person who calls himself, distinctively, a practical man, and it will be always found that a well-established theory, fifty years old, is practical knowledge, so called. To this there cannot be the slightest objection in the non-distinctive sense: a well-established theory, which has been shown to be sufficient, is practical, as opposed to one of which

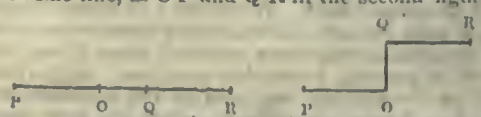
the investigation is more recent, and the completeness not so well ascertained. But when the question is theory, as theory, against practice, as practice, the advocates of the latter frequently find it convenient to assume, for their own share of the matters in contest, all the best theories *plus* the most recent practical knowledge, leaving to the other side the onus of supporting theory upon the most imperfect part of the mass of doctrines which it contains, being that part which is not yet off the anvil. Suppose a merchant going into the bail court to prove his being worth a certain sum; he is asked whether his business, all debts and risks allowed for, would produce that sum: he replies, that his ventures must be beyond record unsuccessful, if it would not be so, over and over again. 'So then,' he is further questioned, 'you cannot positively swear that your business will make you worth the sum in question.' 'I cannot,' he replies, 'positively swear any such thing; but I have enough not employed in business, in land and mortgages, and in the funds, to pay twenty shillings in the pound five times over, upon every risk which I am liable to.' What would be thought of counsel who should retort, 'That is nothing to us; you are described as a merchant, and your solvency must be tried by the state of that part of your property which is now undergoing the fluctuations of trade?' Such is and always must be the state of theory; the amount which is actually realised is enormously greater than the floating balance which is being worked out. Those who are engaged in producing fixed capital from the latter, have a right to the credit which arises from the interest of the former: their labours for the time being are not to produce their return at the instant.

We have, in compliance with common notions, not adverted to the consequences of theory upon the mind and thoughts of men, but have treated it as if its sole object were to advance the mechanical arts and better the physical condition of society. But this is under protest that even if it could not be proved that rational investigation of nature had added one single atom to the physical comfort of life, there would remain such an enormous mass of social ameliorations which can be traced to that source as would outweigh even the triumphs of steam.

THEORY OF COUPLES. The two motions of which any rigid system is susceptible are those of TRANSLATION and of ROTATION. Each of these has this peculiarity, namely, that one particular case of its application yields the other kind of motion. Every motion of a system can, for any one instant, be resolved, at most, into a motion of translation of the whole system, combined with a motion of rotation about an axis; and every application of a system of forces to any rigid body, produces, generally speaking, this compound of translation and rotation. Also, if equal and opposite forces, such as would produce simple translation, be applied at the same point, or if equal and opposite forces, such as would produce rotation, be applied about the same axis, the result is that the equilibrium, or previous motion, of the system remains undisturbed.

But if the equal and opposite forces of translation be applied at different points, the result is rotation only, for the first instant; and if the equal and opposite forces of rotation be applied about axes not coinciding, but only parallel, the effect, at the first instant, is translation only. And though the doctrine of motion is now properly excluded from statics, yet the preceding theorems, together with others mentioned in ROTATION, should be well understood, and viewed in connexion with the science of equilibrium, which is always illustrated, though it may not be demonstrated, by such considerations.

It was for a long time a curious but barren exception, that though any two forces acting in the same plane may, generally speaking, have their joint effect supplied by one single third force, yet if the two forces be equal in magnitude, and opposite in direction, no such single third force will do. If indeed they be applied in the same line, as O P and Q R in the first figure, they equilibrate each other; but if not in the same line, as O P and Q R in the second figure, no



one single force can be found which will either equilibrate them, or produce their effect. About twenty years ago, M. Poinsot, already mentioned for his beautiful theory of ROTATION, applied a remarkable theorem connected with such pairs of forces to the establishment of the theory of the statics of rigid bodies, in a manner which has made his system rapidly take its place among the fundamental bases of the science. We shall in this article point out the manner in which this can be done, without much demonstration, with a view to draw the attention of those who have learned the doctrine of equilibrium in the old way: we cannot make it intelligible (without too great length) except to those who have learned the principles of analytical statics.

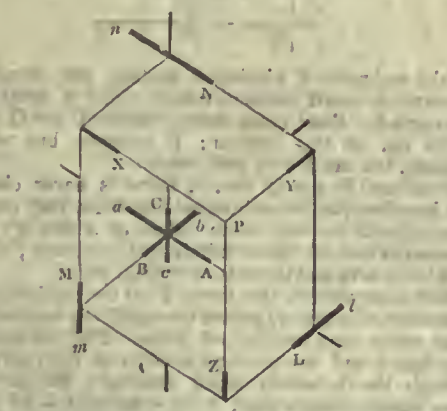
M. Poinsot called a pair of equal and opposite forces, not equilibrating each other, by the name of a *couple*; too general a term perhaps: by it is to be understood a couple which cannot be made anything but a couple, or cannot be replaced by one force: an *incomposible* couple. The *plane* of the couple is the plane drawn through the parallel forces: the *arm* of the couple is any line drawn perpendicular to the forces from the direction of one to that of the other: the *axis* of the couple is any straight line perpendicular to its plane. And if we consider any axis, it will be apparent that the moment or leverage of the couple [LEVER] to turn the system about that axis is represented by the product of one of the forces and the arm. For if, with reference to the axis, x be the arm of one of the forces, $x \pm a$ is that of the other, a being the arm of the couple. Hence if P one of the forces, the united leverage is $P(x \pm a) - Px$ or $\pm Pa$. This product Pa is called the *moment* of the couple.

The last-mentioned property will give a high probability of itself to the following theorems, which are the basis of the theory of couples, and can be proved, the first by aid of the composition of forces only, the second by the principle of the lever. Any couple may have the direction of its arm changed, and consequently of its forces, in any manner whatsoever, either in its own plane, or in any plane parallel to it, provided only that the direction in which it tends to turn the system remains unaltered. Secondly, any couple may be replaced by another which has the same moment, the plane and direction of turning remaining unaltered; that is, the arm may be shortened or lengthened in any manner, provided the forces be increased or diminished in the same proportion. If the system were in equilibrium before, it will remain in equilibrium, however its couples may be altered, in any manner described in the above theorems. Hence it follows that a couple is entirely given when there are given:—1, Its axis or any line perpendicular to its plane, which is also perpendicular to any of the planes into which it may be removed. 2, The moment of the couple; specific forces or arms are unnecessary for its description, so long as their product is given. 3, The direction in which it tends to turn the system. The easiest way of describing a couple is then as follows; suppose for example a horizontal one: Take any vertical line for the axis of the couple, on that axis lay down a line proportional to its moment, and agree that vertical lines drawn upwards shall represent moments tending to turn the system from west to east; and downwards, those tending to turn the system from east to west. But a sign must also be agreed upon; positive moment must consist in tendency to turn in one direction, and negative in the other.

The composition and resolution of couples is easily shown to be done in a manner which perfectly resembles that of ROTATIONS. When the couples can have a common axis (act in the same plane or parallel planes), the moment of the resultant is, in sign and magnitude, the sum of the moments of the components, with their proper signs. To find the resultant of two couples which cannot have a common axis, take axes to them which pass through the same point, and on these axes lay down lines representing the moments of the couples in their proper directions. On those lines complete a parallelogram: the direction of the diagonal is the axis of the resulting couple, and its length represents the moment of that couple. Care must be taken to lay down the directions of the moments properly on the axes; the best isolated rule (when reference is not made to distinct co-ordinate planes) is as follows: let the parts of the plane of the axes which lie in the angle made by the lines representing moments be turned by the two couples in opposite directions.

To the student to whom such a direction would be useful we should say, appeal in all cases to the perceptions derived from ROTATION.

To apply the preceding theorems to the statics of a rigid body, we first take the following conventions:—Assume an origin and three rectangular axes of co-ordinates, as usual. Let the forces which act at each point of the system be decomposed into three, parallel to the axes of x, y, and z. Let each force be called positive, when it acts towards the positive part of the axis to which it is parallel; if for instance the axis of z be vertical, and if its positive part tend upwards, all forces in the direction of z, wherever they act, are called positive while they act upwards, and negative when downwards. As to couples, let their moments be called positive when, acting in the planes of x and y, y and z, z and x, they tend to turn the positive part of the first-named towards the positive part of the second (xy, yz, zx). Let P_1 be the first point of the system; let its co-ordinates be x_1, y_1, z_1; let the forces in the three directions acting at that point be X_1, Y_1, Z_1. Let P_2 be the second point; x_2, y_2, z_2, its co-ordinates; X_2, Y_2, Z_2, the forces there applied: and so on. All co-ordinates and forces have their proper signs. At the origin apply the following pairs of equilibrating forces, X_1 and $-X_1$, Y_1 and $-Y_1$, Z_1 and $-Z_1$; X_2 and $-X_2$, Y_2 and $-Y_2$, Z_2 and $-Z_2$, and so on: which of course do not affect the equilibrium, and are over and above those already applied. Again, at the extremity of x_1, in the axis of x, apply the equilibrating forces Y_1, $-Y_1$; at the extremity of y_1, in the axis of y, apply Z_1, $-Z_1$; at the extremity of z_1, in the axis of z, apply X_1, $-X_1$, and so on for the other points. Lastly, let the points of application of the original forces X_1, Y_1, Z_1, be changed so that each shall act at the projection of the point of application made by its co-ordinate: and the same for the other points. Nothing is done but the application of mutually destroying forces, or the change of the point of application of a force to another point in its direction, and the following figure will show the present arrangement for one point. The original forces, transferred, are marked X, Y, Z; the original point of application P, and the other forces, equilibrating two and two, have great and small letters at their extremities.



We now see that the forces X, Y, Z, are equivalent to

1. The forces X, Y, Z (marked A, B, C) applied at the origin.

2. A pair of couples to the axis of z (L, b) (X, n), the first positive with the moment Yx, the second negative with the moment Xy. These two are equivalent to one couple with the moment $Yx-Xy$.

3. A pair of couples to the axis of x (M, c) (Y, l), the total moment of which is $Zy-Yz$.

4. A pair of couples to the axis of y (N, a) (Z, m) the total moment of which is $Xz-Zx$.

Apply this to every point in the system, and let ΣX stand for X_1+X_2+, &c., and so on: hence it appears that the whole of the forces are equivalent to forces ΣX, ΣY, ΣZ, applied at the origin in the directions of x, y, and z, together with couples in the planes of xy, yz, zx, of which the moments are—

$$\Sigma(Yx-Xy),\ \Sigma(Zy-Yz),\ \Sigma(Xz-Zx).$$

Let $A=\Sigma X$, $L=\Sigma(Zy-Yz)$

$B=\Sigma Y$, $M=\Sigma(Xz-Zx)$

$C=\Sigma Z$, $N=\Sigma(Yx-Xy)$

$$V=\sqrt{(A^2+B^2+C^2)},\quad W=\sqrt{(L^2+M^2+N^2)}$$

Then it appears that all the forces can be reduced to one force, V, acting at the origin, making angles with the axes whose cosines are A : V, B : V, C : V; and one couple having a moment W, and whose axis makes with the axes of co-ordinates angles whose cosines are L : W, M : W, N : W. But when there is equilibrium, both the force and the moment of the couple must vanish, for the single force cannot equilibrate a couple. Consequently the conditions of equilibrium are $V=0$, $W=0$, which give $A=0$, $B=0$, $C=0$, $L=0$, $M=0$, $N=0$, the six well-known conditions of equilibrium.

The forces will have a single resultant when V falls in the plane of the couple whose moment is W; that is, when the direction of V is at right angles to the axis of the couple. This takes place when $AL+BM+CN=0$, a well-known condition.

For further information we may refer to Poinsot's *Elémens de Statique*; or, in English, to Pratt's *Mathematical Principles of Natural Philosophy*; or Pritchard's *Theory of Couples*.

THEORY OF EQUATIONS. Under this term is expressed all that part of algebra which treats of the properties of rational and integral functions of a single variable, such as $ax+b$, ax^2+bx+c, ax^3+bx^2+cx+e, and so on: a, b, c, &c., being any algebraical quantities, positive or negative, whole or fractional, real or imaginary. Unless however the contrary be specified, it is usual to suppose these co-efficients real, not imaginary.

The great question of the earlier algebraists was the finding of a value for the variable which should make the expression equal to a given number or fraction: as what must x be so that $3x^2+2x$ may be 11, or x^3-x^2+6x may be 40, and so on. In modern form it would be asked what value of x will make $3x^2+2x-11=0$, or $x^3-x^2+6x-40=0$, and so on. To find values of a variable which should make an expression vanish, or become equal to nothing, was then the first desideratum; and these values are now called *roots* of the expression. Later algebraists made the finding of these roots subservient to the discovery of other properties of the expressions.

The Hindu algebraists communicated to the Arabs, and through them to the Italians, the complete solution of equations of the first and second degrees. The Italians added the solution of equations of the third degree, and of the fourth imperfectly. These last two degrees have been completed in more recent times, so that it may be now said that the equations of the first four degrees have been completely conquered: that is to say, having given the equation $ax^4+bx^3+cx^2+ex+f=0$, an algebraical expression can be found, having four values, and four values only, and being a function of a, b, c, e, f, which being substituted for x on the first side of the equation, shall make that first side vanish. But the student would look in vain through the books of algebra to see this expression: it is both complicated and useless, and it is more desirable to indicate how it is to be found, than to find it.

The equation of the fifth degree was attempted in all quarters, without success: means were found of approximating to the arithmetical value of one or another root in any one given equation; but never a definite function of the co-efficients which would apply in all cases. A proof was given by Abel, in Crelle's Journal (reprinted in his works), that such an expression was impossible, but this proof was not generally received: it was admitted by Sir W. Hamilton, who illustrated the argument at great length in the 'Transactions' of the Royal Irish Academy, vol. xviii., part ii.; but the singular complexity of the reasoning will probably prevent most persons from attending to the subject. We do not mean in this article to enter into the history of the theory of equations, but only to place its general state before the reader by an exhibition of the principal theorems, mostly without proof. For works on the subject we may refer as follows:—Hutton, *Tracts*, vol. ii., Tract 33, which contains a full account of the earlier algebraists; Peacock, 'Report on certain Parts of Analysis,' in the *Report of the Third Meeting of the British Association*; or the recent works of Murphy, Young, or Hymers; all of which are good, and written on such different plans that any one who makes a particular study of the subject will find it advantageous to consult them all. In French the standard works are those of Budan, Lagrange, and Fourier, which however all treat of particular topics; the

algebraical treatises of Bourdon and Lefebvre de Fourcy take it more generally.

The particular points relative to equations of the first four degrees are as follows:—

1. The expression of the first degree can be reduced to the form $ax+b$; it vanishes when $x=-b:a$, and has only this one root. And $ax+b$ is of the same sign as a or not, according as x is greater or less than the root.

2. The expression of the second degree is more important. It can always be reduced to the form ax^2+bx+c, and its properties are best developed by transforming the preceding into

$$\frac{(2ax+b)^2+4ac-b^2}{4a}$$

There are three distinct cases, according as b^2 is greater than, equal to, or less than, $4ac$.

When $b^2>4ac$, the expression ax^2+bx+c has two real and differing roots, contained in the formula*

$$\frac{-b\pm\sqrt{(b^2-4ac)}}{2a}$$

and has always the same sign as a, except when x lies between those roots. Every change of signs in passing from a to b and from b to c indicates a positive root, and every continuation a negative root: and when one root is positive and one root negative, the positive or negative root is numerically the greater, according as (a, b) shows a change or continuation. When $x=-b:2a$, the expression is at its numerical maximum between the two roots, its then value being $(4ac-b^2):4a$.

When $b^2=4ac$, the expression ax^2+bx+c is a perfect square with respect to x, and absolutely so if a be a square. The two roots become equal, and each equal to $-b:2a$. The expression now never differs in sign from a.

When $b^2<4ac$, the two roots become imaginary, the expression always has the sign of a, and is numerically least when $x=-b:2a$, being then $(4ac-b^2):4a$.

3. The equation of the third degree (or cubic) has been separately considered in the article IRREDUCIBLE CASE.

4. Nothing belongs particularly to the equation of the fourth degree (or biquadratic) except the recital of the various modes in which the solution is reduced to that of a cubic. The various modes are distinguished by the names of their inventors.

Ferrari. Let $x^4+ax^2+bx+c=0$. This can be transformed into

$$(x^2+v)^2=(2v-a)x^2-bx+v^2-c:$$

make the second side a perfect square; that is, find v from

$$b^2=4(v^2-c)(2v-a),$$

or

$$8v^3-4av^2-8cv+4ac-b^2=0;$$

the extraction of the square root then reduces the biquadratic to a couple of quadratics.

Des Cartes. Let $x^4+ax^3+bx+c=(x^2+\sqrt{p}.x+f)(x^2-\sqrt{p}.x+g)$, which gives

$$g+f-p=a,\ (g-f)\sqrt{p}=b,\ fg=c,$$

or

$$p^3+2ap^2+(a^2-4c)p-b^2=0:$$

find a positive root of this equation (it certainly has *one*), and from it find g and f; then the roots of $x^2+\sqrt{p}.x+f=0$, and $x^2-\sqrt{p}.x+f=0$, are those of the given equation.

Thomas Simpson gave a modification of Ferrari's method, and Euler one of that of Des Cartes. (Murphy's Theory of Equations (*L. U. K.*), pp. 54, 55.)

The theory of equations of all degrees is to be divided into two distinct parts; the numerical solution, and the general properties of the roots and the expressions themselves. The *numerical solution* must be carefully distinguished from the *general solution*; the former term applying to any mode of approximating to a single root, the latter to any mode of exhibiting a general expression for the roots. We shall begin by the general properties of the roots: the expression in question being ϕx, or

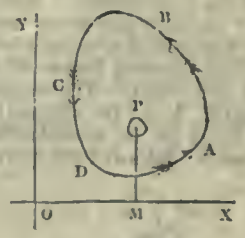
$$a_0x^n+a_1x^{n-1}+a_2x^{n-2}+\ldots+a_{n-1}x+a_n.$$

1. If r be a root of ϕx, or if $\phi r=0$, then ϕx is divisible by $x-r$, and the quotient is another such expression of the $(n-1)$th degree, every root of which is also a root of ϕx, and every number which is not a root (r excepted) is not a root of ϕx. Hence ϕx cannot have more roots than it has dimensions, or cannot have more than n roots.

2. When the expression ϕx is divisible by $(x-r)^m$, it is said to have m roots each equal to r; and when this is the case, the substitution of $r+y$ for x would give an expression in which y^m is the lowest power of y.

3. Every expression has as many roots as it has dimensions. This proposition is one which has only latterly been demonstrated in elementary works, and we shall here give a demonstration with the view of extending the knowledge of a remarkable theorem of M. Cauchy, which is just such a theoretical victory over the difficulty of finding how many roots in general lie between given limits, as Sturm's theorem is relatively to real roots. We shall assume the extended algebra explained in NEGATIVE, &c.

Take any rectangular axes, and let x and y be the co-ordinates of a point, and consider the expression $\phi(x+y\sqrt{-1})$ which can be reduced to the form $P+Q\sqrt{-1}$, where P and Q is each a real function of x and y. Let the point move round the contour ABCD in the positive direction of revolution, and let the fraction P : Q be formed for all the points in the contour (or a sufficient number) in succession. Examine every case in which P : Q passes through 0 and changes sign: let it change sign from + to −, k times and from − to +, l times. Next, whenever x and y have such values that $x+y\sqrt{-1}$ is a root of the expression, or $\phi(x+y\sqrt{-1})=0$, let the point whose co-ordinates are x and y be called a radical point of the expression. The theorem to be proved is as follows: the number of radical points which lie *within* the contour ABCD is $\frac{1}{2}(k-l)$, neither more nor fewer. It must be understood that the contour is so taken that no radical point lies *upon* it.



Take any point P within the contour, and round it draw an infinitely small contour, round which a point is to be first carried. Four cases arise: neither P nor Q vanishes within nor on this contour; P vanishes, but not Q; Q vanishes, but not P; or both vanish.

If neither P nor Q vanish, there is never change of sign in either (for being integral functions, they cannot become infinite for any finite values of x and y), and the theorem is true for the infinitely small contour; for k and l are both = 0, and there is no radical point.

If P alone vanish, the curve P=0 (remember that P is a function of x and y) passes through* the contour two or some other even number of times. The fraction P : Q *may* vanish and change sign as often as the curve passes through the infinitely small contour: but there must be as many changes from + to − as from − to +. For suppose P to be positive at the commencement of the revolution; it is therefore positive at the end. Write down the sign + twice, and between it write any signs whatever, as

$$+\ -\ -\ +\ +\ -\ +\ -\ +;$$

it will always be found that +− and −+ occur equal numbers of times. Hence the theorem is true in this case; for $k=l$, and there is no radical point.

If Q alone vanish, the curve Q = 0 passes through the point, and everything is as in the last, except that P : Q always becomes infinite when it changes sign. Hence the theorem is true; for k and l are each = 0, and there is no radical point.

Lastly, let there be a radical point within, but not on, the infinitely small contour: which may be supposed to contain not more than one distinct radical point. Let Z be the radius vector drawn from the origin to the point of the contour whose co-ordinates are x and y; so that, using the

* This formula should be committed to memory, and quadratic equations always solved by it. Nothing is more amusing than the vitality of the old method of completing the square and extracting the root in every particular case. No doubt a student should have some training in this last-mentioned process: but his ultimate method should be that of remembering, once for all, the formula in the text.

* Prevent the curve P = 0 from touching the contour by enlarging the latter a little if necessary.

extended algebra, $Z = x + y\sqrt{-1}$. Again, let μ and ν be the co-ordinates of the radical point, and A its radius vector; so that $A = \mu + \nu\sqrt{-1}$. Let R be the radius drawn from the radical point to the contour, so that $Z = A + R$, R being infinitely small. By hypothesis $\mu + \nu\sqrt{-1}$ is a root of $\phi z = 0$; let there be m equal roots belonging to the radical point (m being 1, or some other integer): then will $\phi(A + R)$ be capable of expansion into the form $BR^m + B_1R^{m+1} +$, &c., of which, R being infinitely small, only the first term need be considered. Now let B and R (taking the most general forms) be $b(\cos\beta + \sin\beta \cdot \sqrt{-1})$ and $r(\cos\rho + \sin\rho\sqrt{-1})$, whence BR^m will be

$$br^m\{\cos(m\rho+\beta) + \sin(m\rho+\beta)\cdot\sqrt{-1}\},$$

and P : Q will be cot $(m\rho+\beta)$, its remaining terms being infinitely small. Let R make a complete circuit, or let ρ increase from 0 to 2π, whence $m\rho + \beta$ will go m times through four right angles. In each revolution cot $(m\rho+\beta)$ will change from + to − twice, passing through nothing: but never from − to + exceept by passing through infinity. The theorem is then true: for $k = 2m$, $l = 0$, $\frac{1}{2}(k-l) = m$, and there are m radical points (or one radical point belonging to m equal roots) within the contour.

The theorem is then true for every infinitely small contour. Next, let the whole contour ABCD be divided into an infinite number of infinitely small figures, with no other limitation than that no radical point is to fall upon one of the lines of division. Let a point move round each of the infinitely small figures in the positive direction of revolution. It is clear that the expression $\frac{1}{2}(\Sigma k - \Sigma l)$ will not be altered if we remove all the internal division lines and leave only the external contour ABCD: for each internal line is described by two points moving in opposite directions, and wherever one point adds a unit to Σk, the other adds one to Σl. Hence the value of $\Sigma k - \Sigma l$ can be found by finding that of $k - l$ for the boundary only: and the theorem is proved.

If $\phi Z = AZ^n + A_1Z^{n-1} + \ldots$, and if we make the contour in question a circle with the origin as a centre, and a radius so great that the highest term AZ^n need be the only one retained, we can immediately prove that ϕZ has neither more nor less than n roots. For, Z being $z(\cos\zeta + \sin\zeta\sqrt{-1})$ and A being $a(\cos\alpha + \sin\alpha \cdot \sqrt{-1})$, we find as before that P : Q, or all of it that need be considered, is cot $(n\zeta + \alpha)$, whence $k = 2n$, $l = 0$, and $\frac{1}{2}(k-l) = n$.

4. We may now refer to STURM'S THEOREM, to Fourier's theorem (given in the article just cited), to Des Cartes' theorem, a very limited particular case of Fourier's, and to Horner's adaptation of, and addition to, the old method of numerical solution by Vieta (an account of the history of this last problem is given in the 'Companion to the Almanac' for 1839). We have then, since the beginning of this century, a complete theoretical mode of determining the number of roots, real or imaginary, between any given limits; both exceedingly difficult in the complication of the operations which they require. Also, a mode of easy application, though not theoretically perfect, of determining the limits between which the real roots lie; and a process for the numerical solution which places that question upon the same footing as the common extraction of square, cube, &c. roots; making those extractions themselves, except only in the case of the square root, much easier than before.

5. The Newtonian method of approximation is in the following theorem. If a be nearly a root of $\phi x = 0$, and if $\phi a : \phi' a$ be small, then

$$a - \frac{\phi a}{\phi' a}$$

is more nearly a root. See APPROXIMATION for the use of this, and TAYLOR'S THEOREM, p. 129, for a more extensive result. But the use of Horner's method is very much more easy than that of Newton: the former, in fact, includes and systematizes the latter. But this remark applies only to algebraical equations: for all others Newton's form just given remains practically unamended.

6. We refer to the article ROOT for the solution of $x^{2n} \pm 1 = 0$. The following equation, $x^{2n} \pm 2\cos\theta \cdot x^n + 1 = 0$, admits of complete solution on the same principles.

7. If ϕa and ϕb have different signs, one or some other odd number of roots of ϕx lies between a and b: but if they have the same signs, either no one or an even number of roots lies between a and b. Every equation of an odd degree has at least one real root, negative or positive, according as the first and last terms have like or unlike signs. Every equation of an even degree having the first and last terms of unlike signs has at least two real roots, one positive and one negative.

8. If all the coefficients of ϕx be real, and one of the two, $a \pm b\sqrt{-1}$, be a root, so is the other: and if all the coefficients be rational, and one of the two, $a \pm \sqrt{b}$, a and b being rational, be a root, so is the other. If there be a rational fractional root, its denominator must be a divisor of the first coefficient, and its numerator of the last, as soon as the equation $\phi x = 0$ is cleared of fractions. N.B. Among the divisors of a number we reekon 1 and itself.

9. In the equation $a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \ldots + a_{n-1}x + a_n = 0$, the sum of all the roots is $-a_1 : a_0$, the sum of the products of every two is $a_2 : a_0$, that of the products of every three is $-a_3 : a_0$, and so on. Finally, the product of all the roots is $\pm a_n : a_0$, according as n is even or odd. And if $r_1, r_2, \ldots r_n$ be the roots, then $a_0x^n + \ldots$ is the same as $a_0(x-r_1)(x-r_2)\ldots(x-r_n)$.

10. If the preceding expression be called ϕx, and $na_0x^{n-1} + (n-1)a_1x^{n-2} + \ldots$, its derived function, be called $\phi' x$, we have

$$\frac{\phi' x}{\phi x} = \frac{1}{x-r_1} + \frac{1}{x-r_2} + \ldots + \frac{1}{x-r_n};$$

and if ψx be any rational and integral algebraical function of x, the sum $\psi r_1 + \psi r_2 + \ldots + \psi r_n$ is the coefficient of the highest power of x in the remainder of the division of $\phi' x \times \psi x$ by ϕx.

11. If S_n in all cases stand for the sum of the nth powers of the roots of the equation, we have

$$S_0 = n,\quad a_0S_1 + a_1 = 0,\quad a_0S_2 + a_1S_1 + 2a_2 = 0$$
$$a_0S_3 + a_1S_2 + a_2S_1 + 3a_3 = 0,$$

and so on up to

$$a_0S_n + a_1S_{n-1} + a_2S_{n-2} + \ldots + na_n = 0$$

after which, in all cases,

$$a_0S_{n+k} + a_1S_{n+k-1} + \ldots + a_nS_k = 0.$$

Hence also the coefficients of the expression may be found in terms of $S_1\ S_2\ \ldots\ S_n$, as soon as a_0 is given.

12. All rational symmetrical functions of the roots may be easily expressed in terms of $S_1\ S_2$, &c., and thence in terms of the coefficients of the expression.

13. If it be required to find a function ψy the roots of which shall be given functions of those of ϕx, so that in all cases $y = Fx$, proceed as in finding the highest common divisor of ϕx and $Fx - y$, and take for ψy the final remainder. But if this final remainder should be of a higher dimension than, from the known number of its roots, it ought to be, it will be a sign that some of the factors introduced in the process have affected the remainder, and these must be examined and removed. The treatment of this case belongs to the general question of elimination, but the following particular cases are almost all that are necessary.

14. To decrease all the roots of ϕx by a given quantity, or to make $y = x - a$, or $x = y + a$, observe that the resulting equation must be

$$\phi a + \phi' a \cdot y + \frac{\phi'' a}{2} \cdot y^2 + \ldots + \frac{\phi^{(n)} a}{2.3\ldots n} y^n = 0;$$

where the coefficients ϕa, $\phi' a$, $\frac{1}{2}\phi'' a$, &c. may be most readily found by the process described in INVOLUTION (p. 7). The same process may be applied, by using $-a$ instead of a, to increase all the roots of ϕx by a given quantity. It is by this process that the second term of an equation is taken away: thus, the equation being $a_0x^n + a_1x^{n-1} + \ldots = 0$, assume

$$y = x + \frac{1}{n}\frac{a_1}{a}$$

the sum of the roots of the equation in x being $-a_1 : a_0$, that of the equation in y will be 0.

15. To multiply all the roots of an equation by m, multiply its successive terms, beginning from the highest, by $1, m, m^2, m^3$, &c. And to divide all the roots of an equation by m, multiply all the terms by the same, beginning from the lowest. N.B. Terms apparently missing in an equation must never be neglected. Thus $x^7 - 2x^4 + 3x - 1 = 0$ ought to be written

$$x^7+0x^6+0x^5-2x^4+0x^3+0x^2+3x-1=0.$$

This caution is of the utmost importance: in fact no process ought to be applied to any equation without a moment's thought as to whether all the terms are formally written down, and if not, whether the process about to be applied will not require it.

16. To change the signs of all the roots of an equation, change the signs of the coefficients of all the odd powers, or of all the even powers, as most convenient.

17. To change an equation into another whose roots shall be reciprocals of the former roots, for every power of x write its complement to the highest dimension. Thus in an equation of the seventh degree, for x^0 write x^7, for x write x^6, for x^2 write x^5, and so on; lastly, for x^7 write x^0. N.B. Consider the independent term of the equation as affected by x^0. From the reciprocal equation can be found the sums of the negative powers of the roots of the original.

18. The old methods of finding limits to the magnitude of the positive and negative roots of an equation are so rapid that they can hardly be said to be superseded by those of Sturm or Fourier. In enunciating them we speak of coefficients absolutely, without their signs, when mentioning any increase or decrease they are to receive.

If A be the greatest of all the quotients made by dividing the co-efficients by the first co-efficient, no root, positive or negative, is numerically so great as A+1. And if B be the greatest of all the quotients made by dividing the co-efficients by the last co-efficient, no root, positive or negative, is numerically so small as $1 : (B+1)$. Better thus: if L be the first co-efficient, M the greatest, and N the last, signs not considered, then all the roots, numerically speaking, lie between

$$\frac{M+L}{L} \text{ and } \frac{N}{M+N}$$

19. If L he the first co-efficient, and M the greatest co-efficient which has a different sign from that of L, no positive root is so great as $(M+L) : L$. And if L be the last co-efficient and M the greatest which has a different sign, no positive root is so small as $L : (M+L)$. And to apply this to the negative roots, change the signs of all the roots of the original (§ 16), and find limits to the positive roots of the new one.

20. If L be the first co-efficient, M the *greatest* which has a different sign, and if the *first* which has a different sign be in the mth place from the first term exclusive, or belong to the $(m+1)$th term; then no positive root is so great as

$$1+\sqrt[m]{\left(\frac{M}{L}\right)}$$

21. If each co-efficient which differs in sign from the first term, be divided by the sum of all which precede and agree with the first term (the first term itself included), the greatest resulting fraction, increased by unity, is greater than any positive root of the equation.

22. Newton's method of finding a limit greater than the greatest positive root of any equation now merges in Fourier's theorem. It consists in finding a by inspection and trial, so that $\phi a, \phi' a, \phi'' a$, &c. shall all be positive.

23. Any mode of ascertaining a limit greater than the greatest positive root of an equation may be thus treated. Apply it to the reciprocal equation (§ 17), and the reciprocal of the result attained is less than the least positive root of the original. Apply both to the equation of roots with signs changed, and the results give limits for the negative roots of the original.

24. A celebrated mode of examining the roots of equations, but too complicated for ordinary use, consists in forming the equation whose roots are the squares of the differences of the roots of the original. Any quantity being found less than the least positive root of this new equation, its square root is less than the difference of any two roots of the original. If such a quantity could be readily found, the theoretical imperfection of Fourier's theorem would be greatly diminished, and, practically speaking, much advantage would be gained in numerical solution. What is wanted to add to both Fourier's and Horner's method, is a ready mode of finding out when two roots are nearly equal.

25. Lagrange's mode of approximation is as follows:—Having found that a root of an equation lies between the integers a and $a+1$, diminish all the roots of that equation by a, and take the reciprocal equation to the result. Find a root of the last lying between the integers b and $b+1$, diminish all the roots by b, and take the reciprocal equation of the result. Find a root of this last between c and $c+1$, and proceed in the same way. Then the continued fraction

$$\frac{1}{a+}\ \frac{1}{b+}\ \frac{1}{c+} \text{ &c.}$$

is a root of the original.

26. When an equation has equal roots, those roots can be found by an equation depending entirely on the different sets of equal roots. If ϕx have m roots equal to a, $\phi' x$ has $m-1$ of them, $\phi'' x$ has $m-2$ of them, and so on; finally, $\phi^{(m-1)} x$ has one of them. If then ϕx and $\phi' x$ be found to have a common measure, every root of that common measure enters in ϕx one time more than in the common measure itself.

27. When an equation has an integer root, which must be one of the divisors of the last co-efficient, it may be discovered by successive trial, as follows:—Suppose $a_0x^4+a_1x^3+a_2x^2+a_3x+a_4=0$, a_0, &c. being integers. Let k be a divisor of a_4, and let $a_4 : k = l$, an integer. Then if k be a root, we have $a_0k^3+a_1k^2+a_2k+a_3+l=0$, and a_3+l is divisible by k, giving m, an integer. Hence $a_0k^2+a_1k+a_2+m=0$, and a_2+m divided by k gives an integer, say n. Hence $a_0k+a_1+n=0$, and a_1+n divided by k gives $-a_0$. If all these conditions be fulfilled, k is a root. All the divisors of a_4 being tried in this manner, settle the question of the integer roots entirely.

28. If the co-efficients of an equation read backwards and forwards the same, both in sign and magnitude, every root has its reciprocal also among the roots. By reducing it to the form

$$p+q\left(x+\frac{1}{x}\right)+r\left(x^2+\frac{1}{x^2}\right)+\ldots=0$$

which can always be done by division, when the dimension is even, and assuming $y = x+x^{-1}$, an equation of the $2n$th degree can be reduced to one of the nth and n quadratics. But when the dimension is odd, either -1 or $+1$ must be a root, and the equation can be depressed to an even degree by division by $x+1$ or $x-1$.

The student who is acquainted with the preceding results, namely, such as are either stated or referred to in this article, will find no difficulty either in reading on the history of this subject, or in its application. It is peculiarly a subject on which selection should be made for the beginner.

THERA (Θήρα), an island in the Grecian Archipelago, and the chief of the group known by the name of Sporades, although called by some antient writers one of the Cyclades. Its modern name is Santa Thira, which is pronounced and usually written Santorini. It is said by Strabo (x. 484, Casaub.) to be 200 stadia in circumference, but by modern travellers thirty-six miles, and in figure exactly like a horse-shoe. It is opposite the Cretan island of Dia, and distant from Crete 700 stadia, and from the island of Ios, which lay to the north of it, 25 Roman miles. (Pliny, *Hist. Nat.*, iv. 23.) When it first emerged from the sea, it is said to have been called Calliste: Therasia, a small island to the west, and called at present by the same name, was torn away from it, according to Pliny. Volcanic action seems at one time to have been actively at work in this part of the sea. Strabo (i. 57) says, that on one occasion flames burst forth from the sea between Thera and Therasia, which lasted for four days, and that an island was formed in consequence, twelve stadia in circumference. The same phenomenon has also taken place in modern times, and is particularly described by J. Thévenot in his 'Travels in the Levant' (part i.). Pliny also speaks of an island which arose between Thera

and Therasia, to which he gives the names of Hiera and Automate, and of another which appeared in his own age, called Thia. The former is now called Aspronisi, or 'the white island;' the latter Kaimeni, or 'the burnt.'

Thera was originally inhabited by the Phœnicians, who are said to have been left there by Cadmus. It was subsequently colonized by Theras with a mixed colony of Minyans and Spartans (Herod., iv. 147, 148), and always remained faithful to its mother-city Sparta. This island and Melos were the only islands of the Cyclades that remained faithful to Sparta at the beginning of the Peloponnesian war. (Thucyd., ii. 9.) But Thera has acquired its chief importance from having founded the colony of Cyrene in Africa, under the guidance of Battus, in B.C. 631. (Herod. iv. 150, &c.)

The Doric dialect was spoken at Thera, as we learn from inscriptions, and the government was in the hands of the descendants of Minyans and Spartans, who first settled there. We find mention in inscriptions of a senate and a popular assembly.

Coins of Thera are extant belonging both to the time of its independence and that of the Roman empire. Those of the former kind bear the letters ΘΗ, with the head of a youth on one side and three dolphins on the other.

In the present day the island is covered with pumice-stone; and though the soil is dry and barren, it produces a large quantity of cotton and wine. The wine is strong, and is exported to all parts of the Archipelago. There is no wood in the island; and as it has to be imported, and is dear, the inhabitants hardly ever have new bread, but eat biscuits, composed of wheat and barley, which they make only three or four times a year. They have hardly any cattle, and very little fruit except grapes, and there is only one spring in the island. It contains a few castles, surrounded by some houses; but the majority of the inhabitants live underground in caves cut out of the pumice-stone, which are arched over with very light stones of a reddish colour. The island has a very desolate appearance, the coast being craggy and rugged, and the rocks burnt and scorched. It has only one harbour, in the shape of a half-moon; but no ship can anchor in it, as no bottom has yet been found by the plumb-line.

In the beginning of the eighteenth century, when Tournefort visited the island, there were 10,000 inhabitants, and two bishops, one of the Greek and the other of the Latin church. About two-thirds of the inhabitants belonged to the Greek church, (Tournefort, *Voyage into the Levant*, vol. i., p. 202, &c.)

THERA'MENES (Θηραμένης) was a native of Ceos, and the adopted son of Hagnon, or Agnon, an Athenian. He acted a very prominent part about the close and after the end of the Peloponnesian war. He first appears in the history of Greece as taking a part in public affairs in B.C. 409, when, in conjunction with Antiphon, Phrynichus, and Pisander, he endeavoured to upset the democratical constitution of Athens. In B.C. 410 he took part with Thrasybulus in the battle of Cyzicus, and, in B.C. 406, in the celebrated battle of Arginusae. On this occasion, on which the Athenians gained a glorious victory, many lives were lost in the wrecks of their ships, which it was thought might have been saved if proper care had been taken. Theramenes and Thrasybulus had been commissioned by the Athenian generals to take care of the wrecks and to save the men, but they were prevented by a storm from accomplishing this object. The generals in their despatch to Athens concealed the commission they had given to Theramenes and his colleague, as it was clear that the latter would be severely punished for their apparent neglect. After the first report, the generals themselves were summoned to return to Athens, and in self-defence they were compelled to give an accurate account of the occurrence, and the more so as they had reason to believe that Theramenes and Thrasybulus were instigating the people against them. That their suspicion was not unfounded became evident afterwards, for when six of the generals were actually brought to trial, Theramenes was base enough to appear foremost among their accusers. The generals defended themselves; and the late hour of the day rendering it impossible to take the votes of the assembly, the business was adjourned to another day. During the interval, Theramenes and the other enemies of the generals exerted themselves to excite the indignation of the people. On the day appointed for the next meeting a number of persons hired by Theramenes appeared in the assembly dressed in mourning, to rouse the sympathies of the people for the loss of their friends and exasperate them against the alleged authors of their misfortune. After various debates eight of the generals were condemned to death, and six of them, who were present at Athens, were executed immediately. The blame of this act of cruelty falls mainly upon Theramenes, who 'had taken advantage of the uncommon forbearance and candour of his victims, and of his own reputation, which had never before been stained by any atrocious crime, to effect their destruction.'

Soon after the execution of the generals, the eyes of the Athenians were opened, it is said, by Thrasybulus, to their innocence, and it was decided that those who had misled the people should be proceeded against, and that they should give security for their appearance at the trial. Theramenes, however, either by his skill or by accident, not only avoided the prosecution, but retained his place in the popular favour. In the following year (B.C. 405), shortly after the battle of Aegos Potami, when an Athenian embassy had been rejected by the Spartan ephors, Theramenes, who, though he belonged to the oligarchical party, yet kept up the appearance of a friend of the people, offered to go as ambassador to Lysander, who was blockading the city, while famine was raging within. Theramenes promised to procure favourable terms, if the people would trust him. The majority readily acceded to his proposal, and he went to the camp of Lysander. Here he stayed for upwards of three months, hoping that in the meantime the city would be reduced to such a state of weakness as to accept any terms, or that in the interval the oligarchical party would gain the ascendency. There is moreover no doubt that he made Lysander acquainted with the plans of the oligarchs. When he returned to the city, he declared that he had been detained by Lysander, who himself had no power to decide upon the terms of peace with Athens, and that at last he had been directed by the Lacedaemonian general to apply to the government at Sparta. He was accordingly sent thither with nine colleagues, and invested with full power to negotiate peace on any terms. Deputies of the Spartan allies met the ambassadors, and several of them insisted upon the total destruction of Athens; but the Spartans, with an air of generosity, declared themselves willing to grant peace on condition that the long walls and the fortifications of Piraeeus should be demolished, that all ships of war with the exception of twelve should be delivered up to them, and that Athens should join the Peloponnesian confederacy, and follow Sparta both by land and sea. (Xenophon, *Hellen.*, ii. 2.) When Theramenes and his colleagues returned to Athens with these tidings, the famine had reached its height, but there were still some who refused to submit to the humiliating conditions. Theramenes and his party, anxious to get rid of these few before the report was laid before the assembly, gained over a man of the name of Agoratus to bring accusations against them and get them all arrested. The plan succeeded, and the assembly was held in the theatre of Piraeeus, where Theramenes urged the necessity of concluding peace on the terms proposed. Notwithstanding the opposition of some citizens to the treaty, and the taunts of others, who saw through the plans of Theramenes, peace was ratified, and Lysander entered Piraeeus. [LYSANDER.]

After the withdrawal of the Spartan general from Athens, Theramenes, Critias, and their associates, who had assumed the supreme power, wishing to upset the democratical constitution, but to maintain some appearance of decency, invited Lysander to attend the assembly in which alterations in the Attic constitution were to be discussed. Theramenes undertook the management of the business, and proposed that the supreme authority should for the present be placed in thirty persons who should draw up a new code of laws. The presence of Lysander and the neighbourhood of the Peloponnesian troops overwhelmed all attempts of the friends of the people to maintain their constitution, and the proposal of Theramenes was adopted. Theramenes himself was one of the Thirty, and he nominated ten of the others. The outrages and atrocities committed by these Thirty spread general alarm in Attica, and the future was looked to with fearful apprehensions. Theramenes, perceiving the state of feel-

ing at Athens, remonstrated with Critias, the most cruel among his colleagues. This was not from a feeling of humanity, but simply because he saw that the measures of the Thirty would ruin them. Critias was unconcerned about all consequences, and Theramenes gave way. Repeated warnings on his part created some fear lest he should betray them and join the popular party, for he was notorious for his political inconstancy, from which he is said to have received the nickname of Cothurnus (the shoe which fits either foot). At the same time the Thirty became sensible of their dangerous position, and in order to strengthen themselves they made out a list of 3000 Athenians on whom a kind of franchise was conferred, while all the remaining Athenians were treated as outlaws. Theramenes again was dissatisfied with these proceedings, but the tyrants insisted upon disarming the Athenians, with the exception of the three thousand and the knights. The reckless cruelty and avarice of the Thirty grew worse every day, and it was determined that each of them should select out one rich alien who was to be put to death, and whose property should be taken by his murderer. Theramenes refused to have any share in this crime. This refusal increased the fears of his colleagues, and excited their hatred against him, and they resolved to get rid of him before he could become a dangerous enemy. An accusation was brought against him in the name of the Thirty by Critias before the council. He was charged with being hostile to the existing government, and with betraying its interests. Theramenes defended himself, and made such an impression upon the council, that it appeared willing to acquit him. Critias perceiving this, called into the council-chamber an armed band of his followers, whom he had kept in readiness outside, and conversed for a few moments with his colleagues. Hereupon he declared that with the consent of his friends he erased Theramenes from the list of the Thirty and of the three thousand, and that he might now be condemned to death without trial. Theramenes rushed to the Hestia (the altar of Vesta), and conjured the members of the council to protect him, and not to allow Critias to dispose of the lives of citizens; but the herald of the Thirty called in the Eleven (the executioners), who apprehended Theramenes and led him away to punishment. The council was struck with amazement at this bold movement, and Theramenes was hurried across the Agora by Satyrus and the Eleven to prison. When he had drunk the poison which was administered to him, he dashed the cup with the last few drops to the ground, and said, 'This is to the health of my dear Critias.' This happened in B.C. 404.

The manner in which Theramenes died has been admired by antient and modern writers. But his fortitude was not based on the consciousness of a virtuous life, and he no more deserves admiration than a criminal to whom death is a matter of indifference. Thucydides (viii. 68) says of him that he was not wanting in eloquence and ability. Whether he wrote any orations is uncertain. (Cicero, *De Orat.*, ii. 22; *Brut.*, 7.) He is said to have instructed Isocrates (Dionysius Hal., *Isocrat.*, i.), and to have written on rhetoric. It may be true therefore, as Suidas says, that he wrote declamations; but it is much more probable that Suidas confounds him with a late sophist, Theramenes of Ceos. (Eudocia, 231; Fabricius, *Biblioth. Graec.*, ii. 748; Ruhnken, *Hist. Crit. Orat. Graec.*, p. 40, &c.)

(Xenophon, *Hellen.*, ii. 3; Plutarch, *Nicias*, 2; Scholiast on Aristoph. *Nub.*, 360; *Ranae*, 47, 546; Diodorus Sic., xiii. 38, &c.; Thirlwall, *History of Greece*, vol. iv.; E. Ph. Hinrichs, *De Theramenis, Critiae, et Thrasybuli Rebus et Ingenio*, Hamburg, 1820, 4to.)

THERAPEUTICS constitute that department of medical science which relates to the composition, the application, and the modes of operation of the remedies for diseases. Its chief objects are the materia medica, or medicines properly so called [MATERIA MEDICA]; but it includes as subordinate parts hygiene and dietetics, of which the particular purpose is the application of diet and atmospheric and other ordinary non-medical influences, to the preservation or recovery of health.

THERESIENSTADT (*Maria-Theresienstadt, Maria-Theresianopel, Szent Maria Szabatka, Szuboticza*) is a very large town in the county of Bacs, in Hungary, 24 miles from Szegedin, in a plain called Telecska, on the high road to Semlin, in 46° 6′ N. lat., and 19° 40′ E. long. After the battle of Mohacs in 1526, the Turks built a fort on the place where the town now stands. The Turks being totally defeated at Zenta, in 1696, by Prince Eugene, the place was, by the emperor's order, surrounded with fourteen redoubts, and the defence of the frontiers towards Turkey confided to the inhabitants. In 1743, as a recompense for eminent military services, it was made a free market-town or borough, by the name of Szent-Maria, with many privileges; and the population continually increasing by the immigration of Roman Catholics and schismatic Greeks from Dalmatia and Bosnia, and this borough having distinguished itself by its loyalty to the empress (queen) Maria Theresa, it was raised to the rank of a free city the 22nd of January, 1779.

Next to Pesth and Debreczin Theresienstadt is the largest town in Hungary; yet it is not properly a town, but rather an assemblage of villages. It is new and clean, but built without any regularity, and so scattered that many houses might be erected in the vacant sandy spots in the streets. Pinch says it is a good quarter of an hour's walk from one end of the market-place to the other: but, though new and clean, it has a melancholy, desolate appearance. There are a few considerable buildings, viz. the principal parish church of St. Theresa, the Franciscan church, and the handsome Greek church, the Gymnasium, the town-house, and the barracks. The town possesses a more extensive territory than any other town in the kingdom, the area being 556, or, as some say, 756 English square miles in extent. (Stein makes it only 340 square miles.) The whole population does not exceed 40,000, of whom 35,000 are in the town; so that the territory is very thinly peopled, there being only three villages in it. The southern part of the territory produces wheat, barley, oats, and maize; the northern part is sandy, but trees of various kinds have been planted under the direction of a competent person. The breeding of cattle is very flourishing, and numerous herds and flocks, and studs of horses, constitute the riches of the inhabitants, who carry on a brisk trade in wool, cattle, horses, sheep, and raw hides. There are no manufactories, but the people work at their own houses, chiefly for the supply of the town itself. Many follow the business of weavers or tanners, and the women make linen and carpets. They are peculiarly skilful in the art of dyeing: they extract from a large weed or herb, the name of which is not known, the red, green, and black dyes for the worsted of which their carpets are made.

(Thiele, *Das Königreich Ungarn*; Blumenbach, *Die Oesterreichische Monarchie: Die Oesterreichische National Encyclopädie*; Jenny, *Handbuch.*)

THERI'ACA (Θηριακά) was the name given originally by the antients to all those medicines which were intended as antidotes to the bite of venomous animals (*θήρια*), as those which counteracted poisonous drugs were called *ἀλεξιφάρμακα* (Galen, *Comment. in Hippocr.* 'De Alim.,' lib. iii., cap. 7, tom. xv., p. 279, ed. Kühn; id., *Comment. in Hippocr.* 'De Morb. Vulgar. VI.,' lib. vi., cap. 5, tom. xvii., pt. ii., p. 337); afterwards however the word seems to have been somewhat restricted in its signification, or at least *Θηριακή* (in the singular number) is applied to one particular compound, while at the same time this one drug was considered to be a safeguard not only against the bites of venomous animals, but also against poisonous drugs and unwholesome food. (Galen, *De Antid.*, lib. i., c. 1, tom. xiv., p. 1.) Many of these old preparations are preserved in the writings of the antient physicians, but of these it will be enough to mention here the two most famous, viz. the *Mithridatium* (Μιθριδάτιον, or Ἀντίδοτος Μιθριδάτιος), and the *Theriaca Andromachi*.

The Mithridatium received its name from the great Mithridates, king of Pontus, who had a strange affectation of superior skill in the powers of simples. He tried the effects of these upon condemned malefactors, and, finding that different drugs counteracted different poisons, he thought that, by putting all of them together, he should be able to make a compound that would render him secure against any poison that could be given him. (Galen, *De Antid.*, p. 2.) Accordingly he is commonly said to have so fortified his own body by the constant use of this antidote, that he afterwards tried in vain to put an end to his life; but this, if true, 'was probably,' as Dr. Heberden says (*Antither.*, p. 10), 'less owing to the strength of his antidote than to the weakness of his

poison.' However, Pompey seems to have been possessed with the vulgar opinion; and, after he had conquered this king, he took uncommon care to secure his writings, in hopes of some mighty treasures of natural knowledge. He was soon convinced of what he might easily have foreseen; and is represented as laughing at the disappointment of his own credulity, when, instead of those great arcana, he only found one or two trifling receipts:

> 'Antidotus vero multis Mithridatica fertur
> Consociata modis: sed Magnus, scrinia regis
> Quum raperet victor, vilem deprendit in illis
> Synthesin, et vulgata satis medicamina risit;
> Bis denum rutae folium, salis et breve granum,
> Juglandesque duas, totidem cum corpore ficus:
> Haec oriente die parco conspersa Lyaeo
> Sumebat, metuens dederat quae pocula mater.'
> (Seren. Samon., *De Medic.*, cap. *de Venen. Prohib.*)

Soon after, however, there was published at Rome a most pompous medicine under the name of Mithridates, which was pretended to have been found among his papers: its principal virtue was made to consist in its being a most powerful preservative from all kinds of venom; and whoever took a proper quantity of it in a morning was insured against being poisoned during that whole day. (Galen, *De Antid.*, p. 3.) By these representations it gained so great a reputation that some of the Roman emperors prepared it for themselves with their own hands: several physicians among the antients employed their studies upon it in order to render it more perfect; and it has been the subject of many volumes among the moderns, as well as the occasion of many unaccountable medicines made in emulation of it. But, notwithstanding the supposed improvements of the antients, the original Mithridatium continued for a long time to be prepared according to a receipt of Servilius Damocrates, written in a short Greek iambic poem, which is preserved by Galen (*De Antid.*, lib. ii., cap. ii., tom. xiv., p. 115, sq.), and which has been published, together with his other poems, Greek and Latin, Bonnae, 1833, 4to., edited by C. F. Harless.

Andromachus the Elder (who was physician to the emperor Nero, and the first person who is known to have received the title of *Archiater*) made considerable alterations in the Mithridatium by omitting some of the ingredients, adding others (especially the dried flesh of vipers), and by increasing the proportion of opium. His receipt was embodied in a Greek elegiac poem, in order that it might be the more easily preserved without alteration; and this has been inserted by Galen in two of his works (*De Antid.*, lib. i., cap. vi., et *De Ther. ad Pison.*, c. 6), and has been frequently published in a separate form. Andromachus likewise changed the name of the Mithridatium thus reformed to γαλήνη; but in Trajan's time it obtained that of 'Theriaca,' either from the vipers in it, or from its good effects in curing the bites of venomous animals. (Galen, *De Antid.*, lib. i., cap. 6; *De Ther. ad Pison.*, cap. 5, tom. xiv., pp, 32, 232.) The reputation enjoyed by this drug was immense, and surpassed even that of the Mithridatium. The emperor Marcus Aurelius Antoninus was in the habit of taking a small quantity out of honey every morning, and was imitated in this practice by many of his courtiers (Galen, *De Antid.*, lib. i., cap. 4, p. 24); but at last, finding that it made him drowsy and lethargic, he left out the juice of the poppy. (Id., *ibid.*, cap. i., p. 4.) From that time to the present it has more or less maintained its credit, though upon no principle of combination can this heterogeneous farrago be vindicated; and though it has scarcely ever continued the same for a hundred years together. Celsus is the first who describes this medicine (*De Medic.*, lib. v., cap. 23); and according to him it consists of thirty-eight simples. Before Nero's time, five of these were struck out, and twenty others added. Soon after, Andromachus, leaving out six ingredients, and adding twenty-eight, increased the sum total to seventy-five. Aëtius, in the fifth century after Christ (*Tetrab.*, iv., Serm. i., cap. 87, sq., p. 648, ed. H. Steph.), and Nicolaus Myrepsus, in the twelfth (*De Compos. Medicam.*, sec. xxii., cap. i., p. 639, ed. H. Steph.), give us very different descriptions of it; and since that time it has been in a state of perpetual fluctuation, the alterations that it has undergone by accident being as great as those which have been designedly made in it. For of the simples that antiently composed it, several are utterly unknown; others are only guessed at with great uncertainty, and some very erroneously, as might easily be shown, and were so even in Pliny's time (*Hist. Nat.*, lib. xxiv., cap. 1). In the Pharmacopœia of the London College of Physicians both the Mithridatium and the Theriaca Andromachi retained their places certainly as late as the year 1771; and the edition of 1788 is the earliest in which the writer has found it to be omitted. Its rejection was proposed by the late Dr. Heberden (who wrote a little work on the subject, entitled 'Ἀντιθηριακά: an Essay on Mithridatium and Theriaca,' 1745, 8vo., pp. 19); and upon the College dividing on the question, there were found to be *thirteen* votes for retaining and *fourteen* for rejecting it. (Dr. Paris's *Pharmacologia*, vol. i., p. 49, 6th edit.) In the 'Codex Medicamentarius, sive Pharmacopœia Gallica,' published at Paris, 4to., 1818, this preparation appeared under the appropriate title of 'Electuarium Opiatum Polypharmacum.' It consisted of seventy-two ingredients, which were arranged under thirteen heads, viz.: 1, *Acria*, of which there were five species; 2, *Amara*, of which there were eight; 3, *Saporis Styptici*, vulgo *Astringentia*, five in number; 4, *Aromatica Exotica*, fourteen; 5, *Aromatica Indigena*, ten; 6, *Aromatica ex Umbelliferis*, seven; 7, *Resinosa et Balsama*, eight; 8, *Graveolentia*, six; 9, *Virosa*, 'seu quae Narcosin inducunt,' of which there was only one species, viz. Opium Thebaicum; 10, *Terrea insipida et inertia*, consisting also of only one species, viz. Terra Lemnia; 11, *Gummosa, Amylacea, &c.*, four in number; 12, *Dulcia*, consisting of Succus Glycyrrhizae and Mel Narbonense; and, 13, Vinum, or Sherry. An analysis of two ounces of this compound, by M. Guilbert, is given, pp. 324, 325, note; and we are told that one drachm of it contains rather less than one grain of opium. In the last edition of the 'Codex, Pharmacopée Française,' published at Paris, 4to., 1837, under the authority of a *commission de rédaction*, of which M. Orfila was the president, the medicine still appears, and under its old name *Theriaca:* and this, notwithstanding the many improvements that have been introduced, and the number of similar compounds that have been expelled. (Préface, pp. xvi., xvii.) The composition appears to be very nearly if not exactly the same as in the previous edition, but the ingredients are not divided into heads as before. In some parts of Europe the mode of preparing this drug was reckoned among the mysteries of the state, which it was forbidden to divulge: and for some centuries that which came from Venice was particularly valued.

For further information see Heberden's *Antitheriaca* (from which work great part of these observations are taken); Paris's *Pharmacologia;* and also Barth. à Maranta, *De Theriaca et Mithridatio Libri Duo*, &c., Francof., 1576, 12mo.; Nic. THERIS'TICUS, Wagler's name for a genus of birds. Tantalus, Gm.

THERMÆ. [Baths; Roman Architecture.]

THERMO-ELECTRICITY is a name given to the fluid excited by heat in conducting substances, as wires or bars of metal, generally of different kinds, when they are placed in close contact with each other, end to end, and disposed so as to form a periphery or continuous circuit. Since the effects of heat applied to the ends, or junctions, of the bars are made manifest by a magnetized and balanced needle deviating from its usual position in consequence of the application, thermo-electricity is considered as a branch of electro-magnetism; and it may be said to be connected with the electricity which is excited by heat in tourmaline, boracite, and some other minerals. The discovery of the principle was made in 1822, by Dr. Seebeck of Berlin, while engaged in researches concerning electro-magnetism, which but two years before had been discovered by Professor Oersted of Copenhagen; and the name was given to the fluid by the latter philosopher in order to distinguish it from that which is produced by the usual galvanic apparatus, which he proposed to call hydro-electricity.

Some of the most simple experiments by which the effects of thermo-electricity may be illustrated are those which, soon after the discovery, were made by Professor Moll of Utrecht. (*Edinburgh Philosophical Journal*, No. xvii.) A slip of copper bent in the form of a semicircle was attached (in close contact), at its extremities, to the ends of a bar of antimony about fifteen inches long; and the bar being laid in the direction of the magnetic meridian with the wire above it, a small compass needle was suspended, or supported on a pivot between them. On heating the northern extremity of the bar by the flame of a lamp, the north end of the needle was observed to deviate towards the west. Again, when a slip of zinc and one of copper were bent so that, on the extremities being applied together, there was formed a parallelogram having the junctions of the slips in the middle of the shorter sides, and a compass needle was suspended within the circuit, on placing the apparatus in a plane coinciding with the magnetic meridian, with the longer sides parallel to the horizon (the copper slip being uppermost) and heating the northern point of junction, the needle deviated towards the west: the apparatus being inverted so that the zinc slip was uppermost, on heating the northern junction as before, the needle deviated towards the east. It follows from these experiments that the fluid current, if such it be, which affects the magnetism of the needle, circulates about the copper slip in such a manner that when the latter is in a horizontal position its direction is from west to east, passing above the slip, in a plane perpendicular to its length: this effect is similar to that which takes place, though in a contrary direction, when a magnetized needle is brought near a conducting wire joining the poles of an ordinary galvanic apparatus; for if the conducting wire be placed in a horizontal position in the direction of the magnetic meridian, with the copper, or the negative end of the apparatus towards the north, and the needle be below the wire, the north end of the needle deviates towards the east; if above the wire, towards the west.

Effects similar to those which result from the application of heat take place when one extremity of the bar of antimony, or one of the junctions of the zinc and copper, is made colder than the other by means of ice.

When both ends of the bar were heated, no deviation was produced in the needle; and after deviation had taken place by heating one end only of the bar, in proportion as the heat tended to a uniform diffusion, the needle gradually returned to the direction of the magnetic meridian.

Thermo-electric circuits may be formed in a ring consisting of two curved bars of different metals, as bismuth and copper, each being in the form of a semicircle, and the two being attached together in the direction of a diameter; or they may be produced in a rectangle made by placing in close contact four bars of metal, of two different kinds, following one another alternately. M. Oersted formed a hexagonal circuit with six pieces, three of bismuth and three of antimony, which were disposed in alternate order: on heating, by means of a spirit-lamp, one of the places of junction in the ring, or in the rectangle of four pieces, a compass-needle placed within or below the plane of circuit was found to deviate; and it deviated still more when the opposite angles of the rectangle were heated. In the experiment with the hexagonal circuit the deviation was greater in proportion to the number of alternate joints which were heated. Similar effects were produced when the alternate joints were artificially cooled; but the deviation was the greatest when the alternate joints were heated and the others were cooled.

By doubling the lengths of the bars in a rectangle composed of four, the deviation was less than that which was produced by the smaller rectangle; but when the larger rectangle was composed of eight pieces, the deviation was greater.

In this country the subject of thermo-electricity has been diligently pursued by Professor Cumming of Cambridge, who appears to have entered upon it without any other knowledge of the discovery of Seebeck than the simple fact that electro-magnetical action was produced by heating one end of a bar of antimony, to the extremities of which were made fast those of a brass wire; and the details of his researches are contained in a memoir which is published in the 'Cambridge Philosophical Transactions' for 1823. From these it appears that all perfect conductors of electricity, on being heated or cooled in any part, exhibit in general magnetical phenomena; but the intensity of the action, which is indicated by the amount of the deviations produced in a magnetized needle, is not the same in all substances, and with some the direction of the current is contrary to that which is produced in others. When a single bar, of symmetrical form, is heated in the middle, it produces no effect on the needle, probably because the opposing currents counteract each other; and in a ring formed of two metals, when heated at one of the points of junction, the fluid seems to pass from one metal to the other; so that one loses positive electricity, or becomes negative, while the other becomes positive.

Professor Cumming having ascertained from experiments on bars of bismuth, which were made alternately hot and cold, and were placed in contact with each other (each pair of the hot and cold parts, and also the two extremities of the whole compound bar, being connected together by wires), that the action of the whole bar on a needle was greater than that of any two portions, one hot and the other cold, was led to the discovery that electro-magnetism may be exhibited by the mere juxtaposition of an indefinite number of small plates. He was also enabled to determine the thermo-electric relations of different metals by merely placing in contact with each other a small portion of each of the two kinds of metal to be examined, and touching first one of them, and then the other, with one end of a silver or copper wire which was connected with the heated bar. When the metals were bismuth and antimony, the former, on being touched, caused the compass-needle to deviate so as to indicate positive electricity, and the latter so as to indicate negative electricity; and in the memoir above quoted there is given a useful table of the electrical relations of metals in several different combinations. In the same memoir there is also an account of several curious anomalies which were observed in the magnetic action: one of these is, that when iron wire is used to touch the metals examined, of which one is iron, the needle deviates a certain number of degrees in the positive direction; then, as the heat of the wire is increased, the deviation in that direction gradually diminishes till it becomes zero; after which the deviation takes place in a negative direction, and it becomes a maximum in this direction when the wire acquires a red heat.

If two parallel bars of bismuth are connected at one extremity of each by a bar of antimony, so as to form three sides of a square, and the opposite extremities of the bars of bismuth are connected with the two extremities of the bent wire forming an electro-magnetic multiplier [ELECTRO-MAGNETISM, p. 342, vol. ii.], the needle of the multiplier deviates very little; but when those ends of the bars are connected by means of a fourth bar, the effect on the needle is considerable. Now the effect of the galvanic or hydro-electrical current, when produced by silver and zinc, with common water as a conductor, is very small; and hence it is inferred that the thermo-electrical current gives rise to a large quantity of that which is the cause of the magnetic action, the power being however in a low state of intensity.

THERMO'METER (from the Greek words *θερμός*, *hot*, and *μέτρον*, *a measure*) is an instrument by which the temperatures of bodies are ascertained. It consists of a glass tube with a capillary bore containing in general alcohol or mercury, which expanding or contracting by variations in the temperature of the atmosphere, or on the instrument being immersed in the liquid or gas which is to be examined, the state of the atmosphere, liquid, or gas, with respect to calorie is indicated by a scale which is either applied to the tube or engraven on its exterior surface.

The end proposed by a thermometer is the measurement of the temperature of any body with relation to the temperature of some other substance, as of water at the point of freezing: but the measure so obtained must not be understood to express the absolute quantity or density of calorie in any body, it being well known that different substances, though exhibiting the same apparent temperature, contain very different quantities of calorie according to their *capacities* for that element.

The thermometer must have been in use in the beginning of the seventeenth century, but it is not known, precisely, to whom the honour of the invention is due. A physician of Padua named Santorio, and Cornelius Dreb-

bel of Alkmaar in Holland, are the persons to one of whom that honour is, with most probability, ascribed, and the former, in his 'Commentaries on Avicenna' (1626), actually claims it for himself: it may however have happened with this, as with other scientific discoveries, that the idea of the instrument occurred to two persons or more at the same time.

Original Air-Thermometer.

The first thermometers were intended to indicate variations in the temperature of the atmosphere merely; and the most simple of them consisted of a hollow glass-ball at one extremity of a long tube which was open at the opposite extremity: the air within the ball and tube being rarefied by the heat of a lamp, and the tube being in a vertical position, the open end was plunged into a vessel containing a coloured spirit; the pressure of the atmosphere on this spirit caused it to ascend in the tube till the expansive force of the air in the ball and the upper part of the tube became equal to the pressure. In this state, an increase of the temperature of the atmosphere caused the air in the ball to expand and press down the spirit in the tube; on the other hand a diminution of temperature, by causing that air to contract, allowed the external pressure to raise the spirit. A scale was adapted to the tube in order to express the degree of temperature by the number of the graduation at the upper extremity of the spirit.

An effort was made to render the instrument portable by bending the lower part of the tube upwards and terminating this branch also with a ball; and a small aperture was made in the latter in order that the external air might have access to the lower surface of the spirit. Mr. Boyle subsequently modified the air-thermometer by making the tube quite straight and open at both ends: the lower end was immersed in a small glass vessel containing both air and coloured spirit, and the vessel being formed with a neck which closely encircled the tube, it was hermetically sealed to the latter. The variations in the temperature of the atmosphere caused the air in the vessel to expand or contract, and thus to press with more or less force on the surface of the spirit; the latter was consequently made to ascend or descend in the tube.

The air-thermometer invented by Amontons (1702) consisted of a tube nearly 4 feet long, open at both ends and curved upwards at bottom, where it terminated in a ball: this tube carried a column of mercury about 29½ English inches high, so that the air in the ball was compressed by the weight of two atmospheres. A light body, in which was inserted the lower end of a wire, floated on the upper extremity of the column of mercury in the tube; and near the upper end of the wire was an index by which the number of the graduation on a scale was shown. The variations of the temperature of the air in the ball caused the mercurial column to ascend or descend in the tube; and thus were produced corresponding movements in the index. By this instrument it was proposed to measure high temperatures on a scale whose length was only half of that which was required with the simple air-thermometer.

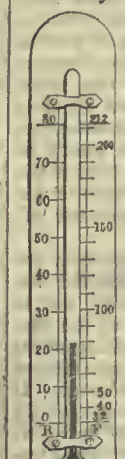
The defects inseparable from all the above thermometers are, that the dilatations of the air are not proportional to the increments of heat, that the length of the column of spirit or mercury varies with the temperature of the atmosphere, also that the air which is in contact with the surface of the spirit in the open vessel, in the first kind of instrument, or with the top of the column of the spirit or mercury, in the others, exerts more or less pressure according to its density; and thus the indications afforded by the thermometer are rendered erroneous, or require corrections which it is difficult to apply. The air-thermometer proposed by Dubuat, and of which the following is a brief description, possesses some advantages above those which have been mentioned; but not being portable, it has never been employed.

It consists of a column of mercury in a tube, like that of a barometer, hermetically sealed at the upper end, and bent below so as to form a short branch inclined at about 40° to the straight part of the tube; this branch terminating with a hollow ball. The mercury occupies the straight part of the tube to the height of about 29½ inches above the bend; and at this bend it terminates without entering into the ball, which, by the construction, is a little above the bend. The part of the tube which is above the column of mercury is free from air, and when the bend is plunged in boiling water the tube is to be in a slightly inclined position, so that a vertical line may pass through the two extremities of the mercurial column: then, upon the ball becoming cool, and the elasticity of the air in it being diminished, the weight of the mercury will cause it to descend in the long branch and rise in the other. The mercury is to be prevented from entering the ball by making the tube decline farther from the vertical position, so that the lower extremity of the mercury may remain in the vertical line before mentioned; and the temperature of the air is to be determined by the height of the top of the column of mercury above a horizontal line passing through the lower extremity, that is, by the cosine of the declination of the tube from the vertical. Since the air in the ball preserves constantly the same volume, the elasticity communicated to it by the caloric in the atmosphere, or by the fluid in which the instrument is plunged, is always in equilibrio with the pressure of the column of mercury, which is the force acting against it, and is proportional to the vertical height of that column.

About the middle of the seventeenth century the members of the Accademia del Cimento caused thermometers to be constructed in which, instead of air, alcohol or spirit of wine was employed. The fluid was introduced, as at present, into a glass tube terminating at bottom in a hollow ball, from which the air had been expelled by heat: the opposite extremity of the tube was then hermetically sealed, and a scale was applied for the purpose of expressing the temperature of the atmosphere, or of the liquid which was to be examined. Alcohol dilates and contracts considerably with the variations of temperature to which it may be subject, though not in so great a degree as air. It is also capable of measuring very low temperatures, but as it is brought to a boiling state sooner than any other liquid, it cannot be employed to ascertain a high degree of heat. Spirit-thermometers were introduced into this country by Mr. Boyle, and they are still used both here and on the Continent.

Sir Isaac Newton, being dissatisfied with the smallness of the range of spirit-thermometers, employed linseed-oil in tubes for the purpose of measuring degrees of heat: this liquid has nearly the same amount of expansibility by increments of caloric as alcohol; and it is capable of bearing very high degrees of heat and cold without either boiling or freezing; but from its viscidity it adheres so much to the interior side of the tube as to render accurate observations quite impossible, and on this account it has not since Newton's time been employed for thermometers.

The thermometer which is now in general use is a slender tube of glass terminating in a ball containing mercury, the air having been expelled and the tube afterwards hermetically sealed. The idea of employing this fluid for the purpose of measuring degrees of heat by its expansion is supposed to have first occurred to Dr. Halley; and the reason why it was not employed by that philosopher appears to have been that the range of its expansion is much less than that of alcohol. According to Boerhaave (*Elementa Chemiæ*, 1732), the honour of having been the first to recommend a mercurial thermometer is to be ascribed to Römer, the discoverer of the motion of light, who is said to have invented it in 1709; but it was not till the year 1724 that such a thermometer was known in this country. In that year an account of a mercurial thermometer which had been invented by Fahrenheit, of Amsterdam, in 1720, was read before the Royal Society, and was published in the 'Philosophical Transactions' (vol. xxxiii.). The advantages of mercury over alcohol and air, as a measure of temperature, are that its expansions are more nearly proportional to the increments of caloric than those which take place in either of the other fluids; it is easily deprived of air, and its power to conduct heat being considerable, the changes of its volume by changes of temperature in the surrounding medium take place more rapidly than those of any other fluid except the gases.



Fahrenheit's Thermometer.

At first the scales for measuring the degrees of heat were

arbitrary, and consequently no two thermometers could be compared together: the scale of the Florentine thermometer was determined by marking the place where the top of the spirit column stood in the tube when the latter was immersed in snow, and the place at which it stood at the time of the greatest heats in Florence: the interval between the points was divided into 60 parts. Subsequently in this country, Mr. Boyle and Sir Isaac Newton formed scales for determining the expansion of the spirit or oil by making the space included in each degree of the tube equal to a certain portion of the whole volume: thus, supposing the ball of the thermometer and part of the tube to be divided into ten thousand equal parts, and to be wholly occupied by the oil when the instrument is plunged in melted ice, Sir Isaac found that by the heat of the human body the oil expanded 256 such parts, and by that of boiling water, 725 parts; then, considering the point at which the top of the column stood in the tube, when the latter was placed in ice, as the zero of the scale, he divided the interval between this point and that at which the top of the column stood when the ball of the thermometer was placed under the arm of a man, into 12 parts. Afterwards by proportion he found that the distance from the ice-point to that of boiling water was equal to 34 such parts (*Phil. Trans.*, vol. xxii.): this method, being of difficult execution, was soon abandoned.

The scale which has been in general use in this country since the year 1724, is supposed to have been invented by Fahrenheit. It is quite unknown on what ground he made choice of the fixed points on his scale, or of the number of graduations between them; but it is thought that one of the fixed points was that of boiling water, and that the other, which is the zero of the scale, was that at which the top of the column stood when the instrument was exposed to an intense cold in Iceland, in 1709. The extent of the scale between this last point and that of boiling water is divided into 212 parts, and the point of freezing water is at the thirty-second division from the zero point. See the scale on the right of the tube in the above figure.

M. Réaumur constructed a thermometer in which spirit of wine was employed, and he formed a scale in a manner nearly similar to that which had been put in practice by Sir Isaac Newton. He computed the volume of the glass ball, and graduated the tube so that the space between two divisions was equal to one-thousandth part of that volume: he then found the zero of the scale by marking the place where the top of the column stood when the thermometer was placed in water just freezing; and afterwards, plunging the instrument in boiling water, he observed whether or not the spirit rose exactly eighty divisions. If not, he strengthened or diluted the spirit till it did so; and the point at which the top of the spirit stood became the point of boiling water. Of this instrument an account was published in the 'Mémoires' of the Academy of Sciences for 1730, but the construction has been long since abandoned; for, besides the difficulty of giving a proper degree of strength to the spirit, it is well known that the latter cannot be made to take the temperature of boiling water, so that the determination of the upper point in the scale must be very erroneous. That which is now called Réaumur's thermometer is an improvement on the former, by M. Deluc, who determined the points of freezing and boiling water by experiment, and divided the distance between them into eighty parts, the zero of the scale being at the former point. See the scale on the left of the tube in the above figure.

A third scale, called 'Centigrade,' has been much in use among the philosophers of the Continent within the last fifty years: it was invented by Celsius, a Swede, and it differs from that of Réaumur or Deluc, only in the distance between the points of freezing and boiling-water being divided into 100 parts. The length of each degree in this thermometer, as well as in that of Réaumur, is greater than in the scale of Fahrenheit; and consequently the indications of temperature, when the top of the spirit or mercury is between the lines of division, are rather uncertain, from the difficulty of estimating them accurately by the eye: also, the temperatures required to be determined being often below the point of freezing-water, the employment of negative signs is of more frequent occurrence with these thermometers than with those of Fahrenheit.

The following formulæ will serve to convert any given number of degrees on Fahrenheit's scale into the corresponding number of degrees on Réaumur's and the Centigrade scales, and *vice versâ*.

Let F, R, and C express any corresponding numbers of degrees on the three scales respectively: then—

$$(F-32°)\frac{4}{9}=R, \text{ and } (F-32°)\frac{5}{9}=C:$$

$$\frac{4}{9}R+32=F, \text{ and } \frac{9}{5}C+32=F:$$

$$\text{also, } \frac{4}{5}C=R, \text{ and } \frac{5}{4}R=C.$$

N.B. When F is between zero and 32°, the values of R and C are negative, and express the required number of degrees below zero on Réaumur's and the Centigrade scale. Also, when F, R, or C expresses any given number of degrees below zero on its proper scale, it must be considered as negative.

The scale invented by De l'Isle of St. Petersburg, in 1733, being still occasionally in use, it may be necessary to mention that it is formed by making the space included in each degree equal to one hundred-thousandth part of the whole volume of the mercury: the zero of the scale is at the point of boiling-water, and between this point and that of freezing-water the space is divided into 150 parts.

It may be observed that the situation of the freezing-point on the scales of thermometers can be determined with great accuracy if the ball and part of the tube be immersed in pounded ice; for it is known that water containing ice and snow remains of the same temperature till the ice is entirely dissolved, every accession of caloric to the water being employed in promoting the dissolution. But the point of boiling water is far from being so precisely known, since it varies with the density of the atmosphere at the time of making the determination. Distilled water in an open vessel, and under a given pressure of the atmosphere, boils at an invariable temperature, except as far as the nature of the vessel may make some difference; for if the heat communicated to the water be increased, the only effect produced is that of driving off a greater quantity of steam in a given time: in a vessel exhausted of the air the water will boil at a temperature expressed by 98° or 100° of Fahrenheit's scale, while in a vessel constructed so as to prevent the steam from escaping it will remain in a liquid state at a temperature expressed by above 400°. In order therefore that the temperatures indicated by different instruments may agree together, it is recommended that this point should be found from water boiling in the open air at a time, if possible, when the height of the mercurial column in the barometer is 30 inches, and when the temperature of the air is indicated by 55° of Fahrenheit's scale.

This effect of the pressure of the atmosphere on the boiling of water was noticed by Fahrenheit in 1724, and M. Deluc, in his 'Recherches sur les Modifications de l'Atmosphère,' has investigated a formula for determining the height of the boiling-point above the freezing-point of the scale in terms of the height of the mercury in the barometer; but the English artist Bird was the first who applied a correction on account of the state of the barometer, for the purpose of fixing the point of boiling water on the scales of thermometers.

The Royal Society having, in 1776, appointed a committee to consider the best means of adjusting the fixed points of thermometers, the formula of Deluc was verified and reduced to English measures for the benefit of artists, in the event of their being obliged to make the instruments under different states of the atmosphere with respect to density and temperature; and the following are some of the corrections which are given by Sir George Shuckburgh for determining the true place of the boiling-point of water. The first column contains the height of the barometer in inches; and the second, the correction which is to be applied with its proper sign to the number 212 on Fahrenheit's scale, in order to give the correct number of

Inches.	°

degrees at which the water will boil under the pressure expressed by the height of the mercurial column. The committee observe that in trying the heat of liquors, the quicksilver in the tube of the thermometer should be heated to the same degree as that in the ball; or if this cannot be done, a correction should be applied on that account. (*Phil. Trans.*, vol. lxvii.)

Thermometer-tubes should have their bores very slender, and, if possible, perfectly equable in the whole of their length. When there is any inequality in the transverse sections, the best artists make the graduations of the scale vary so that they may correspond to the equal divisions of a cylindrical tube; and in order to ascertain the relative dimensions of the sections, they cause a small quantity of mercury, about an inch in length, to slide along the interior of the tube, measuring its length in different places; then, since the lengths are inversely proportional to the areas of the sections, the variations of the former will immediately show the corresponding variations of the latter. It is usual to give to the bore an oval form with the broader side towards the front, in order that the mercury or spirit may be easily distinguished at a certain distance, as by approaching very near the instrument, the heat of the observer's person may affect the length of the column.

It is of course essential that the extent of the thermometer-scale should be great enough to comprehend all the temperatures at which the substances generally required to be examined exist in a state of fluidity; and this extent may be obtained when mercury is employed. According to the experiments of Mr. Dalton, mercury does not boil till it has acquired a temperature equal to 660° of Fahrenheit's scale; and it does not freeze till it is subject to a degree of cold expressed by 39 divisions below the zero of that scale, or 71° below the freezing-point of water. Pure alcohol, on the other hand, has never been frozen, though it has been exposed to a degree of cold exceeding that which is expressed by 91° below the zero of Fahrenheit; and therefore a spirit-thermometer is to be preferred to one of mercury when it is intended to ascertain the temperature of the air in high northern or southern latitudes: but since the spirit boils in air with a degree of heat expressed by 175° of Fahrenheit, it is unfit for many of the purposes for which a thermometer is required. For instruments capable of measuring very high temperatures, see PYROMETER.

In the construction of a thermometer, the air should be carefully expelled from the tube, and even from the mercury or spirit within it: the variations in the density of the atmosphere cannot of course affect the instrument, since the tube is hermetically sealed. It must be observed however that the indications of temperature are not precisely expressed in terms of the dilatation of the mercury or spirit only, but in terms of the excess of that dilatation above the dilatation of glass. The apparent dilatation of mercury in a glass tube is equal to $\frac{1}{64\cdot8}$ of its volume, between the temperatures of freezing and boiling water; and its true dilatation between the same limits is $\frac{1}{55\cdot5}$ of its volume.

A perfect thermometer would be one in which the expansions of the fluid in the tube were exactly proportional to the increments of heat which it might receive from the substance whose temperature is to be determined; but it cannot be said that any of the fluids which as yet have been employed in the construction of thermometers strictly possess this property. Mercury is the fluid in which it exists in the greatest degree; but from the accurate experiments of Deluc it has been ascertained that, between the points of freezing and boiling-water, the temperature indicated by the mercurial thermometer is lower than the true temperature, the greatest difference, which however is only equal to 1°.4 of Réaumur's scale or 3°.15 Fahrenheit, being in the middle between those two points on the scale. From the same experiments it is also found that when thermometers are regulated so as to agree at the points of freezing and boiling water, whether the liquid be oil, spirit, or water, the indications are always below those of mercury; the difference being the greatest at the middle between those points. With oil of olives the difference is 1° of Réaumur's scale (2°.25 Fahr.); with highly rectified alcohol, 4°.9 Réaumur (11°.02 Fahr.); with half alcohol and half water, 6°.7 Réaumur (15°.07 Fahr.); and with water, 19°.5 Réaumur (43°.87 Fahr.). It must be observed that great irregularities take place in the expansion of all fluids when near their boiling state, and that mercury contracts very suddenly when at the point of its congelation. The deviations of the spirit-thermometer from the true indications of heat are known to be rather greater than those of the mercurial thermometer: it may be added that the alcohol in a thermometer-tube loses, in time, part of its strength; and that in consequence, the degree of expansion by a given increment of heat is not the same as when the instrument was made. The expansion of alcohol for temperatures greater than about 175° Fahr., at which the spirit boils, cannot be ascertained practically, because the spirit at that temperature passes into a state of vapour; and the comparison between the mercurial and the spirit thermometer ought not to be carried higher than that temperature; or the scales for mercury and spirit ought to be regulated so as to agree with one another at the freezing-point of water and at the temperature of 175° Fahrenheit: if this were attended to, the differences between the indications of the mercurial and spirit thermometers, above that point, would be less than they appear to be by the tables of Deluc.

Water, like other substances, suffers a diminution of volume by the abstraction of caloric, but when it is cooled to a temperature between 39° and 40° of Fahrenheit's scale, it seems to have attained the maximum of density; and if the process of cooling be continued, it then increases in volume till it is converted into ice. Therefore if a thermometer were made with water, and the top of the column were at 50° Fahr., it would be impossible to know whether the temperature were 50° or 30°, the expansion being nearly equal at equal distances within ten degrees above and below 40° of the scale. The cause is uncertain, but it is probably owing to a partial crystallization, which may begin to take place in water when at a temperature expressed by about 8 degrees above its freezing-point.

The mercurial and spirit thermometers, regulated as before said, differ very considerably at temperatures below that of freezing water; and at 39° below the zero of Fahrenheit, or 32° below the zero of Réaumur, when the mercury is frozen, the difference has been computed to be about 10° Réaumur (22°.5 Fahr.), by which the spirit stands too low. By observations made during Sir Edward Parry's second voyage, the differences between the indications of the spirit and mercurial thermometers varied from 3°.05 to 8° Fahr. between the temperatures +58° and −30°, the alcohol being always too low.

Register Thermometers.—It is of great importance in meteorology that the observer should be able to ascertain the highest or lowest point of a thermometer scale at which the column of mercury may have stood during his absence; and several contrivances have been adopted by artists in order to obtain this end. Of these, one, which is still preferred, was invented by Mr. Six, whose name the instrument bears, and is described in the 'Philosophical Transactions' for 1782. It consists of a long tube bent so as to form three parallel branches, A, B, and C: the part A is an elongated bulb, and the rest of the tube has a capillary bore. The lower portion, *b*, contains mercury, which rises in B and C to certain points, as *a* and *c*, and the bulb is filled with spirit of wine, which passing over the bend at *d*, descends to the upper extremity of the mercury in B: above *c* the branch C is also filled with spirit to near the upper extremity, which is hermetically sealed.

Six's Register Thermometer.

Two small indices of steel coated with glass, which are represented at *m* and *n*, are introduced in the branches B and C: these are capable of being forced upwards by the rising of the column of mercury in either tube, and they have about them a fine wire or a thread of glass; so that they will remain stationary where they happen to be when the heads *a* and *c* of the columns recede from

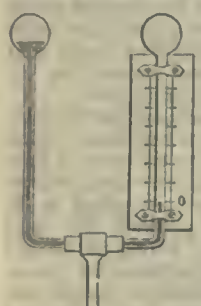
them. Their lower extremities consequently indicate the points at which the ends of the columns may have stood before such recess.

It is evident that the expansion of the spirit in A by increments of heat, will cause that which is in B to press down the column of mercury in that branch and force up the extremity *c*, moving the index *n* before it, while by its friction the index *m* is prevented from descending. On the other hand, the contraction of the spirit in A allows the elasticity of the air in the ball D to force the column in C downwards, the index *n* remaining at the highest point to which it had been previously raised; the mercury in B then rises up, carrying the index *m* before it, till an augmentation of temperature causes the spirit in A to expand, and again force the mercury in B downwards.

The graduations on the scale belonging to the branch C are numbered upwards; while the graduations on the scale belonging to B are numbered downwards. The points *a* and *c* should always indicate the same degree on the two scales; and by means of a magnet the indices *m* and *n* may be brought down to those points: from thence afterwards the former ascends by a decrease, and the latter by an increase of temperature.

An instrument of this kind is generally used for ascertaining the temperature of the ocean at considerable depths, or of the atmosphere at great heights.

Differential Thermometer.—This instrument, which was invented by M. Sturmius, of Altdorf, before the year 1676, and was revived by Professor Leslie in 1804, consists of two thermometer tubes, terminating, at one extremity of each, in a hollow glass ball, and containing coloured sulphuric acid: the opposite extremities are united by the flame of a blow-pipe, and an enlargement of the bore is made at the place of junction. The tube is then bent so as to form three sides of a rectangle, the two balls, which are of equal diameter, forming the upper extremities of two sides; and the instrument is on a stand with the branches of the tube in vertical positions. When the temperature of the air in the two balls is the same, the acid occupies one side and the base, and rises a little way up the other side of the rectangle. To the latter side is attached a graduated scale, with the zero of which the upper extremity of the acid in that branch should coincide. In the event of this adjustment being deranged, it may be restored by causing a small quantity of air to pass from one ball to the other, which is done simply by the warmth of a hand applied to that ball from whence the air is to be driven.



Differential Thermometer, invented by M. Sturmius, of Altdorf.

The variations of temperature in the apartment will evidently have no effect on the instrument, since the action upon the two balls will be equal: but if one ball alone be heated, the rise of the acid in the other will immediately indicate the difference between the temperatures of the media about the two balls by the excess of the expansion of the air in one ball above the expansion in the other. The delicacy of the instrument is such that the least difference of temperature is immediately made sensible by the movement of the acid.

Radiating Thermometer, or Actinometer.—For the purpose of measuring the intensity of solar or terrestrial radiation, an instrument, called an Actinometer, has been used. It consists of a hollow cylinder of glass, which is united at one end to a thermometer-tube, the latter being terminated at the upper extremity by a ball, which is drawn out to a point, and broken off so as to leave a very small orifice: this is stopped up with wax, which is to be removed when the instrument is to be cleaned. The other end of the cylinder is closed by a silver cap furnished with a screw of the same metal, which turns tightly in a collar of waxed leather. The cylinder is filled with a deep blue liquid, and is enclosed in a box, which is blackened on three sides interiorly, and has a thick glass in front. The use of the screw is to diminish or increase the capacity of the cylinder if necessary, driving a portion of liquid into the ball, or withdrawing some from thence so as just to fill the cylinder and the whole stem of the thermometer with the liquid in an unbroken column. When the instrument is to be used, it is placed in a horizontal position with the glass face of the box upwards.

In making the observations, the instrument is disposed so that the sun may shine directly upon its face, when the liquid will mount rapidly in the thermometer stem: it should be allowed to do so for three or four minutes, after which, by turning the screw, the extremity of the liquid must be brought to the zero of the scale. At ten seconds before a complete minute is indicated by the watch, the sun shining on the instrument, the observer begins to follow with his eye the top of the rising column of spirit, and, counting by his ear the beats of the watch, when the sixtieth second has beat, he registers in a book the number of the graduation corresponding to the top of the column; then, waiting till the watch is at ten seconds before the next minute, the observer follows the rising column as before, and, counting the beats by his ear, at the end of the minute he registers separately the height of the column of liquid. The instrument being then drawn into the shade, or covered with a screen, a pair of observations, at the interval of one minute, are made and registered as before, the liquid descending in the tube between the last two observations. The instrument is again placed so that the sun may shine on it, and afterwards in the shade, when two other pairs of observations are made, and so on.

A mean of the two differences between the readings at two nearest observations while the sun shone on the instrument, added to the difference between the readings at the intermediate observations while the instrument was in the shade, is taken as a measure of the intensity of the sun's radiation at the middle time between the first and third observations; and a mean of such results for all the triplets of observations is considered as the general mean.

An approximation to the measure of solar radiation may be obtained by simply exposing a register thermometer with a blackened ball to the direct action of the sun's rays. [RADIATION.] The thermometer should be placed a few inches above the ground, and be screened from currents of air; and the graduations should be made on the stem of the thermometer, in order to avoid the errors arising from the expansion or warping of the scale.

The force of terrestrial radiation may be measured by the minimum temperature of a register thermometer, whose ball is placed in the focus of a parabolical mirror: the face of the mirror is to be turned towards the face of the sky, but away from the rays of the sun.

THERMOMETER, DIFFERENTIAL. [THERMOMETER.]

THERMOPYLÆ. [ZEITOUN, GULF OF.]

THERMOSTAT, or *heat-governor*, an apparatus invented and patented in 1831 by Dr. Ure, for regulating temperature in the processes of vaporization and distillation, in heating baths and hothouses, in adjusting the draft of stoves and furnaces, in ventilating apartments, &c. It acts upon the principle that, when two thin metallic bars, of different degrees of expansibility, are riveted or soldered together side by side, any change of temperature will cause a sensible flexure in the compound bar; the side consisting of the least extensible metal becoming concave, and the other convex. By this flexure of the compound bar, which takes place with considerable force, a movement is effected, which, by the intervention of levers, may be made to open or close stop-cocks, dampers, ventilators, or any description of valves, and thereby to regulate the flow of heated liquids or the admission and emission of air. The compound bars frequently consist of thin pieces of steel and hard hammered brass, riveted together; but various other metals may be employed, and in some cases wood may be used for one part of the bar. The principle of the thermostat may be applied in many different ways, of which the following may serve as examples. In *Fig.* 1, *a* is the compound bar, which is firmly fixed at *b*, and, when exposed to the ordinary temperature of the atmosphere, remains in the straight horizontal position shown in the cut. To the other, or free end of the compound bar, is attached, by means of a connecting rod, the short end of a lever mounted upon the axis of a circular revolving valve, or ventilator, *c*; and from the longer end of the lever is suspended a sliding valve, or damper, *d*. By increasing the temperature of the chamber or vessel in which the thermostat is placed, the compound bar will assume the curved form indicated

by the dotted lines, by which means the position of the lever will be altered, the valve *c* will be turned on its axis, and the damper will be raised. *Fig.* 2 shows another

Fig. 1.

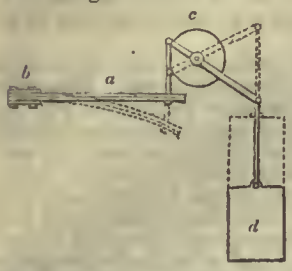


Fig. 2.

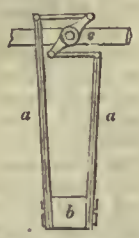

arrangement, in which two compound bars, *a*, *a*, fixed at *b*, are made to open and close a valve *c*, in a pipe through which air, water, or any other fluid is passed. By increasing the temperature of the apparatus, the upper or moveable ends of the bars would recede from each other, and, consequently, alter the position of the valve. A similar contrivance may be placed in a chimney, to modify the position of a damper-plate moving upon its axis, and thereby to regulate the draft. The application of such an arrangement of compound bars to the admission of water to a water-bath is described in the article DISTILLATION, vol. ix., p. 26. *Fig.* 3 shows the principal part of a thermostatic apparatus in which three pairs of compound bars, *a*, *a*, *a*, are used to give motion to a sliding-rod *d*, *d*, with which any kind of valve may be connected by a rack and pinion, a chain and pulley, or otherwise. *b*, *b*, in this figure, is a straight guide-rod, which is fixed at one end by a screw-nut *c*; a milled head being added for the purpose of adjusting the apparatus, so that it may act at any required temperature. The thermostatic bars, in this as well as the previous cases, are nearly or quite straight when cold, and become more or less curved by the action of heat; but in some modifications of the thermostat the

Fig. 3.

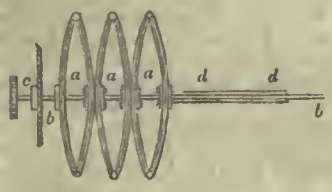

Fig. 4.

bars are always curved, and the action of the apparatus depends upon the increase or decrease of the ordinary flexure. *Fig.* 4, for example, represents a thermostatic hoop, *a*, *a*, which may be immersed horizontally beneath the surface of the water-bath of a still. The hoop is fixed at *b*, and to its free ends are attached short links *c*, *c*, which impart longitudinal motion to the rod *d*. *e* is a lever-handle moved by the sliding-rod, and turning a valve on its axis *f*. The outer end of this lever carries an index, which moves against a graduated scale. *g* is a screw-nut, moveable upon the sliding-rod, to adjust the apparatus before graduating the scale or arc traversed by the index. Some other forms of the apparatus are given in Dr. Ure's 'Dictionary of Arts,' &c., pp. 1237-1239; and on p. 643 of the same work is described a contrivance in which the same natural principle is differently applied.

THEROUENNE. [PAS DE CALAIS.]

THESEIUM (Θησεῖον), the temple of Theseus at Athens, was situate in the north-west part of the city, at no great distance from the gate which led to Eleusis, and immediately above the gymnasium of Ptolemy. It was built in honour of Theseus, soon after his bones had been brought from Scyros to Athens by Cimon, B.C. 469. (Plutarch, *Theseus*, 36; *Cimon*, 8; Diod. Sic., iv. 62.) It possessed an inviolable asylum, where runaway slaves in particular were accustomed to take refuge, and was equalled in sanctity only by the Parthenon and Eleusinium. (Plutarch, *De Exsilio*, p. 607 A; Hesychius, and *Etymolog. Mag.*, under Θησεῖον.) Its sacred enclosure was so large as to serve sometimes as a place of military assembly. (Thueyd., vi. 61.)

The temple of Theseus is in a state of greater preservation than almost any of the antient monuments of Athens, and is used in the present day as a Christian church, dedicated to St. George. It is built entirely of Pentelic marble, and stands upon an artificial foundation formed of large quadrangular blocks of limestone. Its architecture is of the Doric order. It is a peripteral hexastyle, or surrounded by columns, having six in each front. There are thirteen columns on each side, including those at the angles, which are also reckoned among the six belonging to each front, so that the whole number surrounding the temple is thirty-four. It consists of a cella forty feet long, having a pronaos to the east and a posticum to the west. The pronaos and the portico are together thirty-three feet in depth, and the posticum with its portico twenty-seven feet. The breadth of the temple is forty-five feet. The columns are three feet four inches in diameter at the base, and rather more than eighteen feet and a half high, with an intercolumniation of five feet four inches. The height of the temple from the summit of the pediment to the base of the columns is about thirty-one feet. The platform upon which it is built, and which consists of only two steps, is about two feet four inches in height.

The eastern front of the temple was the principal one. This is shown not only by the greater depth of the pronaos, but still more decisively by the sculpture. In the eastern pediment only are there any traces in the marble of metallic fastenings for statues; and the ten metopes of the eastern front, with the four adjoining ones on each side, are exclusively decorated with sculpture, all the others on both sides and on the western front being plain. The only other parts of the temple adorned with sculpture are the friezes over the entrance of the pronaos and the posticum. In the British Museum there are casts of the greater portion of these friezes, and also of three of the metopes from the northern side, being the first, second, and fourth, commencing from the north-east angle. They were made at Athens, by the direction of the earl of Elgin, from the sculptures which then existed upon the temple, where they still remain. The marbles have been greatly injured since the time when Pars made the drawings for Stuart, but enough remains to show that they belong to the highest style of Grecian art: they are almost equal, and, by some, considered even superior, to those of the Parthenon. The relief is bold and salient, approaching to the proportions of the entire statue, the figures in some instances appearing to be only slightly attached to the table of the marble. It appears that all the sculptures were painted, as was the case in many other Grecian temples. Col. Leake says that vestiges of brazen and golden-coloured arms, of a blue sky, and of blue, green, and red drapery, are still very apparent.

The subjects of the sculptures are the exploits of Theseus, and those of his friend and companion Hercules. The metopes in front of the temple relate to the labours of Hercules, and those on the two sides to those of Theseus. On the frieze of the posticum is represented the combat of the Centaurs and the Lapithæ, in which Theseus was engaged; but the subject of the frieze of the pronaos is very doubtful, owing to the mutilated condition of the sculptures. Stuart supposes that it represents part of the battle of Marathon, and especially the phantom of Theseus rushing upon the Persians. Col. Leake thinks it probable that the pannel over the pronaos relates to the exploits of Hercules, in the same way as the other frieze relates to those of Theseus; and he supposes it to represent the battle of the giants, who are said to have been subdued chiefly through the exploits of Hercules. Müller (*Denkmäler der alten Kunst*, p. 11) conceives it to represent the contest of Theseus against the Pallantidæ, who wished to destroy him when he was acknowledged by Ægeus as his successor. Mr. Hawkins (*Description of Antient Marbles in the British Museum*, part ix.) however is of opinion that not one action alone is intended to be represented, but three or four achievements are here recorded, the subjects being separated from one another by groups of seated divinities.

The interior of the temple originally contained three paintings on the walls by Micon, which Pausanias saw and describes (i. 17, § 2). One represented the battle of the Athenians with the Amazons, the second that of the Centaurs and the Lapithæ, and the third an action of Theseus in Crete. The stueco upon which these paintings were

executed is still apparent, and shows that each painting covered the whole wall from the roof to two feet nine inches short of the pavement.

There was also a sanctuary of Theseus in the Peiræeus, as appears from an inscription. (Böckh, *Corp. Inscr.*, No. 103.)

(Stuart's *Athens*, vol. iii.; Leake's *Topography of Athens; Description of Antient Marbles in the British Museum*, part ix.; Forchhammer, *Topographie von Athen*, Kiel, 1841.)

THESEUS (Θησεύς), the great national hero of Athens, is said to have been born at Trœzen, where his father Ægeus, king of Athens, slept one night with Æthra, the daughter of Pittheus, king of the place. Ægeus, on his departure, hid his sword and shoes under a large stone, and charged Æthra, if she brought forth a son, to send him to Athens with these tokens, as soon as he was able to roll away the stone. She brought forth a son, to whom she gave the name of Theseus, and when he was grown up, informed him of his origin and told him to take up the tokens and sail to Athens, for the roads were infested by robbers and monsters. But Theseus, who was desirous of emulating the glory of Hercules, refused to go by sea, and after destroying various monsters who had been the terror of the country, arrived in safety at Athens. Here he was joyfully recognised by Ægeus, but with difficulty escaped destruction from Medea and the Pallantids, the sons and grandsons of Pallas, the brother of Ægeus. These dangers however he finally surmounted, and slew the Pallantids in battle.

His next exploit was the destruction of the great Marathonian bull, which ravaged the neighbouring country; and shortly after he resolved to deliver the Athenians from the tribute that they were obliged to pay to Minos, king of Crete. Every ninth year the Athenians had to send seven young men and as many virgins to Crete to be devoured by the Minotaur in the Labyrinth. Theseus volunteered to go as one of the victims, and through the assistance of Ariadne, the daughter of Minos, who became enamoured of him, he slew the Minotaur and escaped from the Labyrinth. He then sailed away with Ariadne, whom he deserted in the island of Dia or Naxos, an event which frequently forms the subject of antient works of art. The sails of the ship in which Theseus left Athens were black, but he promised his father, if he returned in safety, to hoist white sails. This however he neglected to do, and Ægeus seeing the ship draw near with black sails, supposed that his son had perished, and threw himself from a rock.

Theseus now ascended the throne of Athens. But his adventures were by no means concluded. He marched into the country of the Amazons, who dwelt on the Thermodon, according to some accounts in the company of Hercules, and carried away their queen Antiope. The Amazons in revenge invaded Attica, and were with difficulty defeated by the Athenians. This battle was one of the most favourite subjects of the antient artists, and is commemorated in several works of art that are still extant. Theseus also took part in the Argonautic expedition and the Calydonian hunt. He assisted his friend Pirithous and the Lapithæ in their contest with the Centaurs, and also accompanied the former in his descent to the lower world to carry off Proserpine, the wife of Pluto. When Theseus was fifty years old, according to tradition, he carried off Helen, the daughter of Leda, who was then only nine years of age. But his territory was invaded in consequence by Castor and Pollux, the brothers of Leda; his own people rose against him; and at last, finding his affairs desperate, he withdrew to the island of Seyros, and there perished either by a fall from the cliffs or through the treachery of Lycomedes, the king of the island. For a long time his memory was forgotten by the Athenians, but he was subsequently honoured by them as the greatest of their heroes. At the battle of Marathon they thought they saw him armed and bearing down upon the barbarians; and after the conclusion of the Persian war, his bones were discovered at Seyros by Cimon, who conveyed them to Athens, where they were received with great pomp, and deposited in a temple built to his honour. [THESEIUM.] A festival also was instituted, which was celebrated on the eighth day of every month, but more especially on the eighth of Pyanepsion.

The above is a brief account of the legends prevailing respecting Theseus. But he is moreover represented by antient writers as the founder of the Attic commonwealth, and even of its democratical institutions. It would be waste of time to inquire whether there was an historical personage of this name who actually introduced the political changes ascribed to him: it will be convenient to adhere to the antient account in describing them as the work of Theseus.

Before his time Attica contained many independent townships, which were only nominally united. Theseus incorporated the people into one state, removed the principal courts for the administration of justice to Athens, and greatly enlarged the city, which had hitherto covered little more than the rock which afterwards formed the citadel. To cement their union he instituted several festivals, and especially changed the Athenæa into the Panathenæa, or the festival of all the Atticans. He encouraged the nobles to reside at Athens, and surrendered a part of his kingly prerogatives to them, for which reason he is perhaps represented as the founder of the Athenian democracy, although the government which he established was, and continued to be long after him, strictly aristocratical. For he divided the people into the tribes or classes of Eupatridæ, Geomori, and Demiurgi, of whom the first were nobles, the second agriculturists, the third artisans. All the offices of state and those connected with religion were exclusively in the hands of the first class. Each tribe was divided, either in his time or shortly afterwards, into three phratriæ, and each phratria into thirty gentes (γένη). The members of the separate phratriæ and gentes had religious rites and festivals peculiar to themselves, which were preserved long after these communities had lost their political importance by the democratical changes of Cleisthenes. [CLEISTHENES.]

(Plutarch's *Life of Theseus;* Meursius, *Theseus, sive de ejus Vitâ Rebusque Gestis Liber Postumus*, Ultraject., 1684, where all the authorities are quoted; Thirlwall's *History of Greece*, vol. ii., p. 8, &c.)

THESMOPHO'RIA (Θεσμοφόρια), a festival with mysteries in honour of Demeter (Ceres), to whom all the institutions of civilized life, especially of civil and religious laws, were attributed. The festival of the Thesmophoria especially referred to this part of the character of the goddess, as is clear from several of the ceremonies observed at its celebration, and from the surname of the goddess, 'Thesmophoros,' from which the festival derived its name. It was celebrated in various towns in Greece, and in the Greek colonies, as Sparta, Thebes, Eretria, Ephesus, Syracuse, Agrigentum, and others. But the place where it was held with the greatest solemnity, and where the particulars of its celebration are best known, was Athens. It was introduced at Athens, according to some writers, by Orpheus, and according to Herodotus (ii. 171) by the daughters of Danaus from Egypt. Its celebration was confined to women, especially married women. It commenced every year on the 11th of Pyanepsion, and lasted according to some writers for four, and according to others for five days. The discrepancy in this case, as well as in that of other Greek and Roman festivals, seems to have arisen from the circumstance that the real festival was in many instances preceded by one or more days devoted to preparations and purifications, and that some writers reckoned these days as belonging to the festival. Now that the Thesmophoria were preceded by such preparatory days is expressly stated, and during these days the Athenian women underwent various kinds of purifications. Wellauer, in his little work cited below, has rendered it more than probable that the festival itself did not last more than three days.

Previous to its celebration the women of each demos elected from among themselves two matrons to conduct the solemnities, whose husbands, provided they had received a dowry of not less than three talents, had to pay the expenses of the festival as a liturgy. (Isaeus, *De Cironis Heredit.*, p. 208.) The first day of the festival was called ἄνοδος or κάθοδος, that is, the procession, because the women went from Athens to Eleusis in a procession in which they carried on their heads certain laws (θεσμοί) written either in books or upon tablets. During the night between the first and second day the women solemnized their mysteries at Eleusis. The second day, called νηστεία, or 'the Fast,' was a day of mourning, on which the women were not allowed to take any other food than cakes of sesame and honey, and the greater part of it they spent sitting in mournful attitudes on the ground around the

statue of the goddess. Meursius and others think that the procession to the Thesmophorion (the temple of Demeter Thesmophoros) at Athens, which is alluded to by Aristophanes (*Thesmophor.*, 276, &c.), and in which the women walked behind a waggon laden with baskets containing mystic symbols, took place in the afternoon of this day, the whole of which was a sacred day at Athens, on which neither the senate nor the people were allowed to hold their usual meetings. The third day was called καλλιγένεια, a surname of Demeter, by which she was invoked on this occasion. (Aristoph., *Thesmophor.*, 296, with the Scholiast.) On this day the women made up for the day of mourning, and indulged in various kinds of merriment in imitation of Iambe, who was believed to have created a smile on the face of the goddess during her grief. Hesychius mentions a sacrifice called Zemia (ζημία) in connection with the Thesmophoria, which was offered to propitiate the goddess for any neglect or fault that might have been committed during the celebration of her festival; but whether this sacrifice was offered at the close of the third day or after the festival, cannot be decided.

(Meursius, *Graecia Feriata*, s. v. Θεσμοφόρια; *Dictionary of Greek and Roman Antiq.*, s. v. *Thesmophoria;* Wellauer, *De Thesmophoriis*, Breslau, 1820, 8vo.)

THESPE'SIA (from Θεσπέσιος), the name of a genus of plants belonging to the natural order Malvaceæ. The species are trees with large entire leaves. The calyx is truncate, and girded by a 3-leaved deciduous involucel; the fruit is a capsule with 5 cells, each cell is semi-parted, with 4 seeds at the base.

T. populnea, Poplar Thespesia, has roundish, cordate, pointed, 5-7-veined leaves, with dot-like scales beneath, with the peduncles equal in length to the petioles. This plant is a native of the East Indies, Guinea, and the Society Islands; and is known, where it grows amongst British colonists, as the umbrella-tree. It attains a height of about 40 feet, and has large yellow flowers with a dark red centre. In the tropics it has gained for itself a sacred regard, and is planted about monasteries and convents; hence the name Thespesia (divine). There are two species natives of South America: they are all trees, with handsome, showy flowers. In their cultivation they will thrive well in a mixture of loam and sand, and cuttings will strike freely in sand or mould under a hand-glass in a hot-bed. (Don's *Miller*, vol. i.)

THESPIS (Θέσπις), a native of Icaria in Attica, who lived in the time of Solon and Pisistratus, about 535 B.C. The antient traditions unanimously represent him as the inventor of tragedy. The manner in which this invention is said to have originated is stated differently. According to one account, which is also adopted by Horace, it arose from Thespis travelling during the festival of Dionysus through Attica upon a waggon, on which he performed comic plays. This tradition however is based upon a confusion of tragedy with comedy, the invention of which is not ascribed to Thespis by any antient authority. The invention of Thespis consisted in nothing else than in introducing a person who at the Dionysiac festivals in the city of Athens entered into conversation with the chorus, or related a story to it. The designation of this actor was Hypocrites (ὑποκριτής), that is, the 'answerer,' because what he said or acted answered or corresponded with the songs of the chorus. By means of masks, the invention of which was likewise ascribed to Thespis, he was enabled to act different characters one after another. Some writers who considered the chorus itself as a second actor, speak of two actors in the time of Thespis, and consequently state that Æschylus introduced a third actor. (Themistius, *Orat.*, xxvi., p. 382, edit. Dindorf.) Whether Thespis wrote his plays is not quite certain, although Donatus (*De Comoed. et Tragoed.*, in Gronovius's *Thesaurus*, viii., p. 1387) expressly says so, but the tragedies bearing the name of Thespis in the time of the Alexandrines cannot be considered as genuine. It is an historical fact that Heraclides Ponticus forged tragedies under the name of Thespis; and the few fragments of Thespis quoted by antient writers are unquestionably passages of such supposititious works. The tragedies of Thespis must have fallen into oblivion and have perished at the time when the Attic drama reached its perfection: some of his choral songs however appear to have been known as late as the time of Aristophanes, as we may infer from the concluding scene of the 'Wasps.' We know the titles of four of his tragedies: 'Pentheus,' 'The Funeral Games of Pelias or Phorbas,' 'The Priests,' and 'The Youths;' but of their construction nothing is known, except that each seems to have commenced with a prologue. (Themist., *Orat.*, p. 382.)

Respecting the history of Thespis very little is known. Solon was present at the performance of one of Thespis's plays, and highly disapproved of dramatic performances, as tending to lead men to falsehood and hypocrisy. Towards the end of the career of Thespis tragic contests were introduced at Athens, and Thespis probably contended for the prize with Choerilus and Phrynichus, who is called his disciple. Thespis is also said to have distinguished himself in orchestic, or the art of dancing (Athenacus, i., p. 22), which however can only refer to his skill in instructing the chorus.

(Bode, *Geschichte der Dramat. Dichtkunst der Hellenen*, i., pp. 40-57; Müller, *Hist. of the Lit. of Greece*, i., p. 292, &c.)

THESPRO'TIA (Θεσπρωτία), a district of the antient Epirus, around the river Acheron. Its boundaries are not distinctly stated by antient writers, but the district seems to have included the coast from the mouth of the Ambracian Gulf northwards to the river Thyamis, and the country inland as far as Mount Tomarus. The south-eastern part of Thesprotia, south of the river Acheron, was called Cassopaea, and is sometimes reckoned as a distinct district; but the other statement appears more correct, since Herodotus makes the Thesproti neighbours of the Ambraciots and Leucadians. (Herod., viii. 47.)

Thesprotia was one of the chief abodes of the Pelasgi. This is intimated by the legend which makes Thesprotus the son of Lycaon. In Thesprotia was the oracle of Dodona (Herod., ii. 56), the chief seat of the old Pelasgic religion. [DODONA.] In Thesprotia Aristotle found the Hellenes under their antient name of Graeci (Γραικοί, Aristot., *Meterolog.*, i. 14.) From this country the Thessali migrated to take possession of Thessaly, about sixty years after the Trojan war, having previously left their original seats in Thessaly, and proceeded into Thesprotia, about eight generations before the Trojan war. (Herod., vii. 176; Thucyd., i. 12; Plutarch, *Pyrrh.*, c. i.; Velleius, i. 3; Clinton's *Fasti Hellen.*, i. 19-20, 28.)

Its chief cities were Nicopolis, built by Augustus on the peninsula opposite the promontory of Actc, or Actium, in commemoration of his victory over M. Antonius; Charadra, on the west of the Charadrus; Bucheta, or Buchetima, on the coast. The above are on the south-eastern side of the Acheron. Above the Acheron were,—Cichyrus, formerly Ephyra, on the Acherusian Gulf; Pandosia, higher up the Acheron; Elatria or Elatia, and Batiae, inland; Chimerium, on a promontory of the same name, west of the mouth of the Acheron; north-west of this, Sybota: the positions of Bolurus and Torone are unknown. [EPIRUS.]

(Leake; Pouqueville; Cramer; Hoffmann's *Griechenland.*)

THESSALONIANS, *Epistles of St. Paul to the.* Christianity was introduced among the Thessalonians in A.D. 50, by St. Paul, when he first passed over from Asia Minor into Europe to preach the gospel. According to the account in the *Acts of the Apostles* (ch. xvi.), St. Paul was engaged in communicating to the churches in Asia Minor the decree of the first council of the 'Apostles and elders which were at Jerusalem,' when on his arrival at Troas a vision appeared to him in the night, in the figure of a man of Macedonia, 'who prayed him, saying, Come over into Macedonia, and help us.' In obedience to this call, St. Paul, together with Silas and Timothy, visited the cities of that country, and among the rest Thessalonica, which was at that time the residence of the Roman governor of the province of Macedonia, and a city of great resort. St. Paul found there a synagogue of the Jews, 'and went in unto them, and for three Sabbath days reasoned with them out of the Scriptures,' endeavouring to convince them that Jesus was the Christ or Messiah expected by them. Though some of them believed, his success with the Jews does not appear to have been great: but a considerable number of the 'devout Gentiles' were converted, and many women of distinction: so that the Christian church at Thessalonica was composed both of Jews and Gentiles, of whom the latter were the more numerous. The *Acts of the Apostles* (ch. xvii.) informs us that St. Paul only spent three Sabbath days in preaching to the Jews; but from some expressions in

his own letters to the Thessalonians, coupled with the fact of his receiving money from Philippi more than once while he was at Thessalonica (*Philipp.*, iv. 16), it would seem that he remained for some time in that city. Still he was unable to carry his designs into execution: the unconverted Jews stirred up a persecution against him, so that himself and his companions 'were sent away by night by the brethren' to the neighbouring city of Beroea. Here again the Jews of Thessalonica stirred up a tumult against St. Paul, so that he was obliged to retire to Athens, leaving however Silas and Timothy at Beroea. At Athens he was subsequently joined by them, and being naturally anxious about his recent converts at Thessalonica, and 'when he could no longer forbear' (1 *Thes.*, iii. 1), he sent Timothy from Athens 'to establish them, and to comfort them concerning the faith.' St. Paul then visited Corinth, and on the return of Timothy with 'good tidings of their faith and charity, and that they had a good remembrance of him always' (1 *Thes.*, iii. 6), he wrote his first epistle to them, A.D. 52, from Corinth, and not from Athens, as the subscription of the epistle imports.

It was one of the earliest, if not the very first, of all St. Paul's epistles, and in chap. v., ver. 27, he expresses his desire that it should be read not at Thessalonica only, but in all the churches of Macedonia. Its genuineness has always been admitted: together with the second epistle, it is quoted and recognised as the work of St. Paul, by Irenæus, Clement of Alexandria, Tertullian, Origen, and all subsequent ecclesiastical writers. (Lardner, as quoted in Horne's *Introduction*, vol. iv., p. 372.) The immediate occasion of St. Paul's writing this Epistle was the favourable intelligence brought by Timothy of the steadiness with which the Thessalonians adhered to Christianity in spite of the persecution with which they were assailed by their own countrymen. Besides being exposed to direct persecution, there can be little doubt that they were also in danger of being moved by the reasonings of their religious adversaries, to which the sudden disappearance of St. Paul from Thessalonica, and his apparent desertion of them at a critical moment, might give some plausibility and apparent confirmation. To counteract the natural result of all this was one of the chief objects of Timothy's mission, and the First Epistle to the Thessalonians was written with the same design. Accordingly in chap. i., after a short introduction, in which he couples the names of Timothy and Sylvanus (the Roman form of Silas) with his own, he expresses his thankfulness for their 'work of faith and labour of love, and patience of hope in our Lord Jesus Christ,' and then (vers. 5-10) reminds them of the proofs 'of power and of the Holy Ghost' with which the preaching of the gospel among them was accompanied, as evidences of its truth, and commends them for the constancy of their faith.

In chaps. ii., iii., as a further confirmation of the truth of the gospel, he reminds the Thessalonians of the conduct and character of himself and the other preachers of Christianity. That as a missionary and apostle of Christ, 'he had suffered, and been shamefully entreated'—that in preaching the gospel, he had sought neither temporal profit, nor favour, nor honour. He also explains and vindicates his own conduct in leaving them, and says that although taken from them in presence, he was not in heart,—that he had endeavoured to see them again with great desire, but had been hindered; till at last, when he could no longer forbear, he sent Timothy to them, at whose good tidings of them he expresses the greatest satisfaction and joy.

In chap. iv. St. Paul exhorts them to persevere in the observance of the duties and practical virtues of Christianity, in conformity with the commandments he had given them at first: and further enjoins them not to sorrow or lament over those that were dead, but rather (even as they believed that Jesus died and rose again) to look forward to their resurrection, when the day of the Lord Jesus, that is, the day of judgment, should come.

In chap. v. (1-5) St. Paul warns the Thessalonians of the uncertainty of this event, and concludes the epistle with a variety of precepts and admonitions addressed partly to the whole church, partly to its pastors and teachers, coupled with some reproofs, which, as we may suppose, were called for by the irregularities and failings from which the Thessalonians were not yet exempt.

The undesigned coincidences between this Epistle and the 'Acts of the Apostles' are commented upon by Paley in his 'Horæ Paulinæ,' pp. 293-311.

The Second Epistle to the Thessalonians was written soon after the first, and from the same place. Silvanus and Timothy being joined with the apostle in the inscription of this Epistle, as well as of the former; and as in chap. iii., ver. 2, he requests the prayers of the Thessalonians for his deliverance from wicked men, it is not improbable that he wrote it soon after the insurrection of the Jews at Corinth, when they dragged him before Gallio, and accused him of persuading men to worship God contrary to the law.

This Epistle seems to have been occasioned by the information which St. Paul received on the state of the church at Thessalonica from the messenger who conveyed his first letter to the elders of the church, and his report of the effect produced by its contents. From some expressions in that Epistle (iv. 15; v. 4-6), compared with chapter ii. of the Second, it would seem that a number of Thessalonians had come to the conclusion that the day of judgment was at hand, and would happen in their generation. To correct this misapprehension, and to prevent the anxiety and the neglect of secular affairs which resulted from it, appears to have been the main object and design of St. Paul in writing this Second Epistle to them.

Accordingly, in chap. i., after a short introduction, the apostle proceeds to commend the growing faith and charity of the Thessalonians, and to express his joy at their patience under tribulation, of which he had heard from the messenger who carried his first letter, and he assures them of his constant prayers for their welfare.

In chap. ii. he rectifies their mistake about the day of judgment, and warns them against those who might attempt to deceive them on that subject. By way of setting their minds at rest about it, he assures them that the event would not come to pass until 'a great apostacy' had overspread the church, and the revelation of 'the man of sin, the son of perdition,' should have taken place. These phrases have been variously interpreted, but the generality of Protestant commentators have agreed in referring them to the Roman pontiffs and the Romish church. Some indeed understand them to apply to the rise of Mohammedanism, and others to the revolt of the Jews from the Romans. The Romish church contends that one person only is meant, and not a series or succession of persons.

Whatever the apostle meant by these phrases, he informs the Thessalonians that this mystery of iniquity was already secretly at work, though its full operation was prevented by a restraining power (κάτεχον), which the early Fathers of the Church generally understood to be that of the Roman emperors and empire. (Tertullian, *Apolog.*, p. 31.)

In chap. iii. the apostle desires their prayers for himself and his fellow-labourers, and then reproves some of the Thessalonians for their idleness and irregular life. He concludes with his apostolic benediction, and writes the salutation with his own hand, which, as he informs them, was a token of the genuineness of that and other Epistles similarly authenticated.

This Second Epistle to the Thessalonians is the shortest of all St. Paul's Epistles, but not inferior to any of them in style or spirit, and it is also remarkable as containing a distinct prophecy of the corruptions and delusions which were to arise in the Christian church.

The undesigned coincidences between this Epistle and the 'Acts of the Apostles' are given in Paley's 'Horæ Paulinæ,' pp. 312-322.

(Macknight, *On the Apostolical Epistles*, vol. iii., pp. 1-124; Horne, *Introduction to the Critical Study of the Scriptures*, vol. iv., p. 372; Collyer, *Sacred Interpreter*, vol. ii., p. 275; Percy's *Key to the New Testament*; Whitby, *On the New Testament*.)

THESSALONI'CA (now *Saloniki*), an antient city of Macedonia, in the district of Mygdonia, was formerly called Therme or Therma: it is in 40° 38′ N. lat. and 22° 56′ E. long., about ten miles east of the antient river Echedorus, at the head of the modern Gulf of Saloniki, formerly called the Thermaic Bay, from the antient name of the city. It was at first an inconsiderable place under its old name of Therme, by which it was known in the days of Herodotus and Thucydides, Æschines, and Scylax, who, in his 'Periplus,' makes mention of the Thermaic Gulf. Herodotus, in his 'History' (vii. 128), speaks of it as a place where Xerxes made some stay on his march into Greece, and from which he had a commanding view of the mountains of Olympus and Ossa in Thessaly. A

short time previous to the commencement of the Peloponnesian war (B.C. 432) it was taken and occupied by the Athenians, but it was soon afterwards restored to Perdiccas, the king of Macedonia. According to an account in Strabo (*Epit.*, vii. 330), the name of Thessalonica was given to it by Cassander, the son of Antipater, in honour of his wife Thessalonica, who was the daughter of Philip, king of Macedon, and the sister of Alexander the Great. With a view to its aggrandisement, Cassander collected together (about B.C. 315) the population of several adjacent towns, so as to make it one of the most important cities of Northern Greece. (Strabo, *l. c.*, p. 330.) After the battle of Pydna (B.C. 168), in which the Romans defeated Perseus, the then king of Macedonia, Thessalonica, with the other Macedonian towns, surrendered to the Romans, and was made the capital of the second of the four regions into which Macedonia was divided by them. (Livy, lib. xliv., c. 10 and 45; lib. xlv., c. 29.) Livy speaks of it as being then a very celebrated city, to which its admirable position materially contributed. It possessed an excellent harbour, peculiarly well situated for commercial intercourse with the Hellespont and the Ægean; and it had the additional advantage of lying on the great Roman military road, the Via Egnatia, which, commencing at Dyrrachium, on the western side of Greece, and extending to Byzantium, afforded the easiest land communication with Thrace, Asia Minor, and the shores of the Euxine. In St. Paul's time it was much frequented by people of different nations for commercial and other purposes, as appears from the fact of there being a synagogue of Jews there; and it was also the seat of the Roman government. Pliny (iv. 10) calls it a free city; and Lucian (*Asin.*, 46) speaks of it as the largest of the Macedonian towns. In later times, under the empire, it continued to be so flourishing and important a city, that it was selected as the residence of the prefect of Illyricum, and the metropolis of the Illyrian provinces. (Theodoret, *Hist. Eccl.*, v. 17.) In the reign of the emperor Theodosius it was the scene of a deplorable calamity: it was then protected against the assaults of the Goths by strong fortifications and a numerous garrison. Their commandant, Botheric, with his principal officers, was inhumanly murdered by the people of the town, in consequence of his having thrown into prison one of the popular characters of the circus, to the games of which the Thessalonians of that time (A.D. 390) were passionately devoted. The emperor Theodosius, in the excitement of his indignation, gave orders for the punishment of the people; and, according to the most moderate accounts, no less than 7000 persons were massacred by barbarian soldiers in a promiscuous carnage, which lasted for three hours (Gibbon, *Roman Empire*, c. xxxvii.), a deed, the guilt of which, as Gibbon observes, was aggravated by the long and frequent residence of the emperor at Thessalonica. [THEODOSIUS; AMBROSE.]

For an account of the ruins and antiquities of Thessalonica, see Clarke's and Holland's *Travels*, vol. ii., p. 50; Dodwell's *Tour in Greece*, vol. ii., c. 19, p. 190; Cramer's *Antient Greece*, i. 238.

THE'SSALUS (Θεσσαλός), an antient Greek physician, son of the celebrated Hippocrates, appears to have lived at the court of Archelaus, king of Macedonia, about 360 years before Christ. He was one of the founders of the sect of the Dogmatici, who also took the name of the *Hippocratic* school, because they professed to follow the doctrines of that great man. However, both he and his brother Dracon, and his brother-in-law Polybus, are accused by Galen in several passages of not only mixing up with the opinions of Hippocrates the principles of later philosophers, but also of altering and interpolating his writings. Several of the works that go under the name of Hippocrates are by many critics supposed to have been written by Thessalus, viz. 'De Morbis,' the second, fifth, sixth, and seventh books 'De Morbis Vulgaribus,' and the second book of the 'Praedictiones,' or 'Prorrhetica;' but this conjecture is uncertain.

(Le Clerc, *Hist. de la Méd.*; Fabricius, *Biblioth. Græca*; Haller, *Biblioth. Medic. Pract.*; Sprengel, *Hist. de la Méd.*; Ackermann, *Hist. Literar. Hippocr.*; Choulant, *Handbuch der Bücherkunde für die Aeltere Medicin.*)

THE'SSALUS (Θεσσαλός), one of the founders of the antient medical sect of the Methodici, was born at Tralles in Lydia, and lived in the reign of the emperor Nero, in the first century after Christ. He was the son of a weaver, and followed the same trade himself during his youth, by which means he lost the opportunity of receiving a good education, and was never afterwards able to overcome this disadvantage. He appears however to have soon given up this employment, and applied himself to the study of medicine, by which he acquired a great reputation, and amassed a large fortune. His whole character however, both intellectual and moral, is everywhere represented by Galen in a very unfavourable light; but it must be confessed that Galen himself appears to very little advantage in these passages, and goes beyond all bounds in his abuse of him.

Thessalus adopted the principles of the Methodici, but modified and developed them so much that he attributed to himself the invention of them. In fact on all occasions he appears to have tried to exalt himself at the expense of his predecessors; lavishing upon the antients the most insulting epithets; calling himself by the title ἰατρονίκης (conqueror of physicians), because he thought that he himself surpassed all his predecessors as much as medicine is superior to all other sciences; boasting that he could teach the art of healing in six months; and telling the emperor Nero, in the dedication of one of his works, that none of those who had been before him had contributed anything to the advancement of medical science. By his boasting he attracted a great number of pupils, whom he took with him for six months to visit his patients; but most of them are said to have been common artisans and persons of very low extraction. Galen accuses him of knowing nothing of the action of drugs, though he had written on the subject. He did not care for inquiring into the causes of diseases, and was satisfied with certain problematical analogies; nor did he admit the value of prognostic signs. He did not recommend tapping in cases of ascites. A further account of his opinions may be found in Le Clerc, *Hist. de la Méd.*; Haller, *Biblioth. Medic. Pract.*; Sprengel, *Hist. de la Méd.*

THESSALY (Θεσσαλία), one of the principal divisions of Northern Greece, and the cradle of many of the inhabitants of Greece in general, is an extensive and generally unbroken plain, about 80 miles in extreme length and 70 in breadth, comprising an area of about 5500 square miles, and forming an irregular sort of square. This description applies only to what may be called Thessaly Proper, which is bounded on the west, towards Epirus and Athamania, by the range of Pindus; on the north, towards Macedonia, by the Cambunian Mountains; on the south by the range of Mount Othrys; on the east by a range of mountains running along the coast nearly parallel to Pindus, and including the summits of Pelion and Ossa. The basin of Thessaly is thus surrounded by mountain-barriers, broken at the north-east corner only by the valley and defile of Tempe (or the Cut), which separates Mount Ossa from Olympus, and presents the only road from Thessaly to the north which does not lead over a mountain-pass. At the eastern base of the mountain-range which runs from Tempe to the bay of Pagasæ, now the Gulf of Volo, there is a narrow strip of land called Magnesia, between the hills and the sea, interrupted in several places by lofty headlands and ravines, and without any harbour of refuge from the gales of the north-east. South of Othrys, the southern boundary of Thessaly Proper, lies a long narrow vale, through which winds the river Spercheius, and which, though generally considered as a part of Thessaly, is separated from it by the range of Othrys, and is very different from it in physical features. It is bounded on the south by the range of Œta, which runs from Pindus to the sea at Thermopylæ in a general direction nearly parallel to the Cambunian Mountains; and on its eastern side by the shores of the bay of Malia, now the Gulf of Zeitoun. According to Greek traditions, Thessaly was known in remote times by the names of Pyrrha, Æmonia, and Æolis. The two former names belong to the age of mythology; the last refers to the time when the country was inhabited by the Æolian Pelasgi, previous to the occupation of any part of it by the Thessalians, who, according to Herodotus (vii. 176; Strabo, ix., p. 444), originally came from Thesprotia, a region in the west of Epirus, and settled in the country, which from them derived its future name. At what time it received the name of Thessaly cannot be determined. The name does not occur in the poems of Homer, although the several principalities of which it was composed at the time of the Trojan war are there enumerated, together

with the different chiefs by whom they were governed: it is from Homer (*Iliad*, ii. 700) that we derive the earliest information about this part of Greece.

From very early times Thessaly was divided into four districts, or tetrarchies. These tetrarchies were, according to Strabo (ix., p. 430), Hestiæotis, Pelasgiotis, Thessaliotis, and Phthiotis: and the division, though it was a very antient institution, existed in the Peloponnesian war (B.C. 404).

The first of these tetrarchies, *Hestiæotis*, was the mountainous country between Pindus and Olympus; having generally for its southern limit the river Peneus, though this river did not form an exact boundary through all its course. Herodotus (i. 156) applies this name to the country in the neighbourhood of Ossa and Olympus, the original abode of the Dorians before they settled in Peloponnesus. From a statement in Strabo (ix., p. 437), it would seem that the name of Hestiæotis was derived from a district in Eubœa, whose inhabitants were transplanted to this part of Thessaly by the Perrhæbi. The Perrhæbi themselves however only occupied a small part of the territory, and as they are said to have been the original inhabitants of the country of the Lapithæ, they must at one time have been established in the lower valley of the Peneus. (Strabo, p. 441.) In historical times they dwelt in the valley of the Titaresius under Olympus, where they had shrunk into a small mountain-people. The north-western part of Hestiæotis was in ante-historical times (Homer, *Il.*, ii. 774) occupied by a mountain-tribe of uncertain origin, called the Æthices. In the time of Strabo (ix., p. 434) scarcely any trace remained of them.

The most remarkable towns of Hestiæotis were as follows:—Phaleria, or Phaloria, the first town of any importance on entering Thessaly from Epirus by the passes of Pindus (Liv., xxxii. 15); Oxyneia and Æginium, the latter of which Livy describes as a place of great strength, and almost impregnable. Gomphi (the Wedges), an antient fortress, situated on the Peneus to the south of Phaloria: it was a place of great strength, and might be said to be the key of Thessaly on the side of Epirus to the north: it commanded the communication by the gorge of Clinovo, between this part of Thessaly and the Ambracian Gulf. In the time of Cæsar (*Bel. Civ.*, iii. 80) it was a large and opulent city: it is supposed to be represented by the modern Stagous. Tricca, now Trikhala, on the left bank of the Peneus, about 12 miles south of Gomphi: it is celebrated by Homer (*Il.*, ii. 729), and placed by him under the rule of the sons of Æsculapius, who was said to have been born in the neighbourhood. According to Strabo (ix. 437), there was a temple of Æsculapius there, which was held in great veneration: about 12 miles to the north of it is now situated the convent of Meteora, whose name (the Hanging) is descriptive of its situation upon lofty columns of rock. Metropolis, a town to the north of the Peneus, which contained within its territory the lands of three other places not so famous, but more antient, and which contributed to the formation of the new city. Metropolis, with Gomphi to the north-west, Tricca to the south-west, and Pelinna to the south-east, formed a square of fortresses, in the middle of which was the antient Ithome, called by Homer the 'precipitous.' Pelinna, more commonly Pelinnæum, was an important city on the north of the Peneus, and about 10 miles east of Tricca. Ithome has been supposed to have occupied the site of the convents of Meteora: but it seems to have been farther south. Œchalia, a city celebrated in mythology, is coupled by Homer with Tricca and Ithome. Gonnus, or Gouni, was a town of considerable importance and antiquity. It was situated on the left or north bank of the river Peneus, about 20 miles from the great city of Larissa, and close to the entrance of the gorge of Tempe. Gonnocondylon, a stronghold in the windings of the valley, was situated in the defile above Gonnus, probably not far from the fortress of Roman construction called Horaeo-Castro. The Pelagonian Tripolis, also, a district which included the three towns of Pythium, Azorus, and Doliche, was situated in the north-east of Hestiæotis, and is also reckoned under Perrhæbia by Livy.

Pelasgiotis was in the southern part of the lower valley of the Peneus, and includes the Pelasgian plains which stretch from Larissa to Pheræ, near Pelion, having for its boundary on the east the range of Pelion and Ossa. According to Strabo (ix., p. 441) this part of Thessaly was originally occupied by the Perrhæbi, an antient tribe of apparently Pelasgic origin. It was however wrested from them by the Lapithæ, another Pelasgic nation, whose original abode was in Magnesia. They forced some of the Perrhæbi to retire northwards and across Pindus, while those who remained in the plains were incorporated with themselves, under the common name of Pelasgiots. The principal towns of Pelasgiotis were as follows:—Larissa: this was one of the most antient and flourishing towns of Thessaly, though not mentioned by Homer; it was situated in the most fertile part of the old country of the Perrhæbi. The constitution of the city was democratical, the magistrates being elected and removeable by the people. (Aristot., *Politic.*, v. 6.) Accordingly in the Peloponnesian war, the Larissæans supported the Athenians against the Lacedæmonians. The Aleuadæ, mentioned by Herodotus as princes of Thessaly at the time of the Persian invasion, and one of the most distinguished and antient families of the country, were natives of Larissa. The territory of this city was extremely rich and fertile, but it frequently suffered by the inundations of the Peneus. Modern travellers are of opinion that the present Larissa stands on the site of the old town. The name is Pelasgian. Cranon, or Crannon, to the south of Larissa, was one of the most antient and considerable towns of this part of Thessaly. The inhabitants of this town are supposed by the antient commentators to be designated by Homer (*Il.*, xiii. 301) as the Ephyri. The Scopadæ, a distinguished and princely family of Thessaly, belonged to it. The inhabitants supported the Athenians in the Peloponnesian war, and therefore they may be supposed to have been under a democratical form of government. Scotussa, to the east of Cranon, though noticed by antient authors, does not appear to have been known to Homer. (Strabo, ix., p. 441.) Within its territory was the hill of Cynoscephalæ, or Dogs'-Heads, where a victory was gained by the Romans over Philip of Macedon (B.C. 197). It is one of the hills which separate the plain of Larissa from that of Pharsalia. According to some authors, the Thessalian Dodona was also within the district of Scotussa. Pheræ was near the southern extremity of the lake Boebeis. In the Peloponnesian war the Pheræans assisted the Athenians, whence it is probable that they then had a republican form of government. Subsequently Jason made himself master of Pheræ, his native town, and was succeeded in his authority by his brothers. In later times it fell into the hands of Alexander, who continued for eleven years to be the scourge of his native city, and the whole of Thessaly, till he was checked by the Thebans, under Pelopidas and Epaminondas. He was at last assassinated by his wife and her brothers, who continued to tyrannise over the country till it was liberated by Philip of Macedon. (Diodorus, xvi. 517.) After many changes of fortune, it was taken by the Romans under the consul Acilius. (Livy, xxxvi. 14.) Strabo says of it, that the continued tyranny under which it had laboured hastened its decay. Its territory, according to Polybius (xviii. 2), was most fertile, and the suburbs were surrounded by gardens and walled enclosures. Its port was Pagasæ, about 11 or 12 miles distant. With respect to its modern features, 'Pheræ,' says Dodwell, 'has hardly preserved any traces of antiquity: a few scattered blocks of stone and some Doric trusta are the only antiquities remaining.' The fountain Hypereia, mentioned by Homer (*Iliad*, vi. 457), 'is in the suburbs of the modern town of Belestina, at the foot of the antient Aeropolis. A small lake of about 100 yards in diameter, and with water as clear as crystal, bubbles up out of the ground.' Sir W. Gell adds, that it runs through a coffeehouse, or kiosk. The Dotius Campus is also in Pelasgiotis, on its eastern side: it is a considerable plain encircled by hills to the north, and terminated to the south by the lake Boebeis, the most extensive in Thessaly, and included within the limits of Pelasgiotis.

Thessaliotis was so called, according to Strabo, from its having been first occupied by Thessalians, who came from Thesprotia, and inhabited the plains below Hestiæotis, having the district of Pelasgiotis on the east. This tetrarchy contained towards the south-east the city of Pharsalus, celebrated for the battle fought in its plains between Pompey and Cæsar. It is situated not far from the junction of the Enipeus and the Apidanus, and was a city of great size and importance, though no mention is made of it previous to the Persian invasion of Greece. During the Peloponnesian war, the Pharsalians generally favoured

the Athenians. Xenophon (*Hellenic.*, vi. 1) speaks of it as an independent republic, but it afterwards fell into the hands of Jason, tyrant of Pheræ. There is a modern town called Phersale not far from, if not on, the site of the old Pharsalus; but there are only a few antiquities there. South-west of it there is a hill surrounded with antient walls, and on a lofty rock above it are other ruins of greater magnitude, showing a considerable portion of the walls of an antient Acropolis and remains of the Propylæa. Other towns of Thessaliotis were—Cierium, supposed by Müller to be identical with the antient Arne, the chief town of the Æolian Bœotians; Ichnæ, or Achnæ, where the goddess Themis was especially worshipped; Proerna, not far from Pharsalus, mentioned by Strabo (ix., p. 434). Sir W. Gell observed between Pharsalia and Thaumako the ruins of an antient city, which he supposed might belong to Proerna. They are situated upon the projecting branch of a mountain, where there are many vestiges and walls.

Phthiotis, according to Strabo, included all the southern part of Thessaly, stretching lengthwise from the Maliac Bay on the east to Dolopia and Pindus on the west, and in breadth from Mount Œta on the south as far as Pharsalus and the Thessalian plains on the north, an average distance of about 30 miles. Homer comprised within its limits the districts of Phthia and Hellas properly so called, and the dominions of Achilles. Its inhabitants were the Achæans (Ἀχαιοὶ Φθιῶται), a double name under which they were generally enumerated in the lists of the Amphictyonic nations. The principal cities of Phthiotis were Halos or Alos, on the west side of the Gulf of Pagasæ, usually called the Phthiotic or Achaian, to distinguish it from a city of the same name in Locris. It contained a temple sacred to Jupiter Laphystius, which was visited by Xerxes as he passed through the city; some remains of the town are thought to be still existing. Iton, about six miles west of Halos, on the river Cuarius (Strabo), celebrated for a temple of Minerva Itonis, who was worshipped under the same name in Bœotia. The district of Arne, from which the Æolian Bœotians were expelled by the Thessalians, is by some supposed to have been near these towns and on the shores of the Pagasæan Bay; but Müller (*Dorians*, ii. 475) adduces satisfactory reasons for believing that the Arne, which the Thessalians first occupied, lay to the north-west in Thessaliotis, and that it was identical with the antient Pierium. North of Halos and Iton lay Thebes, the most important town of this part of Thessaly. It was called Phthiotic, to distinguish it from the Thebes of Bœotia. In a military point of view it possessed considerable importance, as it commanded the avenues of Magnesia and the upper parts of Thessaly. It was once in the occupation of the Ætolians, but was wrested from them by Philip, the son of Demetrius, who changed its name to Philippopolis. According to Livy (xxxix. 25) it was once a city of great commercial importance. Some ruins between the modern towns of Armiro and Volo are supposed by Sir W. Gell to be those of Thebes. They consist of an Acropolis, with very antient walls constructed with very large blocks; some towers also are still standing. The port of Thebes appears to have been Pyrasus, about two miles and a half distant. A little south of Thebes was Larissa Cremaste, or the Hanging, so called from its position on the side of a hill; it was also called the Pelasgian. It lay in the dominions of Achilles, whence he is called Larissæus by Virgil (*Æneid*, ii. 198). The ruins of it still exist, and Sir W. Gell says of it, 'The form of Larissa was, like that of many very ancient Greek cities, a triangle, with its citadel at the highest point. In the Acropolis are the fragments of a Doric temple; and from it is seen the magnificent prospect of the Maliac Gulf, the whole range of Œta, and over it Parnassus.' Melitia was situated at the foot of Mount Othrys, on the river Enipeus. Its antient name was Pyrrha, and it boasted of possessing the tomb of Hellen, the son of Deucalion. It was about a whole day's march from Pharsalus. (Thucyd., iv. 78.) To the north-west of Melitia lay the town of Thaumaki or Thomoko, so called (the Wonderful) from the singularity of its position on a lofty and perpendicular rock. It was on the great road leading from Thermopylæ by Lamia to the north of Thessaly. 'After a rugged route over hill and dale,' says Livy (xxxii. 4), 'you suddenly open on an immense plain like a vast sea, which stretches below as far as the eye can reach.' Dodwell says of it, 'It is about five hours from Pharsalia. It must always have been a place of importance. The view from it is one of the most wonderful and extensive I ever beheld.'

On the west of Phthiotis, and close to it, but still separated from it, lay the territories of the Dolopians. According to Homer (*Il.*, i. 480), Dolopia was at the extremity of Phthiotis; but it does not follow that it was included in that district; nor are the Dolopians in early times ever mentioned as the vassals of the Thessalians. They occupied the extreme south-west angle of Thessaly, formed by the chain of Tymphrestus, a branch of Pindus, on one side, and Mount Othrys on the other. They were a very antient nation, as appears from their sending deputies to the Amphictyonic council. At a later period they were subjects of Jason, the tyrant of Pheræ. (Xenophon, *Hell.*, vi. 1.) Afterwards the possession of Dolopia was frequently contested between the Ætolians and the kings of Macedon, but it was finally conquered by Perseus, the last king of that country. The limits of Dolopia were different at different times. Thucydides (ii. 102) seems to have extended it to the west of Pindus. It was a rugged mountainous district, with few towns of note. Ctemene, or Ctimene, was perhaps the most important.

The Ænianes lived in the upper valley of the river Spercheius, being separated from the Dolopes by the hills of Tymphrestus and Othrys. They were also called Œteans from their position on the slopes of Mount Œta. They were a tribe of great antiquity and of some importance, as appears from the fact of their belonging to the Amphictyonic council. Their origin is uncertain, and they made many migrations from one part of Thessaly to another. Plutarch says of them that they occupied in the first instance the Dotian plain; after which they wandered to the borders of Epirus, and finally settled to the south of the Dolopes, with Mount Œta for their boundary on the south. In Strabo's time they had nearly disappeared, having been exterminated by the Ætolians and Athamanes, their neighbours on the west. Their chief town was Hypata, on the banks of the Spercheius.

The Malians, or Melies, as they were called in the Attic dialect, were the most southern tribe connected with Thessaly. They occupied principally the shores of the Maliac Gulf (the Bay of Zeitoun), from the Pass of Thermopylæ on the south to the northern boundary of the valley of the Spercheius. Their country is generally flat; the plains in some parts are extensive, in others narrow, where they are confined on one side by the shores of the Maliac Gulf, and on the other by the mountains of Trachinia. Thucydides divides them into three tribes, the Paralii or Shore-men, the Hierenses or Sacerdotal, and the Trachinians. The second of these classes probably dwelt near the Amphictyonic temple at Thermopylæ; the third on the rocky declivities of Mount Œta. They were always a warlike people, and those persons only who had served as heavy-armed soldiers were admitted to a share of the government. (Aristot., *Polit.*, iv. 100.) The Amphictyonic council was held in their country, and the Malians are included in the lists of the Amphictyonic states. They always maintained friendly relations with the Dorians of Lacedæmon. The principal towns of the Malians were as follows:—Anticyra, at the mouth of the Spercheius: it was said to produce the genuine hellebore, considered by the antients as a cure for insanity. Lamia, four or five miles north of Anticyra: it was celebrated as the scene of the Lamian war, carried on between the Athenians and their confederates against the Macedonians under Antipater. It is generally supposed to have occupied the site of the modern Zeitoun. Trachis, or Trachin (the 'rough'), was so called from the mountainous character of the surrounding country: it was once the chief town of the Trachinians, who were in such close alliance with the Dorians that Diodorus (xii. 59) speaks of Trachis as the mother-town of Lacedæmon. The friendship between Ceyx, a Trachinian hero, and Hercules, together with that of his sons, is the mythological expression for this connection. In later times Heraclea was the most important town of Trachinia. It was a colony from Lacedæmon, founded (B.C. 426) at the request of the Trachinians, about three miles from the sea. Their object in making the request was to gain additional strength against the Ænianes, or Œteans, with whom they were at war: there was also an old enmity between the Œteans and the Lacedæmonians,

who were on this account the more readily induced to found the colony. It soon became an object of jealousy with the other Thessalian tribes, who frequently harassed it, and the Lacedæmonians often sent reinforcements to its support. It was seized by Jason of Pheræ, who caused the walls to be pulled down; but it again became a flourishing city under the Ætolians, who sometimes held the general council of their nation there. It sustained a long siege from the Roman consul Acilius Glabrio, after the defeat of king Antiochus at Thermopylæ (B.C. 191). The surrounding country was marshy and woody, but the vestiges of the city itself, according to Sir W. Gell, are observable on a high flat on the roots of Mount Œta. On the coast of Trachis, close to the mouth of the small river Asopus, which runs through a gorge in the mountain enclosing the Trachinian plain, was the village of Anthele, near to which was the temple of the Amphictyonic Ceres, and the place of meeting of the Amphictyons. This locality was also famous for the celebrated Pass of Thermopylæ.

Magnesia is a country physically distinct from Thessaly, but in historical times was subject to it, and politically included within it. It is a narrow strip of country between the mouth of the Peneus and the Pagasæan Bay on the north and south, with the chain of Pelion and Ossa on the west, and the sea on the east. The people of this district were called Magnetes, and they were in possession of it from very early times. (*Iliad*, ii. 756.) They were an Amphictyonic state. In the time of Thucydides they were dependent on the Thessalians, but they subsequently, with the rest of that nation, became dependent on the kings of Macedon, and continued so till the battle of Cynoscephalæ, when they were declared independent by the Romans. The extreme northern point of Magnesia was Mount Homole, a limb of Ossa, celebrated by the poets as the abode of the antient Centaurs and Lapithæ, and a favourite haunt of the god Pan. (Virgil, *Æneid*, vii. 674.) To the south, at the foot of Ossa, was Meliboea, a town on the coast, ascribed by Homer (*Iliad*, ii. 716) to Philoctetes. Still farther south was the promontory of Sepias, off which the fleet of Xerxes was wrecked. Beyond the southern promontory of Magnesia, now called Hagios Georgios, the coast takes a south-westerly direction to the entrance of the Pagasæan Bay, the Gulf of Volo. Among the principal towns of Magnesia were Iolcos, Demetrias, and Aphetæ. The first of these was a place of great antiquity, and the birthplace of the mythological hero Jason and his ancestors. It was situated at the foot of Pelion, near the small river Anaurus: it was once a powerful city, but according to Strabo, its downfall was hastened by civil discord and bad government: its ruin was completed by the foundation of Demetrias in the neighbourhood. The adjoining shore was still called Iolcos in the days of Strabo, though the town no longer existed. Pagasæ, the port of Iolcos, and afterwards of Pheræ, was famed in Grecian story as the harbour from which the ship Argo set sail on her voyage to Colchis: the name, according to Strabo (ix., p. 436), was derived from the number of springs (Πηγαί) near it. The site is nearly occupied by the present castle of Volo. Demetrias owed its name and origin to Demetrius Poliorcetes. It was founded about B.C. 290, and the first population was derived from the neighbouring towns of Nelia, Pagasæ, &c., all of which were eventually comprised within its territory. It soon became a flourishing city, and was one of the most important fortresses in Greece, being well situated for defending the approaches to the Pass of Tempe, both on the side of the mountains and of the plains. Its maritime position also contributed to its importance, Eubœa, Attica, and Peloponnesus being easily accessible from it. After the battle of Cynoscephalæ it became the chief town of the Magnesian republic, and the seat of government: subsequently it was attached to the house of Macedon, until the battle of Pydna, when it fell under the Romans. (Livy, xliv. 13.) In the time of Strabo it had lost much of its splendour, but it was still the most considerable town of that part of Thessaly. Sir W. Gell thus speaks of its modern state:—'Pass the ruins of a gate and the walls of an antient city. Many other ruins mark the site of a large place (Demetrias).' The Magnesia of Asia Minor was a colony from the Thessalian Magnesia. [ANATOLIA.]

The principal mountain-ranges of Thessaly were—the Cambunian, on the north; Pindus, on the west; the ridges of Othrys and Œta, on the south; and those of Pelion and Ossa, on the east.

The Cambunian range was a branch from Mount Pindus, running in a direction nearly at right angles to it, and separating Thessaly from Macedonia. Herodotus includes this chain under the name of Olympus. The principal road between the two countries over the mountains was by the Pass of Volustana, marked in modern maps as Volutza. Another important defile, leading from Thessaly into Macedonia, passed by Pythium, a village with a temple sacred to the Pythian Apollo, situate on Mount Olympus, at the north-east extremity of the range.

Through this latter defile many armies marched in antient times. Thus Xerxes is said by Herodotus (vii. 132) to have crossed over Mount Olympus from Upper Macedonia into the country of the Perrhæbi in Thessaly. The road which led through Thessaly to this Pythium was called the Via Pythia; and, as Pouqueville states, the shrine of Apollo may have been succeeded by a chapel, erected on the highest summit of Olympus (A.D. 1100), and dedicated to the prophet Elias. The defile is still much frequented by travellers going to Larissa from the north-western parts of Macedonia. Mount Olympus itself is one of the most celebrated mountains of Greece, especially in mythology, the stories of which represented it as being the habitation of the Gods, where Jupiter sat shrouded in cloud and mist from the eyes of mortals. It divides the north-east of Thessaly, or Perrhæbia, from Pieria, the extremity of Macedonia on the south-east. It rises to the height of about 6500 English feet, and the highest parts of it are scarcely ever entirely free from snow. The part of the Cambunian range which lies to the west of Olympus was called Mount Titarus, an outlier or limb of which, Mount Cyphus, rises in the upper valley of the Peneus.

Mount Pindus, the western boundary of Thessaly, was part of the range of mountains which issues from the Thracian Scomius, and forms what may be called the Greek Apennines. On the north it joins the Illyrian and Macedonian ranges, and to the south it is connected with the branches of Œta and the Ætolian and Acarnanian mountains. It separates the waters which fall into the Ionian Sea and the Ambracian Gulf (now the Gulf of Arta), from those which empty themselves into the northern part of the Ægean. The most frequented pass over Pindus from Thessaly into Epirus lay over a part of it called Mount Cercetius, probably not far from the modern town of Metzovo. One of the highest points of Mount Pindus was Tymphrestus, forming its southern extremity, from which branched the ridge of Mount Othrys, closing the great basin of Thessaly on the south, and separating the waters which flow into the Peneus from those which run into the southern Spercheius. Its eastern extremity separates the Maliac from the Pagasæan Gulf, sinking gently toward the coast. It is often celebrated by the poets of antiquity. It is now known by the different names of Hellovo, Varibovo, and Goura. To the south of Othrys lay the ridge of Œta, which however has no connection with Thessaly Proper. It is a huge pile of mountains stretching from Pindus to the sea, which it meets at the Pass of Thermopylæ; it forms the inner barrier of Greece, as the Cambunian range does the outer, to which it is nearly parallel in direction and equal in height. On the west it branches out into the country of the Dorians and into Ætolia. On the south-east, beginning from Mount Callidromus, the highest summit of the range, it is continued without interruption along the coast of the Eubœan Sea, till it sinks into the valley of the river Asopus. By means of another branch to the south-west, it is connected with Parnassus, and after skirting the Corinthian Gulf under the names of Cirphis and Helicon, it forms the northern boundary of Attica, under the names of Cithæron and Parnes.

Pelion is a chain of some extent, running from the south-east extremity of the lake called Boebeis to the extreme south of Magnesia, forming a part of the boundary of Thessaly on the east. Homer (*Iliad*, ii. 743) alludes to it as the seat of the Centaurs, and it was associated with many remarkable events in Grecian story. A fragment of Dicæarchus contains a description of Mount Pelion, and its botanical productions, which appear to have been very numerous. It was exceedingly well wooded. To the north of Pelion and following the line of the coast lies the chain of Ossa (now Kissovo), the roots of which unite with one of the branches of Mount Pelion. At its northern extremity it towers into a steep conical peak, and according to the songs of the country, rivals its neighbour Olym-

pus in the depth and duration of its snows, though it is 1100 feet less in height. Between Ossa and Olympus lies the celebrated Vale and Pass of Tempe (or the Cut), the Turkish name of which is Bogaz (or the Pass). [TEMPE.]

The two prinoipal rivers of Thessaly into which the smaller streams fall are the Peneus and the Spercheius. The Peneus rises in the north-west of Thessaly under Pindus, between the lower ridges of which and the outliers of the Cambunian range its upper valleys are confined. Near Meteora, not far from the rocky Ithome of Homer, its basin opens somewhat towards the south. At Tricca it makes a turn to the east, and its valley expands into a vast plain towards the south-east, on the right of the river, though it is still confined by the hills on the left, till within about 10 miles from Larissa, where there is a considerable flat on the north, the soil of which is said to be alluvial. After leaving Tricca the course is generally north-east, and passing along the Vale of Tempe, the only outlet for the waters of Thessaly, it empties itself into the Ægean Sea. Though fed by the most considerable rivers of Thessaly, it is a very small stream, and generally sluggish and shallow, except after the melting of the snows, when it sometimes floods the surrounding plains. The Marsh or Lake Nesonis, on the road between Larissa and Gonnus, is said to be caused by the floods of the river. The principal tributary of the Peneus on the north is the Titaresius, now the Saranta Poros. It was said to rise in Mount Titarus, a part of the Cambunian range, and it joins the Peneus a little above the Vale of Tempe. The waters of the two rivers did not however mingle; those of the Titaresius being impregnated with a fat unctuous substance, which floated like oil on the surface. (Strabo, ix., p. 441.) This river was also called the Eurotas, and supposed to be a branch of the Styx, one of the rivers of the Infernal Regions. At the present day the inhabitants of its banks are remarkable for their healthy complexion, while the Peneus is surrounded by a sickly population. Its waters also are said to be clear and dark-coloured, while those of the Peneus are muddy and white. (Müller, *Dorians*, b. i., c. 1, s. 6.) On the south the affluents of the Peneus were more numerous. The principal of them were, the Pamisus, the Onochonus, the Enipeus, and the Apidanus. The Pamisus joins the Peneus to the east of Tricca, and is probably the modern Fanari. The Enipeus, rising in Mount Othrys, flowed from the south-west of Phthiotis and fell into the Apidanus. It is now called the river of Goura. The Apidanus is now the Vlacho Iani. Herodotus describes it as one of the largest rivers of Achaia, but still inadequate to the supply of the Persian army with water.

The second great river of Thessaly was the Spercheius, now the Hellada. It flows from Tymphrestus, a branch of Pindus, and after winding through a long narrow vale between the ridges of Othrys and Œta, it falls into the Maliac Gulf. It was much celebrated by the antient poets, and Homer mentions it as belonging to the territory of Achilles round the Maliac Gulf. Its bed and mouth have undergone many changes from the deposit of alluvial matter. (Gell, *Itiner.*, p. 246.)

Roads of Thessaly.—The principal road was that which led from Larissa to Thermopylæ, by Pharsalus, Thaumaki, and Lamia. From the same point another road branched off to Crannon, Pheræ, Demetrias, and along the shores of the Pagasæan and Maliac bays, terminating likewise at Thermopylæ. From Larissa again there was another route by the valley of the Peneus as far as Gomphi, the general direction of which was from east to west. From Gomphi it crossed the chain of Pindus by the Pass of Clinovo to Ambracia and Nicopolis.

The islands connected with Thessaly are very few. They consist of a group lying off the Magnesian coast, and stretching in a north-easterly direction towards Mount Athos and the isle of Lemnos.

The plains of Thessaly, with the exception of those of Bœotia, were amongst the most fertile and productive of Greece in wine, oil, and grain, but more especially in grain, of which it exported a considerable quantity. The Thessalians consequently became very rich, and luxurious in their mode of life (*Athen.*, xii. 624); and so notorious were they for it, that they were charged with having encouraged the Persians to invade Greece, with a view of rivalling them in sensuality and extravagance. Thessaly was also famous for its cavalry, the best in Greece: its plains supplied abundance of forage for horses.

The lands of Thessaly were not cultivated by the Thessalians themselves, but by a subject population, the Penestæ. The account given of them is, that they were the descendants of the Æolian Bœotians, who did not emigrate when their country was conquered by the Thessalians, but surrendered themselves to the conquerors on condition that they should remain in the country and cultivate the land for the new owners of the soil, paying, by way of rent, a portion of its produce. Many of them were richer than their lords. (Athenæus, vi., p. 264.) They sometimes accompanied their masters to battle, and fought on horseback as their knights or vassals. They formed a considerable portion of the population, and frequently attempted to emancipate themselves.

History of Thessaly.—The earliest information about the history of Thessaly is given by Homer (*Iliad*, ii. 710), who describes the country as divided into several independent principalities and kingdoms, and enumerates the chiefs to whom they were subject at the time of the Trojan war. This arrangement however was not of long continuance, and a new constitution, dating probably from that epoch, was adopted, as it would seem, by the common consent of the different states. They agreed to unite in one confederate body, under a president or Tagus, elected by the members of the confederacy. Strabo (ix. 429) informs us that this confederacy was the most considerable as well as the most antient society of the kind established in Greece. Whether it was in any way connected with the Amphictyonic body cannot be determined with certainty, but it is deserving of remark that the majority of the Amphictyonic states were either Thessalian or in some way connected with Thessaly. It does not however seem that this confederation was productive of any great benefit to the country; for, except during a very short period, under Jason of Pheræ, Thessaly never assumed that rank among the states of Greece to which it was by its position and extent entitled. Many of the cities moreover were from time to time in the power of usurpers, or under the sway of powerful families, so that the nation had no means of acting as a body. One remarkable instance of this occurred at the time of the Persian war, when the Thessalian house of the Aleuadæ, the princes of Larissa (Herodotus, vii. 6, calls them kings of Thessaly), either because they thought their power insecure, or with a view to increase it by becoming vassals of the Persian king, invited Xerxes to the conquest of Greece. That the Thessalian nation was in general opposed to their schemes appears from the fact that the Thessalians applied to the other states of Greece for assistance against Xerxes, and wished them, in conjunction with themselves, to oppose him at the Pass of Tempe. The confederate Grecks did not think it expedient to do this, believing it impossible to make any effectual resistance to the north of Thermopylæ; and the Thessalians, being left to their own resources, submitted to the invaders, to whom they proved active and zealous allies. A few years before this they had sustained a severe defeat from the Phocians, which aggravated the rancour of an old enmity. The Thessalians, who were eager to take vengeance for this defeat, availed themselves of their influence with Xerxes to direct his march through Phocis, and to stimulate his fury against the inhabitants (B.C. 480). After the Persian invasion, the Greek historians take little notice of the affairs of Thessaly, except on the occasion of the expedition undertaken by the Athenians for the purpose of reinstating Orestes, son of Echecratidas, a king of Thessaly, as Thucydides (i. 111) calls him, who had been banished from his country. The Athenian general Myronides marched on that occasion as far as Pharsalus; but he was checked in his progress by the Thessalians, who were superior in cavalry; and he was forced to retire, without having accomplished the objects of his expedition. In the Peloponnesian war the Thessalians did not as a nation take any part, though several of the towns were in favour of the Athenians, between whom and the Thessalians there was an old alliance. It would seem moreover that the bias of the nation was in favour of the Athenians, for Brasidas, the Spartan general, was obliged to march through Thessaly (B.C. 424) with secrecy and dispatch when traversing that country on his march towards Thrace. (Thucyd., iv. 78.) Not long afterwards, some troops which were sent out by the Lacedæmonians to reinforce their army in that quarter, were so vigorously opposed by the Thessalians,

that they were compelled to return home without having reached their destination. In B.C. 394 the Thessalians were in league with the Bœotians and their allies, who had formed a hostile confederacy against Sparta. The Spartans thought it necessary to recal from Asia their great commander Agesilaus, and on his way home he had to march through Thessaly. The Thessalians, with their cavalry, endeavoured to harass and obstruct him on his march. His skilful manœuvres however thwarted their designs, and Agesilaus gained considerable credit by defeating on their own ground, with horsemen of his own training, the most renowned cavalry of Greece. But while Sparta was struggling against the coalition of which Thebes was the head, Thessaly was assuming a new position among the states of Greece. To explain this we must observe, that though a kind of political and national unity was nominally acknowledged among the states of Thessaly, still the country had very seldom been united under one government. A few great families, such as the Scopadæ and the Aleuadæ, were sometimes able to extend their influence even beyond the cities of Larissa, Crannon, and Pharsalus, about which their possessions lay. Occasionally one of them was raised to the dignity of Tagus; but their power was always liable to be overthrown, even in their own cities. Towards the close and after the end of the Peloponnesian war, most of the cities acknowledged the ascendency of Pharsalus or Pheræ, the latter of which was, about B.C. 400, under the dominion of Lycophron. This prince endeavoured to extend his power over all Thessaly; and Xenophon (*Hellen.*, ii. 4) mentions a victory which he gained over the Thessalians of Larissa as one of the events which happened in the year of the fall of Athens (B.C. 404); but he does not state what were the results of it. Ten years afterwards Lycophron was still engaged in a contest with Larissa, then subject to Medius, who was probably one of the Aleuadæ. Lycophron was supported by Sparta, and Medius by the Bœotian confederacy, by the assistance received from which he was enabled to make himself master of Pharsalus, then occupied by a Lacedæmonian garrison.

The success of Agesilaus on his return from Asia produced some change in the affairs of Thessaly, for Pharsalus soon recovered its independence, and rose to such eminence as to become a rival of Pheræ. It did not however continue, as of old, under the power of the Scopadæ: it was divided between contending factions, which, for the sake of peace, agreed to place themselves under the power of a person named Polydamas, whose character and virtue had gained the confidence of all parties. (Thirlwall, *Hist. of Greece*, vol. v., p. 56.) Polydamas was accordingly entrusted with the citadel and the administration of the revenues of the city, a trust which he discharged with the strictest integrity.

At Pheræ the supreme power passed into the hands of Jason, who was probably the son of Lycophron, and certainly the inheritor of his ambitious views, which however he enlarged into more comprehensive schemes, and, with superior energy and talents, possessed greater means of realizing. He kept a standing army of 6000 mercenaries, all picked men; and, notwithstanding the opposition of Pharsalus, he compelled most of the principal Thessalian cities to enter into alliance with him: moreover, his sway was acknowledged by several of the neighbouring tribes. The leading states of Greece were wasting their strength in a protracted warfare, and whichever way he turned his eyes he perceived, or imagined that he perceived, facilities for gaining the objects of his ambition, namely, the supremacy of Greece, and the overthrow of the Persian empire in the East; the same schemes in fact as were subsequently executed by Alexander, king of Macedon. The first objects which he had to gain were the title of Tagus, and the union of Thessaly under his authority. To accomplish the latter project it was necessary to gain by persuasion, or overpower by force, Polydamas, the governor of Pharsalus. Jason adopted the former method, and, after a frank statement of his views, prevailed upon Polydamas to second them. A compact was then made between them; and Polydamas exerted his influence so successfully in Jason's behalf, that the Pharsalians were induced to enter into an alliance with him, and to join in a general pacification, which immediately followed. Not long afterwards Jason was either elected Tagus, or assumed the title, without any opposition, and, by his influence and talents, several important cities were induced to join the confederacy. He then fixed the contingents of infantry and cavalry to be furnished by the different states, and raised them to a greater amount than they had ever been before. The army which he could bring into the field consisted of 8000 cavalry and more than 20,000 heavy-armed infantry; and his light troops, as Xenophon (*Hellen.*, vi. 1, 6) observes, were enough to oppose the world. For their maintenance he revived the tribute which had been imposed on the subject tribes of the Thessalians by Scopas, one of his predecessors. The extensive coasts of Thessaly, its forests of excellent ship-timber, and his large revenues, also enabled him to raise a considerable fleet, which he had no difficulty in manning from the Penestæ, or subject population of the country. His resources in fact were in every respect so great, that Thessaly seemed destined, under him, to become both by sea and land the leading power of Greece, and even his projected conquest of Persia no longer impracticable. But these schemes were too vast for the ordinary duration of a human life, though he kept them constantly in view, and made all his actions subservient to them. An instance of this occurs in his conduct after the battle of Leuctra, in which the Thebans defeated the Lacedæmonians, and then invited him to join them in overpowering Lacedæmon. Jason joined them with his forces, but he did not comply with their request. His policy was to keep an even balance between the two states, so as to ensure the dependence of both on himself, and therefore, instead of annihilating the power of Sparta, he offered his services as a mediator between the contending states, and obtained a truce for the Lacedæmonians, under favour of which the remnant of their forces decamped by night (B.C. 371). In the following year Jason's career was terminated. He had made preparations for an expedition to the south of Greece, and had ordered a levy of troops, declaring at the same time his intention of marching to Delphi and presiding over the Pythian games: but before the time came he was assassinated by seven young men; and the honours which were paid in many of the Grecian cities to the assassins, showed the alarm which his ambition had excited. On the death of Jason, Thessaly relapsed into its former insignificance, though his dynasty survived him, and two of his brothers, Polydorus and Polyphron, for a short time shared his authority between them. Polydorus was soon assassinated, and Polyphron became sole Tagus. By his administration the office was changed into a tyranny, and he put to death Polydamas and eight other principal citizens of Pharsalus. After a reign of one year, he was murdered by his nephew Alexander, who thus gained the government, in which he became infamous for his cruelty. The atrocities which he committed filled all his subjects with terror, but especially the antient families, who were likely to be the objects of his jealousy. The Aleuadæ of Larissa accordingly applied to Alexander, the then king of Macedon, who, on being thus invited by the Thessalians, complied with their request. He defeated the tyrant, and took possession of Larissa and its citadel, and afterwards of Crannon, and garrisoned both with his troops. The affairs of his own kingdom however obliged him to withdraw from Thessaly, and the Thessalians, being thus exposed to the vengeance of Alexander, solicited aid (B.C. 368) from the Thebans, who accordingly sent Pelopidas to assist them. The tyrant granted him an interview, which ended in Pelopidas settling the affairs of the country on an apparently firm footing. But the order which he had established was soon deranged by the conduct of Alexander; and the Thebans, on being applied to again, sent out Pelopidas, with his friend Ismenias, but simply in the character of ambassadors, and without troops. They imprudently put themselves into the power of the tyrant, who threw them into prison. To rescue them and avenge the insult, Thebes sent out an army, which however was reduced to such a strait by his cavalry, that it was obliged to retreat, and but for the interference of Epaminondas, who accompanied it, though not as general, it would have been destroyed.

In the following year (B.C. 367) an army was again sent out under Epaminondas, through fear of whom the prisoners were released. Subsequently Alexander renewed his attacks on the liberty of the Thessalian cities, and greatly extended his dominion in the tributary districts. The Thessalians again appealed to the Thebans, and Pelopidas was sent out to aid them (B.C. 364), who fell in his

first battle, in which however Alexander was defeated. The campaign ended in the tyrant being obliged to resign his conquests, withdraw his troops from Phthiotis and Magnesia, and enter into alliance with Thebes. Still Alexander did not cease to be an object of hatred and dread to his subjects and foreigners, by his cruelties and piracies, and at last his wife Thebe conspired with her three half-brothers to murder him. (B.C. 359.) They effected their purpose, and one of them, Tisiphonus, under the direction and with the sanction of Thebe, assumed the government. But his reign lasted a very short time: for towards the end of B.C. 353, we find Lycophron, another of the brothers, at the head of affairs. The new dynasty however seems to have been as unpopular with the Thessalians as the old one, and accordingly, with the Aleuadæ at their head, they applied to Philip, king of Macedon, and requested his assistance. Lycophron applied to his allies, the Phocians, the antient enemies of the Thessalians, at that time under the command of Onomarchus. Philip invaded Thessaly, and, after gaining some success, was obliged to retire; but he shortly afterwards returned at the head of a large army, and made himself master of the whole country, Lycophron withdrawing into Phocis. Philip wished to be considered as a liberator; and accordingly he restored popular government at Pheræ (Diodorus, xvi. 38), though he kept possession of its port Pagasæ, and garrisoned Magnesia with his own troops. The important services which he thus rendered to the Thessalians secured their attachment to his interests, and, in addition to this, afforded him the opportunity of gaining a strong footing in the country, of which he did not fail to avail himself. It would appear however (Thirlwall, *Hist. of Greece*, vol. vi., p. 12) that about B.C. 344, either the tyrants of Pheræ or their party there had regained their ascendency, and Philip was again invited to dislodge them. This he effected with ease, and then availed himself of the opportunity to make Thessaly entirely subservient to his interests, and in fact to render it virtually a province of Macedonia. After expelling the dynasty of the tyrants, he garrisoned the citadel of Pheræ with his own troops, to prevent, as he gave it out, any chance of their restoration to power. He also strengthened his own authority by effecting what was professedly a return to the antient order of things in Thessaly. This was the revival of the tetradarchies as political divisions of the country, for though this antient division into four districts still subsisted, it had long been rather a geographical than a political arrangement. At the head of the four governments he placed his devoted adherents, the chiefs of the Aleuad party, so that they were in reality his viceroys or deputies. The result is described by Demosthenes (*Olynth.*, i. 23) as amounting to a total subjection of the land to Philip, whom it supplied with excellent and numerous troops; besides which, he not only received the harbour duties and customs of the country, but also appropriated to himself the tribute which had always been paid to Larissa by her subject Perrhæbian cantons. (Strabo, ix., p. 440.) On his death the states of Thessaly passed a decree confirming to his son Alexander the supreme station which Philip had held in their councils, and also signified their intention of supporting his claim to the title of commander-in-chief of the whole Grecian confederacy. Immediately after the death of Alexander (B.C. 323), a confederacy was formed against the Macedonians by the Athenians and other states of Greece, which the Thessalians were induced to join. Antipater, the viceroy of Macedonia, was unable to raise an army sufficiently large to cope with the confederacy, and after a battle, in which some Thessalians deserted him and caused his defeat, he retired to Lamia, a town of Thessaly, where he was besieged for some time by Leosthenes, the Athenian general. The siege was however raised by Leonnatus, an eminent Macedonian general, and some additional reinforcement under Craterus enabled him to bring to a successful issue what was called the Lamian war, in which the Thessalians took a very prominent part, and which nearly proved fatal to the Macedonian influence not only in Thessaly, but over the whole continent of Greece. Thessaly was thus preserved to the Macedonian crown till the reign of Philip, son of Demetrius, from whom it was taken by the Romans after the battle of Cynoscephalæ (B.C. 197). All Thessaly was then declared free (Liv., xxxiii. 32) by a decree of the Roman senate and people, but from that time it may be considered as under the dominion of Rome, though its possession was disputed by Antiochus (Liv., xxxvi. 9), and again by Perseus, son of Philip, between whom and the Romans it was the arena of more than one conflict. It was already a Roman province when the fate of the empire of the universe was decided by the battle between Pompey and Cæsar on the plains of Pharsalus.

The slave-merchants of Greece were generally Thessalians. (Aristophanes, *Plutus*, 517.) Their chief slave-market was Pagasæ, the port of Pheræ.

(Clarke, Dodwell, and Gell's *Travels;* Leake's *Travels in Northern Greece;* Thirlwall, *History of Greece;* Cramer, *Antient Greece*, vol. iii., p. 343; Wachsmuth, *Hellenische Alterthumskunde*, vol. i., p. 65.)

THETFORD, a small parliamentary borough, partly in the hundred of Grimshoe, in the county of Norfolk, partly in Lackford hundred, in the county of Suffolk, 88 miles from London by the Norwich mail-road through Woodford, Epping, Bishop Stortford, Newmarket, and Bury St. Edmunds; and 30 miles from Norwich by Attleburgh. It has been confidently asserted that Thetford existed in the time of the Romans, or even anteceedent to their arrival; but it cannot be identified with any of their towns that have been mentioned in antient records. Plot and Blomefield attempted to fix here the Sitomagus of the 'Antonine Itinerary;' others have proposed to fix here the Iciani of the 'Itinerary,' but without any solid ground for their opinion. The Ikeneld or Ieknield Street or Way, and a road called the Peddar or Ieddar Way, crossed the Little Ouse above Thetford, but not very near it. Blomefield describes some traces of fortifications as existing in his time, but it is not clear that they were Roman. Some coins of the earlier emperors, from Claudius to Antoninus Pius, have been found. Under the East Angles it was a place of importance: a synod was held here A.D. 669. When the Danes invaded England in the reign of Ethelred I., they fixed their head-quarters, A.D. 870, at Thetford (called in the Saxon Chronicle, Theodford, Theotford, and Theotforda; and by other old writers Tedford and Thedford), which they sacked: and it is likely that the battle in which they defeated Edmund, king of the East Angles, was fought not far off. There appears to have been an abbey near the town at an early period, for king Edred, the grandson of Alfred the Great (A.D. 952), 'ordered a great slaughter to be made in the town of Theotforda, in revenge of the abbot, whom they had formerly slain.' (*Saxon Chronicle:* Florence of Worcester.) In the reign of Ethelred II. the town was burnt by the Danes (A.D. 1004) under Sweyne, but on their return to their ships they were intercepted by the Anglo-Saxons under Ulfkytel, and did not make good their retreat without serious loss. They burned the town again A.D. 1010. In A.D. 1075 the bishoprie of the East Angles was transferred from North Elmham to Thetford, but remained there not twenty years, being transferred (A.D. 1094) to Norwich. At this time Thetford was a town of considerable size and importance; it was a burgh with 944 burgesses in the time of Edward the Confessor; but at the time of the Domesday Survey there were only 720 burgesses, 224 houses being uninhabited. It gave name to the hundred in which it stood. After the removal of the bishoprie to Norwich, or perhaps before, a Cluniac priory was founded here, the revenues of which at the dissolution were 418*l.* 6*s.* 3*d.* gross, or 312*l.* 14*s.* 4½*d.* clear. There was also a house of canons, which was afterwards a nunnery, a Dominican friary, and several smaller religious houses or hospitals. Thetford was the seat of one of the suffragan bishoprics established by Henry VIII. There have been as many as twenty churches; thirteen are mentioned in Domesday.

The borough of Thetford, according to the Population Returns for 1831, comprehends three parishes, with an area of 8270 acres, and a population of 3462. The parishes of St. Cuthbert and St. Mary are very much intermingled, and are partly in Suffolk and partly in Norfolk: the whole of the other parish (St. Peter) is in Norfolk. The town is chiefly on the north-east or Norfolk bank of the Little Ouse; a smaller part is on the opposite or Suffolk bank. The town is irregularly built, and is neither paved, watched, nor lighted, but has a neat and clean appearance. It has no manufactures, but there is a good deal of malting, and the trade of the place is favoured by the river being navigable up to the town, by means of which an export of agricultural produce and

an import of coal are carried on. St. Peter's church consists of a nave with two aisles, chancel, and tower; the last rebuilt A.D. 1789. The antient part is built chiefly of flint, whence it has obtained the name of 'the black church.' St. Cuthbert's church is of ordinary structure: it has an embattled tower. Both these churches are in Norfolk. St. Mary's is on the Suffolk side of the river, and is meanly built. There are meeting-houses for Wesleyans, Independents, and Quakers; and a Roman Catholic chapel. Considerable remains of the Cluniac priory, especially the antient gateway, still exist on the north-west side of the town. There are also some considerable remains of the nunnery, comprehending the chapel and the ruins of some other parts, at what is called Thetford-place Farm, on the Suffolk side of the river, south of the town; and some relics of other religious structures of the middle ages. The grammar-school is an antient building.

The borough, as we have seen, is as old as the time of Edward the Confessor: under the Municipal Reform Act it has four aldermen and twelve councillors, but is not to have a commission of the peace, except on petition and grant. It first sent members to parliament in the time of Edward VI., and still returns two: the borough limits were not altered by the Boundary Act. There were 156 voters in 1835-6, and 160 in 1839-40.

The livings of St. Mary and St. Peter are rectories, of the clear yearly value of 83*l.* and 55*l.* respectively; that of St. Cuthbert is a perpetual curacy, of the clear yearly value of 50*l.*: all are in the rural deanery of Thetford, and the archdeaconry and diocese of Norwich. There were in the borough in 1833, thirteen day-schools, with from 357 to 367 scholars, namely, 123 boys, 69 to 79 girls, and 165 children of sex not stated; and three Sunday-schools, with 393 scholars, namely, 180 boys and 213 girls.

(Blomefield's *History of Norfolk*; Martin's *History of Thetford*; *Parliamentary Papers*.)

THETIS, Mr. Sowerby's name for a genus of fossil shells, said to resemble *Mactra*, but not to have the internal ligament. It is described as having several small acuminated teeth, but no lateral teeth; so that it in some degree resembles *Tellina* without the posterior plication.

THEVENOT, MELCHISEDEC, is said by all his biographers to have died at the age of 71; and as his death happened in 1692, this places his birth in the year 1621. An entry in the printed catalogue of Thévenot's library informs us that he was uncle of the traveller Jean Thévenot, but beyond this we know nothing of his family or circumstances. It is probable however, from the respectable missions to which he was appointed at an early age, from the large library he collected, and from his being able to devote himself to literary pursuits while apparently in the receipt of no pension, that his family was wealthy and well connected.

It is stated that in his youth he visited several countries of Europe, but the earliest incidents of his life concerning which we have positive and authentic accounts are those mentioned in the brief autobiographical sketch prefixed to the printed catalogue of his library. He tells us that on his return from travelling in 1647, he was nominated resident at Genoa, but that the troubles of the Fronde interfering to prevent his taking possession of the post, he continued to follow the court till 1652. He was then sent to Rome, where he continued nearly three years; and being there at the commencement of the conclave which elected Alexander VII., the royal instructions respecting the part France intended to take on that occasion were addressed to him till the time of M. de Lionne's arrival. Thévenot alludes in mysterious phrase to a delicate and dangerous commission with which he was intrusted after the termination of the conclave, which he says he discharged to the perfect satisfaction of Mazarin and the other ministers. He attended Mazarin during the campaign in Flanders, 1655.

On his return to Paris, Thévenot devoted himself entirely to study. Freniele, a mathematician, and Stenon, a naturalist, resided with him; and in the house adjoining his own he entertained a person to conduct chemical experiments. The meetings of scientific men which had been held in the houses of Père Mersenne and Montmort were transferred to Thévenot's mansion. The expenses thus incurred proved too heavy for his means, and he proposed to Colbert the establishment of a public and permanent association of scientific men under the patronage of the king. The suggestion accorded with the minister's inclinations, and a grand academy was projected, intended to embrace every branch of knowledge. The king's library was to be the place of meeting: the historians were to assemble there on the Mondays and Thursdays of every week; the amateurs of the belles-lettres on the Tuesdays and Fridays; the mathematicians and natural philosophers on the Wednesdays and Saturdays; and general assemblies of all the three classes were to be held on the first Thursday of every month. The historical class was allowed to drop, it being feared that its inquiries might occasion dangerous discussions; the Académie Française, instituted by Richelieu, remonstrated against the foundation of another literary academy; and the only part of Colbert's plan that was realised was the 'Académie des Sciences,' which commenced operations in the month of June, 1666. Thévenot did not become a member of the Academy till 1685.

He had in the mean time however been diligently proseeuting his favourite studies. 'Each of our company,' he says, 'had his task and occupation: mine was to collect and publish in French whatever useful arts were practised among other nations. About this time I invented an air-level, of which I caused the description to be printed, and it is now acknowledged to be the most accurate that has yet been tried. To render geography more perfect, I collected and published three large volumes of a collection of voyages, upon which I had been working for some time. I had the honour to present them to the king, who examined them for nearly half an hour, and, after asking several questions, commanded me to continue the work. M. Colbert informed me that he had his majesty's orders to furnish me with everything necessary to carry out the design.' This distribution of tasks took place about 1659, before the Academy had received its definitive constitution. The first volume of Thévenot's Voyages was published at Paris, in 1662. The author's preface announces a translation of the Voyages and Travels published by Hakluyt and Purchas, with the addition of some translations from the Oriental languages. The second volume appeared in 1664: the preface intimates that for the use of the numerous trading companies that have of late been formed in the kingdom, he has added an account of the present state of the Indies, noting the principal commercial establishments and places of resort of the Dutch and Portuguese; a report from one of the factors of the Dutch East India Company to the directors; and an extract of a letter from the governor-general of the East India Company of France. The third volume was published in 1666, and the fourth in 1672. In the preface to the fourth volume Thévenot informs the reader that the constant discovery of travels which had escaped his research has obliged him to abandon the attempt to classify the voyages inserted in his collection, so that all relating to one quarter of the world should appear together. These four volumes were in folio; and during the remainder of his life Thévenot published in the same form a number of separate accounts of voyages, which, together with some left half printed at his death, were bulky enough to form a fifth volume. The edition of his collection printed after his death at Paris, in 1696, professes to contain all these miscellanea, but a complete copy is rarely to be met with. In 1683 Thévenot published a small book in 12mo., entitled 'Recueil de Voyages de M. Thévenot.' It contains 'A Discourse on the Art of Navigation, with some Problems which may supply in part the deficiencies of this useful art.' Among these problems he has inserted an account of the level above alluded to. The same volume contains an account of the museum of Swammerdam, with some memoirs by that naturalist, said on the special title-page to be 'Extracted, together with the travels which precede it, from the Transactions of the Society which met at the house of M. Thévenot.' It will be advisable to conclude the narrative of Thévenot's life before attempting to pronounce judgment on the merits of his publications.

Colbert died in 1683, and Louvois succeeding to the office of superintendent of buildings, succeeded likewise to the management of the royal library, which was regarded as belonging to that minister's department. Louvois appointed his son, afterwards known as the Abbé Louvois, who was then only nine years of age, librarian. It was necessary to find a deputy for so juvenile an officer: the Abbé Varés was first appointed, but he dying in Septem-

ber, 1684, the office was conferred upon Thévenot, on the understanding that such of his books as were not already in the royal library were to be purchased for it. The zeal which Colbert had manifested at the outset of his ministerial career for the augmentation of the royal collection had abated for some years before his death: from 1673 till his death no important acquisitions had been made. Thévenot found the library extremely deficient in English, German, and Dutch works, and he obtained permission to make arrangements for procuring from those countries their histories, laws, and accounts of their customs; in short, everything calculated to convey information regarding their governments and transactions. The inquiry after Greek and Oriental MSS. in the Levant, begun by Colbert, was continued by Louvois; and Thévenot, by that minister's directions, prepared and transmitted instructions to Messrs. Girardin and Galland and the Père Besnier for the prosecution of the search. It was also at his suggestion that a native of China, who had brought some Chinese books to Rome, was induced to visit Paris, and his books acquired for the king's library. On the death of Louvois a new arrangement was made for the management of the king's library, and about the same time Thévenot resigned or was dismissed from his appointment. There is reason to doubt whether he had given satisfaction as librarian: the historical memoir in the first volume of the printed catalogue of the king's library, which does ample justice to other officials, merely notices his appointment and resignation; and the notice of his life found in his own writing among his papers after his death, has very much the appearance of a defensive statement of his own merits.

Thévenot did not long survive the termination of his connection with the king's library: he died on the 29th of October, 1692.

Thévenot, in addition to most European languages, was able to read Hebrew, Syriac, Arabic, Turkish, and Persian. He commenced a series of observations on the variation of the magnetic needle in 1663, and prosecuted them with great perseverance till 1681. He suggested, in 1669, the measurement of several degrees of the meridian along the Gulf of Bothnia: he invented his air-level about 1660, and recommended its adoption to facilitate observations of the latitude at sea, and he endeavoured to discover a natural unit of linear measurement for all nations. He possessed however rather the taste than the talent for strict scientific observation and reasoning, and this peculiarity was the cause in the first place of his anxiety to have men of science for his habitual visitors, and of his eagerness to collect books of travels, printed or in MS., such works being calculated to gratify a mind which, without a capacity for severe labour, was fond of acquiring knowledge. In books of travels he found information regarding statistics, history, commerce, natural history, and science; and he could relish all these branches of knowledge and appreciate their importance, though he could not task himself to master any one of them. He undertook to publish a systematic collection of voyages and travels, as the task best suited to his turn of mind; but even this required more continuous effort than he was capable of: in the fourth volume the systematic arrangement was abandoned, and only some fragments of the fifth part were published at long intervals. Thévenot was one of those who promote science by imparting a contagious spirit of activity to others more than by anything they accomplish themselves. His taste for collecting books has been the means of supplying the king's library at Paris with some of its not least valuable MSS., some of which have yet to be turned to account. His collection of voyages too has been the means of preserving some curious and valuable narratives. If he did not make a good practical librarian, he at least pointed out the way in which the library might be rendered more complete; and besides preserving materials for geographers to work upon, he directed attention to the means of rendering the science more perfect. Some of his suggestions mentioned above were not without their influence in promoting the application of mathematics and astronomy to geographical research; and he was the first, by directing attention to the line of communication between the Caspian and China, and to the literature of China, to commence that series of investigations which has been so brilliantly carried on by the Jesuits of the seventeenth, and by the Remusats and Klaproths of the past and present century.

Sources from which this sketch has been compiled:—

1, 'Mémoire sur la Collection des grands et petits Voyages, et sur la Collection des Voyages de Melchisedec Thévenot,' par A. G. Camus, Paris, 1802, 4to. Owing to the incomplete condition of most copies of Thévenot's collection, this work is necessary to enable the reader to know what he has published. 2, 'Bibliotheca Thevenotiana, sive Catalogus Impressorum et Manuscriptorum Librorum Bibliothecae viri clarissimi D. Melchisedecis Thevenot,' Lutetiae Parisiorum, 1694, 12mo. This volume contains the autobiographical sketch above referred to: the catalogue of Thévenot's library throws light upon his studies. 3, 'Recueil de Voyages de M. Thévenot,' Paris, 1681. This volume contains the discourse on navigation, in which there are some incidental notices of Thévenot's pursuits. 4, 'Relations de divers Voyages curieux qui n'ont point été publiées ou qui ont été traduites de Hakluyt,' &c., Paris, 1663-1672. The 'Avis' prefixed to the different volumes of this edition contain matter for the biography of Thévenot. 5, 'Histoire de l'Académie des Sciences.' Tome i. contains a corroboration of Thévenot's assertions regarding his share in the institution of the Académie des Sciences. 6, 'Catalogue des Livres Imprimez de la Bibliothèque du Roi: Théologie, première partie,' à Paris, 1739: supplies the dates of Thévenot's appointment as librarian, and of his demission of the office. 7, Le Long et Fontette; 'Bibliothèque Historique de la France,' iv. 66.

THE'VENOT, JEAN, was born at Paris the 7th of June, 1633. In the dedication of the first volume of his travels to his mother, he attributes to her exclusively the great care bestowed upon his education; and from this circumstance it may be inferred that his father died while he was a child. Thévenot distinguished himself as a student at the college of Navarre. The author of the sketch of his life, prefixed to the second volume of his travels, states that his attainments in the languages, physics, geometry, astronomy, and all the mathematical sciences, were respectable, and that he had studied with particular attention the philosophy of Descartes. But it is doubtful whether all these are to be understood as having been his college studies.

He left the college of Navarre before he had completed his eighteenth year. Possessing an independent fortune, his attention was for some time afterwards engrossed by the manly exercises which were then deemed indispensable accomplishments in a gentleman; but having contracted a taste for reading books of travels, he caught the contagious spirit of adventure, and commenced traveller himself in 1652. He visited in succession England, Holland, Germany, and Italy; and, making a prolonged stay at Rome (1654-55), witnessed the solemnities of the installation of Alexander VII. He had taken the pains to prepare an account of his observations during this tour, but judiciously resisted all persuasions to publish it, partly on account of his youth and partly on account of the want of novelty in the subject.

At Rome he became acquainted with the celebrated Orientalist d'Herbelot, who, being a good many years his senior, and already distinguished for his learning, acquired considerable influence over him. D'Herbelot freely communicated to his young friend the information he had collected regarding the East and its inhabitants, and the result of their conversations was that Thévenot determined to devote himself to exploring Asia. D'Herbelot proposed at one time to accompany him, but being prevented by some family matters, Thévenot set out alone.

Thévenot began his first journey from Malta on the 1st of November, 1655: he arrived at Leghorn, on his return, on the 8th of April, 1659. Having reached Constantinople in the beginning of December, 1655, he remained there till the end of August, 1666. Travelling through Brusa and Smyrna, and visiting Chio, Samos, and Rhodes, he arrived at Alexandria on the 29th of December. He proceeded without loss of time to Cairo, which he made his head-quarters for two years, making in the course of that time two excursions, the first to Suez and Mount Sinai, the other to Jerusalem and some of the adjoining districts of Syria. During his stay at Constantinople and Cairo he made himself master of the Turkish and Arabic languages. On his way from Egypt to Italy he touched at Tunis.

From Leghorn Thévenot visited several parts of Italy which he had not previously seen, and in particular resided for a short time at the court of Savoy, before he returned to France. The first volume of his travels, he says, was

prepared for the press to gratify his friends, and especially his mother; and these were not with him mere words of course, for he was more intent upon travelling and observing than publishing. Before his book had passed through the press, and without giving his friends any warning of his intention, he left Paris to renew his researches in the East, and sailed from Marseille on the 6th of November, 1663.

This time his object was to visit Persia and the Indies. He arrived at Alexandria on the 4th of February, 1664: from Alexandria he sailed in a few days to Sidon; and from Sidon he visited Damascus. After a stay of twenty-four days in that city he went to Aleppo, where he remained two months; and then, travelling by Bir and Orfa to Mosul, descended the Tigris to Bagdad. From Bagdad he travelled to Ispahan by the way of Hamadan. Having remained five months at Ispahan, he left it, in company with Tavernier, for Schiraz and Gombroon, intending to sail for India from that port, but the jealousy of the Dutch agents obliged him to return to Schiraz. After examining the ruins of Tshelminar (Persepolis) he proceeded to Basrah, and embarked at that port for Surat, where he arrived on the 12th of January, 1666. Surat continued his head-quarters till February, 1667, during which time he made excursions to Guzerat, the court of the Mogul, and to the Deccan. On his return to Persia he spent five months at Ispahan. He had several attacks of illness in India, and having been wounded by the accidental discharge of one of his own pistols at Gombroon, his cure was tedious. His constitution was probably undermined; for, attacked by fever on his way from Ispahan to Tabriz, he died at Miana, on the 28th of November, 1667. During this journey he had acquired a knowledge of the Persian language.

The narrative of Thévenot's first journey to the East was prepared for the press by himself, but was not published till after his departure from Persia. The account of his travels in Persia, and that of his travels in India, were published (the former in 1674, the latter in 1684) by an editor who is called, in the 'Privilége du Roi,' the Sieur Luisandre, and who states that he was Thévenot's executor, and employs expressions which would lead us to believe that he had married the traveller's mother. The editing of these two volumes has been respectably performed.

Thévenot possessed a natural talent for observation, and the power of expressing himself accurately and unaffectedly. Nothing of importance appears to have escaped his notice: his manner of telling his story impresses the reader with a confidence in his good faith, and his statements have been corroborated on many material points. His mastery of the Turkish, Arabic, and Persian languages gave him an advantage that scarcely any other Oriental traveller of his day possessed. His practice of residing for some time in the principal towns of the countries he visited familiarised him with the customs of the natives. His descriptions of external objects are distinct, and his routes accurate. He had collected a Hortus Siccus in India, and had laid beside each specimen an account of the habitat and characteristics of the plant, along with its name in the Portuguese, Persian, Malabar, and (what his biographer terms) the Indian and Banian languages. This collection came into the possession of Melchisedec Thévenot, and is mentioned in the printed catalogue of his library. Jean Thévenot had also made a collection of Persian and Arabic manuscripts, of which Tavernier says the cadi of Miana kept the best to himself. The matured judgment, and talent for observation and description, displayed in Thévenot's works, are astonishing in one who had been a wanderer from his twentieth year, and who died in his thirty-fourth. His travels, originally published in three volumes, in quarto, which appeared respectively in 1665, 1674, and 1684, were reprinted at Amsterdam, in five duodecimo volumes, in 1689, and at the same place, in the same form, in 1705, 1725, and 1727. A Dutch translation of them was published in 1681, an English translation in 1687, and a German translation in 1691.

This sketch has been compiled from the account of Thévenot's life prefixed to the second volume of his travels, from the travels themselves, and from some incidental notices in Tavernier.

THEW, ROBERT, was the son of an innkeeper in the small town of Patrington, in the East Riding of Yorkshire, where he was born, in the year 1758. His education was neglected, and at a suitable age he was bound apprentice to a cooper. After the expiration of his apprenticeship Thew continued for a time to work at the business to which he was brought up; and Chalmers states that, during the American war of independence, he served as a private in the Northumberland militia. According to the 'Gentleman's Magazine,' his attention was first directed to engraving about the age of twenty-six; when, it is stated, he happened to see an engraver at work, and although he had never practised drawing, he procured a copper-plate, and engraved an old woman's head, from a picture by Gerard Douw, with such extraordinary skill that he was, on the recommendation of Charles Fox, the Duchess of Devonshire, and Lady Duncannon, appointed historical engraver to the Prince of Wales. Whatever foundation there may be for this story, it must be received with some allowance, because a considerable degree of mechanical dexterity is indispensable for the production of a good copper-plate engraving. A more probable account is that about 1783 he settled at Hull, and became an engraver of shop-bills, cards, &c. Chalmers states that he engraved and published a plan of Hull, which is dated May 6, 1784; and that shortly afterwards he solicited subscriptions for two views of the dock at that place. The latter are large aquatint prints, drawn and engraved by Thew, with the assistance of F. Jukes in the aquatinting department; and they were published in London by Thew himself, in May, 1786. Copies of them are preserved in the collection of George III., now in the British Museum. In 1788 Thew was introduced to Alderman Boydell by the marquis of Caermarthen (afterwards duke of Leeds), whose patronage he had obtained by the construction of a camera-obscura on a new principle; and Boydell immediately commissioned him to engrave Northcote's picture of the interview between the young princes, from 'Richard III.,' act iii., sc. 1. This plate was published in 1791, at which time Thew held the appointment above alluded to, of engraver to the Prince of Wales. He subsequently engraved eighteen other plates for the Shakspere Gallery, and part of a nineteenth. Several of these are among the best in the collection, and display a high degree of mechanical skill, as well as an unusual amount of spirit and expression. That of Cardinal Wolsey entering Leicester Abbey ('Henry VIII.,' act iv., sc. 2), from a picture by Westall, is particularly and deservedly celebrated as a fine specimen of the style known among artists as stipple engraving; and in consequence of its superior beauty, proof-impressions of it were, according to the 'Gentleman's Magazine,' charged double the price of any other in the whole work. Thew died in July, 1802, at Stevenage (or Roxley, according to the 'Gentleman's Magazine') in Hertfordshire. (*Gent. Mag.*, Oct., 1802, p. 971; Chalmers's *Biog. Dict.*)

THIA, Dr. Leach's name for a genus of crustaceans, placed by M. Milne Edwards under the tribe *Corystiens*, in the family *Oxystomes*.

Generic Character.—*Carapace* nearly cordiform, a good deal narrowed behind; its upper surface very smooth, and nearly horizontal from before backwards, but much curved transversely, and presenting no distinct regions. *Front* wide, lamellar, and rather advanced; the lateral borders of the enrapace delicate and arched. *Orbits* very small. Internal *antennæ* bent transversely under the front; external antennæ inserted in the gap which separates the front from the floor of the orbit, large and strongly ciliated. Disposition of the *buccal apparatus* nearly the same as in *Atelecyclus*, a genus which immediately precedes it in the arrangement of M. Milne Edwards. Third joint of the external *jaw-feet* advancing to the base of the internal antennæ, but much less elongated, and giving insertion to the succeeding joint by a large notch at its internal angle. *Sternal plastron* very narrow. Anterior feet short and compressed, but less than in *Atelecyclus*; the succeeding feet still shorter, and terminated by a straight and very sharp point. *Abdomen* nearly of the same form in both sexes; only that of the male is rather narrower, and the three joints which precede the last are anchylosed together. (M. E.)

Habits of the Genus.—*Thia* lives buried in the sand at a small distance from the shore. M. Milne Edwards states that but one species is known with any certainty, namely—

Thia polita.—Colour rosy; length ten lines; localities the British Channel and the Mediterranean.

M. Milne Edwards remarks that the aspect of these small crustaceans is very peculiar, and approximates them a little to the *Anurous* section. In other respects, he observes, they bear a strong analogy to *Atelecyclus*, and, as well as that genus, establish a passage between the *Oxystomes* and the *Cancerians*.

Thia polita.

THIAN SHAN MOUNTAINS. [SONGARIA.]

THIAN SHAN NANLU is the name of a Chinese government situated nearly in the centre of Asia. European geographers generally call it Eastern or Chinese Turkistan, and also Little Bucharia. The name of Turkistan is applied to it because the bulk of the inhabitants in that part of Asia is composed of Turkish tribes; and as these tribes are frequently designated by the collective name of Bucharians, from the town of Bokhara, Eastern Turkistan is also called Little Bucharia, or rather Bokharia, to distinguish it from Western or Proper Turkistan, which is called Bucharia without any epithet. Thian Shan Nanlu, in Chinese, signifies the 'southern road of the Thian Shan Mountains,' and has been applied to the countries south of that mountain-system, because they are traversed by the southern of the two great commercial roads which connect China Proper with the countries of Western Asia, whilst the countries north of the Thian Shan are traversed by the northern commercial road, and on that account are called Thian Shan Pelu, 'the northern road of the Thian Shan.' The last-mentioned countries constitute the government of Ili, or Songaria. They have been described under SONGARIA.

Thian Shan Nanlu lies between 36° and 44° N. lat., and extends from 71° to 96° E. long. From west to east it extends about 1250 miles, and its width from north to south varies between 550 and 300 miles. Its area probably exceeds 500,000 square miles, so that it is ten times as large as England without Wales, and twice and a half as large as France. It is mostly surrounded by countries belonging to the Chinese empire: on the north is Songaria, or Thian Shan Pelu, east the province of Kansi, and south Tibet. Only its western side is enclosed by countries independent of China. On the south-west is Ladakh, on the west Kunduz, including Badakshan and Bokhara, and on the north-west Khokan. The three last-mentioned countries are within Western Turkistan, or Great Bucharia.

Thian Shan Nanlu is a country entirely isolated from the rest of the world. On the north, west, and south it is enclosed by mountain-ranges of such extent and elevation, that the places which are permanently inhabited can only be reached by passing for several days over mountains, which are not inhabited except for two or three months in the year, when they are visited by a few families of wandering tribes of mountaineers. On the east of Thian Shan Nanlu is an extensive desert, which appears to be uninhabitable. The country enclosed by the three ranges and the desert receives an abundant supply of water from the mountains, a considerable portion of which is always covered with snow, and the numerous rivers which descend from them form a large river, called the Tarim, which Ritter compares with the Danube, but which does not reach the sea; it terminates in an extensive lake situated on the western edge of the desert. The basin of the river Tarim is the largest closed river-basin on the globe, if that of the Caspian Sea and the rivers falling into it is excepted.

Mountains.—At the south-western angle of Thian Shan Nanlu stands an extensive mountain-knot, called Pushtikhur, which occupies the space between 36° and 37° N. lat., and between 71° and 74° E. long. From its western side issues that elevated chain which is known in Afghanistan by the name of Hindu Kush; from its northern edge another range, called the Tartashling, or Bolor Tagh, which extends northward; and in the eastern part there begins a third range, which traverses the whole of Central Asia, and extends through China Proper to the shores of the Pacific. This last-mentioned range is called by the Chinese Kuenluen, but that portion of it which is contiguous to the mountain-knot of Pushtikhur goes by the name of Thsungling.

The Thsungling may be considered as that portion of the Kuenluen range which extends from the Pushtikhur on the west (72° E. long.) to the mountain-pass of Karakorum on the east (between 76° and 77° E. long.), and occupies nearly the whole of the space between 35° and 37° N. lat. Very little is known of this mountain-region, which cannot surprise us, when we learn that, according to an intelligent Mohammedan traveller, an eternal mass of snow occurs in these parts, which occupies 200 cos (equal to more than 300 English miles) in length. An extraordinary phenomenon is stated to occur on the northern declivity of the mountains, where the Thsungling and Pushtikhur are contiguous—the continuance of rain for three successive months. That portion of the Kuenluen range which is east of the Pass of Karakorum is still less known. As far as the Keriya Pass (84° E. long.) its snow-covered summits lower towards the north with a moderate descent, and a hilly tract of moderate width extends along their base, which is fertilized by the rivers descending from the range; but east of the Keriya Pass no watercourses are found along the base, which leads to the supposition that the declivities of the mountains are extremely steep, and that they are in immediate contact with the sandy desert which extends north of them. Two roads traverse the Kuenluen range. The most western leads through the Karakorum Pass from Hindustan and Cashmir by the way of Leh in Ladakh, to Khoten in Thian Shan Nanlu. The road runs from Leh north-north-east over a mountain-chain, and descends to the valley of the river Shayuk, the course of which it follows upwards between the mountain-masses of the Kuenluen nearly to the source of the river. It passes by a narrow valley over the highest part of the mountains (between 36° and 36° 30′), and descends on the north into the valley of the river Misar, which is a tributary of the Tarim. In the narrow valley of the Misar the road runs to Khelasten (north of 37° N. lat.), where the mountains disappear, and cultivation begins to be general. This mountain-road certainly does not rise to such an elevation as those which traverse the Himalaya Mountains, for it is quite free from snow in summer, and, with the exception of the highest portion, it does not rise above the line of vegetation, or even that of trees, as may be inferred from the fact that fire-wood and fodder for beasts of burthen are generally abundant, and permanent habitations are met with in the valleys of the Shayuk and Misar up to the immediate vicinity of the mountain-pass. The highest part of the pass probably does not exceed 12,000 feet above the sea-level. This road however is much more frequented in winter than in summer, because the melting of the snow on the mountains adjacent to the road renders travelling in summer almost impossible. We have no account of the eastern mountain-road that traverses the Kuenluen range. We only know that it connects the town of Lhassa in Tibet with Khoten in Thian Shan Nanlu, and that it traverses a very mountainous country of great extent, passing near the large lake of Tengri-Nor, and issuing from the mountains by the narrow valley in which the town of Keriya is built. From Keriya it runs north-west through a hilly country to Khoten.

The western districts of the Thian Shan Nanlu are occupied by several ranges, belonging to the Tartashling or Bolor Tagh. This mountain-system extends north of the mountain-knot of Pushtikhur, from 37° to near 41° N. lat., where it descends with long slopes towards the valley of the river Sihoon or Jaxartes. Its extent from south to north therefore does not much exceed 260 miles. It is difficult to determine its extent from east to west, as nearly the whole country from 69° to 74°, between the upper courses of the Sihoon or Jaxartes and that of the Jihoon or Oxus, is almost entirely unknown, and appears to be occupied by widely-spread rocky masses of mountain-ranges, between which only narrow valleys occur, that are visited by the wandering tribes of the Kirghis only

during the summer. It does not appear that any of the sovereigns of the contiguous countries have extended their authority over this extensive mountain-region, or over any part of it, which may be considered as a certain proof that no portion of it is cultivated; and this supposition is supported by the fact, that it is not traversed by any commercial road, and that the two roads which connect Thian Shan Nanlu with Western Turkistan run along the southern and northern base of the Tartashling in the upper valleys of the two rivers Jihoon and Sihoon. We have some account of the mountains enclosing these valleys, which penetrate upwards of 200 miles into the mountain-region, but as these portions of the region are within Turkistan, they are noticed under that head. We shall only observe, that in the interior of the mountain-region, and within the boundary-line of Thian Shan Nanlu, an extensive elevated plain occurs, which is called the Table-land of Pamir. According to Marco Polo it takes ten days to traverse it from west to east; and, according to a Chinese traveller, it is 1000 li (equal to about 350 miles) long, and in some places 100 li (or 35 miles) wide, whilst in others it narrows to 10 li (or between 3 and 4 miles). The elevation of this table-land is so great, that no trees are found on it, and travellers feel their respiration rendered difficult by the rarefaction of the air. The nomadic Kirghis, who visit this elevated region in summer on account of its excellent pastures, keep herds of camels and sheep, and of kashgow or yaks, which latter are to the Kirghis what the rein-deer is to the Laplander of Northern Europe, serving them as animals of burden, and supplying them with food. Their milk is richer than that of the common cow, but the quantity which the yak yields is less. The tail is the well-known chowry of Hindustan. On the table-land of Pamir its hair, which is clipped once a year in the spring, is made into ropes, which for strength do not yield to those manufactured of hemp. It is also woven into mats, and into a strong fabric which makes excellent riding-trowsers. Among the wild animals peculiar to this region are the kuteh-kar and the rass. The kuteh-kar, or wild sheep, attains the height of a two-year-old colt, and has two fine curling horns: it congregates in herds of several hundreds, and is hunted by the Kirghis for its hide and flesh. The rass is a different animal, having straight spiral horns; it is less numerous than the kuteh-kar, but equally prized as food.

The Thian Shan range extends along the northern boundary-line of Thian Shan Nanlu, which is separated by it from the government of Ili. This mountain-range has been noticed under Songaria, vol. xxii., p. 242, where also the range is described which forms the southern border of the Sihoon river-basin, and connects the Thian Shan Mountains with the Tartashling range, and where also the road is mentioned which, leading over the Thian Shan Mountains, connects Thian Shan Nanlu with the government of Ili.

Rivers.—The largest supply of water is derived from the Tartashling, in which three of the great branches of the Tarim river rise. The principal branch originates within the mountain-region in a large lake, called Karakol, which is situated near 39° N. lat., and receives the drainage of a considerable country which surrounds it on all sides. The river issuing from this lake runs eastward, and is called Yaman-yar. It leaves the mountain-region below Tashbalik, near 73° 30′ E. long., and is soon afterwards joined from the north by the Kashgar Daria, which brings to it the drainage of the north-eastern part of the Tartashling. Near the point of confluence the rivers are met by a third river, which flows in a direction from east to west, and brings down the waters collected on the mountain-chain which unites the Tartashling to the Thian Shan. This river, which is called Kezyl Daria, runs about 200 miles. After the union of these three branches the river continues to be called Kashgar Daria, and to flow eastward for 300 miles, without receiving any supply of water, until, between 80° and 81° E. long., it is nearly at the same point joined from the north by the Aksu Daria, from the west by the Yarkiang Daria, and from the south by the Khotan Daria. The Aksu Daria brings down a large volume of water, collected on the southern declivity of the western portion of the Thian Shan, and runs about 200 miles. The sources of the Yarkiang Daria are near those of the Jihoon, or Oxus, south of 37° N. lat., and the upper course of the river is within the mountain-region of the Tartashling, where it runs eastward, but it issues from it about 70 miles above the town of Yarkiang by a northern course. Its course in the plain is first north-east, but below the town of Yarkiang nearly due east, and parallel to the Kashgar Daria for nearly 200 miles. After passing 80° E. long. it turns northward, and soon afterwards joins the Kashgar Daria. Its course exceeds 400 miles; and among its numerous tributaries is the Misar river, which brings down water derived from the northern declivity of the Thsungling. The Khotan Daria collects its waters from the northern declivity of the Kuenluen range, east of 74° and west of 80° E. long., and runs more than 300 miles in a general north direction. In this river, and the mountains which are drained by its upper branches, the yew-stone or oriental jasper is found, which is held in great esteem in China, and exported in large quantities: it is mostly bought by the court of Peking, as the wearing of this stone distinguishes the higher classes of the mandarins from the lower.

After the confluence of these several branches the river is called Tarim, or Tarim-gol, and continues to flow in a nearly due east direction for 400 miles more, when, near 88° E. long., it is lost in an extensive lake, Lop Nor, which is surrounded by still more extensive swamps. It appears that this lower part of its course is skirted by swamps, which extend to a considerable distance from its banks. The extent of Lop Nor from west to east is said to exceed 70 miles, but its width does not appear to be half these dimensions. No river joins the Tarim from the south, east of 81° E. long., but it receives a considerable supply of water from the Thian Shan Mountains, by two rivers, the Ukiat, or Chagar Daria, and the Barun Yulduz, or Kaidu River. The Ukiat Daria, which rises in that part of the Thian Shan Mountains which encloses Lake Issekul on the east [Songaria], runs more than 200 miles in a south-east direction, and joins the Tarim near 84° E. long. The Kaidu River is probably the largest of the confluents of the Tarim, as it collects the drainage of the Thian Shan Mountains between 80° and 87° E. long. Its upper course for about 100 miles is in an elevated valley, parallel to the Thian Shan range from east to west: issuing from the valley it turns abruptly to the east, and draining another parallel valley about 200 miles long by an eastern course it falls into a large lake, which is called Bostu Nor or Bosteng Lake, the dimensions of which are stated to be hardly inferior to those of Lop Nor. This lake is surrounded on the north and south by chains of high hills, but on the east by a sandy desert. In the hills which enclose the lake on the south is a break by which the Bostu Nor discharges its waters into the Tarim. The channel by which this is effected is also called Kaidu, and reaches the Tarim about 80 miles above its influx into Lop Nor. The extensive swamps surrounding Lop Nor seem to begin at the conflux of these two rivers. The whole course of the Tarim amounts, according to the estimate of Ritter, to nearly 1200 miles in a straight line, and if its windings are taken into account, and the Yarkiang Daria considered as its principal branch, it cannot fall short of 1500 miles. The upper parts of this river and its tributaries are probably too rapid for navigation, and the lower parts of most of the tributaries of the Tarim, and of this river itself, lie through countries which are probably uninhabited. It is also probable that during the latter part of the summer, and in autumn and winter, the quantity of water is very small, the rains being very scanty, and the whole supply of water being derived from the melting of the snow on the mountains on which its branches originate. But the water of all these branches is used for irrigation, though that of the Tarim itself is not.

The *Plain* is of great extent, measuring on an average more than 300 miles from north to south, and about 900 from west to east. Its elevation is not known; but considering the peculiarities of its climate and its productions, it is presumed that it can hardly be less than 2000 feet above the sea-level. The largest portion of it is quite unfit for cultivation, and cannot even be used as pasture-ground. This is especially the case with the eastern districts, which are a complete desert. This desert occupies the whole country east of 88° E. long., and surrounds the lakes of Lop Nor and Bostu Nor on the east. South of the river Tarim it extends westward to the banks of the Khotan Daria (81° E. lat.), so that it covers about one-half of the plain. The worst part is that which lies

east of 88°, and is called Han-hai, or the Dry Sea: according to an hypothesis of the Chinese, it is the bed of a lake, which has dried up at some remote period. Its surface is covered with a very fine sand, which is frequently raised into the air by the wind, so that the traces of the caravans soon disappear, except where they are marked by the bones of the beasts of burden which have perished in this desert, through which the nearest road leads from China to Hami in Thian Shan Nanlu. It is however asserted that there are a few places, generally two days' journey from one another, in which drinkable water is found by digging. That part of the desert which lies west of 88°, between the Tarim river and the Kuenluen range, is called the Desert of Lop. Though equally unavailable for agriculture or as a pastoral country, the surface is in many places diversified by large tracts of rocky and stony soil, in which a few animals, as wild horses and wild camels, find a scanty subsistence, and which are overgrown with low shrubs. Water however is scarce, except in spring time. On the north, where it approaches the Thian Shan range, this vast extent of desert is skirted by a narrow tract of hilly ground, which is fit for cultivation or used as pasture-ground. Its width may vary between 20 and 30 miles, and it is in many places abundantly watered by rivers which descend from the mountains on the north, but which as soon as they have traversed the hilly region are lost in the sand of the Han-hai. Only a small portion of this tract can be irrigated, but it is cultivated with the utmost care. It produces rice, wheat, millet, and several kinds of vegetables, especially pulse: it is famous all over China for its excellent fruits, especially pomegranates, oranges, peaches, plums, but above all for its melons and grapes, which are sent in large quantities to Peking. In many places cotton is grown on a large scale. The greater part of this tract however is used as pasture-ground for horses, camels, cattle, and sheep.

The country west of 88° E. long., and between the Tarim river and the Thian Shan Mountains, contains a much larger portion of cultivable ground, especially in the valleys of the Barun Yulduz, or Kaidu river. The upper valley, where the river runs from east to west, is probably very high, as it is mostly used as pasture-ground for cattle and horses, which thrive exceedingly well. The pure and fresh air of this valley is much commended. The lower valley, where the river flows from west to east, is more extensive, and a large portion of it is under cultivation, producing rice, wheat, millet, and sesamum, and containing large plantations of fruit-trees. The hills enclosing the valley rise probably more than 1000 feet above their base, and are used as pasture-ground. Along the base of the southern ridge of hills are also considerable tracts of cultivated land which are irrigated by the streams that descend from the hills, but at the distance of a few miles their waters are lost in the sandy plain which extends along the banks of the Tarim river.

Farther west, between 84° and 80° E. long., the hilly country is not so wide, extending only to the distance of 40 to 50 miles from the Thian Shan Mountains. The hills also have less elevation, and yield only a scanty supply of water for irrigation. The country is only well cultivated in the vicinity of the great mountain-chain, and grows more barren as it recedes from it, except along the banks of the Chagar Daria, or Ukiat River, where cultivation extends to about 70 miles from the Thian Shan. A large portion of it is used as pasture-ground, but in approaching the Tarim the sandy desert occurs. Farther west (between 80° and 77° E. long.) is the valley of the Aksu Daria, which is enclosed by high hills, and in its upper part contains very extensive tracts of fertile land, which are cultivated with great care. They produce every kind of grain, especially wheat, millet, and barley, lentils and beans, also cotton, melons, and several kinds of vegetables. The orchards yield peaches, apricots, pears, pomegranates, grapes, and mulberries, and the rich pastures feed herds of horses, sheep, camels, and cattle. The lower course of the Aksu Daria however lies through the desert and the swamps, which extend along the Tarim river and along the lower course of its principal branches. A few tracts are cultivated on the banks of the Lower Aksu Daria.

In the plain, west of the Aksu Daria, which extends between the Kashgar Daria and the Thian Shan Mountains, the cultivated land seems to be almost entirely limited to the bottom of the Kezyl Daria, where considerable tracts produce rice and other grain in abundance, as well as rich crops of cotton. The uplands, which are north of the river, have a stony and rocky soil, covered with a thin layer of earth, sufficient to produce abundance of grass during some parts of the year, and consequently they are used as pasture-grounds by the Kara Kirghis, or Black Kirghis, who go in summer with their herds of horses and camels to the Thian Shan Mountains. The uplands between the Kezyl Daria and the Kashgar Daria have a sandy soil, which for the greater part of the year is quite destitute of vegetation, and can only be used as pasture for a few weeks.

The western districts of the Thian Shan Nanlu, or those which extend at the base of the Tartashling, are not more favourable to cultivation than the northern districts which we have just noticed. Though the general direction of the Tartashling is from north to south, it seems that the ranges which compose it generally extend in the direction from west to east, and their wide rocky masses advance far into the plain, leaving only narrow and elevated valleys between them, which do not admit of cultivation. These high ranges extend much farther to the east near the Kuenluen, than in the vicinity of the Thian Shan Mountains, and terminate rather abruptly in the plain, so that only a very narrow hilly tract separates them from the level country. Cultivation is limited to this narrow tract, and even here to the banks of the several rivers which drain it. The cultivated grounds are most extensive on the Kashgar Daria and Yarkiang Daria, where these rivers issue from the mountains, and always yield an abundant supply of water for irrigation, especially in the countries surrounding the towns of Kashgar and Yarkiang. Farther down the country is not cultivated, the soil being sandy, and the means of irrigation scanty and uncertain. The principal objects of agriculture are rice, wheat, barley, and millet, with beans and vetches. Several plants are raised from which oil is extracted, among which is sesamum. The mulberry plantations are very extensive, and large quantities of silk are collected at Yarkiand, which is partly exported, and partly used in the manufactures of the country; cotton, hemp, and flax are also cultivated. Fruit-trees are abundant, and their produce, consisting of grapes, pomegranates, quinces, peaches, apricots, and apples, constitutes an article of internal commerce. Melons and cucumbers are of excellent quality. The greater part of the country, though unfit for agricultural purposes, is covered with grass, especially those tracts which are mountainous, and accordingly it abounds in domestic animals, among which the horses and sheep are distinguished. The wool collected in these parts is hardly inferior to that of which the shawls of Cashmir are made. There are also numerous herds of cattle and camels.

We are less acquainted with the productive powers of the countries which extend along the base of the Thsungling, where our knowledge is limited to the tracts that surround the town of Khotan, where a large district is under cultivation, and produces rice, wheat and millet, cotton, hemp and flax; large quantities of silk of the first quality are collected. The vineyards are extensive, and the grapes grown here are much prized. Some plants are raised, which yield dyeing-stuffs, which are exported to China. Among the domestic animals the yak is numerous, and also the horses and sheep; cattle are rather scarce. North of this cultivated tract is a desert, in which many bare rocks occur, but whose surface is mostly covered with sand. This desert, which extends westward to the vicinity of Yarkiang, and northward to the banks of the Yarkiang Daria, is known by the name of Kara-kitai or Rikistan. From this rapid survey of the productive powers of Thian Shan Nanlu it is evident that probably not more than one hundredth part of its surface is available for agricultural purposes. The deserts, and those tracts which are described as such, cover at least three-fourths of the area, and the remainder is mainly occupied with high mountains, which produce a few trees and good pasture. The utter sterility of the Han-hai seems to depend on the soil, but that of the other desert tracts appears partly to be the effect of climate.

Climate.—The climate of the Thian Shan Nanlu is distinguished by that dryness which is characteristic of all table-lands which are considerably elevated above the sea. As its elevation perhaps does not differ much from that of the table-land of Castile in Spain, there

would probably be a great similarity between the climates if the table-land of Spain was not surrounded by a sea, which is not far distant from it, whilst the Thian Shan Nanlu is 1500 miles from the Pacific, which is the nearest sea. The climate of Thian Shan Nanlu is consequently much drier than that of Spain. Though abundant rains are experienced in the mountain-ranges which enclose the plain, and snow falls every winter to the depth of several feet, the quantity of snow and rain which descends on the plain is very small. In the deserts no rain occurs, and it is observed that when the atmosphere is charged with vapour, and distant objects are indistinctly visible, it does not produce any other effect than that of generating extremely heavy gales, which are often so strong as to throw down travellers and their beasts of burden. In the Han-hai they raise a large quantity of sand to a considerable height above the surface. Along the Thian Shan Mountains only two or three showers of rain are annually experienced, and generally they do not continue above an hour. The rain is very minute, and it hardly moistens the surface of the ground. A little snow falls in the western districts, but seems never to occur east of the valley of the Kaidu river. The moisture required for the growth of plants is therefore entirely derived from the mountains. The supply of water from this source is indeed very abundant, but only for about two or three months of the year, and it would only be sufficient for a very limited agriculture, if the inhabitants had not acquired a peculiar art in husbanding this supply. In the districts south of the Thian Shan Nanlu Mountains very large reservoirs have been made, which are filled by the watercourses after the melting of the snow, and from these reservoirs the greater part of the supply is taken, by which many tracts are enabled to produce abundant crops. The western districts do not materially differ from the northern, except that a larger quantity of snow falls, though it is moderate in the plain. The temperature of these districts however is much colder in winter, and it is a remarkable fact that at Yarkiang the river is for three months covered with thick ice, and caravans pass over it with their beasts of burden. The heat in summer is very great all over the country, but the cold of the winter seems to decrease as we proceed from west to east, as frost is hardly known at Hami. The Chinese however state that the difference between the temperature of the summer and winter is very considerable. The country is subject to earthquakes, and several districts suffered greatly from them in 1832, when they were felt on both sides of the Tartashling Mountains. It is probable that this phenomenon also occurs along the Thian Shan Mountains, as an extinct volcano exists in that range, and traces of volcanic action are frequently met with.

Productions.—It is remarkable that Thian Shan Nanlu, though without doubt considerably elevated above the sea-level, produces all the grains and fruits which are cultivated in the most southern parts of Europe, which are situated at the same distance from the equator, and are less elevated. The olive-tree however has not been noticed as growing there. Sesamum, which is cultivated in most parts to a great extent, supplies the place of the olive-tree. The plain, as well as the mountains which surround it, are almost entirely destitute of trees, and even of shrubs. In a few places only some species of trees cover a small extent of surface, but they are short and crooked, and only good for fire-wood. It is not certain, though it is so stated by some travellers, that the true rhubarb-plant grows on the mountains of the Thsungling.

All the domestic animals of Europe abound, with the exception of hogs, which are only kept by the few Chinese settled in the country: all the other inhabitants, being Mohammedans, hold this animal in abhorrence. Camels are kept in the plains and on the mountains. The ranges of the Tartashling are considered the native place of the double-humped camel. In the same mountains the yak is reared by the Kirghis; the larger species of the domestic animals are found in a wild state in the deserts of Thian Shan Nanlu. This is expressly stated of the horse, the camel, black cattle, and the ass; the last is probably the dshikketei, or Equus hemionus of Pallas; of the wild sheep there appear to be several kinds, but the species have not yet been ascertained. On the Thian Shan Mountains the argali is found, and on the Tartashling the kutch-kar and the ràse above mentioned. The jackal is found in great numbers, and there are also tigers, wolves, lynxes, and foxes. On account of the want of natural forests, birds are not numerous, except water-fowl, which abound in the lakes of the desert and the swamps of the Tarim river. On the Thian Shan Mountains a black eagle of great size is met with, and on the Tartashling a still larger kind, called syrym.

Gold is said to be found in the affluents of the Khotan Daria, where some quantity is stated to be collected. It occurs also, according to the account of the Chinese, in the eastern portion of the Thian Shan Mountains, where however it is not collected. Copper and iron are certainly found at several places, and are worked, but the localities are not known. From the volcanic portion of the Thian Shan Mountains sulphur and sal-ammoniac are obtained, and near the same places asbestos and saltpetre. Diamonds are said to exist in the eastern part of the last-mentioned range. Several other precious stones are abundant, and two of them, the yew and the agate, form considerable articles of commerce to China. The agate is only found in the eastern districts of Thian Shan Nanlu.

Inhabitants.—The bulk of the population is of Turkish origin, and it seems that this nation must be considered as the aboriginal stock of the country, as Thian Shan Nanlu constituted the principal portion of the powerful empire of the Hiongnu, which was destroyed by the Chinese in the first century after Christ, and as the history of almost all the different Turkish tribes, however widely spread over Asia and Europe, may be traced to this country. Travellers generally call the Turkish inhabitants of Thian Shan Nanlu, Uzbecks, as they resemble them exactly in the formation of their body [BOKHARA, vol. v., p. 71], and speak the same language. It is however observed, that the Turkish language of Thian Shan Nanlu is not intermixed, as that of the other Turkish tribes, with terms derived from the Persian and Arabic languages, and it is therefore considered the purest of the Turkish dialects. The Memoirs of Sultan Baber are written in this language. The Turks of Thian Shan Nanlu are decidedly superior in civilization to the Uzbecks of Bokhara. They exhibit no less industry than ingenuity in the cultivation of the land, and the articles which are made in their manufactories are of good quality and much prized. Many of them are also engaged in commerce.

They are at present divided into two tribes, Ak-tak and Kara-tak, which hate one another, and frequently make war on each other, which circumstance is considered the principal reason of their inability to resist successfully the invasions of the Olöths and of the Chinese. Each of these two tribes was governed by hereditary chiefs, who were independent of one another. When the Chinese occupied the country, they left the internal affairs in the hands of these chiefs, reserving for themselves only the military department and the police, as far as regarded the neighbouring independent states. The army which the Chinese keep in the country, and which amounts to between 20,000 and 30,000 men, is commanded by Mantchoo officers; and at the places through which the caravan-roads pass to foreign countries the custom-officers are composed half of Chinese and half of Turks. But all the other officers are appointed by the Hakim Iiegs, as the chiefs are called, but the Hakim Iiegs themselves are chosen or confirmed by the court of Peking. The tribute which the Chinese government levies upon the inhabitants is small, but is somewhat increased by the duty on the merchandise which is imported, and which, according to the latest information, is 3½ per cent. The inhabitants however are much oppressed by their native chiefs, as the Chinese government appears to take no notice of the way in which they are governed. For this reason they are ill-disposed against the Chinese, and this hatred is still increased by the extensive fortifications which have lately been erected by the gratuitous labour of the natives. The Chinese merchants who are settled here are not permitted to go to the neighbouring countries which are independent of China, and the foreign commerce is therefore carried on partly by the Turks, but mostly by the Tajicks. The Turks are Mohammedans.

The Tajicks, or Tadjicks, are that nation which considers the Persian as its native language, and which is widely spread over all the central countries of Asia, but inhabits only a few mountain valleys exclusively. In other countries their industry is mostly directed to the cultivation of the soil, but in Thian Shan Nanlu they are chiefly engaged

in trade, and therefore many of them are met with in all commercial places. They are known to Europeans by the name of Bokharians, as the merchants from Bokhara who visit the fairs of Nishnei Novogorod and other places are Tajicks. They are permitted even to trade in the western provinces of China Proper, in Shensi and Shansi, and some of them visit Kiachta. They conform in their dress and costume to the Turks, but preserve their language. They are Mohammedans.

Though Thian Shan Nanlu was subject to the Khalkas Mongols for a considerable length of time, no traces exist of this nation ever having formed settlements in the country. The Olöth Calmucks, when governed by the Galdan and his successors [Songaria, vol. xxii., p. 245], occupied it for a short time, and as they expelled the Khalkas wherever they met them, the total absence of Mongol colonies may be accounted for. There are however in the eastern districts, especially in the town of Hami and its vicinity, a considerable number of Olöth Calmucks, who after the defeat of the Galdan quietly submitted to the sway of the Mantchoos. The number of Chinese is not large. Besides the officers of government, a small number are established in the large commercial towns as merchants; some of them also exercise other trades; but it does not appear that agricultural settlements have been made by them in this country, as in Songaria.

In the mountains at the north-west corner of Thian Shan Nanlu is a tribe of Kirghis, called the Kara Kirghis, and another tribe of that nation is met with in the ranges of the Tartashling. Both are nomadic tribes, occupying during the summer the highest portion of the mountain-region with their herds of camels, yak, horses, and sheep, and descending in winter to the lower regions.

Commerce, Towns, and Manufactures.—Nearly 1800 years ago a commercial road was established, which traverses this country in its length from east to west, and by which the commerce between China and Western Asia has been carried on nearly without interruption. After the downfall of the empire of the Hiongnu under the dynasty of Han, when the dominion of the Chinese extended to the shores of the Caspian Sea, and nearly met the eastern boundary of the Western or Roman empire, this road was first used for the purposes of commerce, and silk and other articles were thus brought to Western Asia. This road passes through the countries which lie along the base of the Thian Shan Mountains. Another road, which has probably been used for an equal length of time, connects Thian Shan Nanlu and China with the northern parts of India, especially with Cashmir, and is also much used at the present day. As almost all our knowledge of the towns of this country and their manufactures is derived from the accounts of the merchants who have passed along these roads, we shall follow their track in noticing them.

The caravans of China, bound for the western countries, or Siyu, as they are called there, after leaving the town of Shatshcou and the gate of Kia-yu-kooan [Tangut, vol. xxiv., p. 32], pass through the desert of Han-hai and arrive after 20 days' journey at Hami (42° 53′ N. lat. and 93° 50′ E. long.). Hami, or Khamil, as it is called by the natives, is a fortified place, being surrounded by high walls, which enclose a space about two miles and a half in circuit. The town is surrounded by large suburbs, where the caravans stop before they proceed for the west, and is populous. The streets are straight and regular, but the houses low and built of dried clay. The country which surrounds the town is not distinguished by fertility, but it is cultivated with extraordinary care and industry. Grapes, melons, and other fruits are sent to China in great quantities.

About 240 miles west of Hami is Pidshan, a fortress which is nearly two miles in circuit, and near which the caravan road passes. About 60 miles farther is Turfan, a considerable place, which however suffered much in the wars of the last century. Karashar is 290 miles west of Turfan. Its fortress is not large, not exceeding one mile in circuit. The town is rather populous, and built on the banks of the Kaidu river, which is said to be navigable at this place. Its commerce is considerable, but manufactures are not mentioned, except that the inhabitants excel in the art of embroidery. Kurli, or Kurungli, is situated on that portion of the Kaidu river which connects the Bostu Nor with Lop Nor, and contains a population of about 4000 individuals. The country round the town is very fertile. The town is 50 miles distant from Karashar to the south-west. Bukur or Bugur, nearly 200 miles distant from Kurli, contains 2000 families, or 10,000 individuals, and has a considerable commerce in copper, oil, sheep-skins, butter, and furs, especially lynx-skins.

Kutshe, which is 100 miles distant from Bugur, is a large town which is three miles in circumference, and contains a great population, of which 6000 are Turks. The mountains north of the town contain several mines, from which copper, saltpetre and sulphur, and sal ammoniac, are obtained. At this town begins the road which leads across the Thian Shan Mountains to Kuldsha in Ili, by the mountain-pass called Mussur Dabahn. Before it reaches the mountain-pass, it runs through the town of Sailim, which is built in an elevated valley, and near some mines. South-west of Kutshe is the town of Shayar, in a district producing abundance of rice, melons, and fruit. It contains a population of 4000 individuals.

In the valley of the Aksu Daria are the towns of Aksu and Ushi. Aksu is a large commercial and manufacturing town, which, according to one statement, contains 6000 houses, and, according to another, a population of 20,000 families. It is not fortified. Its commercial importance is not only derived from its being one of the largest places of depôt on the great caravan-road from China, but also from another road, which leads in a north-eastern direction to the mountain-pass of Mussur Dabahn, by which it communicates with Kuldsha, the capital of Ili, and by which it not only receives the produce of that country, but also several articles brought from Russia. [Songaria, vol. xxii., p. 245.] Bucharian merchants from Tobolsk sometimes proceed as far as this place, and it is likewise visited by traders from Khokand, Tashkend, and Bokhara. Its manufactures are numerous, especially those of cotton-stuffs, among which one called *bumaseya* is in great request in Siberia and Turkistan, and a kind of stuff, half silk and half cotton. Several articles made of leather, especially those of deer-leather, as harness and saddles, which are embossed with great art, are also highly valued, and exported to distant places. There are also some potteries, and many persons are employed in cutting and polishing precious stones. The Chinese garrison, consisting of 3000 men, inhabits a separate quarter of the town. Ushi, which lies higher up in the valley of the Aksu Daria, is built in the centre of an extensive country of great fertility, and is stated to contain 10,000 families. This place has a mint, in which copper coin is made, and it appears to carry on a considerable commerce.

The town of Kashgar is situated in the north-western angle of Thian Shan Nanlu, and at the commencement of the mountain-road which, traversing the chain that connects the Thian Shan with the Tartashling, leads to Ferghana and the towns of Khokand and Tashkend. This road runs in a north-north-western direction. At this place also begins the other caravan-road, which, running south-east and passing along the eastern declivity of the Tartashling, and passing through the towns of Yarkiang and Khotan, leads over the Karakorum Pass to Leh, Gertope, and Cashmir. Besides these two lines of communication and the great caravan-road to China, a fourth road, commencing at Kashgar, runs north-east over the Thian Shan Mountains by the Rowat Pass, and, skirting the western shores of Lake Issekol, leads to Kuldsha and the banks of the Irtish river. This last road appears to be much frequented by Russian merchants. The advantages derived from all these roads concentrating at Kashgar render this town one of the most commercial in the interior of Asia. It is said to contain 15,000 houses, and a population of 80,000 individuals. In the Chinese geography the population is said to consist of 16,000 persons paying a capitation-tax, which would carry it to rather more than is stated by Russian travellers. The Turkish and Bucharian merchants of Kashgar visit the countries north of Hindustan, Bokhara, and Tobolsk; and numbers of merchants who are settled in the neighbouring independent states are always found in the town. All those who are of Turkish origin have free access to it; but the entry of Europeans is prevented by the Chinese authorities. In the middle of the town is a large square, from which four extensive bazars branch off. The Chinese garrison consists of 8000 men, who are stationed here to repress any invasion from the side of Khokand, and are quartered in a strong fortress, which is con-

tiguous to the town. The manufactures are numerous and extensive: the largest are those of silk, in which several kinds of stuffs, as satin, damask, &c., are made, and some of them are interwoven with gold and silver thread. The manufactures of cottons are less important, but their colours are much praised. The jewellers are very expert in cutting the yew and in working gold. Many articles are exported to China. The latest accounts however state that Kashgar and its commercial and manufacturing industry had suffered much by the invasion and rebellion of the Kodjas (1827), and that Yarkiang had become a much more commercial place than Kashgar. It is very probable that the town has recovered its former importance. South-west of Kashgar is the town of Tashbalig, which seems to be an important place, built on the banks of the Yaman-yar river, where it issues from the mountain-region of the Tartashling. On the road leading from Kashgar to Yarkiang is Yengi Hissar, a place of considerable extent.

Yarkiang, or Yarkand, may be considered the capital of Thian Shan Nanlu, as the Chinese military governor generally resides here. It consists of the city or fortress, which is surrounded by a high wall of stone, and is more than three miles in circumference, and numerous suburbs which lie round it. In the fortress a garrison of 7000 men is kept. The houses are mostly built of sun-dried bricks; but as rain is very rare in this country, they may be considered substantial. The river Yarkiang Daria is divided into two arms, and numerous canals have been made from them, by which all the streets are abundantly supplied with water. There are numerous public buildings, especially mosques and medrasses, or colleges: the number of the medrasses is stated to exceed ten. There are two large bazars, one in the city and the other in the suburbs, which are more than three miles long, and contain a great number of shops, well supplied with various articles of merchandise. Most of the shopkeepers are Chinese. There are also several large caravansaries. The country surrounding the town supplies it with three important articles of commerce, silk, fine wool, and horses, of which last great numbers go to other places, and as far as China. These horses are mostly of the Kirghis breed, rather small, but very strong, and much prized. The commerce with the countries north of Hindustan and with Tibet is very considerable. It is stated that there are several kinds of manufactures, but only cotton-stuffs are specified. The number of inhabitants who pay capitation-tax is stated to be between 30,000 and 40,000, which would give a population of between 180,000 and 240,000. Many foreigners are settled in this place. The number of Chinese merchants is only 200, but there are many others engaged in trade and manufactures. A great number of merchants from Shensi and Shansi visit Yarkiang. There are also a considerable number of natives of Cashmir settled here; but only a small number of Hindus, and no Jews or Armenians. The foreign merchants, who are met with in considerable numbers, are from Ferghana, Tibet, and Cashmir.

Khotan appears to have been formerly the name of the town which at present is called Ilitsi or Eelchi, whilst the name of Khotan is applied to the country which extends along the northern base of the Thsungling. This country contains, according to the latest information, 700,000 persons who pay capitation-tax, which would give a population of between 3,500,000 and 4,000,000 individuals. Thus it appears that this country is by far the most populous and important part of Thian Shan Nanlu. A large number of the inhabitants are Buddhists, and it appears that among them are numerous descendants of Chinese, who settled there at a very early period. The town of Ilitsi is described as large and populous; but we have no peculiar account of it. It derives its commercial importance partly from the productions of the country, and partly from the circumstance that the great roads meet at this place. The eastern road passes from Ilitsi to Keriya, and through the pass of Keriya into Tibet, and seems to be the principal line of communication between the last-mentioned country and the northern provinces of China. The western road joins the great caravan-road which leads from Yarkiang to Leh and Cashmir. The principal articles which the country supplies for exportation are the yew-stone and silk, the last of which is grown in large quantities. It seems also that there are mines of copper in the neighbourhood, as vessels of copper are named among the articles manufactured in this place. Silk and cotton stuffs are also made to a great extent, and there are glass-houses. Every week a fair is held, which is sometimes attended by 20,000 persons. Horses are exported in great numbers, and are not less prized than those of Yarkiang. Near the town of Keriya, through which the road passes to Tibet, are some gold-mines.

The articles which are sent from Yarkiang to Cashmir are silver, goats' and sheep's wool, leather tanned in the manner of what is called Russian leather, embroideries of gold and silver, rice, and some few articles of Chinese manufacture; there are taken in return shawls of different qualities, cotton stuffs, sheep-skins and goat-skins, and some minor articles.

Only one caravan goes annually from Yarkiang to Badakshan, which carries a large quantity of tea and some silver, and brings back slaves and precious stones, especially rubies. It appears from Wood's 'Journey' that this intercourse has of late been interrupted by the unsettled state of Badakshan and of Wakhan. [Turkistan.]

The intercourse with Khokand, which had also been interrupted for several years, has lately been re-established. The articles exported to that country are silver, china-ware, tea in boxes, and pressed tea, of which large quantities are consumed by the inhabitants of Turkistan. The imports from Khokand are raw silk and different kinds of cotton stuffs.

The Bucharian merchants settled in Russia have succeeded in advancing as far as Kutsh, Aksu, and Kashgar, to which places they bring broad-cloth, brocades, silver, gold coin, copper, iron, steel, and fur; and they take back several kinds of cotton stuffs, tea, rhubarb, and sal ammoniac.

We are very imperfectly acquainted with the commercial intercourse between China Proper and Thian Shan Nanlu. It does not however appear that the government puts any difficulties in the way of it, and it is stated that the commerce of Yarkiang with the northern provinces is very active. The principal articles which are sent to China are raw silk, great numbers of horses and cattle, the yew and other precious stones, and some dyeing stuffs; in return there are sent to Yarkiang tea, china-ware, and several manufactured articles.

History.—The country of Thian Shan Nanlu has never in any way been connected with the political events of Europe and Western Asia, but frequently with those of Proper China, and it is only from the Chinese and Mongol historians that we learn the political changes to which it has been subject. Thus we are informed that before and at the beginning of our æra this part of Central Asia formed a portion of the powerful empire of the Hiongnu, a Turkish race, which for more than two centuries made war on China, and sometimes laid waste the northern provinces; but in the first century after Christ was overthrown by the dynasty of the Han emperors. It seems that the Chinese thus for the first time got possession of the country, and they soon afterwards succeeded in extending their conquests over Ferghana and the deserts lying round the Aral, so that at that period their empire extended to the Caspian Sea. But in the fifth century after Christ the Chinese were dispossessed of this country by the Tang-hiang, a Tibetan race; and this and other races of the same origin continued to govern Thian Shan Nanlu up to the time of Gengis Khan. From the tenth to the thirteenth century it formed a part of the extensive empire of the Hia or of Tangut [Tangut, p. 33], the overthrow of which, in 1227, was the last of the numerous and great exploits of the Mongol conqueror. [Gengis Khan, vol. xi., p. 117.] As the Mongols soon afterwards got possession of China, Thian Shan was again united to that country, and remained so as long as the descendants of Gengis Khan were masters of China. But when the Yuan dynasty was overthrown, in the fourteenth century (1366), by the Ming dynasty, and the Mongol empire was split into several states, Thian Shan became independent, and several small sovereignties arose under chiefs of Turkish origin. The Ming emperor would probably have succeeded in subjecting them, but for the conquests of Timur Beg, or Tamerlane, who entered the country towards the end of the fourteenth century, and brought it under his dominion. After his death the Turkish chiefs gradually resumed their independent station, and preserved it to the middle of the sixteenth

century, when the Galdan or emperor of the Olöth Calmucks, who subjected to his sway all the tribes north of the Thian Shan Mountains, began to extend his conquests to the south of that range. The petty Turkish sovereigns, not being able to make resistance, yielded, and became tributary to the Olöth Calmucks. When the Galdan had been defeated by the Chinese, and had died (1697), the power passed from the Olöth Calmucks to the Songares [SONGARIA, vol. xxii., p. 245], who soon established their authority among the Turkish princes in Thian Shan Nanlu, and even subjected Tibet. They kept it until their widely extended empire was destroyed by the Chinese in 1756, and their sovereign, Amursana, fled to Tobolsk, where he died (1757). The most powerful of the Turkish princes, the Kodjas of Yarkiang and Kashgar, considered this event favourable to the establishment of their independence, as they thought it impossible that the Chinese could send an army sufficiently numerous for the subjection of Thian Shan Nanlu through the wide desert which separates Proper China from their country, and they refused to submit to the authority of the Mantchoo emperor. But the emperor sent two armies from Ili over the Thian Shan Nanlu Mountains. The first was only partly successful, and took Kutshe; but the other, under the command of Tshaohoei, subjected the whole of the country, and in 1759 the Kodjas were obliged to retire to Badakshan.

In 1765 an insurrection broke out in the town of Ushi, but it was soon put down. In 1826 the descendants of the Kodjas, having insinuated themselves into the favour of the Khan of Khokand, and obtained from him the support of a small army, entered Thian Shan by the Terek Pass, and succeeded in taking Kashgar, Aksu, Yarkiang, and Khotan; but a Chinese army of 60,000 men being sent against them, they were defeated in three battles, and again retired to Badakshan, where Wood, in his journey to the source of the river Oxus, found one of these Kodjas living in exile.

(Du Halde's *History of China;* Mailla's *Histoire Générale de la Chine;* Klaproth's *Magasin Asiatique;* Wathen's *Memoir on Chinese Tartary and Khokan*, in *Journal of the Asiatic Society of Bengal*, vol. iv.; Wood's *Narrative of a Journey to the Source of the River Oxus;* Ritter's *Erdkunde von Asien*, vol. i., ii., and v.)

THIBAUT V., count of Champagne, and first king of Navarre of that name, occupies a respectable rank among the Troubadours. It has been pretty satisfactorily shown by recent writers on the subject that the scandalous stories told of this king by Matthew of Paris and others rest upon no satisfactory evidence. They have however been more successful in disproving the tales of their predecessors than in substituting anything in their place. They have rendered Thibaut's biography in a great measure negative.

He was born about the beginning of the year 1201, and has been called Theobaldus Posthumus, on account of his father having died before his birth. His mother, Blanche, daughter of Sancho the Wise, king of Navarre, took charge of and governed his extensive territories as regent for twenty years. A taste for literature was hereditary in the family of Thibaut. His grandmother, Marie of France, held, about the middle of the twelfth century, one of the most celebrated 'Courts of Love,' and some of her judgments have been preserved by André le Chapelain. His mother Blanche induced by her commands Aubein de Sezano to compose several songs, after he had solemnly renounced the practice of poetry. With such examples before him it was natural enough that the young count of Champagne should contract a taste for rhyming.

An attempt was made in the year 1214 to wrest the territories of Champagne from the widow and her son. The father of Thibaut was a younger son: his elder brother Henry followed Philippe Auguste to the Holy Land, and, marrying there a sister of Baldwin IV., king of Cyprus and Jerusalem, had by her two daughters, Alice, queen of Cyprus, and Philippa, who married Airard de Brienne. The father of Thibaut V., after his brother's departure for Palestine, took possession of Champagne and Brie, which were held without challenge by him, and by his widow in name of her son, till 1214. Airard de Brienne then claimed them in right of his wife. Philippe Auguste decided in favour of Thibaut, and the sentence was confirmed by the peers of France, in July, 1216, on the ground that Henry, when departing for the East, had ceded all his lands in France to his brother, in the event of his not returning. In November, 1221, the seigneur of Brienne was persuaded to abandon his claims upon receiving a compensation.

In the same year Thibaut took upon himself the management of his domains, which rendered him, by their extent, and the title of count palatine, which they conferred upon their holder, the most powerful vassal of the crown. During the brief and troubled reign of Louis VIII. (July, 1223, to November, 1226), Thibaut distinguished himself by nothing but the pertinacity with which he insisted upon his feudal rights. At the siege of Rochelle he consented to remain till the town was taken, but exacted in return a declaration from the king that by so doing he did not render himself liable on any future occasion for more than the 40 days' service in arms due by the vassals of the crown. In the crusade against the Albigenses (induced probably by regard for the count of Toulouse, who was his kinsman) he resisted every entreaty of the king to remain with the army after the 40 days had expired; and his departure from it was one of the foundations for the stories afterwards circulated to his disadvantage.

On the death of Louis VIII. a league was formed by a number of the most powerful French nobles to prevent the queen from acting as regent. Thibaut was at the outset a party to this confederacy. There are extant letters of Pierre, duke of Bretagne, and Hugues de Lusignan (dated March, 1226, which, as the year is now made to commence, would be called 1227), authorizing him to conclude in their name a truce with the king. The regent however found means to detach the count of Champagne from his allies; for an attempt which they made soon after to obtain possession of her person and the king's was frustrated by the opportune arrival of Thibaut at the head of a strong body of horse.

The duke of Bretagne and his coadjutors were much incensed at the desertion of the count of Champagne, and appear to have soon after formed the project of harassing him by supporting the claims of the queen of Cyprus upon Champagne and Brie. He was however, on account of his wealth, too desirable an ally to be lost without an endeavour to regain him. Overtures of reconciliation were made, in consequence of which count Thibaut engaged, in 1231, to take to wife the daughter of Pierre of Bretagne. Thibaut had been twice married before; in his 18th year, to Gertrude, daughter of the count of Metz, from whom he was divorced, and afterwards to Agnes de Beaujeu, by whom he had a daughter. The regent, fearing the consequences of this reconciliation, interfered to break it off. The marriage-day had been fixed, and the bridegroom was already on his way to the place where it was to be celebrated, when letters from the king, forbidding him to conclude the engagement, were delivered to him. He obeyed the royal mandate.

This insult determined the confederates to carry into execution their original project. They sent for the queen of Cyprus, and invaded Champagne, avowedly for the purpose of putting her in possession of it. The king marched to the assistance of Thibaut, and under his auspices a compromise was arranged. Thibaut ceded to the queen of Cyprus lands to the value of 2000 livres yearly, and paid her in addition 20,000,000 of livres in money. This sum was advanced by the king, who received in return the estates of Sancerre and others, which Thibaut's father had held before he acquired Champagne.

Here seems the proper place to notice the stories told by Matthew of Paris regarding the loves of Thibaut and queen Blanche, and the poisoning of Louis VIII., laid to the charge of the former. Matthew only mentions the accusations as a rumour he had heard. No other historian of equal antiquity mentions them. Had Thibaut been suspected of being the murderer of the king, the charge would probably have been urged against him by one or other of the rival factions, with whom he played fast and loose immediately after. There is not a passage in his poems that can be interpreted into a declaration of attachment to Blanche, who was moreover thirteen years his senior. But it is easy to see how the rumour mentioned by Matthew of Paris arose. A rhymed chronicle, apparently of the age of Thibaut, represents him as going

about (1230) in disguise to learn how men spoke of him, and discovering he had no friends. About this time there were violent disputes between the university of Paris and the papal legate, and, the queen supporting the legate, the wild students made and sang ribald songs attributing this report to a guilty passion for his person. In times of civil dissension it is generally found that parties otherwise totally unconnected catch up and spread each others' lies when it suits their purpose. The queen, the legate, and the count of Champagne were all unpopular; the dissolute students had circulated imputations against the chastity of the two former; and the interference of the king to prevent the marriage of the last-mentioned with the daughter of the duke of Bretagne would, under such circumstances, be easily interpreted into a plot of the queen-mother to keep him for herself. It was amongst the students that the first story was invented, and that is the quarter whence Matthew of Paris most probably obtained much of his information regarding French affairs.

In 1232 Thibaut married a daughter of Archambaud VIII. of Bourbon. In April, 1234, he succeeded to the throne of Navarre, on the death of Sancho the Strong. In 1235 he quarrelled with Saint Louis about the territories he had ceded to the king at the time of the arrangement with the queen of Cyprus, representing them as merely transferred to the king in security for the money he advanced, while the latter asserted that they had been sold to him for that sum. It came to blows, and Thibaut was beaten.

In 1239 Thibaut took the cross, and set out at the head of an expedition to the Holy Land. He displayed none of the talents of a general. Unable to procure ships to transport his forces to the scene of action, he marched through Hungary and Thrace. Arrived in the neighbourhood of Byzantium, his treasure was so completely expended, that his followers had to support themselves by plunder. In an engagement near Caesarea the division of the army under his immediate command was beaten, although the other was victorious. He got involved in the defiles of Taurus, and lost two-thirds of his men. Lastly, at the final defeat near Ascalon, he fled ingloriously before the battle was ended, leaving his followers to their fate.

He returned to Pampeluna, which he had made his capital, in 1242, and died in 1253, having done nothing worthy of notice in the interim, leaving a widow and six children.

The poems attributed to Thibaut are in number sixty-six, and there appears no reason for questioning the authenticity of any of them. Thirty-eight are devoted to the expression of passionate complaints and ecstasies; three recount his amorous adventures with peasant-girls; twelve are what may be called rhymed law-cases in matters of love; the rest are exhortations to engage in the Crusade, or invectives against the immorality of the age. The passion of the amorous poems is not very intense: there scarcely needed the few lines appended to most of them, addressed to some brother-troubadour, to show that they are mere displays of the author's cleverness. The cases for the Court of Love are ingenious and insignificant, like all other compositions of that kind. The fifty-fourth song, an exhortation to join the Crusade, is spirited. The sixty-fifth, in which the God of Christians is compared to the pelican feeding its young with its blood, is characterised by a blended tone of toleration and enthusiasm. In the sixty-sixth he starts a theory that the law of God is ripe and wholesome fruit, and that Adam sinned by eating unripe fruit. Thibaut's versification is correct and sweet. There is a spirit of generosity about his poems that is creditable to himself: the neatness and finish of his verses are more attributable to the degree of perfection to which the art had been previously carried by others than to the author's own talents. Altogether his literary productions leave a more favourable impression of his character than the part he played as a warrior and politician. There is tergiversation and something worse in his public conduct, but the disposition evinced by his writings leads to the conclusion that he sinned more through want of firmness than from ill-will.

THIBET. [TIBET.]

THIEL, or TIEL, is the chief town of a district in the province of Gelderland in the kingdom of the Netherlands. It is situated in 51° 50′ N. lat. and 5° 26′ E. long., on the river Waal, about 15 miles from Nimegen, in the tract called the Betuwe, which is celebrated for its fertility. The town of Thiel contains 5000 inhabitants; the district of which it is the chief place, 48,200. The chief occupations of the inhabitants are agriculture and the breeding of cattle; they have also manufactures of woollen, linen, and water-colours. (Stein, *Lexicon*; Hassel; Cannabich.)

THIELEN, JAN PHILIP VAN, was born at Mechlin in 1618. He was of a noble family, and lord of Couwenburg. Though he received an education suitable to his rank, and was instructed in every branch of polite literature, his predilection for the art of painting induced him to become a disciple of Daniel Segers.

Having voluntarily placed himself under so able an instructor, his improvement, as might have been expected, was rapid. His subjects were usually in the taste of Segers, garlands of flowers, with some historical design in the centre, or festoons twining round vases enriched with representations in bas-relief. He always copied from nature, and chose his flowers in the entire perfection of their beauty, grouping them with great taste. His pictures are very highly finished, with a light touch, perhaps less spirited than the works of Segers; but it is sufficient praise to say that his performances rivalled those of his master.

He was much employed by Philip IV., king of Spain, and most of his finest performances are (or at least were*) in the Spanish royal collection. Two of his capital pictures were at Mechlin; they represented garlands and flowers, and many insects of different kinds on the leaves, all finished with exquisite delicacy. The figure of St. Bernard is in the centre of the one, and that of St. Agatha in the other. Weyermann also highly commends one, which has in the centre a nymph sleeping, watched by a satyr, the figures being painted by Poelemburg.

Von Thielen seldom inscribed his name on any of his works; he generally marked them J. or P. Couwenburg.

THIELT is the chief town of the district of the same name in the province of West Flanders, in the kingdom of Belgium. It is about 15 miles south-west of Bruges, on the road from Ghent to Dixmuden. Thielt is a cheerful town, with two churches, 1700 houses, among which are many handsome modern buildings, and 12,000 inhabitants, and is the chief market for the flax-trade of Flanders. At the weekly market there is a great sale for linen, corn, cattle, and butter. The inhabitants have several establishments for bleaching wax and linen, six breweries, and many flourishing manufactories. There are an academy, several literary societies, a musical society, and several schools. [FLANDERS, WEST.]

(Stein, *Lexicon*; Cannabich, *Lehrbuch*; Hoffmann, *Deutschland und seine Bewohner*, vol. iii.)

THIERS, a town in France, capital of an arrondissement in the department of Puy de Dôme, 273 miles from Paris by Nevers, Moulins, and Roanne, and 24 from Clermont-Ferrand, the capital of the department: it is in 45° 51′ N. lat. and 3° 33′ E. long. Thiers originated in the middle ages. There was a strong castle here in the earlier periods of the French monarchy, which became under the feudal system the head of one of the principal fiefs of Auvergne. The town stands on the crest and side of a hill sloping down to the northern or right bank of the Durole, a little stream flowing into the Dore, which itself flows into the Allier. It is in a picturesque situation, amid wild scenery, and commanded by lofty and well-wooded hills on the north, down the side of which the road from Lyon to Thiers runs by a remarkably steep slope. The houses at this entrance

* So many valuable pictures were carried off or destroyed, not only during the French occupation, but in the disorders of late years, that it is difficult to speak positively. Thus the French king, Louis-Philippe, a few years ago sent the Chevalier Taylor to Spain to purchase pictures, at a time when the rage of the populace was directed against the convents. The chevalier accordingly went to Spain, and purchased four hundred and seventy-four pictures; many of which were thereby saved from destruction. The Chevalier Taylor says that he saw some fine pictures by Paul Veronese destroyed, in spite of his urgent entreaties and offers to purchase them.

of the town present a pleasing appearance, from their being painted in fresco in a manner similar to those of Nice; but on proceeding into the town the steep, narrow, dark streets, bordered by gloomy houses, disappoint expectation. There is no public building worthy of notice, and no public square or place except one at the entrance of the road from Lyon: the town is inhabited by workpeople, and presents very few ('not a score,' says one of our authorities) decent houses. The chief manufactures are of paper and playing-cards, fine cutlery and hardwares, leather, and candles. The paper-mills are on the Durole, in the steep rocky banks of which excavations have been made for the sites of the mills: this branch of industry has been established in the town from the sixteenth century. The quality of the paper manufactured here is good, and a large portion of it is sent to Paris. The razors, knives, and scissors, though of ordinary quality, command a good sale, and are exported to Spain, Italy, the Levant, and the East and West Indies: the iron is brought from Nivernais, Berry, and Franche Comté. There are in and round the town 600 manufactories or workshops for cutlery, employing, it is said, 6000 persons. The candles are made from the fat of the goats reared on the surrounding hills. There is a large poor-house, in which woollen cloths, lace, and trimmings are made, and other manufactures are carried on. These various manufactures employ three-fourths of the population of the town and the villages for many miles round. The population of the commune of Thiers, in 1826, was 11,613; in 1831, 9836, of whom 6586 were in the town itself; and, in 1836, 9982. There are an inferior court of justice, a tribunal de commerce, a chamber of manufactures, a council of prud'hommes; some fiscal or administrative government offices, an hospital or poor-house, and a high school, or college. There are eight yearly fairs.

The arrondissement of Thiers has an area of 332 square miles, and comprehends only 39 communes, with a population, in 1831, of 67,870; in 1836, of 70,657: it is divided into six cantons or districts, each under a justice of the peace.

(Vaysse de Villiers, *Itinéraire Déscriptif de la France;* Malte-Brun, *Géographie; Dictionnaire Géographique Universel.*)

THIMBLE, a metallic cap, in the shape of a hollow truncated cone, worn on the finger in sewing, in order to allow the needle to be pressed through the work with adequate force, without injury to the finger. Thimbles used by sempstresses usually have slightly convex tops, which, as well as the upper part of the circumference of the cone, are pitted with numerous small indentations symmetrically arranged, which serve to prevent the end of the needle from slipping; but those used by tailors, upholsterers, and *needlemen* generally, have no tops, but have the like indentations upon the sides of the cone, with which alone the necessary pressure is applied to the needle. Although occasionally made of other materials, as porcelain and ivory, for ornamental purposes, thimbles are most commonly formed of sheet silver, steel, white alloys, or brass; or of silver and steel so combined as to retain the advantage of the superior hardness of the latter metal for the parts which come in contact with the needle, while those which are in contact with the finger are of silver. This is sometimes done by making the cap and upper part of the cone of steel and the lower part of silver; and sometimes by making the body of the thimble entirely of iron or steel, and lining it with silver or gold. As thimbles form an indispensable part of the furniture of a lady's work-table, much ingenuity is often displayed in their decoration by embossing, engraving, and inlaying with gold. They are usually formed by means of a stamping-machine, but the following process, for the description of which we are indebted to Dr. Ure's 'Dictionary of Arts,' &c., p. 1239, has been practised by MM. Rouy and Berthier, of Paris:—Sheet-iron, one twenty-fourth part of an inch thick, after being cut into strips of convenient size, is passed under a punch-press, by which it is cut into circular discs of about two inches diameter. These discs are then made red-hot, and laid in succession upon a series of mandrils, with hollows of successively increasing depth, into which the softened discs are forced by striking them with a round-faced punch, about the size of the finger. After being thus brought to the required shape, the thimble is placed in a lathe, when the inside is polished and the outside is turned, cut with circles for the reception of gold ornaments, and indented or pitted with a kind of milling-tool. After this the thimbles are annealed, brightened, and gilt inside with a very thin cone of gold-leaf, which is firmly united to the surface of the iron simply by the strong pressure of a smooth steel mandril. Gold fillets are then fixed by pressure in the grooves turned to receive them.

Sail-makers, in those coarse kinds of sewing which require the application of considerable force to the needle, employ, in lieu of thimbles, circular plates of cast-iron, indented or pitted on the surface. These are called *palms*, and are secured to the palm of the hand by straps.

The name 'thimble' is applied to the metallic eyes, in the form of rings with a groove in their circumference to receive a rope, which are used in rigging where it is desired to form a loop or eye at the end of one rope, through which another may slide with very little friction.

THINOCORI'NÆ, Mr. G. R. Gray's first subfamily of the family *Chionididæ*, containing the genera *Attagis*, J. Geoff. and Less.; *Ocypetes*, Wagl.; and *Thinocorus*, Eschsch.

THINO'CORUS, Eschscholtz's name for a genus of birds placed by Mr. G. R. Gray in his subfamily THINOCORINÆ.

THION DE LA CHAUME, CLAUDE-ESPRIT, an eminent French physician, was born at Paris, January 16, 1750. His father, who was a banker, gave him an excellent education, and destined him originally for the bar, but he himself preferred the study of medicine. He commenced his studies at Paris with great success, but, for some unknown reason, took his doctor's degree at Rheims. In 1773 he was appointed physician to the military hospital at Monaco in Italy, which was then occupied by a French garrison; and in 1778 to that at Ajaccio in Corsica. His zeal and talents were rewarded by the rank of chief physician to the troops destined to lay siege to Minorca and shortly afterwards to Gibraltar. Here he had to treat a fatal epidemic which prevailed among the combined French and Spanish forces in a typhoid form, the description of which same disease immortalised the name of Pringle towards the middle of the last century. This same squadron had already put ashore and left at Cadiz a great number of Frenchmen that had been attacked by the disease, when, in the beginning of September, 1782, it came to the bay of Algesiras. Here the naval hospital could only receive fifty of their sick, while as many as five hundred were in want of admission; and to place these in private houses was not only a very difficult, but also an undesirable proceeding. In these embarrassing circumstances Thion de la Chaume conceived the happy idea of making the sick encamp under tents as soon as they landed, an arrangement which was dictated by the climate, the season, and the nature of the disease, and of which the boldness was justified by success. La Chaume himself was attacked by the epidemic, and a great number of medical officers of all ranks, as well as the nurses, were carried off by it. When peace was concluded La Chaume returned to France, and was received with distinction by the Comte d'Artois (afterwards Charles X.), who had been a witness of his self-devotion and success at Algesiras, and who appointed him to be one of his own physicians. Shortly afterwards he married, but in the winter of 1785-6 he found that, in consequence of the rapid progress made by a pulmonary disease which had for some time threatened him, it was necessary for him to go to the south of France. Here he met with the kindest attentions from the officers of the regiment which he had formerly taken charge of at Ajaccio, who were at this time in garrison at Montpellier; at which place he died, October 28, 1786, at the early age of thirty-six. Thion de la Chaume wrote but little, though he is said to have carefully noted down every night whatever he had seen during the day worth recording; he nevertheless occupies a high rank in the list of army surgeons. His writings consist almost entirely of articles in medical dictionaries and periodicals, of which the most interesting is the account of the epidemic at Algesiras, which was published in the second volume of the 'Journal de Médicine Militaire.' (*Biographie Médicale.*)

THIONURIC ACID. When nitric acid is made to act upon uric acid, both are decomposed, and *alloxan*, a compound of hydrogen, carbon, oxygen, and azote, is ob-

tained in crystals. If sulphurous acid gas be passed through a saturated solution of alloxan in water, brilliant white crystals are obtained, which are thionurate of ammonia; these are to be decomposed by acetate of lead, and the thionurate of lead formed is to be decomposed by hydrosulphuric acid. By separating the sulphuret of lead, and evaporating the liquor, thionuric acid remains.

Its properties are, that it is a white semi-crystalline mass, readily soluble in water, and the solution reddens litmus strongly; it contains the elements of two equivalents of sulphurous acid, one equivalent of ammonia, and one of alloxan, or—

Seven equivalents of hydrogen . .	7
Eight equivalents of carbon . .	56
Fourteen equivalents of oxygen .	112
Three equivalents of azote . .	42
Two equivalents of sulphur . .	32
Equivalent . .	249

When heated, it is decomposed, much sulphuric acid remains in solution, and a crystalline compound is formed, which is termed *uramil*.

Thionuric acid combines with bases to form salts, which are termed *thionurates*; they are not however of sufficient importance to require description.

THIONVILLE, an important town in France, capital of an arrondissement in the department of Moselle, 208 miles east-north-east of Paris, by Meaux, Château Thierry, Châlons-sur-Marne, Ste. Ménéhould, Verdun, and Metz: it is in 41° 29′ N. lat. and 6° 11′ E. long.

Thionville (Latinized, Theodonis Villa) was a place of consequence in the time of the kings of France of the Carlovingian dynasty, who had a palace here: several important councils were held at Thionville in the reign of Charlemagne and his son Louis le Débonnair. After the extinction of the Carlovingian dynasty, the place came successively into the hands of the counts of Luxembourg, the dukes of Bourgogne, and the house of Austria, passing to the Spanish branch of that family. The duke of Guise took it from the Spaniards, A.D. 1558, but it was restored the following year. In A.D. 1639 it was besieged by the French, who were entirely defeated by an army sent to its relief: it was however taken by the prince of Condé, A.D. 1643, after the battle of Rocroy, and has ever since remained in the power of the French. It was bombarded by the Austrians in A.D. 1792, and again by the allies in A.D. 1814. Thionville is surrounded by strong fortifications, and is a fortress of the third class, and one of the barriers of France toward the Rhenish provinces of Prussia. The town is on the left or west bank of the Moselle; the citadel on the right bank: the two communicate by a bridge, the piers of which are of stone, and the upper part of wood, removeable at pleasure. The town is skirted on the south-east side by the canal of Yutz, over which are two bridges of stone and one of wood. The entrance into the town is by six gates: the houses have little worthy of notice: there are a good parade, a parish church which deserves examination, a riding-school, a corn-market, a theatre, an arsenal, a college or high school, which occupies the ex-convent of the monks of St. Augustine, an hospital, and a military prison. There are some manufactures of hosiery, woollen cloth, hats, household furniture, and candles: there are breweries, tan-yards, and oil and bark mills. There is one yearly fair.

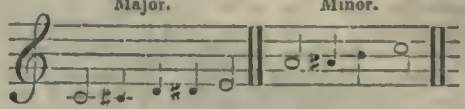
The population of the commune of Thionville, in 1826, was 5821; in 1831, 5645 (of whom 4142 were in the town); in 1836, 5680. There are a subordinate court of justice, several fiscal and administrative government offices, and a society for the encouragement of agriculture and industry.

The arrondissement of Thionville has an area of 405 square miles, and comprehends 117 communes: it had, in 1831, a population of 83,227; and, in 1836, of 87,520: it is divided into five cantons or districts, each under a justice of the peace.

(Malte-Brun, *Géographie Universelle; Dictionnaire Géographique Universel.*)

THIRD, an interval in music, classed among the imperfect concords, because liable to alteration; that is, the third may be either *major* or *minor*. The ratio of the Major Third is 5 : 4; of the Minor Third, 6 : 5. The former comprises one major and one minor tone, as C E. The latter comprises a major tone and a semitone, as A C. Example:—

Or, according to the mode of description adopted by many writers on the subject, the Major Third comprises, inclusively, five semitones; the Minor only four, Example:—



THIRLAGE, a tenure or custom formerly very common in Scotland, by which the owners or occupiers of certain lands were compelled to take their corn to a particular mill, to which the lands were said to be thirled or astricted, and to pay a certain proportion of it, varying in different cases, as a remuneration for the grinding, and for the expense of the erection and maintenance of the mill. Covenants of thirlage also bound the occupiers of the astricted lands to the performance of certain services for the maintenance of the mill and mill-dam, the carriage of millstones from the place at which they were purchased, &c. Thirlage was of three kinds, of which the least oppressive was the thirlage of grindable grain, by which the tenants or possessors of the astricted lands were merely compelled to carry to the mill such of their corn as they might require to use for food. The thirlage of growing corn extended to all the corn raised upon the thirled lands, with the exception of seed-corn, and such as might be used as food for horses on the farms in the state of grain. In some cases this kind of thirlage was modified by a provision to enable the farmer, on payment of a certain proportion of corn as compensation, to sell the remainder of his grain without taking it to the mill to be converted into meal. The third kind of thirlage, called thirlage of *invecta et illata*, required that all corn brought within the thirled district, wherever it might have been raised, should be taken to the dominant mill, that is to say, the mill to which the district is astricted or bound. This kind of servitude, having become in many cases exceedingly oppressive, has fallen into disuse, an annual payment in grain being substituted for it. Further particulars respecting this tenure may be found in Rees's 'Cyclopædia,' art. 'Thirlage;' and in the article 'Law' (clxx., 12-18) in the fourth edition of the 'Encyclopædia Britannica.'

THIROPTERA, Spix's name for a genus of CHEIROPTERA which, according to Cuvier, seems to have many characters in common with *Molossus*: its thumb carries a small concave palette which is peculiar to it, and enables it to hook itself better than it otherwise could.

Example, *Thiroptera tricolor*, Spix, 36, f. 9.

Cuvier remarks that he places this subgenus with doubt, because the description is incomplete.

THIRSK. [YORKSHIRE.]

THIRST is the peculiar sensation which excites the desire to drink. Water is the proper object of this desire. Of all the warm-blooded animals which are subject to thirst, man alone is either disposed, or, by the circumstances of his artificial mode of life, compelled, to satisfy it with any other liquid; and in all the variety of beverages which man has invented, the water with which other ingredients are combined is the only part which is essential to the satisfaction of thirst.

The times and degrees in which thirst is felt during health are, in general, such that, by satisfying it, the body is provided with the quantity of water necessary for the repair of its tissues and the maintenance of their proper moisture, and for the replacement of the fluid which is constantly lost by perspiration and other discharges. But the quantity of water necessary for this purpose varies greatly, according to the different circumstances of age, sex, and temperament, and still more according to the nature of the food taken, the state of the atmosphere, the mode of life, and the custom of the individual. Dry and

hard or salted food excites great thirst, probably because a large quantity of fluid is abstracted from the blood for its digestion; but fruits and soft vegetables assist, by the quantity of water which they contain, in quenching thirst; and infants, receiving their food and drink at once from the milk which is naturally provided for them, are perhaps not sensible of thirst as a healthy sensation different from that of hunger. Strong drinks, again, excite thirst, but in a peculiar manner; either by their irritation of the nerves of the digestive canal, or by the great quantity of fluid which, by exosmosis, they withdraw from the blood.

As a general rule, the degree of thirst during health is directly proportioned to the rapidity of the exhalation of fluid from the skin and lungs. Hence the naturally greater thirst in summer, and the desire for the fresh fruits of the season, which both supply water and produce moisture of the mouth by exciting a flow of saliva; hence also the less natural thirst which is produced by remaining in hot and crowded rooms, and that which is so painfully felt by those who work about iron-forges and steam-engines, and which they can satisfy only by frequent and enormous draughts of water. Of the same kind is the thirst which many have felt in ascending high mountains, on which, as the atmospheric pressure diminishes, the evaporation from the skin is increased; and that which is produced by exposure to a dry brisk wind.

The sensations and other circumstances accompanying ordinary thirst need not be described. The sensation of dryness of the mouth and throat, which most strongly characterizes it, is not always the result of those parts being really deficient in moisture, nor is it removed by supplying the mouth alone with fluid. It is an example of that class of local sensations which are indicative of peculiar general conditions of the body, or of the state of some other part in which no sensation is perceived. These have been called reflex sensations; and one of the characters common to many of them, as well as to thirst, is that the animal perceiving them is impelled to actions which tend to the health of the body. For example, the irritation which is felt at the upper part of the throat, and which induces one to cough, is often due, not to a direct excitement of that part, but to the existence of some irritating substance, such as mucus, in a distant and insensible part of the air-passages. From the latter part an impression is conveyed to the nervous centre; thence, without directly giving rise to a sensation, it is supposed to be reflected to the sensitive nerves of the glottis; and the sensation which is perceived through these excites the desire to cough, and thus leads to the expulsion of the irritating substance. In like manner the sensation of dryness in the mouth induces one to drink, and so to remove not merely the sensation, but the more important condition, such as a deficiency of water in the blood, of which it is a sign.

But as cough may be produced by a direct irritation of the upper part of the larynx, so a sensation similar to that of thirst is often due only to a rapid evaporation from the mouth and throat, as in long speaking or singing; but this may be removed by merely washing the mouth and throat, or by exciting a flow of saliva; means which are insufficient for the remedy of real thirst. That the introduction of water into the blood is necessary for quenching thirst has been often proved in persons who in attempting suicide have divided the pharynx or œsophagus, so that they could no longer swallow in the ordinary mode. Repeated washing of the mouth has been altogether unavailing to relieve their thirst; but the injecting of water through the wound into the stomach has quickly removed the sensation of dryness in the mouth, though none of the water passed through it. Similar facts have been observed in those who, being unable to swallow or to have liquids forced into their stomachs, have been long immersed in baths, and in shipwrecked sailors who have had no fresh water and have relieved their thirst by keeping their clothes soaked with sea-water.

The thirst of many diseases, such as acute fevers and important inflammations, affords another proof of the sensation peculiar to it being chiefly a sign of some general condition; for in these the sensation often continues not only when the mouth is moist, but after large quantities of water have been imbibed, being here probably dependent on some condition of the blood which dilution does not remedy. In certain cases also the sensation seems to be entirely subjective, and dependent on a peculiar condition of the nervous system. This is remarkably the case in a disease of which the true pathology is unknown, and which has been named polydipsia, from its chief symptom being an excessive and insatiable thirst. Several examples have been recorded, in some of which the thirst probably depended on a constant discharge of fluids from diabetic blood, or by dropsical effusions, or otherwise: but in many it could not be traced to such an origin. One of the most remarkable of them is described by Mr. Ware, in the 'London Medical and Physical Journal' for 1816: the patient was a man 22 years old, whose health was in other respects good, but who was compelled to drink six gallons of water daily. He had been accustomed to drink nearly as much from his childhood; and, if deprived of a sufficient supply, his head was always affected, and fainting and dullness of the senses ensued. Nearly all the cases of the same kind which have been published are collected in a paper by M. Lacombe, in the French medical journal 'L'Expérience,' for May and June, 1841, and references to several are given by Tiedemann, in his 'Physiologie des Menschen,' Band iii., p. 71.

If thirst be long unallayed, it produces one of the most dreadful states which a man can be compelled to bear. Those who have attempted suicide by starvation have been unable to resist the desire to drink, though they have endured many days of abstinence from food, and have been compelled thus for a time to protract their lives. The same tortures have been endured by sailors wrecked far from land. As the thirst increases, the mouth and throat become painful and burning hot, the respiration grows difficult, and the expired air feels hot and dry. The voice becomes hoarse, the speech thick and indistinct, and the pulse small and rapid. All secretion diminishes or is suppressed, the skin is hot and dry, and the eyes become painful and inflamed. The sensibility of every part of the body seems exalted, at the same time that the power of the muscles fails; the mind passes slowly from restlessness and anxiety to despair, and at last, as the body grows weaker, begins to wander in a low delirium. At the close of life there is an utter prostration of strength, and, in general, insensibility; but the inflammation of the mouth and eyes, and of all the parts that are not protected from the air by a thick cuticle, increases, and proceeds sometimes to gangrene. The time during which so miserable a state can be endured varies with the strength of the sufferer. Haller (*Elementa Physiologiæ*, t. vi.) has collected examples of men who lived for at least fifteen days without drinking; but the more ordinary period is eight or ten days.

THIRTY TYRANTS (*of Athens*). In the year 404 B.C., when, after the Peloponnesian war, Athens had fallen into the hands of Sparta through the treacherous designs of the oligarchical party, the Spartans themselves did not interfere in any direct way with the political constitution of Athens (Diodorus, xiv. 4), but their negotiations with Theramenes and others of the same party had convinced them that even without their interference the democracy would soon be abolished. In this expectation they were not disappointed, as this was really the object of the oligarchical party. But as this party did not sufficiently trust its own power, Lysander, who had already sailed to Samos, was invited to attend the Assembly at Athens, in which the question of reforming the constitution was to be considered. The presence of Lysander and other Spartan generals with their armies, and the threats that were uttered, silenced all opposition on the side of the popular party, and on the proposition of Theramenes a decree was passed that thirty men should be elected to draw up a new constitution. (Xenophon, *Hellen.*, ii. 3, 2.) Lysias (*in Eratosth.*, p. 126, ed. Steph.) gives a more satisfactory account of the proceedings on that memorable day than Xenophon. These thirty individuals were invested with the sovereign power of the republic. Theramenes himself nominated ten, the Athenian ephors ten others, and the election of the remaining ten was left to the people. The names of the Thirty are preserved in Xenophon (*Hellen.*, ii. 3, 2). Their government, a real reign of terror, which fortunately did not last more than one year, was called in Athenian history the year of anarchy, or the reign of the Thirty Tyrants. From the moment that they had thus acquired an apparently legal power, they filled the vacancies in the

senate and the magistracies with their own friends and creatures. The new code of laws which they were to draw up was never made, that they might not put any restraints upon themselves, and might always be at liberty to act as they pleased. A similar board, consisting of ten men, perhaps appointed by Lysander himself, was intrusted with the government of Piræcus. The object of the tyrants was to reduce Athens to the condition of an unimportant town, and to make the people forget the greatness to which it had been raised by Themistocles and Pericles. The splendid arsenal of Athens was sold and pulled down, and several of the fortresses of Attica were destroyed. To establish their tyranny the Thirty found it necessary to get rid of a number of persons obnoxious to them. The first that were put to death were the sycophants, who during the time of the democracy had contributed most towards its overthrow by their shameful practices; and the senate, as well as every well-meaning citizen, was glad to see the republic delivered of such a pestilence. The senate acted in these trials as the supreme court of justice, and the Thirty presided in it. All the votes of the senators however were given openly, that the tyrants might be able to see which way each senator voted. This mode of proceeding, though it was at first only directed against individuals equally obnoxious to all parties, became alarming when all the distinguished men, who had been imprisoned before the day on which the new constitution was established, in order that they might not frustrate the plans of the oligarchs by their opposition, were in like manner sentenced to death. The apprehensions of the people were but too well founded, and Critias, the most cruel among the Thirty, gave sufficient indications that the Tyrants did not mean to go on with the same moderation. That they might always have at hand an armed force to support them, they sent an embassy to Sparta to ask for a garrison to occupy the Acropolis. This was granted, and came under the command of Callibius as harmostes. His arrival rendered the Thirty secure. They courted the Spartan harmostes in the most obsequious manner, and he in return placed his troops at their disposal for whatever purpose they might wish to employ them in establishing their dominion more firmly. The assistance of the senate in the trials for political offences began to be dispensed with, and the number of the unhappy victims increased at a fearful rate. Not only persons who opposed or showed any dissatisfaction with the rule of the Tyrants, but all who by their merits had gained favour with the people, were regarded as dangerous persons, who, if they could choose, would prefer a popular government, and were condemned to death in a very summary manner. The reign of the Thirty now began to display all its horrors, and no one could feel safe. To be possessed of wealth, especially in the case of aliens, was sufficient to bring a man to ruin, for the tyrants, independent of all political considerations, began to murder for no other purpose than that of enriching themselves by the confiscation of the property of their victims. The remonstrances of Theramenes against this reckless system of bloodshed were not followed by any other consequences than that the Thirty selected 3000 Athenians who were to enjoy a kind of franchise, and who could not be put to death without a trial before the senate. The rest of the citizens were compelled to give up their arms, and were treated as outlaws. By this expedient the Thirty hoped to strengthen themselves, and to become more independent of the Spartan garrison. The opposition of Theramenes to this arrangement involved his own destruction. [THERAMENES.] The horrors which were now perpetrated became every day more numerous and fearful, and numbers of Athenians fled from their native country to seek refuge at Argos, Megara, Thebes, and other places, where they met with an hospitable and kind reception. The tyrants soon began to be uneasy at the crowds of exiles who thus gathered round the frontiers of Attica, and applied to Sparta to interfere. The Spartans issued a proclamation empowering the Thirty to arrest the exiles in any part of Greece, and forbidding any Greek state to interfere on their behalf. This command was entirely disregarded by the Greeks, especially the Thebans, who even declared that the Athenian fugitives should be received and protected in all the towns of Bœotia. Thebes, whose mode of action was not dictated by a generous and humane feeling towards the unhappy Athenians, but rather arose from jealousy of Sparta, thus became the rallying point for a great number of exiles, among whom Thrasybulus was the most enterprising. In what manner the rule of the Thirty Tyrants was at last overthrown, and the democratical constitution was restored at Athens, is related in the article THRASYBULUS.

(Xenophon, *Hellen.*, ii. 3; Diodorus, xiv. 3, &c.; Thirlwall, *History of Greece*, iv., p. 174, &c.)

THIRTY TYRANTS (*under the Roman Empire*). This name has been given to a set of usurpers who sprung up in various parts of the Roman empire in the reigns of Valerian (A.D. 253-260) and Gallienus (261-268). This appellation of the Thirty Tyrants, in imitation of the Thirty Tyrants of Athens, is highly improper, and bears no analogy to the Thirty of Athens. They rose in different parts, assuming the title of emperor, in irregular succession, and were put down one after another. Their number moreover does not amount to thirty, unless women and children, who were honoured with the imperial title, are included. Trebellius Pollio, who, in his work on the 'Triginta Tyranni,' describes the adventures of each of them, has taken great pains to make out that their number was thirty. There were however only nineteen real usurpers,—Cyriades, Macrianus, Balista, Odenathus, and Zenobia, in the eastern provinces; Posthumus, Lollianus, Victorinus and his mother Victoria, Marius, and Tetricus, in Gaul, Britain, and the western provinces in general; Ingenuus, Regillianus, and Bureolus, in Illyricum and the countries about the Danube; Saturninus, in Pontus; Trebellianus, in Isauria; Piso, in Thessaly; Valens, in Achaia; Aemilianus, in Egypt; and Celsus, in Africa. The majority of these usurpers were persons of low birth, without any talent or virtue, and scarcely any one of them died a natural death. The best among them were Piso and Odenathus, and the latter, who maintained himself at Palmyra, received the title of Augustus from the Roman senate, and was enabled to bequeath his empire to his widow, the celebrated Zenobia.

(Trebellius Pollio, *Triginta Tyranni;* Gibbon, *Hist. of the Decline and Fall*, chap. x.; Manso, *Leben Constantin's des Grossen*, p. 433, &c.)

THIRTY YEARS' WAR is the name of that memorable contest which lasted from 1618 to 1648, between the emperor and the Roman Catholic states of Germany on one side, and the Protestant states, with their allies, Denmark, and afterwards Sweden and France, on the other side. Spain, Holland, and Transylvania also took part in it, but their interference was less direct. This long struggle has generally been considered a religious war. It had indeed its origin in religious differences, but political ambition afterwards became the real motive of the contending parties, and religion was used to veil the designs of the leaders, and to keep up the enthusiasm of the people. The Thirty Years' War arose out of the state of political and religious confusion into which the German empire was thrown by the Reformation, and which in the beginning of the seventeenth century had become so inextricable, that a civil war, without foreign interference, became apparently the shortest if not the only means to save Germany from ruin.

In order to facilitate the understanding of the history of the Thirty Years' War, we shall first give a short view of the state of religious and political affairs in Germany during the latter part of the sixteenth century.

When the war between Charles V. and Maurice elector of Saxony was terminated by the treaty of Passau (1552), and after the conclusion of the Second Peace of Religion (1555), the memory of the dangers from which Germany had escaped preserved the empire during a long period from the calamity of a new religious war. The Protestant religion was propagated, without any violence, in many provinces which had until then been faithful to Rome. As early as 1580 the most powerful hereditary princes of the empire, except the archdukes of Austria and the dukes of Bavaria and of Cleves, were all converted to the doctrines of Luther; the Roman Catholic princes, and even the emperors Ferdinand I. and Maximilian II., were obliged to make many concessions in religious matters in order to keep their subjects in obedience.

By the Second Peace of Religion the princes had acquired the 'ius reformandi,' that is, the right of protecting

their subjects in religious affairs, which right was gradually considered by them as a right of reforming the state of religion. For this purpose the Roman Catholic princes employed the Jesuits and the Capuchins; the Jesuits were active in the conversion of men distinguished by birth, by knowledge, or by their social position, and the Capuchins worked upon the mass of the people. Their zeal and success occasioned bitter complaints among the Protestants, who however gave causes of complaint equally numerous and equally well founded to the Roman Catholics. The dissatisfaction of the people was augmented by the selfish policy of their princes.

The ecclesiastical dignity of a bishop having lost all its signification in the Reformed religion, the Protestant bishops became mere temporal princes. Among their number were the archbishops and bishops of Bremen, of Magdeburg, of Verden, of Lübeck, of Osnabrück, of Ratzeburg, of Halberstadt, and of Minden. There being, at the same time, some hope that the Protestant bishops might become hereditary princes in their bishopries, the Roman Catholic bishops of Münster, of Paderborn, of Hildesheim, and the elector archbishop of Cologne, manifested their intention to adopt the Protestant faith. Availing themselves of the privilege granted them by the 'jus reformandi,' they encouraged their subjects to adopt the Protestant religion. The Roman Catholic princes tried all in their power to prevent such changes, but the Protestant princes favoured them, and each party had its motive for doing so, as the younger sons of the princes and nobles of both parties were usually appointed bishops, abbots, and canons.

The Roman Catholic party recovered its political influence towards the end of the sixteenth century. The Protestant elector archbishop of Cologne, Gebhard, count of Truchsess, was driven from his see, and his successor, Ernst, duke of Bavaria, who held together the bishopries of Cologne, of Liège, of Münster, and of Hildesheim, oppressed the Protestants in all his extensive dominions. The bishops of Würzburg and of Bamberg, assisted by the Jesuits, compelled their Protestant subjects to emigrate, and the archbishop of Salzburg treated the Protestants with unheard-of cruelty. In Strassburg there were at the same time a Protestant and a Roman Catholic bishop, who, after a bloody feud, were both sustained by the emperor Rudolph II. in those parts of the bishopric which they had conquered (1593). The Roman Catholic people were equally persecuted by the bishops of Halberstadt and of Osnabrück, and the troubles were increased by the differences which arose in the Protestant party itself between the Lutherans and the Calvinists.

The leader of the Calvinists was the elector palatine Frederick IV., who, with a small number of Calvinist princes, refused to appear at the diet of Regensburg (1594), which was assembled by Rudolph II. for the purpose of obtaining the assistance of the empire against the Turks. Frederick and his party declared that they would not assist Rudolph in the Turkish war, unless he satisfied all the claims of the Protestants, and at the same time they promised a subsidy of 400,000 gulden to Henri IV. of France if he would restore the Protestant bishop of Strassburg to the entire bishopric. The Lutheran princes expressed the utmost indignation at the treacherous conduct of Frederick IV., and they sent their contingents to the Turkish war. But from that moment there was a French party among the princes of the empire, and we shall afterwards see how dexterously France managed her influence over Germany.

The diet at Regensburg was dissolved in 1608 without any results with respect to the peace of the empire. The Roman Catholic states claimed the restitution of all the territories, bishopries, abbeys, and churches, which had been seized by the Protestants since the treaty of Passau (1552); but so far were the Protestant, and especially the Calvinist, princes from yielding to these claims, that they resolved to resist them by every means in their power. For that purpose they concluded the 'Protestant Union' on the 4th of May, 1608, of which however the elector of Saxony declined to become a member. The elector palatine Frederick IV., a Calvinist, was the leader of the Union. The members of the Union immediately levied troops, and sent ambassadors to England, France, and Venice, thus giving the example of a well-organized rebellion, and showing that they would resist the emperor and break the constitution of the empire with the assistance of foreigners.

The confusion of political and religious interests increased after the death of John William duke of Jülich, Cleves, and Berg (1609), one of the most powerful princes of the Roman Catholic party. The succession to his rich and extensive territories was disputed between John Sigismund, elector of Brandenburg, a Lutheran; the count palatine of Neuburg, Philip Louis, a Calvinist; and Christian II., elector of Saxony, a Lutheran, but a friend of the emperor. Alarmed by this latter circumstance, the elector of Brandenburg and the count palatine resolved to govern those duchies in common, until they could find an opportunity to settle this affair; and they immediately took possession of Jülich, Cleves, Berg, and the dependent counties. This act was declared by the emperor to be a breach of peace; he ordered the vacant inheritance to be sequestrated, and he appointed Leopold of Austria, bishop of Strassburg and Passau, to carry the measure into effect. He was assisted by the whole Roman Catholic party, which, alarmed at the loss of such a powerful member as the duchy of Cleves, concluded a union, to which they gave the name of the 'Liga' (11th July, 1609). This Liga was afterwards the strongest support of the emperor during the Thirty Years' War; Maximilian, duke of Bavaria, was at the head of it. But as early as the 11th of February, 1610, the Union concluded an alliance with Henry IV. of France, and occupied the bishopries of Würzburg and Bamberg. French troops entered the duchy of Jülich. King Henry seemed to have found an opportunity of carrying into effect his plans of a European republic, but he was murdered on the 14th of May, 1610. Frederick IV. died only five months later, and the Union concluded a peace with the Liga at Münich on the 24th of October, 1610. In the mean time a deadly personal animosity had broken out between the elector of Brandenburg and Wolfgang William, the son and successor of the count palatine Philip Louis, owing to their common government in the states of the late duke of Cleves. Wolfgang William, in order to obtain assistance against Brandenburg, adopted the Roman Catholic religion; and the elector of Brandenburg made himself a Calvinist for the purpose of obtaining the assistance of the Union, which was chiefly composed of Calvinist princes. The confusion which arose from these sudden changes became still greater by the interference of the king of Spain, Philip III. This king became afraid of new religious troubles in his provinces of the Netherlands, situated on the boundaries of the duchies of Cleves and of Jülich, and he therefore ordered his general, Spinola, to occupy them for the count palatine with a body of 30,000 Spaniards. But no sooner had his army entered these territories than the United States of the Netherlands, then at war with Spain, sent troops into the same countries under the pretence of occupying them for the elector of Brandenburg (1614). This was the first example of a war between foreign powers being carried on in Germany.

The empire was now on the eve of a general war. It was generally expected that it would begin on the banks of the Lower Rhine, but, on the contrary, it broke out in Bohemia.

By a solemn declaration of the emperor Rudolph II., liberty of religion had been granted to the Utraquists, a numerous Protestant sect in Bohemia (9th of July, 1609). The document containing this declaration had the name of the 'Majestäts-Brief.' Civil troubles having broken out in Bohemia, and Rudolph II. having taken arbitrary measures to put an end to them, the Bohemians deposed him, and chose his brother Matthias king in his stead, in 1611. Rudolph II. died of grief in the following year, and Matthias likewise succeeded him on the Imperial throne (1612). The number of Lutherans and Calvinists having greatly increased in Bohemia, they claimed the same religious liberties with the Utraquists. Matthias refused to yield to these claims, and serious differences arose between him and the Lutheran and Calvinist Bohemians. They were joined by the Utraquists, who were afraid the emperor might abolish the 'Majestäts-Brief.' Matthias sent commissioners to Prague, who assembled the deputies of the Bohemian states in the royal castle of the Hradshin, and declared to them that their king and emperor would not extend the 'Majestäts-Brief' to the Lutherans and

Calvinists. Suddenly an armed party of Bohemian nobles, who belonged to the Utraquists, rushed into the room where the commissioners and the deputies were assembled. They seized two of the commissioners, the counts Martinitz and Slawata, who were detested in Bohemia, and they and their secretary Fabricius were precipitated from the windows, a height of eighty feet; but a heap of dung preserved them from being dashed to pieces, and they all escaped and hastened back to Vienna.

This happened on the 21st of May, 1618, and this day is justly regarded as the beginning of the Thirty Years' War.

The conduct of the Bohemians towards the Imperial commissioners was by no means an act of rashness or anger. The party of the Utraquists had previously resolved upon it, because they wanted to give the signal for an insurrection which had been secretly prepared among all the Protestants of Bohemia and her dependent provinces Moravia, Silesia, and Lusatia, as well as among those of the archduchy of Austria. The insurgents immediately organized a regular administration of the kingdom. They also levied an army, which was commanded by the count of Thurn, and which was reinforced by a body of the troops of the Union, commanded by Christian, prince of Anhalt, one of the greatest intriguers of his time. The emperor Matthias died soon afterwards (20th of March, 1619), and Ferdinand II., archduke of Austrian Styria, succeeded him as emperor. Previously to the event of the 21st of May, 1618, Ferdinand had been crowned as future successor of Matthias in Bohemia.

The leaders of the Union encouraged the Bohemians to further resistance. Although Ferdinand II. promised religious liberty to all the Protestants of Bohemia, they nevertheless sent their troops against him, and declared the throne vacant. Frederick V., elector palatine, the son-in-law of James I. of England, was chosen king of Bohemia, and he was crowned at Prague on the 4th of November, 1619. In the mean time the count of Thurn had made great progress in Austria. In the month of July, 1619, he was under the walls of Vienna, and, although this city was relieved, he remained with his army in the adjacent country. There he was joined by Betlen Gabor, the sovereign prince of Transylvania, who had overrun Hungary and who took up his winter-quarters in Moravia, together with the count of Thurn. In the same winter (1619–1620) the new king of Bohemia made a defensive and offensive alliance with the Protestant insurgents of Hungary, and he proposed a similar alliance to Sultan Ahmed I. This imprudent and unpatriotic policy made his cause unpopular among all parties in Germany.

Ferdinand II. took vigorous though arbitrary measures to recover Bohemia and her dependencies, those extensive and rich countries which are now inhabited by upwards of ten millions of inhabitants. The pope, Spain, Bavaria, and even the Protestant elector of Saxony, promised their assistance to the emperor. In the autumn of 1620 the Lower Palatinate was occupied by the Spaniards under Spinola; the duke of Bavaria overran the Upper Palatinate and entered Bohemia; John George, elector of Saxony (since 1611), conquered Lusatia; and Austria was rescued by the emperor himself, who had made peace with Betlen Gabor. At last the Bavarians, commanded by their duke and the celebrated Tilly, forced the Bohemians to make a stand on the Weisse Berg under the walls of Prague. There they were completely defeated on the 8th of November, 1620. Frederick fled from his capital, and after a short stay in his second capital, Breslau, he abandoned his kingdom and took refuge in Holland. Towards the close of 1621 Bohemia, with all her dependencies, was in the hands of the emperor, who rewarded his ally, the elector of Saxony, with the province of Lusatia. He punished the Bohemians severely. A great number of nobles were beheaded, and their estates, as well as those of a still greater number of fugitives, were confiscated; but an amnesty ('quoad vitam et honorem') was given on the 4th of May, 1622, to all those who had not been condemned before that day. The Lutheran and Calvinist ministers were banished, and their churches were shut up; but not those of the Utraquists, notwithstanding the 'Majestäts-Brief' was abolished. The Roman Catholics were restored to all their rights; and the university of Prague and the whole national education were put under the direction of the Jesuits. The emperor then put king Frederick under the ban of the empire, declared his electorship to be forfeited, and proposed the duke of Bavaria to be chosen elector. This proposition however gave dissatisfaction to the other electors, who considered the banishment of Frederick as illegal because the council of the electors had not formally pronounced it according to the constitution of the empire.

The power of the emperor increased so much by his conquest of Bohemia, and the Roman Catholic states were so much encouraged, that they claimed those bishoprics, abbeys, and churches which had been reformed by the Protestants since the Second Peace of Religion.

Before the fate of Bohemia was decided, Christian IV., king of Denmark and duke of Holstein, several princes of northern Germany, and the ambassadors of England, Sweden, and the United States of the Netherlands, held a congress at Segeberg in Holstein for the purpose of forming an alliance against any ambitious schemes of the emperor. After the battle on the Weisse Berg, king Frederick also came to Segeberg, and claimed the assistance of the northern princes in order to recover his electorate. These princes however had assembled exclusively for their own interests. The bishoprics of Lübeck, of Bremen, of Verden, of Schwerin, of Halberstadt, and several others, had been bestowed on younger sons of the reigning houses of Holstein and of Brunswick, and they were sure to lose them if the Roman Catholic party had power enough to take them. Frederick therefore found only one friend. This was Christian, duke of Brunswick and bishop of Halberstadt, an unprincipled man, who loved Elizabeth of England, the wife of the unhappy king of the Bohemians, and swore he would die for her. With a strong body he entered the Palatinate. He was beaten by Tilly at Höchst (6th June, 1622). Christian now joined the count of Mansfeld, a man not less unprincipled than himself, and they retired to northern Germany as far as East Friesland. They plundered and robbed friends as well as enemies, but, pressed by Tilly, they disbanded their troops, and fled to England (December, 1623). Maximilian of Bavaria having been chosen elector at the diet of 1623, and Tilly being then in possession of several northern bishoprics, king Christian concluded an alliance with England and the United States of the Netherlands for the purpose of obtaining subsidies for the war which he intended to declare against the emperor. Christian of Halberstadt and the count of Mansfeld promised their assistance. The former went to France and levied troops there, and Mansfeld, who had obtained a commission as an English general, levied a strong force in England. They united in the Netherlands, and, after many adventures and dangers, Mansfeld succeeded in joining the duke of Mecklenburg, who was an ally of the king of Denmark. Meanwhile the latter king had been appointed commander-in-chief of the united forces of the circle of Lower Saxony, and, though the greater part of the princes of this circle shortly afterwards made their peace with the emperor, the king advanced into Hanover, where Tilly was ready to receive him (1625).

The emperor was then in a very embarrassed situation. The war in northern Germany was carried on by the troops of the Liga, and principally by those of Bavaria, commanded by Tilly, who was at the same time commander-in-chief of the forces of the Union. The duke of Bavaria had consequently an immense influence in public affairs; the emperor was obliged to cede to him the revenues of a part of his archduchy of Austria as an indemnification for his expenses in the Bohemian war, and to appoint him his high commissioner in the electorate of the Palatinate. On the other side, Ferdinand II. was threatened by the count of Mansfeld, who was then at the head of a strong army in the duchies of Mecklenburg, and who was ready to invade Lusatia and Silesia, and to join Betlen Gabor, prince of Transylvania. This prince had again taken arms against Austria, and there was only a small body of Imperial troops to check him.

Albrecht of Waldstein [WALLENSTEIN], the hero of the Thirty Years' War, saved the emperor and preserved the empire. Known as a skilful general, and in possession of very large estates, he was created duke of Friedland in 1624. In 1625 Ferdinand II. appointed him commander-in-chief of an Imperial army which did not exist, but which was created by Waldstein in a very short time.

Waldstein advanced towards the Lower Elbe, and took a fortified position at Dessau. There he was three times attacked by Mansfeld. On the 1st and on the 11th of April, 1626, Mansfeld was beaten; on the 25th of the same month he was put to the route. He reinforced his army in Mecklenburg, and in June invaded Silesia with 20,000 men, in order to join Betlen Gabor. Waldstein marched in a parallel direction, and weakened his enemy by skirmishes. On the 8th of September Mansfeld was on the banks of the Waag in north-western Hungary, with only one-fourth of his army, while Waldstein with fifty thousand men stood between him and Betlen Gabor. This prince made peace with the emperor, and Mansfeld, leaving the remainder of his army to the command of John Ernst, duke of Saxe-Weimar, fled to Venice, but died on his way, in a village in Dalmatia. Christian of Halberstadt, his fellow-adventurer, had died before him, in the 27th year of his age.

While Waldstein was victorious in eastern Germany, Tilly carried on the war in the country west of the Elbe against the king of Denmark. In consequence of a fall from his horse, which had affected King Christian's mind to an alarming degree, he firmly believed that God had chosen him to be the champion of the Protestant religion. But half of his army was destroyed by the skilful manœuvres of Tilly, and at last the king was obliged to make a stand at Lutter am Barenberg, between Goslar and Hildesheim. A battle ensued, in which the Danes were completely defeated (17th of August, 1626), and Christian fled beyond the Elbe into his dominions.

Tilly employed the following year (1627) in besieging and taking the towns on the left side of the Elbe, which were occupied by Danish garrisons. In the month of July he was joined by Waldstein, who, after his victories over Mansfeld, had driven the Danes from the countries east of the Elbe. Waldstein, after having put the dukes of Mecklenburg to flight, attacked the king of Denmark, who had assembled a new army (1628), and in one campaign his troops conquered all the continental possessions of Christian IV., who was compelled to beg for peace before the end of the year. A congress assembled at Lübeck, and on the 22nd of May, 1629, Waldstein granted peace to the king of Denmark, on conditions unexpectedly favourable: Jutland, Sleswik, and Holstein were restored to Christian, who promised not to interfere in the German affairs nor to make any further claim on bishopries on behalf of his kinsmen. Immediately after the peace of Lübeck, Waldstein was invested with the duchies of Mecklenburg, the dukes having previously been dispossessed and put under the ban of the empire for their adherence to the king of Denmark.

One of the most remarkable events in the Danish war was the siege of Stralsund on the Baltic, a town which belonged to the Hanseatic confederacy, though it was subject to the duke of Pomerania. Stralsund being occupied by a Danish garrison, it was besieged by the troops of Waldstein, who conducted the siege during the months of June and July, 1628. On the 14th of July the town capitulated; but before the Imperial troops had taken possession of it, a Swedish fleet appeared off Stralsund, and landed a strong body of troops, who took possession of the fortress. Although the inhabitants of Stralsund had promised obedience to the emperor, the Imperial troops were not allowed to enter the town, which remained under the command of a Swedish general. Of this most unfair and insulting interference on the part of the Swedes, Waldstein was previously aware; and this was one of the reasons why he allowed such favourable terms to the king of Denmark at the peace of Lübeck; another cause was a daring design of the emperor on the liberty of the Protestant religion. Encouraged by the success of his armies, and misled by imprudent counsellors, Ferdinand II., on the 6th of March, 1629, issued the 'Edictum Restitutionis.' By this edict he deprived the Calvinists of their religious liberties; and he declared that, conformably to the Second Peace of Religion, all the bishopries, abbeys, and churches which had been taken from the Roman Catholics since that peace should be restored to them; and that the Roman Catholic possessors of Protestant territories should not be hindered from the enjoyment of the privileges granted by the 'Jus Reformandi.' The ecclesiastical states which had been ceded to members of the house of the elector of Saxony, who was still an ally of the emperor, were alone excepted from this ordinance. If the 'Edictum Restitutionis' had been executed, a general civil war would have been the immediate consequence; but it met with much opposition. Only a few Protestant bishopries were conferred upon Roman Catholic princes, and the legal execution of the Edict was made dependent upon the arbitration of a general meeting of all the states. This meeting was called the 'Day of Composition,' and was fixed for the month of February, 1631.

The religious troubles seemed now to be nearly at an end. All the states of Germany wished for peace; and all hoped that this peace was to be settled on the 'Day of Composition.' The Protestant party was still powerful enough to obtain favourable conditions for their religion. The emperor's power had much increased, but the ambition of his counsellors and the haughtiness of his generalissimo, Waldstein, met with vigorous opposition among the members of the Liga, who obliged the emperor to deprive Waldstein of his rank as commander-in-chief of the Imperial forces (1630). Foreign interference was not at all necessary. But foreign interference was nevertheless prepared by France and Sweden.

Gustavus Adolphus, king of Sweden, was master of all the countries which lie around the northern and eastern parts of the Baltic, and his favourite plan was to make this sea into a Swedish lake. He was also a pious man, and sincerely attached to the Protestant faith. Deeply afflicted by the dangers to which this religion was exposed in Germany, he formed the plan of becoming its protector, and he pursued this plan with the more zeal and perseverance, as he was convinced that by becoming protector over the Protestant religion he would also become master of the Baltic. Immense influence in Germany, and the possibility of being raised to the dignity of emperor, would have been the consequence of success in either of his ambitious designs. (Extracts of documents contained in Breyer, *Beiträge zur Geschichte des Dreissigjährigen Krieges*, pp. 210, 219, 221, 252.) France, then weakened by civil troubles, was unable to interfere directly in the German war, and her minister, Richelieu, employed every means in his power to persuade the king of Sweden to make the first attack. Gustavus Adolphus being then at war with the Poles, Richelieu tried to negotiate a truce between the belligerent parties; but the emperor, anxious to prevent any such peace, sent his general, Arnheim, to Poland, with those troops who had been employed in the siege of Stralsund. Although the Swedes had first violated the German territory by occupying that fortress, they nevertheless considered the assistance which the emperor gave to the Poles as a declaration of war. But, instead of attacking the hereditary states of the emperor on the Polish frontier, Gustavus Adolphus, by the mediation of the French ambassador, Charnacé, made a truce with the king of Poland for six years, at Altmark, in the month of September, 1629. He then made great preparations for an attack on the German countries along the Baltic, and ordered his fleet to blockade the towns of Wismar and Rostock in Mecklenburg, which were occupied by the troops of Waldstein. The king of Sweden was the more active because he was checked in his designs on the Baltic by Waldstein, who had assumed the title of Imperial admiral of the Baltic, and who, by means of the Hanseatic towns, wished to restore the supremacy of the German navy in the northern seas. But, having been deprived of his military command by the emperor in 1630, Waldstein saw himself compelled to defer the execution of these gigantic plans.

French subsidies enabled Gustavus Adolphus to be ready for the new war as early as the spring of 1630. On the 24th of June he landed 16,000 men on the island of Usedom, on the coast of Pomerania. He styled himself Protector of the Protestant Faith, and came to Germany at a moment when the princes were assembled at Regensburg for the purpose of settling their religious affairs, and when the Protestant party itself had sufficient power to protect its faith. The first act of Gustavus Adolphus was to compel Bogislav XIV., duke of Pomerania, a Protestant prince, to appear in his camp, and to surrender to him his capital, Stettin, a town equally important by its fortifications and by its situation near the mouth of the Oder. He then gradually occupied all Pomerania, and on the 13th of January, 1631, concluded a treaty with France, by which

he engaged himself to carry on the war against Austria with 16,000 cavalry and 30,000 foot, on the condition of an annual subsidy of 400,000 thalers. Meantime he summoned the Protestant princes to join him, but when assembled at Leipzig (10th of February to 12th of April, 1631) they declared the king of Sweden an intruder, and they promised to assist the emperor with all their forces. George, duke of Brunswick Lüneburg, was the only prince who joined the Swedes, in the hope of obtaining some ecclesiastical territory as an addition to his hereditary states. Thus deceived in his hopes, the protector of the Protestant faith attacked George William, elector of Brandenburg, who was his brother-in-law and one of the first Protestant princes of the empire. He compelled him to surrender his fortress of Spandau, and he then made an alliance with the city of Magdeburg.

This rich and populous Imperial town joined the Swedish party for the purpose of escaping the danger of being occupied by the Imperialists, who were ordered to defend that fortress against the Swedes. For this conduct Magdeburg was put under the ban of the empire. Tilly having been charged to execute the ban, and to take the town by force, the citizens of Magdeburg hoped to be rescued by the king of Sweden, who had promised his assistance, but Gustavus durst not advance as far as the Elbe, unless his rear was secured by an alliance with the electors of Brandenburg and of Saxony. Magdeburg was taken by storm by Tilly and Pappenheim, whose troops plundered the town during three days and destroyed it by fire (20th of May, 1631). The unhappy fate of this opulent town was made the subject of a charge against the king of Sweden, who however had gained such influence over the princes of northern Germany, that his political credit was in no way weakened by this event. He forced the elector of Brandenburg to conclude an alliance with him; he drove the Imperial garrisons from Mecklenburg, and restored the dukes; and he ravaged the electorate of Saxony until the elector surrendered his towns, and concluded a defensive and offensive alliance with Gustavus Adolphus (14th of September, 1631). Previously to this, William V., landgrave of Hesse-Cassel, had voluntarily attached himself to the Swedes, for the sole purpose of profiting by the confusion into which the empire was thrown by their interference. Bernhard, duke of Saxe-Weimar, offered his services as general to Gustavus Adolphus, and he was immediately put at the head of a part of the Swedish army.

While the king of Sweden thus had his power increased by the forced or voluntary adherence of the princes, Tilly reinforced his army, and occupied Leipzig. But on the 17th of September, 1631 (N. S.), Tilly lost the battle of Leipzig against the united forces of the Swedes and Saxons; and such was the disorganization of the Imperial army, that Gustavus Adolphus found no enemy to oppose his march to southern Germany. However, instead of invading the hereditary states of the emperor, the king of Sweden conquered the bishopries of Würzburg and Bamberg in Franconia, which he intended to keep for himself. He then took the archbishopric of Mainz and the Palatinate, but did not restore it to its legitimate master, the banished king of Bohemia, Frederick V. At last he marched to Bavaria, and forced his way across the Lech after a bloody victory over the Bavarians, who lost their general, Tilly (5th of April, 1632). Augsburg, a free Imperial town, was forced to pay homage to Gustavus Adolphus, who on the 7th of May made his entrance into Münich, the capital of Bavaria. During this time the Saxons, the compulsory allies of the Swedes, had occupied a considerable part of Bohemia and Silesia. The great designs of Gustavus Adolphus now became manifest. He proposed to George William, elector of Brandenburg, that Frederick William, the elector's son, should marry his only daughter Christina. Frederick William was thus to become master of Sweden, Finnland, Ingermannland, Esthonia, Livonia, Curland, Prussia, Brandenburg, Mecklenburg, Pomerania, of the bishopries of Bamberg, Würzburg, Mainz, Magdeburg, Halberstadt, Speier, and Worms, of the Palatinate, and of all the countries which the king hoped to conquer in southern Germany. But this brilliant offer was refused by George William. It is said that this prince, who was a zealous Calvinist, would not allow his son to become a Lutheran. But another condition of this marriage being to assist the king of Sweden in his designs on the Imperial crown, it seems that the elector refused the proposals, because he would not make himself the instrument of Swedish ambition.

The emperor was then in the utmost extremity. He had no army to oppose to the Swedes, and if he had had one, the only general who, after Tilly's death, was able to lead it with success against Gustavus Adolphus, Waldstein, had been deprived of his rank as commander-in-chief, and had become a deadly enemy of the emperor. Ferdinand was obliged to humiliate himself before his vassal, and at last Waldstein consented to resume the command of the Imperial army, not as its general, but as its supreme and independent master. This army however did not exist, but was to be created by Waldstein.

When Gustavus Adolphus occupied Münich, Waldstein had already levied a strong body of troops, with which he expelled the Saxons from Bohemia. The defeat of his ally obliged the king of Sweden to relinquish the attack on Austria, to leave Bavaria, and to hasten to the assistance of Saxony, then exposed to the victorious Imperialists. He made a stand at Nürnberg, in order to observe the Imperial army (January, 1632). In the month of July Waldstein arrived at Fürth, near Nürnberg, and took up a strong position, by which he checked the king, and intercepted the supplies of provisions which were destined for the Swedish camp. Gustavus Adolphus assaulted the camp of his adversary on the 24th of August, but his troops were driven back with great slaughter; and the king, seeing his army exposed to hunger and disease, left his camp on the 8th of September, and retired to Saxony. Waldstein followed him, and in the month of October both the armies were in Saxony. Waldstein divided his army into two bodies, in order to enter into winter-quarters, thinking that the king of Sweden had renounced hostilities for that winter. But on the 6th of November he was suddenly attacked by the Swedes at Lützen, a small town in the environs of Leipzig, and he lost the battle in consequence of a part of his army having been separated from the main body. This victory however was fatal to the Swedes, on account of the death of Gustavus Adolphus, who was killed; and the battle was gained by Bernhard, duke of Saxe-Weimar, who immediately took the command of the Swedish army. Waldstein retired to Bohemia, where he remained, strangely inactive, although he soon repaired his losses at the battle of Lützen.

The death of Gustavus Adolphus did not lessen the power of the Swedes, nor change their politics: the chancellor Oxenstierna directed their affairs with the same views and the same skill as the late king; and the new generalissimo, Bernhard of Saxe-Weimar, was one of the most distinguished captains of his time. In 1633 Oxenstierna concluded an alliance with the states of the circles of Suabia, of Franconia, of the Upper Rhine, and of the Lower Rhine, and duke Bernhard got possession of Regensburg. Waldstein however destroyed the Swedish army in Silesia, conquered Lusatia, and entered into negotiations for the purpose of concluding a separate peace with Brandenburg and Saxony, those compulsory allies of the Swedes, who were afraid of the dangers to which Germany was exposed by the Swedish protection of the Protestant church. But Waldstein, whose pride became insupportable, and whose policy was crooked, was accused of high treason by his numerous enemies; and he was assassinated in the midst of his army, on the 25th of February, 1634. Ferdinand of Austria, the son and heir of the emperor, succeeded Waldstein as commander-in-chief of the Imperial and Bavarian armies: his lieutenants were Gallas and John von Werth, both experienced generals. Reinforced by a corps of Spaniards, he attacked the Swedes at Nördlingen, on the 7th of September, 1634. The Swedes were routed, their general, Horn, was made prisoner, and southern Germany fell into the hands of the Imperialists, who, though they exacted heavy contributions from the Protestant inhabitants, respected the liberties of the Protestant church. The Protestant princes of southern Germany, who hoped to aggrandize their states by means of the Swedes, were disappointed by the defeat of their protectors; but they found another powerful ally, who was always ready to encourage the German princes in their rebellious undertakings against the authority of their emperor. This ally was France. Löffler, the vice-chancellor of the duke of Würtemberg, and Streif, a privy counsellor of the margrave of Baden, negotiated an alliance between their

sovereigns and France (11th of November, 1634). The king of France being one of the first Catholic princes, he durst not assume the title of protector of the Protestant church, as the king of Sweden had done, and he therefore styled himself the protector of the liberties of the states of Germany against the tyranny of the emperor. His policy was nevertheless severely blamed by his fellow-believers. Jacob Keller, a German Jesuit, wrote a book concerning the policy of Louis XIII., who, at the same time, protected the Protestants in Germany, and persecuted them in his own kingdom; but this book was burnt in Paris by order of the Sorbonne. Duke Bernhard of Saxe-Weimar at the same time having sold himself and his army to France, Saxony and Brandenburg saw at last that any longer adherence to the Swedish alliance would be the ruin of themselves and of all Germany. Saxony concluded peace with the emperor on the 30th of May, 1635, at Prague; and Brandenburg gave in its adherence to this peace on the 27th of August following: the favourable conditions which they obtained proved that the emperor had given up all schemes of oppressing the Protestant church. The landgrave of Hesse-Darmstadt, the dukes of Mecklenburg, of Brunswick, and of Saxe-Weimar (duke William), the cities of Frankfort, of Erfurt, &c., the Hanse towns, and at last the whole circle of Lower Saxony, became parties to the peace of Prague in the course of the same year. Among all the Protestant states of importance, Hesse-Cassel, Würtemberg, and Baden were the only states which continued their alliance with the foreign invaders. This fact also proves that the Swedes had not armed for the sake of the Protestant religion, as they pretended; and that their sole purpose was conquest. If they had taken arms for the liberty of their faith, they would have made that liberty a principle, and they would have withdrawn from Germany as soon as this principle had ceased to be interfered with. Such disinterested conduct is indeed rare in history, and is often regarded as contrary to the substantial welfare of that nation which adopts it. But is the rarity of the fact a proof of its absurdity? To veil ambition with moral or religious pretexts is a common practice, but it deserves to be stigmatized with the name of public hypocrisy; and such was the Swedish interference in the Thirty Years' War.

The most important event from the year 1635 to 1639 was the conquest of Alsace by duke Bernhard of Saxe-Weimar, who hoped to possess that Austrian province as an hereditary duchy. His plans however were contrary to the policy of France, who herself aimed at the possession of Alsace, and had bribed the duke for the sole purpose of employing him as an instrument. No sooner had the duke's intentions become manifest, than he fell suddenly ill, and died on the 8th of July, 1639. His army, a strong and experienced body, was bought by France, who immediately occupied Alsace. The Imperialists however, reinforced by the Saxon troops, gained a victory at Haselünre over the Swedish general Knyphausen, who was killed (December, 1635); and they forced Magdeburg to surrender (1636). They and the Saxons were beaten in their turn at Wittstock by the Swedish general Banér (24th of September, 1636); and duke Bernhard defeated them at Rheinfelden (21st of February, 1638), and made prisoners generals Savelli and the celebrated John von Werth. Previously to this the emperor Ferdinand II. died (15th of February, 1637), and was succeeded by his son Ferdinand III., who had been king of the Romans since 1636. Leopold William, the brother of Ferdinand III., was appointed generalissimo of the Imperial army; and as early as the spring of 1640 he succeeded in driving the Swedes, under Banér, from Bohemia, and he pursued them as far as Hesse and Hanover. In the autumn of 1640 the emperor issued a proclamation, granting to the rebellious Protestant princes a general amnesty and the sovereignty over their temporal dominions on the status quo of 1630, and over their ecclesiastical territories on the status quo of 1627. But these princes treated the proclamation with neglect, still hoping that by their alliance with the foreigners they would acquire some privileges and some little territory more. They sent new contingencies to the army of Banér, who, in January, 1641, advanced as far as Regensburg. He was reinforced by a French corps, commanded by the Marshal de Guébriand, but their united forces were defeated by the Imperialists, and on their retreat they lost half of their troops. Banér died in the month of May, 1641, and his successor was Torstenson, who led the Swedes to new triumphs.

The war had now lasted for twenty-three years. Swedes, Danes, Spaniards, Dutchmen, Frenchmen, half-savage warriors from Hungary, Transylvania, and Croatia, had ravaged Germany from one sea to the other. Adventurers from all the countries of Europe flocked to Germany to learn warfare, and to enrich themselves by the plunder of the country. The foreigners pretended to protect the churches, but the churches were laid in ruins; they professed to defend the liberties of the cities, but the cities were deserted; they promised to maintain the privileges of the princes, and they robbed them of their dominions, and led them to disobedience and anarchy.

Before the war commenced, the people were told that they were on the eve of a religious contest, but they hesitated to believe it; no deep religious hatred, no fanaticism disturbed their domestic peace. After the war had lasted some years, their passions were roused, and their warlike spirit excited them to take up arms, some for the defence of their hearths, and others to follow Waldstein or any other leader of the time. The pretext which the princes made of religion was shown by their attacks on the property of the church, and thus the people lost their respect for religion. The example of Christian of Halberstadt, of Mansfeld, of Waldstein, who supported their armies by robbing indifferently Roman Catholics and Protestants, corrupted both peasants and citizens; and commerce and industry being ruined, and agriculture becoming an uncertain means of living, they formed bands of robbers, who ravaged the country. From these bands the Swedes recruited their troops, who, after the death of Gustavus Adolphus, were chiefly composed of Germans. The armies presented an aspect like those of the Goths when they invaded the Roman empire. One-third and often only one-fifth of them were soldiers: the remainder were vagabonds, women, and children, who followed the army, carrying with them on carts the property which they had stolen on their march. The greater part of the women were prostitutes, who, in the army of Waldstein, had a perfect military organization. They were divided into regiments, companies, and sections, each body being commanded by a prostitute, and the women having the same rank among these female adventurers which their lovers had in the army. The provinces which were the principal theatre of war were laid waste, and the inhabitants fled, or were killed, or died of hunger and disease. Of 500,000 individuals, the population of the duchy of Würtemberg in 1618, only 48,000 remained at the end of the war in 1648.

Torstenson, the new generalissimo of the Swedes, conquered, or rather traversed, in the spring of 1612, Saxony, Silesia, and Moravia, and his light horse appeared in the neighbourhood of Vienna. At the same time the Marshal de Guébriand penetrated into Suabia, in hope of joining the Swedish army under the walls of the emperor's capital. The Imperial generals however succeeded in delivering the hereditary states of Ferdinand; and while Torstenson retired to the north, where his presence became urgent on account of a new war with Denmark, the French army was compelled to cross the Rhine. Guébriand was killed in an engagement near Rotweil, and his successor, the count of Rantzau, a German nobleman in the French service, who had again appeared on the right bank of the Rhine, was surprised by the Imperialists under John von Werth, Mercy, and the duke of Lorraine. The battle was fought on the 24th of November, 1643, near Duttlingen, and the French army was almost annihilated. Christian IV. of Denmark was not more fortunate in his war with the Swedes than he had been against Tilly and Waldstein; but while he was fighting with Torstenson in Jutland, Gallas, the general of the emperor, suddenly appeared in Holstein, with the view of placing the Swedes between two fires. From this dangerous position Torstenson escaped by a bold manœuvre, which he executed with his usual rapidity. He advanced as if to attack Gallas, but suddenly turned to the right, crossed Holstein, and penetrated by rapid marches into the heart of Germany, thus obliging the Imperial army to follow him in order to protect the hereditary states of the emperor. The Swedes often made a stand to engage in skirmishes which proved disastrous to the Imperialists, and Gallas brought only half his army back to Austria. In the mean time

France had levied a new army, which was put under the command of Turenne, and which was reinforced by a body under Louis d'Enghien, afterwards prince of Condé. They attacked the Imperialists under Mercy, who, after a gallant resistance and various success, was at last obliged to retire to the east of the Black Forest, leaving the Palatinate, Alsace, and Baden in the hands of the French (autumn, 1644). The Imperialists were still more unfortunate in eastern Germany. Torstenson defeated them and the Saxons at Jankau in a bloody battle (6th of March, 1645), and their general, Hatzfeld, was made prisoner. In one campaign Torstenson made himself master of Silesia and Moravia, and encamped near Vienna; and his lieutenant, Königsmark, conquered the bishopries of Bremen and Verden. The elector of Saxony, and the elector of Brandenburg, Frederick William, who had succeeded his father George William in 1640, renounced their alliance with the emperor, and made their separate peace with Sweden; and their example was followed by Maximilian, elector of Bavaria. This hitherto faithful ally abandoned the emperor in 1647, after the victory of Turenne at Allerheim, and after the conquest of Suabia by Turenne, who advanced towards Münich. The defection of the elector of Bavaria excited the discontent of his army, and was considered an act of high treason by his generals. John von Werth, the idol of the soldiers, conceived the plan of putting the Bavarian army under the command of the emperor, and of seizing the elector and his ministers for the purpose of confining them in order to secure their fidelity. The plot was betrayed at the moment when it was to have been carried into effect. But John von Werth escaped, and Ferdinand created him a count of the empire. This event was followed by a victory of the Swedes at Susmarshausen, near Augsburg (7th of May, 1648). Königsmark, their general, now invaded Bohemia, and on the 31st of July conquered that separate part of Prague which is called the Kleinseite. This conquest was the last important event of the Thirty Years' War, which began and ended at Prague.

Peace of Westphalia.—As early as 1640 the Diet at Regensburg was occupied in putting an end to this awful war, and in 1641 preliminaries were prepared at Hamburg under the mediation of Denmark. Münster and Osnabrück were afterwards chosen for the places of congress, and the meeting was to be held in the spring of 1642, but it was not organised before the spring of 1643. The count of Auersberg was the emperor's ambassador at Osnabrück, where he was to negotiate a peace with the Swedish ambassador, John Adler Salvius; and the count of Nassau met at Münster the count d'Avaux, the ambassador of the king of France. The states of Germany sent likewise ministers or agents to both these towns; ambassadors of Venice and of the pope came as mediators; and Spain and the United States of the Netherlands sent their plenipotentiaries for the purpose of settling their private differences, and interfering in those of Germany. The negotiations lasted three years: the various chances of the war prevented the parties from acting upon an invariable principle, and the troublesome intervention of the German States were an obstacle to private interests being made subordinate to the general interest. At last the count of Trautmannsdorf, 'the most honest among all the ambassadors,' arrived from Vienna with full powers, and on the 14-24th of October, 1648, a double peace was concluded at Münster and at Osnabrück, which was legally considered as one, under the name of the Peace of Westphalia. Previously to this Spain and the United States of the Netherlands had likewise made peace at Münster, on the 20-30th of January, 1648. These are the principal conditions of the peace of Westphalia:—

I. *Conditions concerning the cession of territories and rights to foreign powers.*

1, Sweden, as 'an indemnification for her expense in the war and for ceding several of her conquests to their former possessors,' acquired Pomerania, except a part of Pomerania Citerior (duke Bogislav XIV. had died in 1637); the town of Wismar in Mecklenburg; the archbishopric of Bremen, and the bishopric of Verden, as hereditary duchies; a sum of five millions of thalers, which was not to be paid by the emperor, but by those circles where Gustavus Adolphus had promised to protect the Protestant church. In respect of these territories Sweden became a member of the empire.

2, France acquired the sovereignty over the bishopries of Metz, Toul, and Verdun, the possession of which had been ceded to king Henry II. in 1556; the sovereignty over Pignerol; the town of Breisach, and the right of keeping a garrison in Philippsburg; the landgraviats of Upper and Lower Alsace, the Sunigau, and the Imperial rights over ten free towns in Alsace, but not over Strassburg. These territories were ceded to France in full sovereignty, and the king of France consequently did not become a member of the empire.

3, The United States of the Netherlands and the confederacy of the cantons of Switzerland were acknowledged by the emperor as independent states; legally speaking, these countries were parts of Germany until the peace of Westphalia.

II. *Conditions concerning the cession of territories and rights to members of the empire.*

(These indemnifications were effected by secularising bishopries and other ecclesiastical territories.)

1, Hesse-Cassel acquired the abbey of Hersfeld, some of the fiefs of Schauenburg, and six hundred thousand thalers which were to be paid by Roman Catholic bishops.

2, Brandenburg acquired the bishopries of Halberstadt, of Minden, and of Camin, as hereditary principalities; and the archbishopric of Magdeburg as an hereditary duchy.

3, Mecklenburg acquired the bishopries of Ratzeburg and of Schwerin as hereditary principalities, and the commanderies of Mirow and Nemerow, which were taken from the Knights of St. John.

4, Brunswick acquired the convents of Walkenried and Groningen, and the privilege of appointing a prince of the reigning house bishop of Osnabrück; on this condition, however,—that the bishopric was to be governed alternately by a Protestant bishop of the House of Brunswick, and by a Roman Catholic bishop, who was to be chosen by the chapter.

5, The duke of Bavaria was confirmed as elector, and rewarded with the Upper Palatinate and the county of Cham.

6, Charles Louis, the successor of the banished elector palatine Frederick V., was restored to his dominions, except that part of them which was ceded to Bavaria; and as the electorship of his father was forfeited, an eighth electorship was created and bestowed upon him.

III. *Conditions concerning religion and the constitution of the empire.*

The principle of these conditions was, a general amnesty with regard to those who had rebelled against the emperor, though the word 'rebel' was not employed; and the maintaining of the status quo of 1618, before the beginning of the Bohemian war, with regard to the restitution of bishopries, churches, &c., which had been seized by either of the parties.

A. *Religion.*

1, The treaty of Passau and the Second Peace of Religion were confirmed.

2, The religious quality of a territory or state was to be decided after the status quo of the 1st of January, 1624 (N.S.).

3, Equality of political rights between the Roman Catholics, the Lutherans, and the Calvinists or Reformed.

4, The Jus Reformandi was reduced to its original meaning as a mere protection of religion. This principle was checked by numerous and complicated exceptions, which afterwards led to many complaints.

5, The ecclesiastical jurisdiction of the bishops was conferred upon the Protestant princes as a right of sovereignty; in the Roman Catholic territories it remained in the hands of the bishops.

B. *Constitution of the empire.*

1, The princes acquired the right of concluding separate defensive and offensive alliances with foreign states; and they became almost sovereign with regard to their subjects.

2, The German empire was changed into a kind of confederacy of almost sovereign states, the emperor becoming a mere director of the public affairs.

IV. *Conditions concerning the relations between Germany and foreign powers.*

1, The peace of Westphalia was guaranteed by Sweden and France.

The Thirty Years' War was the Peloponnesian War of Germany, and by the Peace of Westphalia the German princes prepared the destruction of their independence and the downfall of the empire. The German princes were originally rich landowners appointed by the emperors as high judges (graven, comites) and military commanders (herzoge, duces). From the eleventh century they endeavoured to obtain possession of these functions as hereditary rights. During five centuries they carried on a system of rebellion against the Imperial authority, and gradually usurped rights and privileges which the emperors were compelled to confer upon them in due form. Thus both legislation and administration became hereditary in the princes. Having succeeded with regard to political rights, they considered the Reformation of Luther as an opportunity of usurping ecclesiastical legislation. It was granted to a great number of them by the Peace of Westphalia. Luther's reforms gave birth to the Protestant faith, but this faith required to be supported by a church. A Protestant church did not exist before the Peace of Westphalia, nor was it established by this peace, nor is there now any general Protestant church in Germany. The princes considering themselves as legal successors of the bishops, the episcopal rights became a part of political sovereignty, and the ministers of the faith gradually became functionaries of the princes. Their first duty was to obey them; they not only obeyed, but they crouched before them and their ministers; their abject behaviour is shown by numerous works published during the latter part of the seventeenth century and the eighteenth century. When the people saw the dependence of the ministers on the temporal authority, they confounded the commands of their faith with the laws of their princes, and, not discovering any divine character in these laws, they forgot the divine origin of their religion. Thus they fell into that remarkable indifference concerning religious matters which now prevails in the greater part of the Protestant countries of Germany. This religious state is a consequence of the Thirty Years' War.

The political consequences of that war are still more evident. Germany was a wilderness—its material strength was ruined—its political power was broken—its intellectual development was checked—and the fierce and manly spirit of the nation was broken by their thousand arbitrary rulers, who themselves became slaves of the French. Divided into factions by the private interests of the princes, Germany became the theatre where the armies of all Europe met to settle the differences of their kings. This state of things lasted a hundred and fifty years, and ended with the destruction of the German empire by Napoleon.

(K. A. Menzel, *Geschichte des Dreissigjährigen Krieges*, 2 vols. 8vo., Breslau, 1835-37; Breyer, *Geschichte des Dreissigjährigen Krieges nach ungedruckten Papieren*, 1st vol., München, 1811, 8vo.; Breyer, *Beiträge zur Geschichte des Dreissigjährigen Krieges aus bisher ungedruckten Papieren*, München, 1812, 8vo.; Schiller, *Geschichte des Dreissigjährigen Krieges:* this work, distinguished by the beauty of its style, contains the most interesting description of the Thirty Years' War; but its historical value is not very great; Leo, *Lehrbuch der Universal Geschichte*, vol. iii.: the author's description is remarkable for the application of philosophical principles to history; Eichhorn, *Deutsche Staats- und Rechts-Geschichte*, vol. iv.: the author starts from a legal point of view, but he treats political and religious rights rather as a lawyer than as a publicist; Woltmann, *Geschichte des Westphälischen Friedens*, Leipzig, 1808-9, 2 vols. 8vo.; Meiern, *Acta Pacis Westphalicae publica, oder Westphälische Friedenshandlungen*, Göttingen, 1734-6, 6 vols. fol.)

THISTLE, the common name of *Carduus*, a genus of plants belonging to the large natural order Compositæ. From the time of Theophrastus down to that of Caspar Bauhin, all plants that possessed a spiny involucre were comprehended in the genus Carduus. The artichoke (Cynara) and the teasel (Dipsacus) were included in it by Tragus and Lobelius. Morison confined the genus to those plants that had spiny scales of the involucre and a crown of feathery down (pappus) surmounting the seed. Plants resembling them, but without a spiny involucre, he called *Cirsium*, and those without the feathery pappus *Carduus impropriè dictus*. Tournefort adopted these distinctions. Vaillant defined Carduus more accurately, giving it to plants with a globular involucre composed of spiny scales, with compound flowers, tubular florets, stamens united by the anthers, a hairy receptacle, and a hairy pappus on the seeds. If the pappus was feathery, he called the genus *Acama;* and when the receptacle was not hairy, but honeycombed, he used the term *Onopordon*, a name previously applied to thistles by Pliny. When the scales and receptacles were fleshy, he named the genus *Cynara*. Linnæus adopted these genera, but changed Vaillant's *Acama* into *Cnicus*, a name which had been previously employed by Tournefort for another genus.

The genus *Carduus*, Common Thistle, consists of upwards of 30 species, most of which are inhabitants of Europe. None of them are found in the New World.

C. nutans, Musk-Thistle, has decurrent spiny leaves, with handsome drooping flowers; the scales of the involucre cottony, the outer ones spreading. It is a common plant on waste ground, in dry, stony, or chalky soils, in Great Britain. It gives out, especially in the evening in warm weather, a strong smell of musk.

C. marianus, Milk-Thistle, has spinous leaves embracing the stem; the scales of the involucre leaf-like, recurved and spinous at the margin. It is a native of England; scarce in Scotland. The leaves are distinguished by the milky whiteness of their veins. This milkiness is said, according to an absurd story, to have been produced by a drop of the Virgin Mary's milk, just as the Milky-Way was supposed to arise from that of Juno. This plant is an esculent, and may be eaten young as a salad, or boiled and eaten as greens. The young stalks, when peeled and soaked in water, are also excellent.

The root may be prepared like salsify and skirret, and the receptacle may be cooked and eaten as the artichoke. When cultivated, the seeds should be sown in spring, and the plants kept at a foot and a half distance from each other, and the earth thrown up round them till they are etiolated.

The genus *Cnicus*, Plume-Thistle, is known by the feathered down that crowns the seeds. It is a large genus: nine of the species are inhabitants of Great Britain.

The Cotton-Thistle is the *Onopordon*, which is known by its honeycombed receptacle. The *O. Acanthium* is a British species. The leaves are ovato-oblong, sinuated, spinous, decurrent, and woolly on both sides. It attains a height of from four to six feet. It is cultivated in Scotland as the Scotch Thistle; but it is doubtful whether this national badge has any existing type, as the representations of the Scotch Thistle on ancient wood-carvings, coins, and armorial bearings, differ more from each other than any known species of thistles. The receptacle and stalks of the Cotton-Thistle are sometimes eaten, in the same manner as the artichoke and cardoon. [Cynara.]

The Carline Thistle forms the genus *Carlina*, which obtained that name from a tradition that the root of the Common Carline (*C. vulgaris*) was shown by an angel to Charlemagne as a remedy for the plague which prevailed in his army. The genus is known from the others by the inner scales of the involucre being spreading and membranous, and of a yellow colour. The Common Carline is a frequent plant in Great Britain on dry hilly pasture and in fields. It is about one foot high.

The Blessed Thistle is the *Centaurea benedicta*, the *Carduus benedictus* of old writers. The involucre of the genus Centaurea is not spiny, and the seeds have a very simple pappus, or none. The Blessed Thistle is a native of the Levant, and in the middle ages was held in extravagant estimation on account of its supposed virtues. It is still cultivated in some places on account of its medical properties.

For Sow Thistle, see Sonchus.

Some of the species of thistles are admitted into gardens. They form a pretty variety for borders, and require little care in their cultivation. They sow themselves very extensively by means of their winged seeds. On this account they are great pests to the farmer. In fields the annual kinds may be got rid of by the weeding-hook, but

the perennial kinds must be ploughed and the roots picked out. The *Carduus arvensis* has got the name of Cursed Thistle, on account of the difficulty of eradicating it where it has once grown. Although injurious to man, by exhausting the soil of that nutriment which plants supplying food require, their seeds are generally eaten by birds, and the larvæ of many insects live entirely on their leaves.

THISTLE. The thistle, with its strong prickly leaves and stem, establishes itself in the meadows and corn-fields, when it is not very carefully eradicated, and occupies the place of more useful plants. There are many varieties of the thistle, some of which are not destitute of elegance when in full blossom. Considered as a weed in our fields, our principal object is to eradicate it, which, in consequence of the ready dispersion of the seeds by the wind, is not easily done, as a slovenly farmer may seed the whole country around; and where the thistles are not eradicated from the hedges and sides of roads and paths, it is impossible to destroy them entirely: wherever the soil is newly turned up, especially when it is of a nature where wheat will grow well, thistles invariably arise: hence the saying of the blind man in choosing land, 'Tie me to a thistle.'

Those crops which are usually hoed can readily be cleared of thistles: but where the seed is sown broadcast, the labour of weeding them out is much greater. If they are not extracted with the root, they will soon grow again with redoubled vigour. In a moist season they may be pulled up by means of a wooden or iron forceps, which grasps them strongly near the crown of the root, and, as it has a projection which serves as a fulcrum, a pressure on the handles draws the root out when they are brought together. When a field has been long infested with thistles, the best way of clearing it is to watch when the thistle is in full bloom and the seed is just forming; if it be then cut off at the root it will die. Thus in two years a field may be entirely cleared of thistles.

It is chiefly in arable land that thistles are most troublesome. In pastures it is sufficient to eradicate them once, and to permit none to grow along the hedges and ditches. The seed does not readily vegetate, unless it finds a loose soil; and little birds are so fond of it, that they will leave none that is not covered with earth, especially in the beginning of winter. In some countries there are penalties inflicted on those who allow thistles to remain in their hedges or along the high road which borders their land; and a man may complain to a magistrate of a neighbour who will not destroy the thistles on his land, when the delinquent will be admonished or fined, as the case may require. Such a law would be very advantageous in many parts of the country, where no attention is ever paid to the weeds which grow in the hedges or in waste spots.

THISTLE, ORDER OF THE, an antient Scottish order of knighthood, sometimes called the order of St. Andrew. The early history of this order is involved in some obscurity, and the most absurd attempts have been made to establish its claim to high antiquity, of which it is sufficient to allude to the legendary account recited in the warrant for the restitution of the order in 1687, and given most minutely by several Scottish antiquaries, attributing its formation to Achaius, king of the Scots, in commemoration of a victory obtained by himself and Hungus, king of the Picts, over Athelstan. Nicolas observes, as a fitting illustration of this legend, that Achaius died upwards of a century before the reign of Athelstan; and he further shows that the thistle was not the acknowledged badge or symbol of Scotland until the latter part of the fifteenth century. Even after it became a national ornament, and formed a distinguishing feature of a collar resembling that now worn by Knights of the Thistle, it is by no means certain that it was considered the badge of an order of knighthood; and the searching investigation of Sir Nicholas Harris Nicolas, which is detailed at great length in the third volume of his recently published 'History of the Orders of Knighthood of the British Empire,' leads him to the conclusion that it is difficult to believe in the existence of the Order of the Thistle, as an organized fraternity, until the reign of James VII. of Scotland and II. of England. Whether it had any such prior existence or not, 'it is admitted,' he adds, 'even by the assertors of the antiquity of the order themselves, that, after the Reformation orders of knighthood being considered in Scotland as relics of popery, it fell into desuetude; and consequently it is not pretended that there were any "knights of St. Andrew," or "of the Thistle," after the accession of King James VI., in 1567.' The warrant of James II. for the re-institution of the 'most ancient and honourable order of the Thistle,' which is printed at full by Nicolas, and which asserts that by authentic proofs, documents, and records, the order 'continued in great glory and splendour for many hundreds of years,' bears date Windsor, May 29, 1687; but, although statutes were issued, and eight knights were nominated by James II., the patent or diploma for the restitution of the order never passed the great seal. Owing to the abdication of James, the order again fell into abeyance, until it was finally revived by Anne in 1703. In the warrant of 1687 it is stated that the order consisted originally of the king and twelve brethren (in allusion to the Saviour and the twelve apostles), and the same number was ordained as the full complement by Anne, although it was not filled up for several years. This continued without alteration until July 16, 1821, when, in consequence of the coronation of George IV., an ordinance was issued for the appointment of four extra members, who should become regular knights as vacancies should occur; and in May, 1827, the number of knights brethren was permanently extended to sixteen. Originally none but Scottish noblemen were admitted to the order; but since the time of George I. it has also been conferred upon several English peers. No foreigners have been admitted to the order; nor have any commoners, excepting a few who were heirs-apparent to dukedoms. It is usual for knights of the Thistle to resign the ensigns of the order when elected into that of the Garter, although the statutes contain no express provision to that effect; but in a few instances this custom has been dispensed with, as a special mark of royal favour. The decorations worn by the knights consist of a collar of enamelled gold, composed of sixteen thistles, interlaced with sprigs of rue, fastened to the mantle by a white riband; a small image of St. Andrew, also of enamelled gold, suspended from the collar; a medal or badge of gold, having an image of St. Andrew within a circle containing the motto of the order, 'NEMO ME IMPUNE LACESSIT' (No one provokes me with impunity'), and a thistle; a green riband, to which the medal is attached, and which is thrown diagonally over the left shoulder; and a star, consisting of a thistle enamelled in its natural colours upon a ground of gold, and surrounded by the motto and rays of silver. The star is worn on the left shoulder, on a mantle of green velvet, which, with other parts of the dress, are minutely described by Nicolas. Although the original statutes of the order, which were printed by Sir N. H. Nicolas in 1828, do not strictly define the method of admission, it was ordained by George I., in 1717, that vacancies should be filled up by election in a chapter of the order; but the usual practice has been for the sovereign to appoint to vacancies without summoning a chapter. His late Majesty, William IV., re-established the practice of election in a chapter of the knights brethren, but it has been again dispensed with by her present Majesty. The officers of the order are the dean, the chancellor, the secretary, the king-at-arms, and the usher, each of whom receives an annual salary, and a fee on the election of a knight, excepting only the chancellor, that officer never having been appointed, although he is mentioned in the statutes of 1687, 1703, 1717, and 1833: his duties are performed by the secretary. A complete list of knights of the Thistle, from the revival or creation of the order in 1687 to 1840, is given in the work above cited, from which this brief account is condensed.

THLASPI'DEÆ, a tribe of plants of the natural order Cruciferæ, having for its type the genus Thlaspi. It is also called Pleurorhizæ, from having the radicle of the embryo at the side of the cotyledons. The silicle opens with a very narrow dissepiment, and has keeled navicular valves. The seeds are oval, with flat accumbent cotyledons. The principal genera of this tribe are, *Thlaspi*, the Bastard Cress; *Iberis*, the Candy-tuft; *Hutchinsia*; and *Biscutella*, the Buckler-Mustard. They are most of them insignificant plants, possessing the acrid biting properties of the whole order. The genus Thlaspi is known by its silicles being emarginate at the apex with the valves winged at the back; the petals are equal, the pedicels bractless, and the flowers are white. Some of them, as the *Thlaspus arvensis*,

Penny Cress, have a strong alliaceous odour. They grow on rocks and barren places, and are frequently found amongst collections of rubbish from mines, &c., and are inhabitants of most parts of the world in cold and temperate regions.

Hutchinsia was named by Sir J. E. Smith after Miss Hutchins of Belfast, who contributed many observations on marine plants to the 'English Botany.' It has an elliptical silicle with wingless valves, equal petals, entire leaves, bractless pedicels, and variously-coloured flowers, but never yellow. All the species are mountainous plants. They possess no active properties, but are pretty little plants, and will grow on rock-work or in small pots. They are best grown in a soil composed of sand, loam, and peat. The annual kinds may be propagated by seeds; the perennial, by dividing the roots or by cuttings.

The Candy-tuft is known by two of its petals being larger than the other two; they are of a white or purplish colour, but never yellow. They are mostly mountainous plants, but grow well in gardens; and, if the seeds are sown at different periods, will blossom all the summer, and even through a mild winter. The shrubbery species are also well adapted for rock-work, and may be propagated by cuttings. [IBERIS.]

Biscutella has a flat silicle with one-seeded cells, a long permanent style, a compressed seed, and yellow scentless flowers. They are also alpine plants. In the garden they form a pretty variety with the other plants, on account of their yellow flowers. A dry sunny situation in a light sandy soil suits them best. They are best propagated by seeds, and may be kept in blossom during the summer by sowing at different periods of the year.

THOA, a genus of Polypiaria; included by Linnæus in Sertularia.

THOMAS, Θωμᾶς, תְּאוֹמָא (in Greek, Δίδυμος; John, xi. 16; xx. 24), one of the twelve apostles of Christ. (*Matt.*, x. 3.) The Hebrew and Greek names both signify *a twin*. St. Thomas is presumed to have been a Galilean; but no particulars of his birth-place or call to the apostleship are given, and the first notice of him individually is in *John*, xi. 40. Christ having expressed an intention of returning to Judæa, in order to raise his friend Lazarus from the dead, Thomas encouraged the other apostles to attend him, although he regarded death as the certain consequence of this step. The impulsiveness of character thus indicated was not long after very differently displayed. Thomas happened to be absent when Christ, after his resurrection, first appeared to the apostles; and when made acquainted with the fact, he expressed an incredulity which could only be satisfied by the manual evidence of inserting his finger in the holes which the spear and the nails had made in the body of his crucified master. Eight days after, when Christ again appeared, Thomas was present; and the reaction in his mind was very strongly expressed by him, when he was pointedly called upon by Jesus to stretch forth his hand and take the desired proof. (*John*, xxi. 24-29.) Thomas is not again mentioned in the New Testament. Doubtless he laboured, like the other apostles, in the propagation of the Christian doctrines: and ecclesiastical traditions make him one of the apostles of the Gentiles. It is alleged that he travelled eastward, and laboured among the various nations which then composed the Parthian empire. (Euseb., iii. 1; Rufin., x. 9; *Recognit.*, ix. 29.) There is a singular concurrence of Oriental and Western testimony (which may be seen in Assemanni and Baronius), to the effect that St. Thomas extended his labours farther eastward, and then southward, until he reached the coast of India and Malabar, where, having exercised his apostolic labours with success, he passed on to the coast of Coromandel; and having made great conversions to the faith in those parts, he proceeded over to some coast on the east, called China (which may possibly have been the country now called Cochin-China), and afterwards returned to Coromandel, where, having suffered martyrdom, he was buried in the mount since called St. Thomas's Mount.

In the quarters indicated there are Christian churches which bear the name of St. Thomas, and claim him for their founder. If they derive their existence as a church uninterrupted from the apostolic age, this fact may be taken as a corroboration of the above traditions. But if the effects which resulted among them from the labours of Mar Thoma and other Nestorian missionaries, at the commencement of the sixteenth century, were really an original conversion, or at least a re-conversion, and not, as is often supposed, the revival of a fallen but not extinct church—then this claim is to be regarded only as an echo of the tradition which has always prevailed in the Syrian churches, and which must be estimated by its intrinsic probability and value.

(Besides Assemanni and Baronius, see Tillemont, i. 397, sq.; Cave's *Antiq. Apostolicæ;* Winer's *Biblisches Realwörterbuch*, art. *Thomas;* Buchanan's *Christian Researches;* Yeate's *Indian Church History;* and Principal Mill's *Letter to the Society for the Propagation of the Gospel* (July 29, 1822), inserted in *Christian Remembrancer* for Nov., 1823.)

THOMAS A' KEMPIS. [KEMPIS.]

THOMAS AQUI'NAS. [AQUINAS.]

THOMAS, ANTOINE LÉ'ONARD, was born at Clermont in Auvergne, on the 1st of October, 1732. His father, it has been generally believed, died while Thomas was an infant, leaving a widow with three sons and a daughter. The eldest son, Joseph Thomas, who embraced the clerical profession, died in 1741: he composed a dramatic piece, entitled 'Le Plaisir,' which was acted with success in 1740. The second, Jean Thomas, died in 1755, professor in the college of Beauvais: he published some Latin verses, and introduced into his college an improved method of teaching Latin. It appears therefore that the taste for literature was common to the whole family.

Antoine Léonard was educated at home till he had completed his ninth year, and was then sent to prosecute his studies at Paris, where his brothers preceded him. In a letter which he addressed, in 1767, to Madlle. Moreau, he mentions that his second brother had taken great pains with his education. They were an attached family: Antoine retained all his early devotion for his mother till her death, in 1782; and his sister, the only member of the family who survived him, lived with him till his death.

Antoine Léonard Thomas distinguished himself at the university. In 1747 he carried off two of the prizes distributed in his class in the college of Duplessis: in 1748 and 1749 he studied rhetoric in the college of Lisieux, and obtained four prizes: from October, 1749, to August, 1751, he studied philosophy with equal distinction, at first in the college of Lisieux, subsequently in that of Beauvais. When he finished his university career, his friends wished him to study for the bar, and he did so far comply with their desire as to attend law classes and the office of a solicitor. This continued till the death of his second brother, in 1755, at which time he had retired, apparently on account of his health, which was always infirm, to his native district. A short time after he accepted the offer of a professorship in the college of Beauvais. He continued to discharge the duties of his appointment till 1761, when, finding them injurious to his health, he resigned, and was appointed private secretary to the Due de Praslin.

Thomas commenced his career as author in 1756 by publishing 'Reflections Philosophiques et Littéraires sur le Poème de la Religion Naturelle.' This was throwing down the gauntlet to the whole school of Voltaire: the patriarch himself took no notice of the publication, and Grimm spoke of it as the work of 'a silly lad just escaped from the school of the Jesuits.' In the same year Thomas addressed an ode, full of hyperbolical compliments, to Sechelles, controller-general of finance: the flattery was successful; it obtained from the minister an addition to the revenues of the college. In 1757 Thomas composed, on the occasion of the great earthquake at Lisbon, a 'Mémoire sur les Causes des Tremblemens de Terre,' which was crowned by the Academy of Rouen. In 1759 he published 'Jumarville,' a poem in four cantos, on the death of a French officer, killed, as the French alleged, under circumstances of peculiar atrocity, in the war between the French and English, in the backwoods of America. Fréron praised this poem in the 'Année-Littéraire,' a tribute of thanks to the young author who had ventured to attack Voltaire. These early works of Thomas are remarkable only for their turgid style, commonplace ideas, and for the eagerness of the author to avail himself of the popular topic of the day.

About this time the French Academy, with a view to render the prize-essays of its members more popular, began to propose the éloges of great men as the subjects. Thomas entered the lists three successive years, and was successful every time. His 'Eloge de Maurice, Comte de Saxe,' was crowned in 1759; his 'Eloge de Henri François d'Aguesseau,' in 1760; and his 'Eloge de René du Guay-Trouin,' in 1761. In 1760 he also competed for the prize of poetry: his 'Epître au Peuple' was declared next in merit to the poem of Marmontel, to which the medal was assigned. In these compositions a marked improvement can be traced. There is no greater originality of thought than in his first productions—nothing of genius in them; but more matter, more of artistical finish, and less of boyish inflation of style.

The connection with the Duc de Praslin was less advantageous to Thomas than it promised to be at the outset. The duke procured for him the sinecure appointment of secretary-interpreter to the Swiss cantons. But a vacancy occurring soon after in the Academy, this minister, who had a personal quarrel with Marmontel, sought to obtain it for his secretary. Thomas had the magnanimity to refuse the appointment, urging the superior claims of Marmontel. This act of honesty lost him the favour of the Duc de Praslin, and closed the career of office which was opening to him. The admission to the Academy was not however long deferred. He delivered his inaugural address to that body on the 22nd of January, 1767.

Between 1761 and 1767 he composed—'Eloge de Sully,' crowned in 1763; 'Eloge de Descartes,' crowned in 1765; in 1766, 'Eloge de Louis, Dauphin de France,' composed and published at the request of the Comte d'Angiviller; and his inaugural discourse. In October, 1767, his opera of 'Amphion' was brought out, but without success. These works are all characterised by a progressive improvement in execution. They differ also from his juvenile productions in an attempt to adopt the sparkling and antithetical style of the Encyclopædists, and in the complete appropriation of their bold satirical tone in respect to polities, although much of the author's juvenile respect for religion remained with him to the last. As a natural consequence of the change, Grimm had by this time begun to praise Thomas, and Fréron had cooled in his admiration of him: Voltaire had written a complimentary letter on the 'Eloge de Descartes,' but had on the other hand remarked to his friends that they ought now to substitute the word *galithomas* for *galimathias:* Diderot continued implacable. It was rumoured that the court, enraged at the free strain of the 'Epître au Peuple,' and the sarcasms launched against itself and the feudal system in the 'Eloge du Dauphin,' threatened the liberty of Thomas.

The principal publications of Thomas, from the time of his admission into the Academy till his death, are—'Eloge de Marc Aurèle,' read to the Academy in 1770, and published in 1775. His reply, as director of the Academy, to the inaugural discourse of the archbishop of Toulouse, also in 1770. 'Essai sur le Caractère, les Mœurs, et l'Esprit des Femmes, dans tous les Siècles,' 1772. 'Essai sur les Eloges; ou l'Histoire de la Littérature et de l'Eloquence appliquées à ce genre d'Ouvrage,' published in 1773, in an edition of his collected works. He commenced a poem on the czar Peter I.; but only four books and part of a fifth were completed at the time of his death. The increased technical skill of the author continues to show itself in these works; but the increased boldness of his attempts serves also to show the natural meagreness and feebleness of his genius. He was utterly devoid of impassioned imagination. His 'Eloge de Marc Aurèle' is an attempt to personify a Stoic of the age of that emperor: it is alike deficient in interest and dramatic truth. His essay on the character and manners of women is a collection of passages which would have swelled his didactic essay on 'éloges' to too great a bulk. It was said at the time that this panegyrical essay on the sex pleased them less than the vituperations of Rousseau. No wonder the treatise of Thomas is cold and unimpassioned; it was forced work; but the ravings of Rousseau are the scoldings of a jealous man who has been anxious but unable to please. The treatise on 'éloges' is a worthy consummation of the author's labours in that empty and artificial branch of literature which has all the falsehood of oratory without the interest which attaches to the eloquence of the bar or senate from its power of producing great practical effects. The partially completed poem of 'The Czar' is sensible and the versification smooth, but the four books are four separate poems, in the manner (though not so good) of Goldsmith's 'Traveller.' They never could have been made parts of an epic.

Thomas died on the 17th of September, 1785. His health, always delicate, had been undermined by incessant study. His end is supposed to have been hastened by the shock he received from an accident which happened to one friend and the death of another. That he was capable of generous feeling and disinterested action he showed when he forfeited the favour of the Duc de Praslin by refusing to accept a seat in the Academy to the exclusion of Marmontel. That he was capable of sincere affection is proved by the footing on which he stood with his family and friends. The insinuations against his sincerity and veracity thrown out by Diderot seem to have no better foundation than the change of tone in his later from his earlier publications. The truth is, that, like many other inferior *littérateurs*, Thomas was a mere echo of the society by which he was surrounded. He took his colouring in youth from his preceptors, most of whom were ecclesiastics; in after-life, from the sceptical literary conversation of the salons of Paris. His éloges are his most characteristic works, a kind of composition too inaccurate to have value as history, too cold and remote from the real business of life to impress as oratory. He stands however high among his class of writers. The high finish and some of the brilliancy of the French school cannot be denied him; though for this he was indebted quite as much to the company he kept as to natural talent, or even his unquestionable painstaking.

(*Œuvres* de M. Thomas, Paris, 1792; *Œuvres Posthumes* de M. Thomas, Paris, An x. (1802); 'Sketch of Thomas,' by Saint Surin, in the *Biographie Universelle.*)

THOMAS, ST. (Santo Thome), an island in the Gulf of Guinea, extends from 1′ to 25′ N. lat., and from 6° 25′ to 6° 43′ E. long. It is about 140 miles west-north-west from Cape Lopez. The island is of an oval shape: its greatest length is about 30 miles, and its greatest breadth about 18 miles. Its area may be estimated at about 420 square miles. It is of basaltic formation, and mountainous: the Pico de Santa Anna de Chaves is 7000 feet high. The mountains are mostly covered with wood, and there are numerous streams well supplied with fish. The vegetation is abundant. The chief exports are sugar, indigo, and cotton. The island belongs to the Portuguese; and the inhabitants, who are chiefly composed of Portuguese and of negro slaves, amount to about 18,000. A number of runaway negroes live in the mountains. The chief town is called Santo Thome.

THOMAS, ST., Island. [Virgin Islands.]

THOMASIN, or TOMASIN, surnamed Tirkeläre, Clär, or Zerkler, a German poet of the thirteenth century. He was a native of the Italian province of Friuli, and born about the year 1186. Being thus an Italian by birth, or, as he himself says, a Walich, he wrote in his earlier days an Italian work, probably a didactic poem, 'On Courteous Manners,' which is no longer extant. In the course of the year 1216, when he had just reached his thirtieth year, he wrote in the space of ten months a great didactic poem in German, which from his native country he called 'The Welsh Guest' (Der Welsche Gast), and which consists of ten books. This poem, of which there exist many excellent manuscripts, is one of the most splendid productions of German literature during the thirteenth century, and, although the author is a foreigner, the work breathes throughout a pure German spirit, and displays all the depth and intensity of German thought and feeling. In the beginning of his poem Thomasin admits that he is not a perfect master of the language which he used; but still the peculiarities are so few and slight, that it requires a profound knowledge of the old German language to discover the foreigner. Eschenburg therefore supposes that the author's statement respecting his native country is a mere fiction. But this supposition, as well as another, that the 'Welsh Guest' is merely a German translation of the Italian work 'On Courteous Manners,' is without foundation, and contradicted by numerous passages of the former work. The object of this poem is to show in what virtue,

piety, and good conduct consist, and why man should strive after them. It shows that a remarkable progress had taken place in the mind of Thomasin during the interval between the composition of the Italian and that of the German work. In the former, as he himself states, he had proceeded from the idea that courteous conduct and nobility of birth were always combined with a noble mind, or, in other words, that the changeable rules respecting good manners were of greater value than the eternal law of morality which is implanted in every man's heart. This prejudice is altogether given up in his German poem, where he declares that a man is foolish who thinks himself great because he is of noble birth and possesses courteous manners, and that it is only a man's heart and real character that make him worth anything. Virtue with him is now a fundamental principle, and not a mere expedient. He describes virtues and vices, and their respective consequences, with a truly Socratic spirit and dignity. Thomasin was well acquainted with the history of antiquity, and it is among the antients that he found his best models of really virtuous men. The whole poem is a sublime and altogether practical system of morality: it is a philosophy in the garb of poetry and occasionably embellished by figurative language. But he does not write in the spirit of any particular school; his object is in general to instruct man on matters concerning his physical and spiritual welfare.

This masterpiece of early German poetry and philosophy has never yet been published entire, but it is said that Frommann is preparing an edition of it. Fragments of it are printed in Eschenburg's 'Denkmäler Altdeutscher Dichtkunst,' p. 121, &c.; compare Gervinus, 'Geschichte der Poetischen National Literatur der Deutschen,' vol. i., p. 456, &c.

THOMA'SIUS, CHRISTIAN. The real name of this author is Thomas, and in the works which he published in his mother tongue he always calls himself Christian Thomas. He was born at Leipzig, on the 12th of January, 1655, and was the son of Jacob Thomasius (1622-1684), a distinguished professor of philosophy, and some time rector of the celebrated Thomasschule at Leipzig, under whose auspices Leibnitz was educated. The education of Christian Thomasius was conducted by his father, whose knowledge of philosophy and its history gave his mind at an early age a decided turn. Christian had scarcely attained his fourteenth year when he was found sufficiently prepared to enter the university. In his sixteenth year he obtained the degree of bachelor of arts, and the year after that of master of arts. The chief subjects of his studies were philosophy and law, more especially the law of nature, which he regarded as the basis of all other laws. The instruction of his father and his own experience at the university had convinced him that the methods of teaching then followed were pedantic and deficient, and he determined to remedy these defects as much as was in his power. In 1675 he went to Frankfort-on-the-Oder, where he began a course of lectures on law, but they do not appear to have been well received by his colleagues, and a few years after, in 1679, after having obtained the degree of doctor of laws, he left Frankfort, and made a literary journey to Holland. On returning to Leipzig he commenced the practice of the law. But this occupation did not offer sufficient scope for him, and he again became an academical teacher, in which capacity he brought about the most beneficial reforms. The law of nature, which had until then been almost entirely neglected in the universities, continued to be the principal subject of his studies. The older professors, who found themselves disturbed in their routine of teaching by the energy and boldness of the young man, began to clamour against him. So long as his father lived, violent outbreaks were prevented, partly because he restrained his son's eagerness for reforms, and partly because the other professors esteemed him too much to hurt his feelings by open attacks upon his son. When however his father died, in 1684, the bitterness and boldness with which young Thomasius attacked antiquated prejudices of all kinds together with their champions, involved him in numerous disputes. This enmity was not only provoked by the matter and the manner of his teaching, but also by several publications which tended to destroy established opinions. One of them, on polygamy, especially gave great offence; he asserted that polygamy was at least not contrary to any law of nature.

Up to this time it had been the general custom in all German universities to deliver lectures in Latin, and to make all public announcements of them in the same language. In the year 1687 Thomasius published his program in German, and announced that he would deliver a course of lectures in German, and on a subject which appeared altogether foreign to a university,—viz. on the manner in which the Germans should follow the example of the French ('Discours, welcher Gestalt man denen Franzosen im gemeinen Leben und Wandel nachahmen soll,' published at Leipzig, 1687, 4to.). This daring innovation was regarded by his colleagues as a perfect heresy, though, after the example was once set, it was gradually followed by other professors, until it became the universal practice in all German universities to lecture in German. It was a necessary consequence of this that books of a scientific character now began to be written in German. Notwithstanding both the open and secret attacks to which Thomasius had thus exposed himself, he continued to combat prejudice, pedantry, and error. He was unsparing in his censure, which was usually combined with wit and satire, and even his former teachers did not escape. In the year after, 1688, he established a German Monthly Review, under the title, 'Freimüthige, jedoch vernunft- und gesetzmässige Gedanken über allerhand, fürnemlich aber neue Bücher,' which he conducted from 1688 till 1690, and which gave him immense influence in all parts of Germany, and the means of chastising his enemies. His enemies in their turn tried every means to avenge themselves; and although Thomasius at first succeeded in averting the danger that was gathering around him, yet the disputes became daily more vehement and serious, especially with two divines, Pfeifer and Carpzovius, who charged him with atheism. The theological faculty of Leipzig was likewise gained over to their side. H. G. Masius, court preacher to the king of Denmark, who had been rather severely dealt with by Thomasius in his Journal, and who made a reply, to which Thomasius answered in a very energetic manner, persuaded the king of Denmark to have all the published parts of Thomasius's Journal burnt in the market-place of Copenhagen by the hangman, 1689. Such proceedings in a foreign country were treated by Thomasius with contempt; but the storm was gathering over his head. In the same year he became involved in disputes with the Pietists, and also came forward to justify marriages between two persons of different religions, which enraged the divines of Wittenberg to such a degree, that the chief consistory was induced by various charges which were made against him to issue an order for the apprehension of Thomasius. He escaped the danger and fled to Berlin, where he met with a kind reception and the protection of Frederick III., the great elector of Brandenburg (afterwards King Frederick I.), who not only permitted him to settle at Halle, but also to lecture in the Ritteracademie (academy for young noblemen) of that place. He began his lectures here in 1690, and met with the same approbation on the part of the students as at Leipzig; and the increase in the number of students induced the elector in 1694 to found the university of Halle, in which he appointed Thomasius professor of jurisprudence, and conferred upon him the title of councillor, with a salary of 500 thalers. In this new position too Thomasius continued to be annoyed by numerous disputes, partly with his former adversaries and partly with others. In the year 1709 he had the satisfaction to receive an invitation to the chair of jurisprudence in the university of Leipzig, which however he refused. King Frederick I. of Prussia, pleased with the determination of Thomasius not to leave his service, rewarded him with the title of privy-councillor. In 1710 Thomasius was elected rector of the university of Halle, and dean of the faculty of jurisprudence. He died on the 23rd of September, 1728, in the seventy-third year of his age.

If ever a man exercised a beneficial influence upon his age and country, an influence which will extend to the latest posterity, it is Thomasius. He was one of the few men, like Luther and Lessing, who now and then rise up in a nation, give it an impulse, and determine its course. At the time when Thomasius began to make himself known, philosophy and theology were studied and taught in such a

manner that it was evident that the spirit which had been created by the Reformation would soon vanish altogether. All philosophical and scientific works were written in Latin, which formed an inadequate medium for communicating new thoughts and ideas, which were frequently crippled and imperfect on that account, or the language itself was barbarous. In the universities also Latin was the ordinary language for communicating knowledge, which thus remained in the exclusive possession of a small number, and without influence upon the nation at large. Thomasius prepared the way for better things, first by communicating knowledge in his native language, and by extending the sphere within which speculation had until then been carried on. At the same time he urged the necessity of writing in a clear and intelligible style, which many of his countrymen in recent times have greatly neglected. His own style, though not always pure, is precise and vigorous. As in places of learning Thomasius destroyed old prejudices and pedantry, he also boldly combated superstition and hypocrisy in the affairs of common life, such as the belief in ghosts, spectres, and witchcraft; and it is almost entirely owing to his exertions that trials for witchcraft and torture were abolished in Germany. In reference to this, Frederick the Great says of Thomasius, 'He denounced trials for witchcraft so loudly, that persons began to be ashamed of them, and from that time the female sex has been permitted to grow old and die in peace.' All this would alone be sufficient to immortalize his name, even if he had no claim to it by what he did in philosophy. Here he indeed found things in such a state, that it required all his energy to clear the field from the weeds with which it was overgrown, before it was fit to receive the seed, and accordingly his philosophy is more of a destructive than of a constructive character. But in this negative way he has done incalculable service to his nation, and Frederick the Great justly says, that, among all the philosophers of Germany, none have contributed more to render its name illustrious than Leibnitz and Thomasius.

The number of works of Thomasius is considerable. Besides those mentioned above, the following must be noticed: 'Einleitung zu der Vernunftlehre, worinnen durch eine leichte, und allen vernünftigen Menschen, waserlei Standes oder Geschlechts sie seyn, verständliche Manier, der Weg gezeiget wird, ohne die Syllogistica, das Wahre, Wahrscheinliche und Falsche von einander zu entscheiden und neue Wahrheiten zu erfinden,' Halle, 1691, 8vo. The fifth and last edition of this work appeared at Halle, 1719, 8vo.; it was the first readable book that had ever been produced in Germany on logic. 'Von der Kunst vernünftig und tugendhaft zu lieben, als dem einzigen Mittel zu einem glückseligen, galanten, und vergnügten Leben zu gelangen, oder Einleitung der Sittenlehre,' &c., Halle, 1692, 8vo.; an eighth edition of it appeared in 1726. This work contains a system of ethics better than any that had appeared before him. 'Historie der Weisheit und Thorheit,' in three parts, Halle, 1693, 8vo. 'Weitere Erläuterung durch unterschiedene Exempel, anderer Menschen Gemüther kennen zu lernen,' Halle, 1693, 8vo., reprinted in 1711. 'Der Kern wahrer und nützlicher Weltweisheit,' Halle, 1693, 8vo.: this is a translation of Xenophon's 'Memorabilia of Socrates,' which Thomasius strangely enough took from the French translation of Charpentier, although he himself was well acquainted with the Greek. 'Versuch vom Wesen des Geistes, oder Grundlehren die einem Studioso Juris zu wissen und auf Universitäten zu lernen nöthig sind,' Halle, 1699, 8vo., reprinted in 1709. 'Ernsthafte aber doch muntere und vernünftige Gedanken und Erinnerungen über allerhand auserlesene juristische Händel,' 4 vols., Halle, 1720-21. His miscellaneous and smaller essays appeared in a collection under the title 'Kleine Deutsche Schriften mit Fleiss zusammengetragen,' Halle, 1701, 8vo. A complete list of his works is given in Luden's *Christian Thomasius nach seinen Schicksalen und Schriften dargestellt*, with a preface by Johannes von Müller, Berlin, 1805, 8vo.; and in Jörden's *Lexikon Deutscher Dichter und Prosaisten*, vol. v., p. 37-59.

THOMA'SIUS, JACOB. [THOMASIUS, CHRISTIAN.]

THOMASTON. [MAINE, p. 307.]

THOMOND, THOMAS, an architect who practised at St. Petersburg, and held the rank of a major in the Russian service, was a native of France, and born at Nancy, December 21, 1759. Scarcely had he completed his professional education at Paris, when the Revolution rendered it unsafe for him, he and his family being royalists, to remain in the country, and he accordingly emigrated to Russia, where he at first supported himself by the productions of his pencil, which not only found purchasers, but made him favourably known to the St. Petersburg public. The taste he displayed in architectural subjects led at length to his being employed by the government in that branch of art which he had originally intended to follow, and one of the first works of any importance intrusted to him was the Great Theatre (erected by the German architect Tischbein, 1782-83), which he was commissioned to improve and partly remodel, in 1804. Although not altogether free from the peculiarities of the French school, the façade and octastyle Ionic portico which he added to that structure is one of the noblest pieces of architecture in the northern capital of Russia, and, of its kind and date, in Europe. Had he executed nothing else, that alone would have entitled him to rank higher in his profession as an artist than many who owe their celebrity as much to the number as to the merit of their works. But he had also the opportunity of displaying his taste and ability in another very striking public edifice at St. Petersburg, namely, the Imperial Birzha, or Exchange, erected by him between the years 1804 and 1810, which is an insulated structure (about 256 by 300 feet) of the Roman Doric order, peripteral and decastyle at each end (although without pediments), and having altogether 44 columns. Situated at the southern point of the Vassilievskii Island, immediately facing the Neva, it stands in the centre of a spacious *plotchad*, or 'place,' upon a rich architectural terrace, which sweeps out so as to form a semicircular esplanade in front, at each extremity of which is a flight of steps leading down to the river, and a massive rostral column 120 feet high. Taken altogether, the architectural combination thus produced is exceedingly picturesque, and may be said to be unique.

Thomond also erected some private mansions and other buildings at St. Petersburg, the mausoleum of the emperor Paul at Pavlovska, the theatre at Odessa, and the Poltava monument. In 1808 he published some of his buildings and architectural designs in a quarto volume, very unsatisfactorily executed however; and he also wrote a treatise on painting, an art to which he was greatly attached. He died August 23, 1813.

(Kukolnik, in *Khudozhestrennya Gazela*, 1837.)

THOMPSON, SIR B. [RUMFORD, COUNT.]

THOMSON, JAMES, was born at Ednam in Roxburghshire on the 11th September, 1700. His father was clergyman of the place, and distinguished for his piety and pastoral character. James was first sent to the grammar-school at Jedburgh, and completed his education at the University of Edinburgh, where in 1719 he was admitted as a student of divinity. In 1720 his father died, 'and this,' says Dr. Murdoch, 'affected him to an uncommon degree, and his relations still remember some extraordinary instances of his grief and filial duty on that occasion.'

Thomson turned from divinity to poetry owing to the following incident:—The Rev. Mr. Hamilton, who then filled the chair of divinity, gave as a subject for an exercise a psalm in which the majesty and power of God are described. Of this psalm Thomson gave a paraphrase and illustration as the exercise required, but in so poetical and figurative a style as to astonish the audience. Mr. Hamilton complimented the performance and pointed out to the students its most striking points; but, turning to Thomson, he suggested that if he intended to become a minister he must keep a stricter rein over his imagination and learn to be intelligible to an ordinary congregation.

Some encouragement held out to him by Lady Grisel Baillie following this intimation of the Professor, he determined to give up divinity and try his fortune in London. Slender as this pretext of 'encouragement' was, there have been many poets who have thus sought their fortune from no stronger reason. The truth is, Thomson wanted to try his capacity in London, and seized on this as a pretext. Arrived there, says Dr. Johnson, he was one day loitering about 'with the gaping curiosity of a new-comer, his attention upon everything rather than upon his pocket,' when his handkerchief, containing his letters of recommendation to several persons of consequence, was stolen from him. And now the lonely poet in the vast city first

felt his inexperience and his poverty. A pair of shoes was his first want; his manuscript of 'Winter' his only property. A purchaser for this poem was found with great difficulty; but Mr. Millar consented to give a trifle for it, and it was published in 1726. It was little read till Mr. Whately and Mr. Spence spoke so favourably of it that attention was attracted, and it rose rapidly into popularity, and one edition very speedily followed another.

This success procured him many friends, among whom was Dr. Rundle, who introduced him to the lord chancellor Talbot; and some years after, when the eldest son of that nobleman made a tour on the continent, Thomson was appointed his travelling companion. Meanwhile his poetical powers were fully employed, and in 1727 appeared his 'Summer;' in 1728, his 'Spring;' and in 1730, his 'Autumn.' Besides these he published, in 1727, 'A Poem sacred to the Memory of Sir Isaac Newton,' and 'Britannia,' a poetical invective against the ministry for the indifference they showed to the depredations of the Spaniards in America. By this piece he declared himself a favourer of the opposition, and therefore could expect nothing from the court.

The tragedy of 'Sophonisba' was acted in 1727, Wilks taking the part of Masinissa, and Mrs. Oldfield that of Sophonisba. So high were the expectations raised, that every rehearsal was dignified with a splendid audience collected to anticipate the pleasure that was preparing for the public. Its success however was very equivocal. 'There is,' says Johnson, 'a feeble line in the play:—

"O, Sophonisba, Sophonisba, O!"

This gave occasion to a waggish parody,

"O, Jemmy Thomson, Jemmy Thomson, O!"

which for awhile was echoed through the town.'

At this time long opposition to Sir Robert Walpole had filled the nation with clamours for liberty, and Thomson, instinctively seizing the poet's office to utter in verse the wants of the nation, determined on writing a poem on 'Liberty.' He spent two years on this undertaking, and viewed it as his noblest work, probably because it had cost him the most trouble. It was divided into five parts, which were published separately, thus: 'Antient and Modern Italy compared; being the first part of "Liberty," a poem,' 1735. 'Greece; being the second part, &c.,' 1735. 'Rome; being the third part, &c.,' 1735. 'Britain; being the fourth part, &c.,' 1736. 'The Prospect; being the fifth part, &c.,' 1736. The poem of 'Liberty' does not now appear in its original state, having been shortened by Sir George (afterwards Lord) Lyttelton. Of all Thomson's works this is the least read, and deservedly so; for, independent of the feebleness of its execution, it is obvious, as Johnson remarked, that 'the recurrence of the same images must tire in time; an enumeration of examples to prove a position which nobody denied must quickly grow disgusting.'

His friend Talbot appointed him secretary of briefs, a place requiring little attendance, suiting his retired indolent way of life, and equal to all his wants. When his patron died, Lord Hardwicke succeeded him, and kept the office vacant for some time, probably till Thomson should apply for it; but either his modesty, pride, or depression of spirits prevented his asking, and the new chancellor would not give him what he would not request. This reverse of fortune increased his literary activity. In 1738, besides editing his own works in two volumes and writing a preface to Milton's 'Areopagitica,' he produced the tragedy of 'Agamemnon,' with Quin for his hero. For this he got 'no inconsiderable sum,' though it had but poor success. Johnson says that on the first night Thomson seated himself in the upper gallery, and was so interested in its performance, that 'he accompanied the players by audible recitation, till a friendly hint frighted him to silence.'

Thomson's next tragedy was 'Edward and Eleonora,' which was not allowed to be represented on account of certain pretended allusions. He then wrote, conjointly with Mallet, the masque of 'Alfred,' which was represented before the prince and princess of Wales at Clifden in 1740. This masque contains the national song of 'Rule Britannia,' which Mr. Bolton Corney ascribes, 'on no slight evidence,' to Mallet.

Thomson's next work was another tragedy, 'Tancred and Sigismunda,' which, being taken from the interesting story in 'Gil Blas,' instead of the Grecian mythology, as were his other pieces, had more success. Garrick and Mrs. Cibber played the principal parts. His friend Sir George Lyttelton now appointed him surveyor-general of the Leeward Islands, from which, after paying a deputy, he received about 300*l.* a year.

The 'Castle of Indolence,' which was many years under his hands, was now finished and published (1748). It was at first little more than a few detached stanzas, in the way of raillery on himself, and on some of his friends who reproached him with indolence, while he thought them at least as indolent as himself. But the subject grew under his hands till it became his masterpiece.

A violent cold, which from inattention became worse, at last carried him off, on the 27th August, 1748. He left behind him a tragedy of 'Coriolanus,' which was brought on the stage by Sir George Lyttelton for the benefit of his family. A considerable sum was gained, which paid his debts and relieved his sisters. The remains of the poet are deposited in Richmond churchyard.

Thomson was 'more fat than bard beseems;' of a simple, unaffected, indolent, sensual character; silent in company, but cheerful among friends, of whom he had many and true. This character is discernible in his writings. His simplicity is seen in the purity and warmth of his sentiments, sometimes even childish; his indolence in the slovenliness of his versification, and the inappropriateness of so many of his epithets: he never seems to have thought anything worth the toil of polishing, and hence the perpetual use of pompous glittering diction substituted for thought or description; his sensuality appears in the gusto with which he describes all luxuries of the senses, and the horrors of deprivation. Amidst much that is truly exquisite both in feeling and expression, he mingles the absurdities of a schoolboy's trite commonplaces and mechanical contrivances to piece out his verse. A sweet line of almost perfect beauty is followed by a bombastic allusion, or some feeble personification as tiresome as the first was bewitching. A touch of nature is overloaded by superfluous epithets—a picturesque description is often marred by pedantry or carelessness. Hazlitt says that 'he is affected through carelessness—pompous from unsuspecting simplicity of character. He is frequently pedantic and ostentatious in his style, because he had no consciousness of these vices in himself.'

In spite of these drawbacks, Thomson is a charming poet, and one whose works have always been the delight of all classes. The popularity of his 'Seasons' equals that of any poem in the language, and it is said that some one, finding a shabby copy of it lying on the window-seat of a country ale-house, exclaimed, 'That's true fame!' Thomson's beauties are genuine: his descriptions of nature often come with the force of reality upon the mind; and no one ever painted more successfully the 'changing scene' and the 'rustic joys' of England.

His 'Castle of Indolence' may be regarded as his best-sustained effort, for, although separate passages of the 'Seasons' may be superior, yet on the whole it has fewer defects, while some of the stanzas, especially in the first canto, fill the mind with lazy luxury.

Of his tragedies we need say little: their neglect has been so signal, that we may accept so unanimous a verdict without further examination; indeed the genius of Thomson was eminently undramatic.

(Dr. Johnson, *Lives of the Poets;* Murdoch's *Life of Thomson;* Thomson's *Seasons*, edited by Bolton Corney; Hazlitt's *Lectures on the English Poets;* Campbell's *Specimens of the British Poets.*)

THOMSONITE. This mineral occurs generally in masses. Structure fibrous and radiated, the fibres prolonged into small columnar crystals in the occasional cavities. Primary form a right rhombic prism. Cleavage parallel to the diagonal planes of the primary form. Fracture uneven. Hardness—scratches fluor spar, or 5·0. Colourless, translucent, and in small fragments transparent. Lustre vitreous. Brittle. Specific gravity 2·35 to 2·37.

Before the blow-pipe it intumesces and becomes opaque, but does not fuse; at a red heat it loses water.

It occurs at Kilpatrick, near Dumbarton, in trap associated with analcime and prehnite.

THONON. [Chablais.]

THORA'CIC DUCT is the principal trunk of the lymphatic or absorbent system, and the canal through which the greater part of the chyle and lymph is conveyed into the blood. It commences, below, at what is called the receptaculum chyli, which receives all the principal absorbent vessels from the intestines and from the lower extremities, and lies at the posterior and middle part of the abdomen, on the upper lumbar vertebra and on the right side of the aorta. In man the diameter of the receptaculum is but little greater than that of the thoracic duct, which is continued from it; in most other animals it is considerably greater, and the duct seems in them to commence in a large pouch. From the receptaculum chyli the thoracic duct passes upwards, on the right side of the aorta, and behind it, from the abdomen into the chest, being joined in its course by the lymphatic vessels of the adjacent organs. Opposite the sixth dorsal vertebra it begins to bend to the left, and, after passing behind the arch of the aorta, it ascends to the level of the seventh cervical vertebra, curves forwards and downwards, and opens into the left subclavian vein, usually near its junction with the left jugular vein. At this orifice of the thoracic duct there are two valves, like those of the veins, which open to permit fluid to pass from the duct, but close when any is forced against them from the vein. Other valves in uncertain number are found in different parts of the duct, and have all the same direction as those of veins. [Absorbents; Chyle; Digestion.]

THORAX. [Respiration.]

THORDO is the Latinized name of a celebrated Danish lawyer, whose real name was Thord, or, more completely, Thord Deghn. He lived in the reign of Waldemar III., king of Denmark, and was descended from an antient family of that country. Concerning his life little is known beyond the fact that he was chief judge of the province of Jütland. His name has come down to us through a collection of Danish laws which he formed into a kind of code. It contains the earliest Danish laws, to which no historical origin can be assigned, as well as the subsequent laws which were passed between the years A.D. 1200 and 1377, by the Danish parliament, and sanctioned by the kings. They are not arranged in chronological order, but systematically, and comprise civil as well as constitutional laws. They are of very great value to the student of the social and political history of Denmark. Danish editions of this small code appeared at Ripen, 1504, 4to.; and at Copenhagen, 1508, 4to. Ludewig, in his 'Reliquiae Manuscriptorum omnis aevi diplomatum ac monumentorum ineditorum,' vol. xii., pp. 166-216, has published a Latin translation of this code of laws. In the title to them Thordo calls himself, 'Thordo legifer Daciae,' where Daciae must mean Daniae, that is, Denmark.

THORDSON, STURLA, belonged to the celebrated Icelandic family of the Sturla; his name Thordson indicates that he was a son of Thordo. He was a nephew of Snorri Sturluson, and born about A.D. 1218. Being a man of high rank and great knowledge, he was appointed to the most important offices by the Danish kings Haeon and Magnus, and it was at their command that he wrote the history of Iceland, Denmark, and Norway, from the time where the work of Snorri Sturluson broke off. This history bears the title of 'Historia Sturlungorum,' but the work which is now extant under that name is only an abridgment of the original history, and the latter part is altogether lost. The substance of the work is given in Torfaeus, 'Historia Rerum Norvegicarum,' who, in his Prolegomena, also gives an account of the 'Historia Sturlungorum.' Thordson died in A.D. 1288, at the age of seventy.

THORER. [Tobias.]

THORESBY, RALPH (born 1658, died 1725), a virtuoso and antiquary, and an early Fellow of the Royal Society, was the son of a merchant at Leeds, and born in that town. He had his early education in the Leeds grammar-school, but, being intended by his father for commercial life, he did not pass to any of the higher seats of learning. He had however what may be called a liberal commercial education, being sent by his father to Holland for the purpose of becoming acquainted with the mode of conducting business in that country, and of acquiring the modern languages; and afterwards to London for a similar purpose. He settled in his native town, where his family was connected with some of the principal persons who then formed the society of Leeds, and where he had a business prepared for him, which had been successfully conducted by his father, who died when the son was just twenty-one.

Thoresby possessed from a very early period of life an eager curiosity respecting the things and persons around him which presented any features of historical interest, and a desire of collecting objects of curiosity, natural or artificial. His father had something of the same taste, having purchased the collection of coins and medals which had been formed by the family of Lord Fairfax, the parliamentary general, and this collection was the basis of the museum formed in a few years by the son. This museum was a means of bringing him acquainted with all the celebrated antiquaries and naturalists of the time, and was a perpetual attraction to persons of curiosity, who often visited Leeds for no other purpose than to see it. It is not too much to say of it that it was perhaps the best museum ever formed in England by a gentlemen of private and rather small fortune; containing, it is true, some things which would now be esteemed of not the smallest value, but also many objects of very high value, especially in the two grand departments of manuscripts and coins.

As he advanced in life, the curiosity which had at first been directed upon the objects more immediately around him became expanded so as to comprehend objects of more general interest, and in fact the whole range of what is usually understood to be comprehended in the term antiquarian literature. In the department of natural history he was also not merely a collector, but an observer, and he made many communications, esteemed of value, to his private friends or to the Royal Society.

With this turn of mind, it will hardly be supposed that he was very successful in his mercantile affairs. He had however the good sense to withdraw from business before his fortune was entirely lost to him, and about the forty-sixth year of his age he seems to have wholly retired from it, and to have formed the determination of living on the little income which the portion of his property that remained would afford him.

Besides amassing such manuscript matter as he could by any means become possessed of, he was himself a laborious transcriber, and was also accustomed to commit to writing notes of things which he observed, or information collected from his friends or the old people of his time. When released from the cares of business, he had leisure to make use of these notes, and he entered upon the preparation for the press of two works, which it was intended by him should contain all that he had gathered in what had been from the first his favourite subject, the illustration of the history, and whatever belonged to it, of his native town. One of them was to be in the form of a topographical survey of the whole of the large parish of Leeds, and of a few of the smaller parishes which are supposed to have been comprehended under the very antient local term 'Elmete:' the other, a history of the various transactions of which that district had been the scene, of its more eminent inhabitants, of the public benefactors, and of the changes which had taken place in the state or fortunes of its inhabitants. The first of these designs only was accomplished. The work appeared in a folio volume in 1715, under the title of 'Ducatus Leodiensis, or the Topography of the Town and Parish of Leeds.' This work leaves little for the inhabitants of the town to desire in this kind, except that he had prepared the 'historical part' also, to which the author is perpetually referring the reader. The work is more than its title promises, since it contains a large body of genealogical information, comprehending the descents of nearly all the families of consequence who inhabited the central parts of the West Riding. There is also

a very large descriptive catalogue of the treasures deposited in his museum.

The 'Ducatus' is the principal literary work for which we are indebted to him. As a kind of supplement to it, he published, in 1724, a history of the Church of Leeds, under the title 'Vicaria Leodiensis,' which, like his former work, has many things not strictly belonging to his subject, but in themselves valuable. A new edition of the 'Ducatus,' containing also all the matter of the 'Vicaria' which properly belonged to Leeds, was published by Thomas Dunham Whitaker, LL.D., in 1816.

The writings of bishop Nicolson, bishop Gibson, Obadiah Walker, Calamy, Strype, Hearne, and many other persons, show how willing Thoresby was to give assistance to any of his literary friends in their various publications.

Thoresby kept during the greater part of his life an exact diary of each day's occurrences. Large extracts from the portions which remain of it were published in two octavo volumes in 1830, and two more volumes were published at the same time of selections from the letters of his various friends; these were published under the care of Mr. Hunter. They exhibit the peculiar features of a somewhat remarkable character, and the particular incidents of his life. A large account of him may be found in the 'Biographia Britannica,' and another prefixed to Dr. Whitaker's edition of his topographical work.

THORITE, a mineral in which thorina was discovered to exist by Berzelius. It occurs massive and compact. Fracture uneven, very brittle, and full of cracks. Hardness about 5·0. Lustre resinous; vitreous; opaque. Colour black. Specific gravity 4·63 to 4·80.

Before the blow-pipe, gives off water, and becomes yellow, but does not fuse.

It is found in syenite, in Norway. It contains nearly 58 per cent. of thorina, mixed with thirteen metallic and other bodies.

THO'RIUM, or THORI'NUM, a metallic body discovered by Berzelius in an earth to which he had given the name of *thorina*. When this was converted into chloride of thorium, and treated with potassium, after washing the mass a heavy metallic powder was left of a deep leaden-grey colour, which, when pressed in an agate mortar, acquired an iron-grey tint and a metallic lustre. It is not oxidized by water, either hot or cold, but when heated in the air it burns brilliantly, and is converted into oxide of thorium, or thorina, which is perfectly white, and devoid of any trace of fusion. Thorium is scarcely at all acted upon by nitric acid, and slowly by the sulphuric; but hydrocloric acid dissolves it readily with the evolution of hydrogen gas.

Oxygen and Thorium combine to form oxide of thorium, or thorina, by heating the metal in the air, or by decomposing the chloride by means of an alkali. When it has been strongly heated, its density is 9·402, and it is then insoluble in any acid but the sulphuric, and in that with difficulty. It is precipitated in the state of hydrate from its solutions by the alkalis, and in this state it is readily soluble in acids, and is converted into carbonate by exposure to the air. The alkaline carbonates dissolve the hydrate, carbonate, and subsalts of thorina; thorina is precipitated from solution by the ferrocyanide of potassium. Thorina probably consists of—

One equivalent of oxygen . . .	8
One equivalent of thorium . . .	60
Equivalent . .	68

Besides combining readily with oxygen, as already mentioned, thorium unites energetically with chlorine, sulphur, and phosphorus; but the compounds which they form have not been minutely examined.

THORN. [Cratægus.]

THORN-APPLE. [Datura.]

THORN (in Polish, *Torunia*) is a celebrated fortress in the government of Marienwerder, in the province of Prussia. It is situated in 53° N. lat. and 36° 25′ E. long., on the right bank of the Vistula, over which there is a bridge, which is the only standing bridge over the Vistula in its whole course. (The others are floating bridges.) It consists of two parts, the German and the Polish bridge, which are separated by an island called the Mazarkämpe. The German part, from the town to the island, is 1246 feet long; the Polish part is 927 feet long. The whole distance from Thorn to the opposite bank of the Vistula (including 296 feet for the island) is 2469 feet: the breadth of the carriage-way is 18 feet; it is 17 feet above the river at its ordinary level.

Thorn is divided into the old and the new town. There are two Lutheran and three Roman Catholic churches, two monks' convents and one of Benedictine nuns, a celebrated Lutheran gymnasium, a Roman Catholic school (formerly a Jesuits' college), four elementary schools, one girls' school, four hospitals, an infirmary, and a house of correction. The most considerable buildings are the cathedral, built in the Gothic style; St. John's church, containing the monument of Copernicus, who was born here in 1473; the town-house, built in 1602, on the model of that at Amsterdam (the doors, inlaid with ebony and ivory, the marble tables, and the paintings on the walls are memorials of former splendour); the well-known leaning tower, like that at Pisa; and the house in which Copernicus was born.

Thorn is indebted for its foundation to Herman Balk, master of the Teutonic order, who immediately on his arrival, in 1231, fortified the antient castle of Turno, at Old Thorn, about five miles from the present town. In the following year he founded the town, but, finding the situation inconvenient, pulled it down in 1235, and chose another site eight miles farther up the Vistula. At the commencement of the fourteenth century Thorn joined the Hanseatic League, and during the dominion of the Order became rich and flourishing through its extensive commerce. It afterwards joined 'The Union of the Prussian Cities,' and with it threw off the authority of the Knights: it took an active part in the sanguinary war arising from this step, which ended with the peace concluded in its walls in 1466, by which West Prussia was annexed to Poland. Commerce continued to flourish under the Polish government, but the city suffered severely, partly from the internal troubles of the kingdom, partly by the wars with Sweden, during which it was twice plundered by the Swedes (1655, 1703). Charles XII. entirely destroyed the fortifications. The Reformation was favourably received at an early period, but led to very harsh measures on the part of the Roman Catholics, and to internal troubles. These dissensions continued from the time of Sigismund I. (1506-1548), through the sixteenth and seventeenth centuries; and at the beginning of the eighteenth century occasioned what is called the 'Thorn Tragedy,' a persecution excited by the Jesuits, which ended, on the 7th December, 1724, with the execution of the burgomaster John Rossner and eleven of the principal citizens.

When West Prussia was separated from Poland in 1772, Thorn and Danzig remained under the Polish government, but their prosperity declined in consequence of the many obstructions to their commerce caused by the regulations of Prussia for the navigation of the Vistula. After its union with Prussia, on the second partition of Poland, in 1793, its commerce and prosperity revived. Since 1809 it has been again converted into a fortress. It is also important as a commercial port for the exportation of the produce of the country, corn, timber, linen, raw hides; especially however corn. The population, including the garrison, is nearly 12,000 inhabitants.

THORNBURY. [Gloucestershire.]

THORNE. [Yorkshire.]

THORNEY. [Cambridgeshire.]

THORNHILL, SIR JAMES, an eminent painter during the reigns of Queen Anne and George I., and, says Walpole, 'a man of much note in his time, who succeeded Verrio, and was the rival of Laguerre in the decorations of our palaces and public buildings,' was descended of a very antient family in Dorsetshire, and was born at Weymouth in 1676. Through the extravagance of his father, who disposed of the family estate, Thornhill was compelled to support himself by his own exertions. He adopted the profession of a painter, and, by the liberality of an uncle, Dr. Sydenham, the eminent physician, he was enabled to pursue his studies in London, where he placed himself with a painter, whose name is not known, with whom however he did not remain long. Thornhill appears to

nave made rapid progress in the public favour, for in his fortieth year, when he made a tour through Flanders, Holland, and France, he was sufficiently wealthy to purchase many valuable pictures of the old masters and others. Upon his return he received the commission from Queen Anne to paint the interior of the cupola of St. Paul's cathedral, in which he executed eight pictures illustrating the history of St. Paul, painted in chiar'oscuro, with the lights hatched in gold: for this work he was appointed historical painter to the queen, yet was paid only forty shillings the square yard for his production. Thornhill's reputation was now established, and, through the favour of the earl of Halifax, he received the commission to paint the princess's apartment at Hampton Court, which the lord chamberlain, the Duke of Shrewsbury, had intended should be painted by Sebastiano Ricci, then in great favour with the court in England; but the Earl of Halifax, who was then first commissioner of the treasury, declared that if Ricci painted it he would not pay him. Sir James executed many other great works, as the staircase, the gallery, and several ceilings in the palace at Kensington, a hall at Blenheim, the chapel at Lord Oxford's at Wimpole in Cambridgeshire, a saloon for Mr. Styles at Moor Park in Hertfordshire, and the ceilings of the great hall at Greenwich Hospital. Sir James commenced the last work in 1703, and was occupied upon it for several subsequent years, but it was not entirely painted by his own hands. The paintings are allegorical: on the ceiling of the lower hall, which is 112 feet by 56, are represented the founders of the institution, William III. and Queen Mary, in the centre, surrounded by the attributes of national prosperity; in the other compartments are figures which represent the zodiac, the four seasons, and the four elements, with naval trophies and emblems of science, among which are introduced the portraits of famous mathematicians who have advanced the science of navigation, as Tycho Brahé, Copernicus, Newton, and others. On the ceiling of the upper hall are represented Queen Anne and her husband Prince George of Denmark; other figures represent the four quarters of the world; on the side walls of the same apartment are the landing of William III. at Torbay, and the arrival of George I. at Greenwich; on the end wall facing the entrance are portrait groups of George I. and two generations of his family, with accessories, and Sir James Thornhill's own portrait. These works, which are executed in oil, have little to recommend them besides their vastness; yet in invention and arrangement they are equal to the majority of such works in the great buildings on the continent: in design and colouring however they are inferior.

Walpole has preserved some interesting details respecting the remuneration Thornhill received for some of his works: he says, 'High as his reputation was, and laborious as his works, he was far from being generously rewarded for some of them, and for others he found it difficult to obtain the stipulated prices. His demands were contested at Greenwich; and though La Fosse received 2000*l.* for his work at Montague House, and was allowed 500*l.* for his diet besides, Sir James could obtain but forty shillings a square yard for the cupola of St. Paul's, and I think no more for Greenwich. When the affairs of the South Sea Company were made up, Thornhill, who had painted their staircase and a little hall, by order of Mr. Knight, their cashier, demanded 1500*l.*, but, the directors learning that he had been paid but twenty-five shillings a yard for the hall at Blenheim, they would allow no more. He had a longer contest with Mr. Styles, who had agreed to give him 3500*l.*, but, not being satisfied with the execution, a lawsuit was commenced, and Dahl, Richardson, and others were appointed to inspect the work. They appeared in court bearing testimony to the merit of the performance; Mr. Styles was condemned to pay the money, and, by their arbitration, 500*l.* more, for decorations about the house, and for Thornhill's acting as surveyor of the building.' Thornhill obtained permission, through the earl of Halifax, to copy the Cartoons of Raphael at Hampton Court, upon which he bestowed three years' labour; he made also a smaller set, one-fourth the size of the originals, and distinct studies of the heads, hands, and feet, intending to publish an exact account of the whole for the use of students, but the work never appeared. These two sets of the Cartoons were sold the year after his death, with his collection of pictures, among which were a few capital specimens of the great masters: the smaller set sold for seventy-five guineas, the larger for 200*l.* only, a price, says Walpole, which can have been owing solely to the circumstance of few persons having spaces in their houses large enough to receive them. They were purchased by the duke of Bedford, and were placed in his gallery at Bedford House in Bloomsbury Square, where they remained until that house was pulled down, when they were presented by the owner to the Royal Academy.

Thornhill painted also several portraits and some altar-pieces: he painted the altar-piece of the chapel of All Souls at Oxford; and one which he presented to the church of his native town, Weymouth. There is also at Oxford, according to Dallaway, a good portrait of Sir Christopher Wren by Thornhill; and in the hall of Greenwich Hospital there is by him the portrait of John Worley, in his ninety-eighth year, one of the first pensioners admitted into the hospital: it is painted in a bold careless style, and was presented to the hospital by Thornhill himself. In 1724 he opened an academy for drawing at his house in Covent Garden. He had previously proposed to the earl of Halifax the foundation of a Royal Academy of the Arts, with apartments for professors, but without result: Sir James estimated the cost at 3139*l.*; for, amongst his other occupations, he occasionally 'dabbled' in architecture. At the end of his life he was afflicted with the gout, and in the spring of 1734 he retired to his paternal seat at Thornhill, near Weymouth, which he had the satisfaction of repurchasing; but his period of repose was extremely short, for, says Walpole, 'four days after his arrival, he expired in his chair, May 4, 1734, aged fifty-seven, leaving one son named James, whom he had procured to be appointed serjeant-painter and painter to the navy; and one daughter, married to that original and unequalled genius, Hogarth.'

Sir James Thornhill amassed considerable property, was a man of agreeable manners, was a Fellow of the Royal Society, and represented his native town, Weymouth, in parliament for several years until his death. He was knighted by George I.: his widow, Lady Thornhill, died at Chiswick in 1757.

(D'Argenville, *Abrégé de la Vie des plus fameux Peintres;* Walpole, *Anecdotes of Painting in England;* Pilkington, *Dictionary of Painters.*)

THORNTON, BONNELL, was born in London, in the year 1724. He was educated at Westminster School, and at Christchurch, Oxford. In compliance with the wish of his father, who was a physician, he studied medicine, but he seems not to have liked the profession, and left it for literature. George Colman the Elder was his fellow-student both at Westminster School and at Christchurch, though about nine years younger than Thornton. Similarity of taste led to friendship, and they commenced in conjunction the series of periodical essays called 'The Connoisseur,' which was continued from January 31, 1754, till September 30, 1756. The papers are chiefly of a humorous character, and the wit and shrewd observation of life which they display well entitle them to the place which they still retain among the works of British essayists. Thornton contributed largely to 'The St. James's Magazine,' 'The Public Advertiser,' 'The Covent-Garden Journal,' and other periodical works. He published separately 'An Ode on St. Cecilia's Day, adapted to the antient British music, viz. the salt-box, the Jews'-harp, the marrow-bones and cleavers, the hum-strum or hurdy-gurdy, &c., with an Introduction giving an account of those truly British instruments.' London, 1762, 4to.

In 1767, in conjunction with Colman and Richard Warner, he published two volumes of an English translation of Plautus, 'The Comedies of Plautus, translated into familiar Blank Verse.' Of the plays contained in these two volumes, Thornton translated 'Amphitryon,' 'The Braggart Captain,' 'The Treasure,' 'The Miser,' and 'The Shipwreck;' 'The Merchant' was translated by Colman, and 'The Captives' by Warner. The rest of the plays were translated by Warner, and were published, after Thornton's death, in two additional volumes. In 1768 Thornton published 'The Battle of the Wigs, an additional Canto to Dr. Garth's Poem of The Dispensary,' London, 4to.

Thornton, who appears to have injured his constitution by habitual indulgence in drinking, died May 9, 1768, at

the age of 44. There is an inscription to his memory, by Thomas Warton, in the cloisters of Westminster Abbey.

(Baker's *Biographia Dramatica*, by Reed and Jones.)

THOROUGH-BASE, the art of playing (on keyed instruments, and according to the rules of harmony) an accompaniment from figures representing chords, such figures being placed either over or under the notes of the instrumental base staff. This is one of the many absurd terms employed in music, and its meaning is altogether arbitrary.

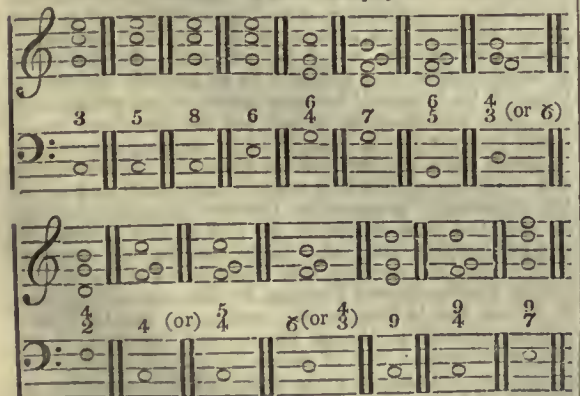
The figures used in *Thorough-Base* are the nine units. These represent certain intervals or sounds. Thus a 6 placed over a c in the base, points out A as an accompaniment: and that figure also implies two other notes attendant on it, namely, the 3rd and 8th, which are called the *accompaniments* of the 6th. A 6 and a 5 placed under it $\binom{6}{5}$, indicate the intervals of the 6th and 5th played together; and also, as accompanying notes, the 3rd and 8th. The figures 3, 5, and 8, singly, or together, represent the perfect or common chord. But in *Thorough-Base* a base note without any figure is supposed to carry a perfect chord. The chords are, as a general rule, assigned to the right hand of the performer, and the intervals are, in most cases, counted from an octave above the figured note. This will be more clearly understood by referring to the articles ACCOMPANIMENT, CHORD, and HARMONY.

The following is a tabular view of the figures used in *Thorough-Base* to represent chords, together with those, not written, but understood, representing the accompaniments which, with the base, form the chords:—

Chords designated by figures.		Accompanying intervals.
3rd,	accompanied by a	5th and 8th.
5th,	„	3rd and 8th.
8th,	„	5th and 3rd.
6th,	„	3rd and 8th.
$\frac{6}{4}$th,	„	8th.
7th,	„	3rd, 5th, and 8th.
$\frac{6}{5}$th,	„	3rd and 8th.
$\frac{4}{3}$rd,	„	major 6th.
$\frac{4}{2}$nd,	„	6th.
4th	(sometimes called the 11th), accompanied by a	5th and 8th.
$\frac{5}{4}$th,	accompanied by an	8th.
6th (sharp 6th)	„	$\frac{4}{3}$rd.
9th,	„	3rd and 5th.
$\frac{9}{4}$th,	„	5th.
$\frac{9}{7}$th,	„	3rd.
7 (sharp 7th)	„	5th, 4th, and 2nd.

Some other chords of an extraordinary kind are occasionally formed; but they are always clearly denoted, in *Thorough-Base*, by an ample number of figures.

The above chords exemplified.



When two figures are placed in succession over one base note, the time of the latter is divided between them. Example:—

A sharp, or flat, or natural, placed alone over a base note, relates solely to the 3rd. Example:—

When other intervals are to be raised or lowered, the proper characters for the purpose are prefixed to them. A dash through a figure is equivalent to a sharp.

The practice of figuring a base staff, whether in a score or in the part assigned to a keyed instrument, has fallen into disuse, the harmony being now fully and clearly presented to the eye of the accompanyist in notes placed in a treble staff over the base. But a knowledge of what is yet too commonly misnamed *Thorough-base*, that is to say, harmony, is absolutely indispensable to the good musician, and very much abbreviates the labour of those who, as amateurs, only aspire to a practical skill either as vocal or instrumental performers. The rules of harmony stand in the same relation to music as those of grammar do to language.

The invention of a *Figured Base* (*Basso Cifrato*, as the Italians so well denominate it) has been stated to have taken place in 1605, and is commonly attributed to Ludovico Viadana, *Maestro di Cappella* at the cathedral of Mantua. But this kind of musical abbreviation was earlier practised, and by an English composer, Richard Deering, who, in 1597, published his *Cantiones Sacræ*, at Antwerp, in which a figured base appears. And we have now before us Jacopo Peri's serious opera *Euridice*, printed at Florence in 1600, in which the base is figured throughout. Lying by us also is Caccini's *Nuove Musiche*, likewise printed at Florence, but one year later, and here we find the base regularly figured. The edition of the latter work referred to by Dr. Burney, is dated Venezia, 1615; it is to be presumed therefore that the active historian of music was not so fortunate as to have met with the first edition of Caccini's remarkably curious and now very rare work.

THOU, JACQUES-AUGUSTE DE (or, as he called himself in Latin, Jacobus Augustus Thuanus), was born at Paris, on the 8th of October, 1553: he was the third son of Christophe de Thou, first president of the parlement of Paris, and of his wife Jacqueline Tuellen de Celi. Besides their three sons and four daughters, who grew to be men and women, De Thou's parents lost six children in infancy; and he himself was so weak and sickly a child till he reached his fifth year, that he was not expected to live. In the exemption which this state of health procured him in his childhood and early boyhood from severer task-work, he amused himself in cultivating a turn for drawing, which was hereditary in his family; and in this way, he tells us himself, he learned to write before he had learned to read. Although originally intended for the church, he went in his early studies the whole round of literature and science as then taught; and while yet only in his eighteenth year he had conceived from the perusal of some of his writings so great an admiration of the celebrated jurist Cujacius, that he proceeded to Valence in Dauphiné, and attended his lectures on Papinian. Here he met with Joseph Scaliger, with whom he contracted an intimate friendship, which was kept up for the thirty-eight remaining years that Scaliger lived. In 1572, after he had been a year at Valence, he was recalled home by his father; and he arrived in Paris in time to be present at the marriage of Henry, the young king of Navarre, and to witness the horrors of the massacre of St. Bartholomew which

followed. He relates that he saw the dead body of Coligny hanging from the gibbet on Montmartre. The next year he embraced an opportunity of visiting Italy, in the suite of Paul de Foix, who was sent by Charles IX. on a mission to certain of the Italian courts; and he remained in that country till the death of Charles, in May, 1574, and the accession of Henry III., the news of which reached them at Rome, recalled De Foix home. In 1576 he made a journey to Flanders and Holland. In 1578 he succeeded Jean de la Garde, Sieur de Saigne, as one of the ecclesiastical counsellors of the parlement de Paris—an entrance into public life which, he says, he made with reluctance, as withdrawing him in part from the society of his books and the cultivation of literature, in which he would have been much better pleased to spend his days. The next year he lost his eldest brother; and from this time it began to be proposed that, for the better chance of continuing the family, his original destination should be changed, and that he should quit his ecclesiastical for a civil career. Some years elapsed however before this scheme was finally determined upon. Meanwhile he continued to pursue his usual studies; and he states that he had already conceived the project of his great historical work, and begun industriously to collect materials for it wherever he went.

It was in the year 1582, while on a visit to Bordeaux, that he made the acquaintance of Montaigne, whose character as well as genius he has warmly eulogized. The same year his father died; and having also by this time lost his second brother, he, in 1584, resigned his rank as an ecclesiastical counsellor, and on the 10th of April was appointed by the king to the office of master of requests, which then was wont to be held indifferently by ecclesiastics or laymen. Two years after he obtained the reversion of the place held by his uncle, of one of the présidents au mortier in the parlement de Paris; and in 1587 he married Marie, daughter of François Barbanson, Sieur de Cani. When, in the next year, in the increasing distractions of the state, Henry III. found himself obliged to leave Paris, De Thou, who, as well as his father and his brothers, adhered steadily throughout the troubles of the time to the royal party, accompanied his majesty to Normandy, and afterwards to Picardy. At Chartres, in August, 1588, he was admitted a counsellor of state; and from this date he took a leading part in all the principal public transactions which followed. When the estates of the kingdom were assembled at Blois, in October of this year, De Thou, as he tells, was there courted with much blandishment by the duke of Guise, but steadily resisted the attempt to seduce him from his loyalty. He had left Blois and was in Paris when the news of the murders of the duke of Guise and his brother the cardinal (on the 23rd and 24th of December) reached the capital; and he had great difficulty in effecting his escape from the popular fury. He succeeded however in rejoining the king at Blois; and having soon after been dispatched on a mission into Germany and Italy to raise succours of men and money for the royal cause, he was at Venice when he heard of the death of Henry, in August, 1589. He immediately set out by the way of Switzerland for France, and met the king of Navarre, now calling himself Henry IV., at Châteaudun. He was received very graciously; and for some years from this time he was constantly with Henry, or employed on missions to different quarters in his service.

In 1591, while Henry was at Nantes, he received accounts of the death of Amyot, bishop of Auxerre (renowned for his translations of Plutarch and other Greek authors); upon which his majesty immediately bestowed his office of keeper of the royal library on De Thou. It was in the year 1593, as he has noted, that he at last actually commenced the composition of his History, which he now states he had conceived in his mind so long as fifteen years before. In 1594 the death of his uncle opened to him his reversionary office of one of the presidents of the parlement de Paris.

Among other important transactions in which he had a part after this, was that of the Edict of Nantes, published in 1598, which he was greatly instrumental in arranging. He has left an account of his own life, in ample detail, down to the year 1601, in which the last event he notices is the death of his wife, in August of that year. In 1604 he published the first eighteen books of his 'History.' The work was received with general applause by the literary public throughout Europe, and, although some things in it gave umbrage to the more zealous friends of the Roman Catholic faith, it was not till several years afterwards, when a second portion of it had been published, that it was formally stigmatized by being inserted in the 'Index Expurgatorius.' De Thou however severely felt this authoritative condemnation of his performance, when it did take place, in November, 1609. The death of Henry IV., in 1610, did not deprive De Thou of his place in the ministry; but he had no longer the same influence as before; and a new appointment, which he received the following year, of one of the three directors charged with the management of the finances, on the retirement of the great Sully, was felt by himself to be not so much an accession of power or honour, as a burdensome and obnoxious office forced upon him, for which he was fitted neither by tastes, habits, nor qualifications. In this same year his brother-in-law, Achille de Harlay, resigned his office of first president of the parlement de Paris, in the hope that De Thou would be nominated his successor; but the place was given to another. These disappointments and disgusts, together with the loss of a second wife, are supposed to have shortened the life of De Thou, who died at Paris on the 7th of May, 1617, in his sixty-fourth year. By his second wife, whose family name was de Bourdeilles, he left three sons and three daughters, one of the former of whom, François Auguste de Thou, the inheritor of his father's virtues and of a considerable share of his talents, fell a sacrifice to the inexorable revenge of Cardinal Richelieu, one of whose last acts was his putting this unfortunate young man to death for his alleged participation in what was called the conspiracy of Cinqmars:—he was executed at Lyon, in his thirty-fifth year, on the 12th of September, 1642, not three months before Richelieu's own death.

The president De Thou is the author of a number of Latin poems, one of the principal of which, entitled 'De Re Accipitraria' (on Hawking), was published in 1584; but his fame rests upon his 'Historia sui Temporis,' or 'History of his own Time,' written also in Latin, in 138 books, of which the first 80 appeared in his lifetime, the remainder not till 1620. The space over which it extends is from the year 1544 to 1607, comprehending the closing years of the reign of Francis I., the entire reigns of Henry II., Francis II., Charles IX., and Henry III., and nearly the whole of that of Henry IV. For about one-half of this period of sixty-three years it has the value belonging to the narrative of one who was himself a principal actor in many of the affairs which he relates, and who with regard to many others was so placed as to have an opportunity of seeing much that was concealed from the common eye; but in truth, from the author's family connections, and his extended acquaintance among the eminent and remarkable persons of his time, this is an advantage which belongs in some degree to the earlier as well as to the later part of the work. It is also admitted to have throughout the merit of a rare impartiality: with no deficiency of patriotic feeling, and perfect steadiness to his own political principles, De Thou is always ready frankly to recognise the high qualities, of whatever kind, that may have belonged either to the citizen of a rival state or a party opponent. As for religious prejudice, he shows so little of that, as to have exposed himself to the imputation of having no religion, or at least of not being really a believer in the form of Christianity, the Roman Catholic, which he professed. But for either of these charges there seems to be no ground. The reputation of his 'History' however stands not so much upon the facts contained in it that are not elsewhere to be found, as upon the skill displayed in its composition—not so much upon the material as upon the workmanship; and it is very evident that with all the pains he took in the collecting of information, this was the praise of which he was the most ambitious, as indeed may perhaps be said to have been the case with the most famous historians of every age and country, from Herodotus and Thucydides among the Greeks, and Livy and Tacitus among the Latins, to Hume and Gibbon among ourselves. But De Thou's manner of writing, though flowing and eloquent, is not very picturesque; and of course he also loses something in meiness and natural grace, ease, and expressiveness, by writing in a dead language. De Thou's Latin style, with all its merit, is not admitted to be faultless, though he has

taken great pains to give it as uniformly classical an air as possible, not only by metamorphosing all his modern names, both of places and persons, so as to give them antique forms, often to the no small perplexity and hindrance of the reader, but, what sometimes produces still more obscurity or ambiguity, by generally endeavouring to describe modern proceedings and transactions in the established legal, political, and military phraseology of the old Romans. The best edition of De Thou's 'History' is that published at London in 1733, in seven volumes, folio, under the superintendence of Samuel Buckley, Esq., and at the expense of Dr. Mead. The last volume of this edition contains De Thou's autobiographical memoir (first published in 1620, and also written in Latin), in six books, together with a mass of additional materials illustrative of the history of his life and works.

THOUARS. [Sevres, Deux.]

THOUARS, LOUIS MARIE AUBERT DU PETIT, an eminent French botanist, was born at the château de Boumois, in Anjou, 1756. His family was wealthy and noble, and being destined for the army, he was early sent to the school of La Flèche. He was made a lieutenant of infantry at the age of 16. This was in a time of peace, and he occupied his leisure in studying the science of botany and its literature. At the time of the loss of La Perouse and his companions, Aristide du Petit Thouars proposed to his brother Aubert that they should go in search of him. To this he willingly consented, hoping to add to his stock of plants and his fame by the voyage. The two brothers sold their patrimony, raised a subscription, and having secured the patronage of Louis XVI., were ready to start on their voyage, when a curious accident separated them. The ship that was to have taken them lay at Brest, and Aubert, with his vasculum (the tin box which botanists carry to put their plants in) at his back, intended to botanise on his way from the capital to the port. He was however found by some *gens d'armes* in the woods, and being suspected as an enemy of his country in those days of disorder, he was arrested and thrown into prison at Quimper. He was however soon released, but too late, as his brother had sailed. He followed him to the Isle of France, but his brother had again departed; and being here without money and without friends, his only resource was his botanical knowledge, and he accordingly applied for employment to some of the rich planters of that island. He quickly obtained an engagement, and remained in the island nearly ten years. On this spot he was very favourably placed for making those observations for which his previous studies had so well prepared him; and during his stay here he collected most of the materials for the numerous works which he published on his return. Whilst a resident in the Isle of France he made a voyage to Madagascar, and collected plants from that island. He returned to Paris in 1802. Many of the results of his researches in the Isle of France and Madagascar were communicated to the Institute and other scientific bodies in Paris. His first work on the botany of the islands which he had visited, was published at Paris in 1804, with the title 'Plantes des Iles de l'Afrique Australe formant des Genres nouveaux,' &c., 4to. He also published on the same subject the 'Histoire des Végétaux des Iles de France, de Bourbon, et de Madagascar,' 1804, 4to. In the same year Bory St. Vincent gave an account of the vegetation of the African islands, in his Voyage dans les quatre principales Iles des Mers d'Afrique,' Paris, 4to., although he did not go out till Du Petit Thouars had returned. In 1806 Du Petit Thouars was appointed director of the royal nursery-ground at Paris, which office he held till the closing of this institution a short time before his death, which took place in May, 1831. In 1806 he published another work on the plants of Africa, with the title 'Histoire des Végétaux recueillies dans les Iles Australes d'Afrique,' Paris, 4to. In 1810 his 'Genera nova Madagascariensia' appeared, in which the Madagascar plants were arranged according to the system of Jussieu. His latest work on systematic botany was one on the Orchidaceæ of the African islands, 'Histoire des Plantes Orchidées recueillies dans les trois Iles Australes d'Afrique,' 1822, Paris, 8vo. His publications on vegetable physiology are equally numerous. Most of these had their foundation in observations and experiments which he made whilst in the Isle of France. In 1805 he published his 'Essai sur l'Organisation des Plantes,' Paris, 8vo.; in 1809, another essay on the vegetation of plants; in 1811, 'Mélanges de Botanique et de Voyages,' Paris, 8vo.; in 1819, a kind of botanical miscellany, passing in review his own labours, under the title 'Revue générale des Matériaux de Botanique et autres, fruit de trente-cinq années d'observations,' Paris 8vo.

As a systematic botanist the views of Du Petit Thouars were uncertain and speculative, and the delay in the publication of his works on African botany deprived him of the merit of introducing to the world many new species. In his physiological works his views are ingenious, but in most cases wanting in sufficient data to establish them. His views on the formation of buds, the motion of the sap, and the origin of wood, are those which have excited most attention. But each of these is perhaps more indebted to the speciousness of its reasoning than to the correctness of the facts, for the importance that botanists have attached to it. But at the same time his great activity of mind, his extensive erudition and original observation, have had a great influence on the progress of botany in the present century. He was a contributor to the 'Biographie Universelle,' and wrote the lives of many of the botanists in that work. The genus of plants *Thouarea* was named after him, and Bory St. Vincent named *Aubertia* in honour of him.

THOURET, MICHEL-AUGUSTIN, an eminent French physician, was born in 1748, at Pont-l'Evêque, in the antient province of Normandy and the modern department of Calvados, where his father was royal notary (*notaire royal*). His education was commenced at his native town, and finished at the university of Caen. He afterwards went to Paris, and in 1774 was admitted gratuitously by the Faculty of Medicine in that city to the degree of M.D., an honour which was gained by public competition (*concours*). A few years later, upon the foundation of the Royal Society of Medicine, Thouret became one of its earliest members, and enriched the Memoirs of the Society by several valuable essays. The most important public work in which he took a part was the exhumation of the bodies in the cemetery of the Holy Innocents, of which he drew up a most interesting report. This cemetery, together with a church of the same name, stood on the spot now occupied by the Marché des Innocens, and had become in process of time so unhealthy from being the principal burial-ground in Paris, that it was absolutely necessary to destroy it. This great work had been several times attempted, but as often abandoned on account of the dangers and difficulties of the undertaking; at last however, in 1785, a committee was named for directing the works, which were carried on without any intermission by night and by day for more than six months, and which were at length completely successful. Thouret afterwards filled several public situations with equal zeal and integrity; and in the midst of the labours of his numerous employments was carried off, after a few days' illness, by a cerebral affection, at Meudon, near Paris, June 19, 1810. Great honours were paid him after his death by the Faculty of Medicine at Paris, of which body he was dean. His works consist almost entirely of essays published in the 'Histoire et Mémoires de la Société Royale,' of which perhaps the most interesting are the 'Rapports sur les Exhumations du Cimetière des SS. Innocens,' mentioned above. These were afterwards published in a separate form at Paris, 1789, 12mo. (*Biographie Médicale.*)

THOUROUT is a town in the province of West Flanders, in the kingdom of Belgium, in the district of Bruges, on the high road from that city to Menin and Courtray. It is a well-built town, with a population of 8000 inhabitants, who have a considerable trade in linen, flax, and linseed. They also manufacture hats, starch, and wooden shoes. [Flanders, West.] (Stein, *Lexicon*; Schulz, *Allgemeine Erdkunde*, vol. xvii.)

THRACE (Θρᾴκη, *Thracia*) was in earlier times the name of the country bounded on the north by the Danube, on the south by the Propontis and the Ægean Sea, on the east by the Black Sea, and on the west by the river Strymon and the chain of mountains which form the continuation of Mount Rhodope. This country is divided into two parts by Mount Hæmus (now the Balkan), which runs from west to east, separating the plain of the lower Danube from the rivers which flow into the Ægean Sea. This mountain probably derived its name

from its cold and snowy top, since Hæmus seems to contain the same root as the Sanscrit *hima*, 'snow,' whence also comes the name of the Himâlaya Mountains. Two extensive ranges branch off from the southern side of Mount Hæmus: one at about a hundred miles from the Euxine, which runs in a south-eastern direction towards Constantinople; the other, which is far larger, branches off near the sources of the Hebrus, and likewise runs to the south-east. The latter bore the name of Rhodope, and is now called the Despoto Mountains. Between these two ranges there are many plains, which are drained by the Hebrus (the Maritza), the principal river of Thrace, and its tributaries. For a further account of the physical geography the reader is referred to the articles BALKAN MOUNTAINS and MARITZA.

In ancient times there was a great quantity of corn and wine grown in the valley of the Hebrus. In the 'Iliad' the ships of the Achæans are described as bringing wine every day to Agamemnon from Thrace (ix. 72); and the Maronean wine, which retained its reputation in the time of Pliny (*Hist. Nat.*, xiv. 6), is spoken of in the 'Odyssey' (ix. 197). In the mountainous parts of the country there were also mines of precious metals. (Justin, viii. 3.)

The Thracians were divided into many separate and independent tribes; but the name of Thracians seems to have been applied to them collectively in very early times. Thrace, according to Stephanus Byzantinus (*s. v.* Θράκη), was previously called Perce (Πέρκη). It signifies any country in the north, according to Ukert (*Geographie von Griechen und Römer*, I., i., p. 282), who quotes the remark of Andron of Halicarnassus (Schol. *ad Lycophr.*, 894, 1283), that Oceanus had four daughters, Asia, Libya, Europa, and Thrace, from whom the four parts of the world were named; and thence he concludes that Asia signified the east, Libya the south, Europa the west, and Thrace the north. This conclusion however hardly amounts to a small probability. Josephus and many Biblical scholars suppose that the name is derived from Tiras (תִּירָס), the son of Japhet (*Genesis*, x. 2), but this opinion rests on little more than an apparent similarity of sound.

The Thracian nation, according to Herodotus (v. 3), was, next to the Indians, the most numerous of all, and if united under one head would have been invincible. He observes that the usages of the different tribes were similar, with the exception of the Getæ [GETÆ], the Trausi, and those who dwelt above the Crestonæi. The account which he gives of the most striking national peculiarities of the Thracians, represents them as a barbarous and savage people, which is supported by other antient writers, though the districts on the southern coast seem to have attained to some degree of civilization, owing to the numerous Greek cities which were founded there at various times. The Thracians, says Herodotus (v. 6), sell their children to be carried out of the country as slaves; they do not guard their young women, but permit them to have intercourse with whatever men they please; they purchase their wives with great sums; they puncture or tattoo their bodies, which they regard as a sign of noble birth; agriculture they despise, and consider it most honourable to live by war and robbery. Deep drinking prevailed among them extensively, and the quarrels over their cups became almost proverbial. (Hor., *Carm.*, i. 18 and 27.) In earlier times, however, there must have been a greater degree of civilization among some of their tribes at least, than prevailed at a later period. The earliest Greek poets, Orpheus, Linus, Musæus, and others, are all represented as coming from Thrace; and Eumolpus too, who founded, according to tradition, the Eleusinian mysteries at Attica, is also said to have been a Thracian. At an early period likewise the Thracians spread extensively over southern Greece. Thucydides (ii. 29) says that they once dwelt in Phocis: Strabo (ix. 401, 410) speaks of their settlement in Bœotia; and their invasion of Attica under Eumolpus, who fought against Erechtheus, is mentioned by many writers. (Strabo, vii. 321; Thucyd., ii. 15; Pausan., i. 38.)

The Thracians are said to have been subdued by Sesostris (Herod., ii. 103), and subsequently by the Mysians and Teucrians, who crossed over into Europe before the Trojan war, and penetrated as far as the Ionian Sea and the Peneus. (Herod., vii. 20.) But the first real historical event respecting them is their conquest by Megabazus, the general of Darius, who conquered all the separate tribes, with the exception of the Satræ, who were the only Thracian people that had retained their independence down to the time of Herodotus. (Herod., v. 2; vii. 111.) After the failure of the expedition of Xerxes, the Thracians appear to have recovered their independence; and in the time of the Peloponnesian war we find a powerful native empire in Thrace, which was under the dominion of Sitalces, who is called by Thucydides (ii. 29) king of the Thracians. This empire was founded by the father of Sitalces, Teres, the king of the Odrysæ, one of the most powerful of the Thracian tribes. It extended along the coast from Abdera to the mouth of the Danube, a distance of four days' and four nights' sail with a favourable wind, and was by land a journey of eleven days by the shortest road for an active man: it extended inland from Byzantium to the Læi and the Strymon, a journey of thirteen days. The tribute paid to Seuthes, the successor of Sitalces, was 400 talents, besides a great number of presents to himself and the Odrysian nobles. Thucydides says that of all the kingdoms between the Ionian Gulf and the Euxine, this was the greatest in revenue and opulence, but that it was inferior to the Scythians in military strength and numbers. In the third year of the Peloponnesian war, B.C. 429, Sitalces, who had formed an alliance with Athens, invaded the territories of Perdiccas, king of Macedonia, with an army of 150,000 men; but being disappointed of the co-operation of an Athenian fleet, he was persuaded by his nephew Seuthes to accept the overtures of Perdiccas, and return home with his army, after remaining in Macedonia thirty days. In the year B.C. 424, Sitalces fell in battle against the Triballi, the most powerful Thracian people between Mount Hæmus and the Danube, and was succeeded by his nephew Seuthes. The power of the Odrysian empire however did not last long. In little more than twenty years from the death of Sitalces it had lost its former greatness; and when Xenophon crossed over into Thrace, in B.C. 400, he found Medorus, the reigning king of the Odrysians, unable to command the obedience of his Thracian subjects. (Compare *Anab.*, vii. 2, s. 32, &c.) In the reign of Philip, the father of Alexander, Cotys was the most powerful of the Thracian chiefs, and is usually called king of Thrace; but he was deprived by Philip of almost all his dominions between the Strymon and the Nestus, and became little else than a vassal of the Macedonian kingdom. He was a savage and vindictive barbarian, and was assassinated in B.C. 358. His son Cersobleptes succeeded to the throne; but he was eventually stripped of all his territories by Philip, who reduced, in B.C. 343, the whole of Southern Thrace at least, and compelled it to pay tribute. (Diodorus, xvi. 71.) On the death of Philip there was a general movement among the Thracians to throw off the Macedonian supremacy, at the head of which the Triballi placed themselves. But Alexander, by his activity, suppressed this rising: he crossed the Hæmus, marched into the country of the Triballi, and, after defeating them, advanced as far as the Danube, which he crossed, and offered up a sacrifice on its right bank. (Arrian, *Anab.*, i. 2, 3; Strabo, vii. 301.) On the death of Alexander, Thrace fell to the share of Lysimachus, who erected it into an independent monarchy; but it subsequently came under the dominion of the Macedonian kings. They seem however to have left the country under the government of its native rulers, and were probably contented with what the Greeks called a hegemony. In the Roman war against Perseus, Cotys, king of the Thracians, is mentioned as an ally of Perseus; though the Thracians, just before the war broke out, had sought the alliance of the Romans. (Livy, xlii. 29, 51; compare xlii. 19.) On the conclusion of the war, however, Cotys was allowed to continue in possession of his kingdom, notwithstanding the assistance he had rendered to Perseus. (Livy, xlv. 42.)

At what time Thrace was reduced to the form of a Roman province is uncertain, but it seems not to have constituted a distinct province till a late period. Under Augustus, the part of Thrace north of the Hæmus was conquered by the Romans, and was afterwards erected into a separate province under the name of Mœsia. [MŒSIA.] The name of Thrace was then confined to the country south of the Hæmus, and between the Euxine, the Propontis, and the Ægean Sea. Its boundary on the west differed at various times: in the time of Ptolemy (iii. 11) it seems to have been the Nestus; but as the Strymon was anciently the boundary between Macedonia and Thrace, it will be

convenient, in the following description of the principal places in Thrace, to consider the district between the Strymon and the Nestus as belonging to the latter country.

Beginning then on the left bank of the Strymon, the first town we come to is Amphipolis, which was founded by the Athenians, and was one of the most important towns in Thrace. [AMPHIPOLIS.] It was situated in the country of the Edones, who dwelt between the Strymon and the Nestus, but originally inhabited the Macedonian district of Mygdonia. (Thucyd., ii. 99.) The next town of importance east of Amphipolis was Philippi, which was founded by Philip of Macedonia: it was previously called Crenides, but was then only a small place inhabited by the Thasians, who settled there for the purpose of working the gold and silver mines in its neighbourhood. West of Philippi the country was an extensive plain stretching towards Amphipolis, which has become memorable on account of the battle fought there by Antony and Octavius (Augustus) against Brutus and Cassius. Under the Romans Philippi became a colony, and was the chief city in that part of the country, when it was visited by the Apostle Paul. (*Acts*, xvii. 12.) It still retains the name of Filibi, but is only a village.

West of the Nestus the first town of importance on the coast is Abdera. [ABDERA.] Next comes Dicæa or Dicæopolis, which was a Greek city on the shores of the lake Bistonis (Herod., vii. 109); and then Maroneia and Ismarus, which were both in the country of the Cicones, where Ulysses landed and was defeated by the inhabitants, after he had taken their city. (*Odys.*, xi. 39, &c.) The Maronean wine has been already mentioned, and the city was in consequence sacred to Dionysus, as may be seen from its coins. It was originally called Orthagoria. Its ruins are still named Maroni. Ismarus is not mentioned by later writers as a city, but only as a mountain celebrated for its wine. Following the coast we next come to Stryme, a colony of the Thasians; then to Mesembria, built by the Samothracians (Herod., vii. 108); and next to Doriscus, situated in a large plain, in which Xerxes numbered his army. (Herod., v. 59.) Crossing the Hebrus we come to Ænos, which, according to Virgil (*Æn.*, iii. 17, &c.), was founded by Æneas, but it is mentioned under this name by Homer, as the place from which Pirous came to the Trojan war (*Il.*, iv. 520). It was a place of considerable importance in later times, and under the Romans was a free town. (Pliny, *Nat. Hist.*, iv. 18.) It is still called Enus.

After passing round the head of the Gulf of Melas, now the Gulf of Saros, we come to the Thracian Chersonese (Χερρόνησος, or Χερσόνησος ἡ ἐν Θράκῃ), now Gallipoli, which was very early colonized by Greek settlers, and though but of small extent is of considerable importance in antient history. In early times it was inhabited by the Dolonci, a Thracian tribe, who being hard pressed in war by the Apsinthii, were led to invite Miltiades, the son of Cypselus, an Athenian, to be their king, in consequence of an answer given them by the oracle at Delphi. This was about the year B.C. 560. Miltiades complied with their request, and took with him to the Chersonese a colony of Athenians. On his death he was succeeded by his nephew Stesagoras, and he by his brother Miltiades, the son of Cimon, who fled to Athens to escape the vengeance of Darius, on account of the advice he had given to the Ionian chiefs in the Scythian expedition of Darius. (Herod., vi. 34, &c.) [MILTIADES.] When the Persians were driven out of Greece, the Chersonese came into the hands of the Athenians, who retained it till the end of the Peloponnesian war. Shortly afterwards the Lacedæmonians, at the request of the inhabitants, built a strong wall across the isthmus to protect the country from the incursions of the Thracians. (Xenoph., *Hell.*, iii. 2, s. 8-10.) It subsequently came under the power of Athens, who wrested it from Cersobleptes, the son of Cotys, when he was deprived of his other dominions by Philip. Afterwards it formed part of the kingdom of Lysimachus, who founded the city of Lysimachia on the isthmus, which he made his capital. It was on the western side of the isthmus, not far from the antient Cardia, the inhabitants of which he removed to his new city. (Diodorus, xx. 29; Pausan., i. 9, s. 10.) South of Lysimachia were Agora, Ide, Pæon, and Alopeconnesus, the last of which only was of any importance. It was an Æolian colony, and was one of the chief towns of the Chersonese in the time of Demosthenes. On the eastern side of the Chersonese, upon the Hellespont, the most southerly town was Cynossema, near which the Lacedæmonian fleet was defeated by the Athenians under the command of Thrasybulus and Thrasyllus, in B.C. 411. (Thucyd., viii. 104, &c.) Above Cynossema was Madytus, which was also one of the chief towns of the Chersonese in the time of Demosthenes (Demosth. *pro Cor.*, p. 256); and north of Madytus was Sestos. [SESTOS.] North of Sestos was the small river of Ægospotamoi, with apparently a town of the same name at its mouth, near which the Athenian fleet was totally defeated by Lysander, in B.C. 405, who was enabled in consequence to obtain possession of Athens and put an end to the Peloponnesian war. Above Ægospotamoi were Callipolis, now Gallipoli, which has given its name to the peninsula, and Pactya, opposite Lysimachia.

As the other towns are not of so much importance as the preceding, a brief notice of them will be sufficient. On the Propontis the chief seaport was Perinthus, afterwards called Heraclea, and sometimes also Heraclea Perinthus. (Zosimus, i. 62; Diodorus, xvi. 76.) On the Bosporus (not Bosphorus, as it is frequently, but incorrectly, written in modern maps and works), which connected the Propontis and the Euxine, the antient Greek city of Byzantium was situated, which occupied part of the site of the modern Constantinople. [BYZANTIUM.]

On the European coast of the Euxine the chief towns were Salmydessus, Apollonia, and Mesembria. The two former were colonies of the Milesians, and the last of the Megarians. (Strabo, vii., 319.)

In the interior of the country the towns most worthy of mention are Trajanopolis, on the Egnatian road to the west of the Hebrus; Plotinopolis, so called in honour of Plotina, the wife of Trajan, to the north of Trajanopolis; Hadrianopolis, on the Hebrus, originally called Orestias, and now Adrianople [ADRIANOPLE]; and, lastly, Philippolis, also on the Hebrus, now called Filibi. The names of these towns sufficiently show by whom they were built or enlarged.

The Via Egnatia, which was the great road of communication between the Ionian Sea and Byzantium, and which is spoken of under MACEDONIA (p. 243), entered Thrace at Amphipolis, and passed by the towns of Philippi, Neapolis, Abdera, Maximianopolis, Trajanopolis, Cypsela, Apri, Heraclea, till it reached Byzantium.

Xenophon, in his 'Anabasis' (vi. 4), speaks of Thrace in Asia, which he describes as extending from the junction of the Bosporus and the Euxine along the Asiatic coast as far as Heraclcia: the country within these limits was inhabited by Thracci Bithyni. The harbour of Calpe was about the middle of this coast-line. [BITHYNIA.]

THRA'CIA, Dr. Leach's name for a genus of testaceous mollusks described as intermediate between *Anatina* and *Mya*, and as having some resemblance to *Corbula*.

THRAPSTON. [NORTHAMPTONSHIRE.]

THRASÆ'TOS, Mr. G. R. Gray's name for a genus of Eagles, *Harpyia*, Cuv., FALCO *destructor*, Daud. [FALCONIDÆ, vol. x., p. 174.]

THRA'SEA PAETUS. His prænomen is uncertain; some writers call him Lucius, and others Publius, but he is generally called simply Thrasea Paetus or Thrasea. He was a native of Patavium, Padua (Tacitus, *Annal.*, xvi. 21; Dion Cass., lxii. 26), and, like most men of talent at the time, he went to Rome, where he afterwards became a senator and a member of the priestly college of the quindecimviri. The first time that Thrasea came prominently forward in the senate was in A.D. 59, when a senatusconsultum was passed by which the city of Syracuse obtained permission to employ a greater number of gladiators in the public games than had been fixed by a law passed in the time of J. Cæsar. (Tacitus, *Annal.*, xiii. 49; Dion Cass., liv. 2; Sueton., *Caes.*, 10.) Although the matter was of no importance, Thrasea took an active part in the deliberation, merely to impress upon his colleagues the necessity of paying attention even to the smallest matters belonging to the administration of the senate. In the same year Nero determined to carry into effect his design of getting rid of his mother Agrippina. [NERO; AGRIPPINA.] When the crime was committed, and when the emperor sent a letter to the senate in which he endeavoured to exculpate himself, the degraded senators congratulated him upon having got rid of so dangerous a woman. The only man who on that occasion had the

courage to show his detestation of the crime was Thrasea. (Dion Cass., lxi. 15; Tacit., *Annal.*, xiv. 12.)

In the year A.D. 62, when the praetor Antistius was charged by Cossutianus Capito with high treason for having composed and read at a numerous party of friends some libellous verses upon the emperor, and when the emperor showed an inclination to interfere in the trial, Thrasea boldly claimed for the senate the right to try the case according to the existing laws. The firmness of Thrasea induced most of the senators to follow his example and to vote with him. Cossutianus was thwarted in his hope of getting Antistius sentenced to death, and the emperor, though highly annoyed, endeavoured to disguise his anger. (Tacitus, *Annal.*, xiv. 48, 49.) A short time afterwards Thrasea again attracted general attention in the senate by a speech against the assumption and insolence of wealthy provincials. It had at that time become customary with the provincials to request the Roman senate, by embassies, to offer public thanks to the proconsuls who returned from their province, and who had conducted the administration to their satisfaction. The ambition to gain this distinction often deprived the proconsuls of their independence, and degraded them into flatterers of influential provincials, who thus obtained an improper power. Thrasea proposed to the senate a measure to remedy the evil, but although it met with general approbation, he did not succeed in making the senate pass a decree, which was however done shortly after on the proposal of Nero himself. (Tacitus, *Annal.*, xv. 20-22.) Nero already hated Thrasea, and envy now began to increase the hatred. When therefore, in A.D. 63, Poppaea, the wife of Nero, was expecting her confinement at Antium, and all the senators flocked thither to wait for the event, Thrasea was forbidden to go there. The Stoic philosopher bore this insult with his usual calmness. Nero afterwards indeed declared to Seneca that he was reconciled to Thrasea, but this was probably no more than an expression of his fear. The inflexible character of Thrasea, his refusal to take any part in the degrading proceedings of the senate, and the esteem which he enjoyed among his contemporaries, increased the hatred of Nero, who only waited for a favourable opportunity to get rid of him. It appears that from the year A.D. 63 Thrasea never attended the meetings of the senate. Three years thus passed away, when at length, in A.D. 66, his old enemy Cossutianus brought forward a number of charges against Thrasea, the substance of which was, that he took little or no part in public affairs, and that when he did so, it was only to oppose the measures of the government; that he was a secret enemy of the emperor, and fulfilled neither his political duties as a senator nor his religious duties as a priest. Thrasea first requested a personal interview with the emperor, which was refused. He then wrote to him, asking for a statement of the charges against him, and declaring that he would refute them. When Nero had read this letter, instead of which he had expected a confession of guilt and an humble petition for pardon, he convoked the senate, to decide upon the charges against Thrasea and others. Some of Thrasea's friends advised him to attend the meeting, but most dissuaded him from it. One young and spirited friend, Rusticus Arulenus, who was tribune of the people, offered to put his veto upon the senatus-consultum, which however Thrasea prevented. The philosopher now withdrew to his country-house. In the senate, which was surrounded by armed bands, the quaestor of the emperor read his oration, whereupon Cossutianus and others began their attacks upon Thrasea. The wishes of Nero, and the presence of armed soldiers ready to enforce them, left the senators no choice, and it was decreed that Thrasea, Soranus, and Servilia should choose their mode of death, and that Helvidius, the son-in-law of Thrasea, and Paconius, should be banished from Italy. The accusers were munificently rewarded. Towards the evening of this day the quaestor of the consul was sent to Thrasea, who had assembled around him a numerous party of friends and philosophers; but before he arrived, a friend, Domitius Caecilianus, came to inform him of the decree of the senate, which spread consternation among all who were present. Thrasea's wife Arria, who was a relative of Persius the poet (*Vita A. Persii Flacci*), was on the point of making away with herself, but her husband entreated her not to deprive her daughter of the last support which now remained to her. When at length the quaestor arrived and officially announced the decree, Thrasea took Helvidius and his friend Demetrius to his bed-room, and had the veins of both his arms opened; and when the blood gushed forth, he called out, 'Jove, my deliverer, accept this libation.' (Tacitus, *Annal.*, xvi., 21-35; Dion Cass., lxii. 26.)

Thus died Thrasea, according to the unanimous consent of the antients a man who professed the genuine and stern virtues of the olden time in the midst of a degenerate age. Tacitus calls him virtue itself, and even Nero is reported to have said, 'I would that Thrasea liked me as much as he is a just judge.' (Plutarch, *Rei Publicae gerendae Praecepta*, p. 810, A. ed. Frankf.; comp. Martial, i. 9; Juvenal, v. 36; Pliny, *Epist.* viii. 22.) The principles which guided him through life he had imbibed from the Stoic philosophy. Cato the younger was his favourite character in the history of the Roman republic; he wrote a Life of Cato, which Plutarch made use of in his biography, and thus we probably still possess the substance of it. (Plutarch, *Cato Min.*, 25 and 37; compare Heeren, *De Fontibus Plutarchi*, p. 168.) Rusticus Arulenus wrote a work on Thrasea and Helvidius, in which he characterised them as men of the purest integrity—an expression which became fatal to the author. (Sueton., *Domit.*, 10; Tacitus, *Agric.*, 2, and 45.)

THRASHING. The separation of the grain from the ear in corn has always been one of the most laborious operations on a farm. Where the quantity grown is merely sufficient to supply food for the cultivators of the soil, the simplest methods answer the purpose sufficiently. The corn taken by handfuls may be beaten on a piece of wood or a table, and by repeatedly turning the straw the whole of the grain may be readily beaten out. This mode of thrashing is still adopted in order to obtain the finest and ripest grains for seed; but then the straw is afterwards thrashed over again with the *flail*, which is the instrument most generally adopted for thrashing corn. It is needless to describe this instrument, which is so generally known. It requires some practice to use it effectually and to avoid accidents to the thrasher himself or the bystanders. The flail being swung round the head, the beating part of it is made to fall horizontally on the straw which is spread on the thrashing-floor; and, by inserting this part occasionally under the straw, it is turned over and a fresh portion is brought up to be beaten. This is done without losing the stroke or time when several men are thrashing together. If it were not that thrashing is mostly done in winter, when no out-door work could well be done, few labourers would submit to its toil; and it is very difficult to ensure the entire separation of the grain without great vigilance and attention on the part of the master or overseer. If the labour is paid by the day, much time is usually lost; and if it be by the quantity of grain thrashed or by the number of sheaves, there is a great temptation for the men to hurry over the work, as more grain is thrashed out at first when the ears are full than afterwards.

Where the corn is thrashed out immediately after harvest, to be put into a granary, as is the case in those countries where extensive tracts of rich land are sown with corn two or three times without much tillage or manuring, and then left to be recruited by several years' rest and pasture, the most common practice is to level a portion of a field, and laying the corn in the straw in a large circle, to drive oxen and horses over it till it is all trodden out. This is the method alluded to in Scripture, and can only take place where the climate is serene and dry. Till ingenuity had produced machines to supersede the flail, this was the only instrument in use. The first idea of a machine for thrashing was that of imitating the motion of the flail, but so much depends on the eye of the thrasher, that no mechanism could well imitate the motion of his arms. This was consequently given up, and an imitation of the rubbing of the grains from the ears between the hands, combined with the beaters of a flax dressing-machine, gradually produced the present improved thrashing-machine.

Without a figure it would be difficult to describe the different parts and motions of a thrashing-machine. They are however now so common, that it will suffice to give the general principle of action, and to mention some of the latest improvements in it. A rapid motion is given to a hollow cylinder round a horizontal axis; on the outer surface there are projecting ribs parallel to the axis at

equal distances from each other; the width of these is from two to six inches. Around half the cylinder is a case the inner surface of which is lined with plates of cast-iron grooved in the direction of the axis. The ribs or beaters come quite close to these grooves, so that an ear of wheat or other corn cannot well pass between them without being flattened. The sheaves of corn, having been untied, are spread on a slanting table, and in some machines are drawn in between two iron rollers, of which one is plain and the other fluted. The motion of these rollers is slow, while that of the cylinder or drum is very rapid. The beaters act on the straw as it comes through the rollers, and beat out most of the corn; but what remains is carried in between the beaters and the fluted ease, and when it has made half a revolution all the grain has been beaten and rubbed out. It falls on a sieve which lets the grain through, but retains the straw, which is raked off by hand or by circular rakes moved by the machinery. Some of the best implement-makers in England have found the two rollers superfluous, and have accordingly dispensed with them. The straw is at once subjected to the beaters, and the machine may be fed more or less rapidly according to circumstances. It requires a little more attention in the person who feeds the machine, but more work is done and some power saved. The great perfection of a thrashing-machine is to rub out every grain and to break the straw as little as possible; the larger the scale of the machine the better it does this. Hand-machines have been made on the same principle, but they do not effect any saving in the expense, requiring many men to produce the effect of one horse. The great advantage of hand-machines is that men and women can be employed to thrash who could not use the flail skilfully. Moveable thrashing-machines are very generally in use in England where farms are small. They are often the property of an industrious labourer or mechanic, who undertakes to superintend the work, the farmer finding horses and men. Thus he goes from farm to farm and earns his livelihood from a small capital laid out in the purchase of a machine. The price of thrashing in this way is about half of what is usually paid for thrashing with the flail; it is more rapidly done, there is less chance of pilfering, and fewer grains remain in the straw.

On very large farms it has been found economical to erect a steam-engine to work the thrashing-machine, chaff-cutter, and other domestic implements. Where coals are cheap there is a great saving. A steam-engine costs little to keep it in order. When not working, the interest on the original price is the only loss, whereas horses must be fed whether they work or not. The price of steam-engines is so much reduced and their construction so simplified, that they will probably soon form an essential part of the implements on every farm.

There are some thrashing-machines on a new principle which are said to work well. The drum is furnished with rows of spikes, and similar spikes are fixed into the cover, which work in the intervals between the first. The corn in the straw is drawn in by the spikes on the drum, which revolves rapidly, and the ears being beaten in all directions by the fixed and the revolving spikes, the grain falls out of the ear and is collected below. Such a machine was exhibited at the Agricultural Meeting at Cambridge in 1840, but it seemed to break the straw more, and to be more apt to clog, than the machines in general use. These will no doubt be made gradually simpler and cheaper, till they entirely supersede the flail, even in very small farms.

THRASYBU'LUS (*Θρασύβουλος*), the son of Lycus, was born at Steiria in Attica. In the year B.C. 411 the oligarchal party at Athens gained the ascendency, and formed a new senate of 400 members. The oligarchs in the fleet stationed at Samos endeavoured to bring about a similar revolution there, but their efforts failed; and among the men who exerted themselves to maintain the democratical constitution, Thrasybulus, who then had the command of a trireme, was foremost. He and his friend Thrasyllus compelled the oligarchs to swear to keep quiet, and not to attempt any alteration in the constitution. The generals who were known to belong to the oligarchs were removed, and Thrasybulus and Thrasyllus were appointed in their stead. The army under their command assumed the rights and power of the people of Athens, and in an assembly of the camp Thrasybulus got a decree passed, by which Alcibiades, who had lately been the chief support of the democratical party, and who was living in exile with Tissaphernes, should be recalled. Thrasybulus set out to fetch him to the camp. (Thucydides, viii. 81.) In 410 B.C. he greatly contributed to the victory which the Athenians gained in the battle of Cyzicus. In B.C. 408, when Alcibiades returned to Athens from Byzantium, Thrasybulus was sent with a fleet of eighty galleys to the coast of Thrace, where he restored the Athenian sovereignty in most of the revolted towns; and while he was engaged here he was elected at Athens one of the generals, together with Alcibiades and Conon. In B.C. 406 Thrasybulus was engaged as one of the inferior officers in the Athenian fleet during the battle of Arginusae; and after the battle he and Theramenes were commissioned by the generals to save the men on the wrecks: but a storm prevented their executing this order. Respecting the fate of the generals and the conduct of Theramenes on this occasion, see THERAMENES. Thrasybulus is not charged with any improper act during the proceedings against the generals, and for two years after his name does not occur in the history of Attica.

During the government of the Thirty Tyrants at Athens, he was sent into exile, and took refuge at Thebes. The calamities under which his country was suffering roused him to exertions. The spirit which prevailed at Thebes against Sparta, and against its partisans at Athens, emboldened him to undertake the deliverance of his country. With a band of about seventy, or, according to others, of only thirty fellow-exiles, he took possession of the fortress of Phyle, in the north of Attica. The Thirty, sure of victory over so insignificant a garrison, sent out the 3000 Athenians whom they had left in the enjoyment of a kind of franchise, and the knights, the only part of the population of Athens who were allowed to bear arms. On their approach to Phyle some of the younger men, eager to distinguish themselves, made an assault upon the place, but were repelled with considerable loss. The oligarchs then determined to reduce the fortress by blockade; but a heavy fall of snow compelled them to return to Athens. During their retreat the exiles sallied forth, attacked the rear, and cut down a great number of them. The Thirty now sent the greater part of the Lacedaemonian garrison of Athens and two detachments of cavalry to encamp at the distance of about fifteen stadia (nearly two miles) from Phyle, for the purpose of keeping the exiles in check. The small band of Thrasybulus had in the meantime increased to 700, as the Athenian exiles flocked to him from all parts. With this increased force he one morning descended from Phyle, surprised the enemy, and slew upwards of 120 hoplites and a few horsemen, and put the rest to flight. Thrasybulus erected a trophy, took all the arms and military implements which he found in the enemy's camp, and returned to Phyle.

The Thirty now began to be alarmed at the success of the exiles, and thought it necessary to secure a place of refuge in case the exiles should succeed in getting possession of Athens. For this purpose they, or rather Critias, devised a most atrocious plan. By fraud and force he contrived to secure 300 citizens of Eleusis and Salamis capable of bearing arms; and after they were conveyed to Athens, he compelled the 3000 and the knights to condemn them to death. All were accordingly executed, and Eleusis was deprived of that part of its population to which it might have looked for protection. In the meantime the number of exiles at Phyle had continued to increase, and now amounted to one thousand. With these Thrasybulus marched by night to Piræeus, where he was joyfully received, and great numbers of other exiles immediately increased his army. The Thirty no sooner heard of this movement than they marched against Piræeus with all their forces. Thrasybulus, by a skilful manœuvre obliged the enemy, who was superior in numbers, to occupy an unfavourable position at the foot of the hill of Munychia. In the ensuing battle the army of the tyrants was put to flight and driven back to the city. Critias fell in the contest.

The consequences of this success showed that there had been little unity among the oligarchs, and that an open breach had only been prevented by fear of Critias. Some of the Thirty and a great many of the 3000 were in their hearts opposed to the atrocities which had been committed, and had avoided, as much as they could, taking part in the rapine and bloodshed. They also were aware that the hatred and contempt under which they were

labouring were owing mainly to the violence of their colleagues; and for the purpose of maintaining their own power they now resolved to sacrifice their colleagues. An assembly was held in which the Thirty were deposed, and a college of ten men, one from each tribe, was appointed to conduct the government. Two of these ten had formerly belonged to the Thirty, and the rest of the Thirty withdrew to Eleusis. As regards the army of exiles under Thrasybulus, the new government of Athens was no less determined to put them down than the Thirty had been. Thrasybulus therefore continued to strengthen himself, and to prepare for further operations. His army had gradually become more numerous than that of Athens, for he engaged aliens in his service, and promised them, in case of their success, the same immunities at Athens as those enjoyed by the citizens (*ἰσοτέλεια*). Arms, of which he was still in want, were generally supplied by the wealthy citizens of Piraeeus and other places, and by the ingenuity of his own men. As the danger from the exiles became at last very imminent, the Ten of Athens applied to Sparta for assistance. At the same time the faction at Eleusis also sent envoys to Sparta; but the government of Sparta refused to send an army for an undertaking from which it could reap no advantages. However Lysander, as harmostes, obtained leave to levy an army, and his brother Libys was appointed admiral to blockade Piraeeus. Lysander went to Eleusis, and got together a numerous army. Being thus enclosed by land and by sea, Thrasybulus and his army had no prospect except to surrender.

But their deliverance came from a quarter whence it could have least been expected. The power and influence which Lysander had gradually acquired, had excited the envy of the leading men at Sparta, even of the ephors and kings, and they were now bent upon thwarting his plans. King Pausanias was accordingly sent out with an army to Attica, avowedly to assist Lysander in his operations, but in reality for the purpose of preventing the accomplishment of his designs. He encamped near Piraeeus, as if he designed to besiege the place in conjunction with Lysander. After several sham manœuvres against the exiles, Pausanias gained a victory over them without following it up. He now sent secretly an embassy to them, requesting them to send a deputation to him and the ephors; and he also suggested the language which the deputies should use. At the same time he invited the pacific party at Athens to meet and make a public declaration of their sentiments. Hereupon a truce was concluded with the exiles, and a deputation of them, as well as of the pacific party at Athens, was sent to Sparta to negotiate a general settlement of affairs. As soon as the Ten of Athens heard of this, they also sent envoys to Sparta to oppose the other embassy. But this attempt failed, and the ephors appointed fifteen commissioners with full powers, in conjunction with king Pausanias, to settle all the differences between the parties in Attica. In accordance with the wishes of the exiles and the peaceful party of the city, the commissioners proclaimed a general amnesty, from which none were to be excluded except the Thirty, the Eleven, and the Ten who had formed the government of Piraeeus. Any one who might not think it safe to return to Athens was permitted to take up his residence at Eleusis. This clause is unintelligible, unless we suppose that the Spartans still wished to see Eleusis in the hands of a party which might check the reviving spirit of independence among the Athenians. Sparta guaranteed the execution of the proclamation. Pausanias withdrew his forces, and Thrasybulus at the head of the exiles entered Athens in triumph, and marched up the Acropolis to offer thanks to Athena. An assembly was then held, in which Thrasybulus impressed upon all parties the necessity of strictly observing the conditions of the peace.

Eleusis was now the seat of the most violent of the oligarchical party, and they still indulged some hope of recovering what was lost. They assembled a body of mercenaries to renew the civil war; but Athens sent out a strong force against them. Xenophon says that the leaders of the Eleusinian party were drawn to a conference and then put to death. This isolated statement is rather surprising, as in all other respects the popular party showed the greatest moderation, and immediately after the quelling of the Eleusinian rebellion Thrasybulus induced the Athenians to proclaim a second amnesty, from which no one was to be excluded. This amnesty was faithfully observed. The first step after the abolition of the oligarchy was the passing of a decree which restored the democratic form of government.

Thrasybulus acquired the esteem of his fellow-citizens by the courage and perseverance which he had shown in the deliverance of his country, and although for many years he does not come forth very prominently in the history of Attica, he was no less active in restoring Athens to her former greatness, than he had been in wresting her from the hands of her enemies. His last military undertaking belongs to the year B.C. 389, when the government of Athens placed a fleet of 40 galleys at his command, with which he was to support the democratical party in the island of Rhodes. On his arrival there he found that no protection was needed, and he sailed to the north part of the Ægean. In Thrace he settled a dispute between two princes, and gained them as allies for Athens. At Byzantium and Chalcedon also the influence of Athens was restored, and with it new sources of revenue to the republic were opened. After this he sailed to Mitylene, the only town in the island of Lesbos in which the Spartan party had not gained the ascendency. Thrasybulus here fought a battle with Therimachus, the Spartan harmostes, who was defeated and slain. Several towns were now reduced, and after he had plundered the lands of those who refused to submit to Athens, he prepared to sail to Rhodes; but before he landed there, he sailed along the southern coast of Asia Minor to levy some contributions there. His fleet cast anchor in the mouth of the river Eurymedon in Pamphylia, near Aspendus. In consequence of some outrage committed by his soldiers on land, the Aspendians were exasperated, and during the night they surprised and killed Thrasybulus in his tent, in B.C. 389.

Hinrichs, *De Theramenis, Critiae, et Thrasybuli Rebus et Ingenio*, Hamburg, 1820, 4to.; Thirlwall, *History of Greece*, vol. iv.)

THRASYBU'LUS (*Θρασύβουλος*), of Collytus in Attica, was a contemporary of Thrasybulus, the deliverer of Athens, from whom he is usually distinguished by the epithet of the Collytian. He was one of the Athenian exiles who joined his namesake at Phyle and afterwards at Piraeeus. (Demosthenes, in *Timocrat.*, p. 742.) In the war against Antalcidas he commanded eight Athenian galleys, with which he was taken prisoner by the Spartan admiral.

(Xenophon, *Hellen.*, v. 1, 26, &c.; compare Æschines in *Ctesiphont.*, p. 73, ed. Steph.)

THRASYBU'LUS (*Θρασύβουλος*), a tyrant of Syracuse. He was a son of Gelo, and brother of Hiero the Elder, who ruled over Syracuse till the year B.C. 466. Hiero was succeeded by his brother Thrasybulus, who was a bloodthirsty tyrant, and oppressed the people still more than Hiero: great numbers of citizens were put to death and others sent into exile, and their property filled the private coffers of the tyrant. In order to protect himself against the exasperated citizens, he got together a large force of mercenaries, and relying on this new support, he carried his reckless cruelties so far, that at last the Syracusans determined to rid themselves of their tyrant. They chose leaders to give them a military organization, that they might be enabled to resist the mercenaries of Thrasybulus. The tyrant at first endeavoured to stop the insurrection by persuasion, but this attempt failing, he drew reinforcements from Catana and other places, and also engaged new mercenaries. With this army, consisting of about 15,000 men, he occupied that part of the city which was called Achradina, and the fortified island, and harassed by frequent sallies the citizens, who fortified themselves in a quarter of their city called Ityce. The Syracusans sent envoys to several Greek towns in the interior of Sicily, soliciting their aid. The request was readily complied with, and they soon had an army and a fleet at their disposal. Thrasybulus attacked them both by sea and land, but his fleet was compelled to sail back to the island after the loss of several triremes, and his army was obliged to retreat to Achradina. Seeing no possibility of maintaining himself, he sent ambassadors to the Syracusans with offers of terms of peace, which was granted on condition of his quitting Syracuse. Thrasybulus submitted to these terms, after having scarcely reigned one year, and went to Locri in Southern Italy, in B.C. 466,

in exile. After the Syracusans had thus delivered themselves of the tyrant, they granted to his mercenaries free departure, and also assisted other Greek towns in Sicily in recovering their freedom. (Diodorus Sic., xi. 67 and 68.)

THRASYMENE LAKE (Trasiménus Lacus, in the best Latin MSS.; in Greek writers, ἡ λίμνη Τρασυμένη, or Θρασιμένη), the antient name of the Lago di Perugia in Italy. It was in Etruria, and was the scene of the third defeat of the Romans by Hannibal after he had crossed the Alps. [HANNIBAL.] The lake itself is fully described under PERUGIA.

THRAULITE. *Hisingerite. Hydrated Silicate of Iron.* Occurs in roundish nodules. Fracture uneven or imperfect conchoidal. Structure curved, foliated. Brittle. Splendent. Nearly opaque. Lustre vitreo-resinous. Colour brownish-black.

Gives out water when heated in a glass tube; imperfectly fused by the blowpipe, and is, after heating, attracted by the magnet.

It occurs at Riddarhyttan in Westmanland (1) and at Bodenmais in Bavaria (2), accompanying iron pyrites.

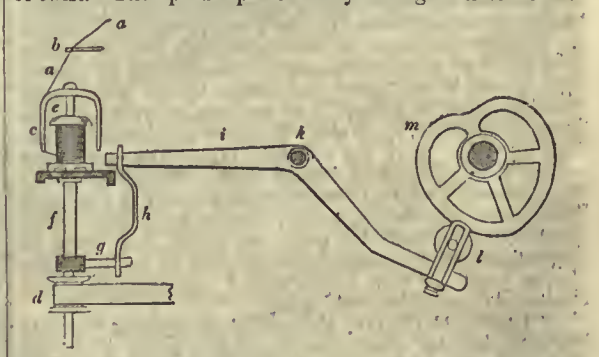
THREAD (French, *Fil;* German, *Zwirn;* Dutch, *Garen;* Italian, *Refe;* Spanish, *Hilo, Torzal;* Russian, *Nitki*), a small line formed by twisting together fibres of vegetable or animal substances, as flax, cotton, or silk. Sewing-thread, and the various kinds of thread used in the manufacture of bobbin-net, lace, and some other kinds of textile fabric, consist of two or more *yarns*, or simple spun threads, firmly united together by twisting, just as a rope-strand consists of several yarns or distinct cylinders of hemp. [ROPE, vol. xx., p. 154; SPINNING, vol. xxii., p. 349.]

In a paper on the manufactures of Paisley, printed in the Appendix to Anderson's 'History of Commerce' (edition of 1787-9), it is stated that 'the manufacture of thread was first attempted in this country by Mrs. Millar, of Balgarran, in 1722, on having received some information and machinery from Holland.' Her example was speedily followed by several families in Paisley, where the manufacture soon became of considerable importance. The first manufacturers imitated the kind called Nuns' or ounce thread, which was made up in hanks of forty threads each, reeled upon reels a yard in circumference; but when the profits of the manufacture were diminished by competition, it was injured by the surreptitious practices of some of the manufacturers, who reduced the number of threads in each hank from forty to thirty, and when this became notorious in the market, put but twenty-eight threads in the hank, or reduced the diameter of their reels, and consequently the length of the threads. These frauds were carried to such an extent that it became necessary, in 1788, to pass an act of parliament requiring all manufacturers of this description of thread to use uniform standard reels of thirty-six inches in circumference, and to put thirty threads or rounds of the reel in each hank. From the statement above referred to, it appears that the number of machines employed at Paisley in twining thread, in 1784, was not less than 120; and that the number employed in the thread manufacture in the whole of Scotland at that time was at least 500, of which about 200 were engaged in the production of the different species of ounce threads. These consumed upon an average 2400 spindles of yarn each, or 480,000 in the whole; and these spindles, valued at 4*s.* 6*d.* each, when manufactured into thread, amounted to 108,000*l.* The 300 machines employed in making other kinds of thread consumed upon an average 2000 spindles each, or 600,000 spindles in the whole, which, estimated at 3*s.* 9*d.* each when manufactured, amounted to 112,000*l.* Thus the total annual value of the thread manufactured in Scotland about 1784 was 220,000*l.*; and it is stated that the manufacture gave employment in its various operations, from the spinning of the flax to the finishing of the thread, to upwards of 20,000 women, besides 4000 or 5000 men.

The manufacture of thread from fibres of cotton-wool, for sewing and other purposes, is one of the many important departments of British industry called into exercise by the improvements effected by Arkwright and his successors in spinning-machinery, and forms a considerable branch of business both in Manchester and in Scotland, for exportation as well as for home consumption.

The operation of combining yarns of cotton or linen into thread is performed by a machine called a doubling and twisting frame, somewhat resembling the throstle of the cotton-spinner. Engravings of this machine, with a minute description, are given in Dr. Ure's 'Cotton Manufacture of Great Britain,' vol. ii., pp. 226-234, and 'Dictionary of Arts,' pp. 1239-1241, from which authorities the following account is derived. Along the centre of the machine is an elevated creel or frame-work, which supports two parallel rows of cops or bobbins of yarn, one row towards each side of the machine. The cops or bobbins are placed vertically, or nearly so, and the lower ends of their axes rest in oiled steps or hollows, while the upper ends are supported by wire eyes, so that they may revolve with facility. The number of cops or bobbins of yarn is twice as great as that of the twisting spindles when the thread is to consist of two yarns, three times as great for thread formed of three yarns, &c.; and the yarn with which they are charged is frequently *gassed*, or passed quickly through a series of coal-gas flames, to singe off any loose downy fibres, before it is taken to the doubling and twisting frame. From the cops the yarns are conducted over horizontal glass rods, which are fixed parallel with the creel, and thence downwards into troughs filled with water or very thin starch-paste, which by moistening the yarns facilitates the subsequent process of twisting. To ensure the equal moistening of the yarns they are, while being drawn through the troughs, made to pass either under a glass rod, or through eyes which may, if necessary, be lifted out of the trough without wetting the fingers, by means of upright stems provided for that purpose. The wetting-troughs and other apparatus are alike on each side of the machine; but in further tracing the progress of the thread we shall confine our attention to one side, and to the apparatus necessary for producing one thread, although a great number of such trains of apparatus are combined in one frame, and set in motion by one train of impelling machinery. After being wetted the yarns pass over the rounded edge of the trough, which is covered with flannel for the purpose of absorbing the superfluous moisture; and thence under and partly around an iron roller, which is made to revolve with any required velocity by a train of wheel-work. Upon this roller rests another, of box-wood, which revolves solely by contact with the iron roller, its axis playing in vertical slots. In passing under the iron roller, then between it and the wooden roller, and finally over the latter, the yarns required to form the thread are brought together and slightly compressed; but although thus prepared for a more intimate union, they are not yet twisted together. The action of the winding and twisting apparatus may be illustrated by a diagram, in which none but the essential parts are shown. In this figure *a a* represents the untwisted thread, or rather the united yarns which are to form the thread, and *b* is a fixed eyelet through which they are conducted to the flyer *c*, which is mounted upon and revolves with a long vertical spindle set in motion by a whorl or pulley and strap at *d*. *e* is the bobbin upon which the finished thread is wound by the revolution of the flyer, which also gives to it any predetermined degree of twist. The spindle passes freely through a hole in the



centre of this bobbin, which rests upon a bar called the copping-rail, the transverse section of which is indicated

by a tint in the cut; and the copping-rail, which extends the whole width of the machine, is supported at intervals by vertical rods, one of which is shown at *f*. To these rods, and consequently to the copping-rail and bobbins supported by them, a reciprocating vertical motion is imparted through the connecting pieces *g* and *h*, from the bent lever *i i*, which is pivoted at *k*, and receives its motion through the adjustable friction-roller *l*, from an eccentric or heart wheel *m*. Thus by the combined rotatory motion of the spindle and flyer, and rising and falling motion of the bobbin, the thread is at once twisted and wound regularly upon the bobbins, which may be easily removed when full. It is unnecessary to detail the contrivances by which motion is communicated to various parts of the machine, and it is sufficient to add that, by changes in the relative sizes of some of the toothed wheels by which the moving-power is distributed from the main shaft, the spindles, which always revolve much faster than the rollers, may be made to do so to any required degree, so as to impart a greater or less degree of twist to the thread.

Silk thread is, according to Dr. Ure, commonly twisted in lengths of from fifty to a hundred feet, with hand-reels somewhat similar to those employed in rope-making.

(Anderson, *History of Commerce*, vol. iv., pp. 703-4; Dr. Ure's *Cotton Manufacture of Great Britain*, vol. ii., pp. 226-234; *Dict. of Arts*; &c.)

THREATS AND THREATENING LETTERS. By the criminal law of England, threats of personal violence, or any other threats by which a man of ordinary firmness and prudence may be put in fear, and by means of which money or other property is extorted from him, amount to the crime of robbery. [Robbery.] And by the statute 7 Will. IV. & 1 Vict., c. 87, sect. 7, a person demanding by menaces any property of another with intent to steal the same, is declared to be guilty of felony, and is liable to imprisonment for any term not exceeding three years. Besides these offences, it is a misdemeanor at common law to threaten another in order to deter him from doing some lawful act, or to compel him to do an unlawful one, or to extort money or goods from him, or to obtain any other benefit to the person who makes the threat.

The offence of sending or delivering letters or writings, threatening to kill or injure the person to whom they are sent or delivered, or to burn his house, or to accuse him of some heinous crime for the purpose of extorting money, was formerly considered to be high treason (stat. 8 Hen. V., c. 6); and under the stat. 9 Geo. I., c. 22, continued for more than a century to be punishable as a capital felony. By the stat. 4 Geo. IV., c. 54, s. 3, it was declared to be desirable that a less punishment should be substituted for that of death; and it was enacted that, 'if any person shall knowingly and wilfully send or deliver any writing, with or without any name or signature subscribed thereto, or with a fictitious name or signature, threatening to kill or murder any person, or to burn or destroy his house, outhouse, barns, or stacks of corn or grain, hay or straw, the offender shall be guilty of felony, punishable with transportation for life, or not less than seven years, or imprisonment for any term not exceeding seven years.' By a more recent statute, 7 & 8 Geo. IV., c. 29, sect. 8, it is enacted that, 'if any person shall knowingly send or deliver any letter or writing, demanding of any person with menaces, and without any reasonable or probable cause, any chattel, money, or valuable security; or if any person shall accuse, or threaten to accuse, or shall knowingly send or deliver any letter or writing accusing or threatening to accuse, any person of any crime punishable by law with death, transportation, or pillory, or of any assault with intent to commit any rape, or of any attempt or endeavour to commit any rape, or of any infamous crime (the meaning of which term is specially defined in the 9th section of the same statute), with a view or intent to extort or gain from such person any chattel, money, or valuable security,' every such offender shall be guilty of felony, and shall be punishable with transportation for life or not less than seven years, or with imprisonment not exceeding four years, with or without whipping.

THREE, RULE OF, the technical name of the rule in arithmetic by which, three quantities being given, the first and second of one kind, a fourth is found such that the four are in proportion, or that the first is the same multiple, part, or parts, of the second, which the third is of the fourth.

In the earliest modern treatises are found the explanatory headings of this process, from which the denomination *rule of three* has been formed by abbreviation. Almost all such abbreviations date from the time when systems of commercial arithmetic began to be written, that is, about the beginning of the sixteenth century. Before that time, such books as were written always contained demonstrations from full definitions; and it was not judged necessary to provide the simple ease of finding a fourth proportional to three given numbers with a separate name, or to divide the rule for doing it from others. This however was done by traders in their daily practice, who separated the rule of three from the other parts of arithmetic, and called it the *golden rule*, an older term, probably, than *rule of three*. Bishop Tonstal ('Ars supputandi,' 1522) begins his chapter on the 'Regula de tribus notis quartum ignotum commonstrantibus' in this manner: 'Præcipua omnium regula est quæ de tribus notis quartum ignotum in noticiam educentibus ab Arithmeticis traditur. Vulgus *regulam auream* vocat; quia hæc cæteris Arithmeticæ regulis velut cæteris metallis aurum præstet.' Robert Recorde (1540) calls it the 'feate of the rule of proportions, whiche for his excellencie is called the golden rule.' Humphrey Baker (1562) uses the phrase 'rule of three,' and says that 'the philosophers did name it the golden rule....but nowe in these latter daies, by us it is called the rule of three.'

The immense variety of questions which are to be solved by finding a fourth proportional defies all classification: but they may all be reduced to one form, though it may in particular cases not be easy to see the mode of reduction. That form is:—A produces B; what will C produce? It may be that it is money which produces goods, or goods which produce money, or money which produces interest, or money of one country which produces money of another, or time which produces distance travelled, &c. &c. &c. The difficulty to beginners is the reduction of the question given to the above simple form, which must be done before what is (or used to be) called the *statement* of the question can be made, namely, the writing down the numbers A, B, C, in the proper order, with the marks of proportion between them:

A : B : : C : the answer required.

It is proper enough to say that this is a question of proportion when numbers only are considered: but absurd when the things represented by the numbers are used instead of the numbers. Thus, if 5 pence buy 10 apples, 7 pence will buy 14 apples, and the number 5 is to 7 as 10 is to 14, or 5 is the same fraction of 7 as 10 is of 14. But it is absurd to say that 5 pence bear the same proportion to 10 apples that 7 pence bear to 14 apples: simply because 5 pence are not any assignable fraction of 10 apples. That there is a *relation* is true: but that relation is not proportion. Thus, it is not absurd to say, in the common language of the rule, As 5 pence are to 10 apples, so are 7 pence to 14 apples; for the first does stand to the second in the same relation as the third to the fourth: 5 pence must, at all rates, do as much towards the purchase of 10 apples as 7 pence towards that of 14 apples. With this understanding there is no objection to the common mode of statement, and the proof of the rule is as follows:—If A of the first produce B of the second, then, at the same rate of production, 1 of the first must produce $\frac{B}{A}$ of the second; whence C of the first must produce $C \times \frac{B}{A}$, or $\frac{CB}{A}$ of the second.

The importance of the rule of three induced arithmeticians to attach two other rules to it: the inverse rule of three (called by Recorde, Baker, &c., the *backer* rule); and the double rule of three. Some of the writers of Cocker's school, apparently by an abbreviation of his words, tell us that the rule of three inverse is used 'when less requires more and more requires less;' meaning that the greater the third of the given numbers, the less will be the answer, and *vice versâ*. Thus, suppose that 10*l*. has been lent me for 3 months, and I want to know how long I ought to lend a given sum (other than 10*l*.) in return: evidently the more I lend, the less the time for which I ought to lend it. If the sum be 15*l*., then 3 months is to the time re-

quired, not as 10 to 15, but in its inverse ratio, as 15 to 10, or 15 : 10 : : 3 : $3\times10\div15$, or 2; and 2 months is the answer required.

The double rule of three (at least in the class of questions which are usually considered as falling under it) is applied where time is an element in the production which the question supposes. For example: supposing it known that A men can pave B square feet in C days, it may be asked how many men can pave *b* square feet in *c* days, or how many square feet can *a* men pave in *c* days, or how many days will it take *a* men to pave *b* square feet. If we write down the data and answer in two lines, and in the following order—force employed—effect produced—time of production—thus,

A	B	C
a	*b*	*c*

the rule is—Take such an answer as will make the extremes of each line multiplied by the mean of the other, the same in both. That is, let $A\mathit{b}C = a\mathrm{B}c$, and according as *a*, *b*, or *c* is to be found, the mode of working is as follows:—

$$a=\frac{A\mathit{b}C}{\mathrm{B}c},\ b=\frac{a\mathrm{B}c}{AC},\ c=\frac{A\mathit{b}C}{a\mathrm{B}}$$

The proof is as follows:—*One* man in C days could pave $\frac{B}{A}$ square feet, and in *one* day $\frac{B}{AC}$ square feet. By similar reasoning one man in one day could pave $\frac{b}{ac}$ square feet. Hence

$$\frac{B}{AC}=\frac{b}{ac};\ \text{or}\ a\mathrm{B}c=A\mathit{b}C.$$

The principal caution which a beginner requires is;—not to suppose that the rule of three (or the rule of finding a fourth quantity which, with three others, shall constitute a proportion) is to be applied in all cases in which three quantities are given to find a fourth. That such a caution is necessary arises from the defect of works on arithmetic; which frequently exhibit this rule without any mention of proportion, and leave it to be inferred that there is but one way of obtaining a fourth quantity from three others.

THREE RIVERS. [CANADA.]

THRIO'THORUS, M. Vieillot's name for a genus of birds, *Sylvia*, Lath., and placed by Mr. G. R. Gray in his subfamily TROGLODYTINÆ, of his family *Certhidæ*.

THRIOTHU'RUS, M. Vieillot's name for a genus of Birds (*Sylvia*, Lath.), placed by Mr. G. R. Gray in his subfamily TROGLODYTINÆ.

THROCMORTON, SIR NICHOLAS, was descended from an antient family in Warwickshire, and his ancestors had been employed in the higher offices of state for some centuries. His father, Sir George Throcmorton, had been in favour with Henry VIII., but, being a zealous papist, he incurred the king's displeasure by refusing to take the oath of supremacy, and about 1538 was imprisoned in the Tower of London, where he remained several years.

Nicholas, who was Sir George's fourth son, was born about the year 1513. Having been appointed page to the Duke of Richmond, the king's natural son, he accompanied his master to France, and remained in his service till the duke's death in 1536.

Sir George Throcmorton was released from the Tower in 1543. His son Nicholas was then appointed sewer to the king, in which it was his duty to attend the

> 'marshall'd feast,
> Serv'd up in hall with sewer and seneschal.'

In 1544 he headed a troop in the armament against France which Henry VIII. commanded in person; he assisted at the siege of Boulogne, and after his return received a pension from the king as a reward for his services. After the king's death he attached himself to the queen-dowager Catherine Parr, and to the Princess Elizabeth. In 1547 he distinguished himself in the campaign in Scotland under the Protector Somerset; he was present at the battle of Pinkey (or Musselburgh), and Somerset sent him to London with the news of the victory. He was soon afterwards created a knight, appointed to a place in the privy-chamber, and admitted to great intimacy with Edward VI. The king bestowed upon him some valuable manors, and made him under-treasurer of the Mint. He sat in parliament during Edward's reign as member for Northampton.

A short time before the king's death, Sir Nicholas married the daughter of Sir Nicholas Carew, and on taking his wife to visit his father at Coughton in Warwickshire, he was received with coldness by the old knight; partly perhaps on account of his Protestant principles, but chiefly because he had been knighted before his eldest brother. To remove this cause of offence, he took his brother back with him to court, and, at the request of Sir Nicholas, the king raised him to the dignity of a knight.

Sir Nicholas Throcmorton was present when Edward VI. died at Greenwich in 1553. He was aware of the designs of the partisans of Lady Jane Grey, but, though a Protestant, he was too much attached to law and legitimacy to give the least sanction to them. He therefore came immediately to London, and despatched Mary's goldsmith to announce to her the king's demise.

On the 2nd of February, 1554, Sir Nicholas Throcmorton was arrested and committed to the Tower on a charge of being concerned in the rebellion of Sir Thomas Wyatt. On the 17th of April he was brought to trial at Guildhall, London. This trial is the most important and interesting event in his life. A report of it, taken from Holinshed, is given in the 'Library of Entertaining Knowledge—Criminal Trials.' It is certain that he was acquainted with Wyatt's intentions, and there is little doubt that he was to some extent implicated in the rebellion. He was tried before commissioners, some of whom were bitterly inimical to him, and who seemed to regard his trial as merely a form necessary to be gone through previous to his execution. Sir Nicholas however conducted his own defence; and this he did with such admirable adroitness, such promptness of reply and coolness of argument, intermixed with retorts, spirited, fearless, and reiterated, in answer to the partial remarks of the lord chief justice and other commissioners, and followed up by an impassioned earnestness of appeal to the jury, that, in defiance of the threats of the chief justice and the attorney-general, he obtained a verdict of acquittal. Sir Nicholas was directed to be discharged, but was remanded, and kept in prison till the 18th Jan., 1555. The jury were made to suffer severely for their independent verdict. Two were fined 2000*l.* each, six were fined 1000 marks each, and four, who expressed contrition, were not fined. All were remanded to prison, where they remained till the 12th of December, when five were discharged on payment of the reduced fine of 220*l.* each, three on payment of 60*l.* each, and four without fine.

Sir Nicholas Throcmorton, after his release, avoided the approaching storm of persecution by going to France, where he remained till 1556. Though he afterwards served in Queen Mary's army under the Earl of Pembroke, he devoted himself chiefly to the princess Elizabeth, whom he visited privately at Hatfield. When Queen Mary died, he was admitted to see her corpse, and, as Elizabeth had requested, took from her finger the wedding-ring which had been given to her by Philip, and delivered it to Elizabeth. Elizabeth gave him the office of chief butler of England, a situation of some dignity, but inconsiderable emolument, and afterwards made him chamberlain of the exchequer. In 1559 he was sent on an embassy to France, and remained at the French court as resident ambassador till the beginning of 1563. Dr. Forbes has published the greater part of Throcmorton's correspondence with his own government while he was in this confidential situation. It displays great diplomatic skill and management, but perhaps rather too much tendency to intrigue; and he supported the cautious and somewhat doubtful policy of Cecil with zeal and discretion. Indeed he was on the most confidential terms with Cecil during the whole of this period, but after his return a coolness arose between the two statesmen, which increased till it became a strong personal animosity.

In 1565 Throcmorton was sent on a special embassy to Scotland, to remonstrate with Mary Queen of Scots against her intended marriage with Darnley; and when Mary was imprisoned at Lochleven in 1567, Throcmorton was commissioned by Elizabeth to negotiate with the rebel lords for her release.

In 1569 Throcmorton was sent to the Tower on a charge, which indeed appears to have been well founded, of having been engaged in the intrigue for a marriage between Mary Queen of Scots and the Duke of Norfolk. Though he was not kept long in confinement, he never afterwards regained the confidence of Elizabeth, and the distress of

mind occasioned by the loss of her favour has been thought to have hastened his death, which took place at the house of the Earl of Leicester, Feb. 12, 1571, in his 58th year.

Sir Francis Walsingham, in a letter to the Earl of Leicester, on the occasion of Throcmorton's death, says of him that 'for counsel in peace and for conduct in war he hath not left of like sufficiency that I know.' Camden says he was 'a man of large experience, piercing judgment, and singular prudence; but he died very luckily for himself and his family, his life and estate being in great danger by reason of his turbulent spirit.'

(*Criminal Trials*, in *Library of Entertaining Knowledge*; *Pictorial History of England.*)

THROMBUS is a tumour formed by blood effused from a vein after bleeding, and coagulated in the adjacent cellular tissue. It is a kind of intense ecchymosis or bruise, and usually arises from the puncture in the vein not having been made exactly opposite that in the skin, so that some of the blood, instead of flowing out, is infiltrated between the vein and the surface. It is rarely of sufficient importance to require treatment, and is usually removed like the effused blood of an ordinary bruise. Sometimes however inflammation ensues around the tumour, which should be treated by leeches and cold; or, if it proceed to suppuration, should be managed like a common abscess.

THROSTLE. [Thrushes.]

THRUSH, or Aphthæ, is a disease which commonly appears in the form of minute opaque-white vesicles scattered over the interior of the mouth and fauces. Vesicles or blisters of this kind often appear in a succession of eruptions, those which were first formed bursting and leaving tender and raw surfaces, while others are breaking out; and thus continuing through the whole course of some general disorder of the system.

The only variety of thrush in which the eruption is the most obvious sign of disease is that which is called milk-thrush, or aphtha infantum, or sometimes, in the supposition that it is the primary disease, idiopathic thrush. This however is almost always connected with disturbance of the digestion and other functions, and is usually traceable to some error of diet. It is most frequently observed in children that are brought up 'by hand;' and, in ordinary cases, requires only the means adapted to correct the disturbed digestion, such as small doses of magnesia and gentle purgatives. In very weakly children however, and in those that are ill fed and clothed, the surface of the mouth and fauces, exposed by the bursting of the vesicles, may slough or ulcerate; and this condition is always a sign of the necessity of administering tonics, nutritious food, and even powerful stimulants, such as wine or brandy. It is this form of thrush which is usually described as aphtha maligna.

In adults, thrush is a very common occurrence in the advanced stages of many diseases, such as typhoid and other acute fevers, the hectic fever accompanying phthisis, diabetes, &c.: in short, in nearly all cases in which there is great prostration of strength, thrush may occur. In these cases, the only treatment that can be applied peculiarly to it is local. Great relief is often afforded by lightly sponging the affected surfaces with a solution of nitrate of silver, in the proportion of eight or ten grains to an ounce of water. Gargles, consisting of a drachm of alum to a pint of water or acidulated infusion of roses, or of one or two drachms of sub-borate of soda to half a pint of water, are often beneficial; and so is the mel boracis of the Pharmacopœia, when a small quantity of it is held for a few minutes in contact with the affected part.

THRUSHES. Under this name many ornithologists treat of the whole of the Merulidæ, in which article the views of Mr. Vigors, Mr. Swainson, and the Prince of Musignano, now Prince of Canino, with regard to this family, are given.

Since the article *Merulidæ* was written, Mr. G. R. Gray has published his 'List of the Genera of Birds,' and we proceed to lay before our readers his arrangement.

Mr. G. R. Gray makes the *Turdidæ* (*Turdus*, Linn.) the second family of his third tribe (*Dentirostres*) of his second order (*Passeres*). The *Dentirostres* are placed by him between the *Tenuirostres* and the *Conirostres*, and the *Turdidæ* between the *Luscinidæ* and the *Muscicapidæ*.

The following are the subfamilies and genera into which Mr. G. R. Gray divides the Turdidæ:—

Subfam. 1. Formicarinæ.

Genera:—*Notodela*, Less.; *Eupetes*, Temm.; *Ajax*, Less.; *Dasycephala*, Sw.; *Pithys*, Vieill.; *Formicivora*, Sw.; *Myrmeciza*, G. R. Gray; *Urotomus*, Sw.; *Malurio*, Less.; *Corythopis*, Sundev.; *Brachypteryx*, Horsf.; *Macronus*, Jard. and Selby; *Tinactor*, Pr. Max.; *Formicarius*, Bodd.; *Chamæza*, Vig.; *Grallaria*, Vieill.; *Cissa*, Boie; *Brachyurus*, Thunb.; *Myiophoneus*, Temm.; *Hydrobata*, Vieill.

Subfam. 2. Turdinæ.

Genera:—*Petrocossyphus*, Boie; *Orocetes*, G. R. Gray; *Larvivora*, Hodgs.; *Bessonornis*, Smith; *Saxicolides*, Less.; *Chaëtops*, Sw.; *Geocichla*, Kuhl; *Zoothera*, Vig.; *Myiophaga*, Less.; *Oreocincla*, Gould; *Turdus*, Linn.; *Merula* (Ray), Boie; *Mimus*, Briss.; *Toxostoma*, Wagl.

Subfam. 3. Timalinæ.

Genera:—*Donacobius*, Sw.; *Pellorneum*, Sw.; *Aipunemia*, Sw.; *Cnteropus*, Sw.; *Garrulax*, Less.; *Actinodura*, Gould; *Cinclosoma*, Vig. and Horsf.; *Suya*, Hodgs.; *Sibia*, Hodgs.; *Tesia*, Hodgs.; *Malacocercus*, Sw.; *Timalia*, Horsf.; *Pomatorhinus*, Horsf.; ———? *Paludicola*, Hodgs.; *Icteria*, Vieill.; *Turnagra*, Less.

Subfam. 4. Oriolinæ.

Genera:—*Dulus*, Vieill.; *Sphecotheres*, Vieill.; *Oriolus*, Linn.; *Mimeta*, Vig. and Horsf.; *Analcipus*, Sw.; *Sericulus*, Sw.; *Oriolia*, J. Geoff.

Subfam. 5. Pyenonotinæ.

Genera:—*Microscelis*, G. R. Gray; *Microtarsus*, Eyton; *Malacopteron*, Eyton; *Trichophorus*, Temm.; *Hypsipetes*, Vig.; *Yuhina*, Hodgs.; *Phyllastrephus*, Sw.; *Hæmatornis*, Sw.; *Pycnonotus*, Kuhl; *Andropadus*, Sw.; ? *Trichixos*, Less.; ? *Setornis*, Less.

Mr. G. R. Gray, with his usual diligence and accuracy, gives the synonyms of all these genera; and observes, with regard to some of them, that *Drymophila*, Sw., has been used in botany; that *Leptorhynchus*, Menestr., was previously employed; *Petrophila*, Sw., used in botany; *Cossypha*, Vig., used in entomology, only the termination is there in *us*; *Cichla*, Wagl., previously used in ichthyology; *Paludicola*, Hodgs., previously employed in herpetology; and *Micropus*, and *Brachypus*, Sw., previously used in other branches of natural history.

Some of these forms have already been noticed in detail in this work, and we shall here confine ourselves to the true thrushes, or those so nearly allied to them, that, in common parlance, they are so termed.

European Thrushes.

The following thrushes are European:—

Black Ouzel, or Blackbird, *Merula vulgaris*, Ray; the *Ring Ouzel*, *Merula torquata*, Briss.; the *Migratory Ouzel*, *Merula migratoria*, Sw.; the *Black-throated Thrush*, *Turdus atrogularis*, Temm.; the *Fieldfare*, *Turdus pilaris*, Linn.; the *Redwing*, *Turdus Iliacus*, Linn.; the *Missel Thrush*, *Turdus viscivorus*, Linn.; the *Song-Thrush*, or *Throstle*, *Turdus musicus*, Linn.; *Naumann's Thrush*, *Turdus Naumanni*, Temm.; the *Pallid Thrush*, *Turdus pallidus*, Pall.; *White's Thrush*, *Turdus Whitei*, Eyton; the *Siberian Thrush*, *Turdus Sibiricus*, Pall.; the *Water Ouzel*, or *Common Dipper*, *Cinclus aquaticus*, Bechst.; the *Black-bellied Water-Ouzel*, *Cinclus melanogaster*, Brehm; Pallas's *Water Ouzel*, *Cinclus Pallasii*, Temm.; the *Rock-Thrush*, *Petrocincla saxatilis*, Vig.; and the *Blue-Thrush*, *Petrocincla cyaneus*, Vig.

Of these, the Water Ouzel, or *Common Dipper*; the *Missel Thrush*; *White's Thrush* (occasional only); the *Song Thrush*; the *Fieldfare*; the *Redwing*; the *Blackbird*; and the *Ring Ouzel*, or Ring Blackbird, are British.

We select as an example the sweetest songster among this tribe, in our opinion at least, and we write it without disrespect to the rich mellow whistle of the blackbird, or the loud stirring notes of the missel thrush.

The *Throstle* or *Song Thrush*.

This well-known bird needs no description. It is the *Grive* and *Petite Grive* of the French; *Tordo*, *Tordo comune*, and *Tordo Bottaccio* of the Italians; *Sing-drossel*, or *Weiss-drossel*, of the Germans; *Mavis*, with the other names above given, of the modern British;* and *Aderyn bronfraith* of the antient British.

Geographical Distribution.—Inhabits every country in Europe, haunting gardens and woods near streams or mea-

* N.B. The *Mavis* of the French is the *Redwing*.

dows. Bechstein says that in Germany, as soon as the autumnal fogs appear, the throstles collect in large flights to seek a warmer climate, the principal time of passage being from the 15th of Sept. to the 15th of October, and the return about the middle or end of March, when each pair seeks its own district. In Britain it is permanent, and spread over England, Wales, Ireland, Scotland, and its islands. Russia, Denmark, Sweden, and Norway possess it. In the south, besides Germany, France, Italy, and Greece have it. It has been seen in winter at Smyrna and Trebizond. Professor Nilsson states that it leaves Sweden for the winter, and comes farther south. Mr. Selby observes that such visitors arrive in Britain with a north or north-east wind, and, after staying a few days to recruit, move southward.

Habits, Food, &c.—Worms, insects, snails, and fruits form the food of the throstle. The common garden-snail, *Helix hortensis*, and the wood-snail, *Helix nemoralis*, are killed and eaten in great numbers by this species. The bird beats and breaks the shells against a stone to get at the animals. The nest is made of green moss generally, and fine root-fibres on the outside, and is lined within with cow-dung and decayed wood, the lining forming a cement, so perfectly spread that it will hold water. Eggs four or five, of a light blue, the larger end having a few small black specks or spots. Time of incubation thirteen days. The first hatch generally comes forth in April, but the young have been known to be out at the end of March. There are generally two broods in the year. Both the cock and the hen sit, but the former less than the latter. He often feeds her on the nest. A holly, a thick bush—a tall one is mostly preferred—a dense and somewhat high shrub or a fir, is usually selected; but the bird has been known to breed in an open shed or tool-house, and does not seem to shun the neighbourhood of man. In 1833 a pair built their nest in a low tree at the bottom of Gray's Inn Gardens, near the gates where passengers are going by all day long. The hen laid her complement of eggs, and was sitting on them, when a cat climbed up and killed her on the nest. The cock immediately deserted the place.

Bechstein states that in captivity the Throstle is easily taught to perform airs. For taking it he recommends a perch with a limed twig as the best mode of capturing a fine-toned male: but in September or October he says that they may be caught in the water-traps, where they repair at sunrise and sunset, so late that they sometimes cannot be seen, and the bird-catcher is only guided by his ear. He observes that, when the birds enter the water, there must be no haste on the part of the fowler, because they like to bathe in company, and assemble sometimes to the number of ten or twelve at once, by means of a peculiar call. Bechstein tells us that the first which finds a convenient stream, and wishes to go to it, cries in a tone of surprise or joy, '*sik, sik, sik, siki, tsac, tsac, tsac!*' then all the thrushes in the neighbourhood immediately reply in concert and repair to the place. The bath is entered however with a good deal of circumspection on their parts, and they seldom venture till they have seen a Red-breast bathe without danger. But the first that bathes is soon followed by others, and they begin to quarrel among themselves if the bath is not large enough to accommodate all satisfactorily. Bechstein further remarks that it is a good plan to have a tame bird running and fluttering on the banks of the stream, as a decoy to attract them.

Asiatic Thrushes.

Example, *Turdus erythrogaster*.

Description.—Male.—Grey-cæruleseent above; the cheeks, the sides of the neck, and the quills black; breast, abdomen, and rump red; beak and tarsi black.

Female differs in being cæruleseent-brown, the lower part of the back obscurely banded with brown; neck in front whitish marked with dark brown; breast, abdomen, and rump reddish-white marked with undulations. Length 8½ inches.

Mr. Gould (*Century of Birds from the Himalaya Mountains*) states that this beautiful species exhibits a marked departure in the style of colouring from its more typical congeners; and were it not that its form dictated the situation in which it is retained, it would otherwise seem to be allied in many respects to the genus *Petrocincla*.

Locality.—The rocky districts of Himalaya; never found in the low lands.

Turdus erythrogaster, male and female. (Gould.)

African Thrushes.

Example, *Turdus strepitans*, Smith (*Merula Letsitsirupa* of the same).

Description.—Male.—Front and top of head brownish-grey; occiput, upper aspect of neck, interscapulars, scapulars, and shoulders deep yellowish-grey, faintly shaded with brown; back, rump, and upper tail-coverts dirty ash-grey. Under parts white, tinted in places with ochre-yellow; sides of the neck, whole of the breast, flanks, and belly variegated with blackish-brown pyriform spots, one on each feather, the large end reaching nearly to its point. Sides of the head white, slightly tinted with ochre-yellow, variegated below the eyes with three blackish-brown bands; the foremost proceeds from the base of the lower mandible, the second from the middle of the under eyelid, and the third from the outer angle of the eye; the first extends nearly horizontally, and the two others obliquely downwards and backwards till they unite with the horizontal one. Primary wing-coverts and primary quill-feathers deep brownish-red, the latter tipped and edged externally with yellowish-white; the first two-thirds at least of the inner vanes of these feathers are of a clear buff-colour, darkest towards the shafts; secondary wing-coverts and secondary and tertiary quill-feathers dark greyish-brown, the outer vanes lightest, all margined externally and tipped with dirty white. Eyes reddish brown; upper mandible and tip of lower inferiorly as well as the claws liver-brown; lower mandible elsewhere, and the cutting edge of upper, pale saffron-yellow. Feet and insides of the hill deep straw-yellow.

Figure robust and rather short. Bill long, and moderately strong; upper mandible broad and slightly depressed towards the base, narrow and distinctly notched near the tip; culmen between nostrils elevated and rounded, towards the point of the bill strongly curved; nasal fossæ large and membranous, the nostrils narrow longitudinal slits near to the edges of the mandible; wings short and rounded, and when folded they reach over the first half of the tail; the first quill-feather rudimentary, the third rather the longest; the second and fourth of equal length, and scarcely shorter than the third; the fifth a little shorter than the fourth, and the remaining primaries diminish in length successively. Tail short and slightly forked. Legs long, tarsi robust, anteriorly indistinctly scutellated, posteriorly entire; toes strong, the inner and outer toes of the same length; claws strong, much curved and pointed. Length from point of bill to tip of tail eight inches six lines

Female differing but little in colour, if at all, from the male. (Smith.)

Locality, Habits, Food, &c.—Dr. Smith states that immediately upon reaching Kuriehane, this thrush began to appear in the thickets, and he continued to acquire occasionally a specimen even in the vicinity of the tropic. It seeks, he says, its food upon the ground, and, when so occupied, its resort is readily discovered by the natives from the noise it makes in scratching the ground, or in displacing rubbish and decayed leaves which conceal the insects it is seeking. The name by which it is known in the country it inhabits is, he informs us, characteristic of the vigour with which it employs its feet, and the nearest translation he can give is 'Ground-Scraper.'

Dr. Smith further remarks that the form of its bill, particularly towards the base, the length of its legs, and the shortness of its tail, are all characters which remove it from the more typical species of the genus *Turdus;* but yet there is in its structure and habits what necessarily constitutes it a true thrush. (*Illustrations of the Zoology of South Africa.*)

Turdus strepitans, male. (Smith.)

American Thrushes.

Example, *Turdus mustelinus*, Gm.

Description.—Above, bright cinnamon brown, brightening into rufous on the head, and inclining to olive on the rump and tail. Beneath, whitish, thickly marked with pencil-shaped dusky spots. Vent pure white. Orbits of the eye white. Bill dusky brown, slightly notched, lower mandible flesh-coloured towards the base. Legs and claws very pale flesh-colour. Iris dark chocolate. Length 8 inches; alar extent 13 inches. (Nuttall.)

This appears to be the *Turdus melodus* of Wilson and *Tawny Thrush* of Pennant, and is generally known as the *Wood Thrush*.

Locality, Habits, Food, &c.—Nuttall states that this solitary and retiring songster inhabits, during summer, the whole continent from Hudson's Bay to Florida, and, according to his friend Mr. Ware, breeds as far south as the vicinity of Natchez, in the State of Mississippi. He remarks that it is not satisfactorily ascertained whether the species quits the boundaries of the United States in winter, because the bird is then silent, and always difficult of access. He thinks it probable that this Thrush may winter in the Southern States, as a young bird, gleaning insects and berries, had been caught in a garden in Boston on the 26th October.

But, wherever the Wood Thrush may winter, it arrives in the Middle States from the 1st to the 15th of April. Nuttall thus describes its song and habits:—

'At the dawn of morning he announces his presence in the woods, and from the top of some tall tree, rising through the dark and shady forest, he pours out his few clear and harmonious notes in a pleasing reverie, as if inspired by the enthusiasm of renovated nature. The prelude to this song resembles almost the double longuing of the flute, blended with a tinkling, shrill, and solemn warble, which re-echoes from his solitary retreat, like the dirge of some sad recluse who shuns the busy haunts of life. The whole air consists usually of four parts or bars, which succeed, in deliberate time, and finally blend together in impressive and soothing harmony, becoming more mellow and sweet at every repetition. Rival performers seem to challenge each other from various parts of the wood, vying for the favour of their mates, with sympathetic responses and softer tones; and, some wageing a jealous strife, terminate the warm dispute by an appeal to combat and violence. Like the Robin and the Thrasher, in dark and gloomy weather, when other birds are sheltered and silent, the clear notes of the Wood Thrush are heard through the dropping woods, from dawn to dusk, so that, the sadder the day, the sweeter and more constant is his song. His clear and interrupted whistle is likewise often nearly the only voice of melody heard by the traveller, to mid-day, in the heat of summer, as he traverses the silent, dark, and wooded wilderness, remote from the haunts of men. It is nearly impossible by words to convey any idea of the peculiar warble of this vocal hermit, but amongst his phrases the sound of *'airŏee*, peculiarly liquid, and followed by a trill, repeated in two interrupted bars, is readily recognisable. At times their notes bear a considerable resemblance to those of Wilson's Thrush, such as *eh rhehu 'vrehu*, then varied to *'eh villia villia*, *'eh villia vrehu*, then, *'eh villa villu*, high and shrill.

'The Wood Thrush is always of a shy and retiring disposition, appearing alone, or only in single pairs, and, while he willingly charms us with his song, he is content and even solicitous to remain concealed. His favourite haunts are low shady glens by watercourses, often rendered dark with alder-bushes, mantled with the trailing grape-vine. In quest of his insect prey he delights to follow the meanders of the rivulet, through whose leafy shades the sunbeams steal only in a few uninterrupted rays over the sparkling surface of the running brook. So partial is this bird to solitude, that I have known one to sing almost uniformly in the same place, though nearly half a mile from his mate and nest. At times, indeed, he would venture a few faltering low notes in an oak near his consort, but his mellowest morning and evening warble was always delivered from a tall hickory, overtopping a grove of hemlock firs, in which the dimness of twilight prevailed at noon. The Wood Thrush, like the Nightingale, therefore, feels inspired in darkness, but, instead of waiting for the setting sun, he chooses a retreat where the beams of day can seldom enter. These shady retreats have also an additional attraction to our Thrush; it is here that the most interesting scene of his instinctive labour begins and ends, here he first saw the light, and breathed into existence, and here he now bestows his nest in a sapling oak, or in the next thick laurel or blooming alder, whose berries afford him an ample repast in the coming autumn. Outwardly it presents a warm bed of withered beach or oak leaves, above these a layer of coarse old grass and leaf-stalks is laid, tempered with a mixture of mud and decayed wood smoothly plastered, so as to form a crust like the nest of the Robin. The whole is then surmounted by a thin lining of the black fibrous radicles of the fern.'

Wood Thrush.

The same author states that the eggs, which are four or

five in number, are scarcely distinguishable from those of the Robin, and of an uniform bright greenish blue destitute of spots. Beetles, caterpillars, and other insects, and in autumn berries, constitute the principal food of the species. Nuttall further states that the young remain for weeks around gardens in quest of berries, and that they are particularly fond of those of the various species of cornel and *viburnum*. At this season, he says, they occasionally leave their favourite glens, and in their devious wanderings, previous to their departure, sometimes venture to visit the rural suburbs of the city. The young, it appears, are easily reared, and, like our Throstle, sing nearly as well in the cage as in their native wilds. (*Manual of the Ornithology of the United States and of Canada.*)

THUA'NUS. [Thou, De.]

THUCY'DIDES (Θουκυδίδης), the son of Olorus, or Orolus, and Hegesipyle, was a native of the demus of Alimus in Attica. He was connected by his mother's side with the family of the great Miltiades, and the name of his father was a common one among the Thracian princes. If he was forty years old at the commencement of the Peloponnesian war, according to the statement of Pamphila (Gellius, xv. 23), he was born in B.C. 471. In his own work he nowhere mentions his age or the time of his birth, but he says that he lived through the whole of the Peloponnesian war, and that he was of the proper age for observing its progress (v. 26).

Our principal information respecting the life of Thucydides is a biography of him written by Marcellinus, which is however full of contradictions and doubtful stories. There is also an anonymous biography of him prefixed to many editions of his works, which is still worse than that of Marcellinus. Thucydides mentions incidentally a few facts concerning himself, which is almost all that we know with certainty about his life.

There is a well-known story that when a boy he heard Herodotus read his History at Olympia, and was so much moved that he burst into tears. But there is good reason for believing that this recitation of the History of Herodotus never took place at the Olympic games [Herodotus]; and if there is any foundation for the story of Thucydides having heard him read it, we would rather refer it to a later recitation at Athens, which is mentioned by Plutarch and Eusebius. Suidas is the only writer who says that Thucydides heard Herodotus at Olympia; Marcellinus and Photius relate the same tale without mentioning where the recitation took place.

There seems nothing improbable in the accounts of the antient biographers that Thucydides was taught philosophy by Anaxagoras and rhetoric by Antiphon; but their statement that he accompanied the Athenian colony to Thurii is probably a mistake arising from their confounding him with Herodotus, who, we know, was of the colonists. But whether he went to Thurii or not, it is certain that he was in Athens in the second year of the Peloponnesian war, B.C. 430, when he was one of those who had the plague. (Thucyd., ii. 48.) In the eighth year of the war, B.C. 424, he was in command of an Athenian fleet of seven ships, which lay off Thasos. Brasidas, the Lacedæmonian commander, made an attempt to obtain possession of Amphipolis on the Strymon, which then belonged to Athens; and Thucydides, as soon as he heard of it, sailed to protect Amphipolis, but was only in sufficient time to save Eion, a seaport at the mouth of the Strymon. Amphipolis had fallen before he could arrive there. (Thucyd., iv. 102, &c.) For this he was either condemned to death or banished by the Athenians in the year following, B.C. 423; and in consequence of the sentence passed upon him he spent twenty years in exile, namely, till B.C. 403. (Thucyd., v. 26.) This year coincides exactly with the restoration of the democracy by Thrasybulus, when a general amnesty was granted, of which Thucydides seems to have availed himself. Where he passed the time of his exile is not mentioned by himself. Marcellinus says that he first went to Ægina, and afterwards to Scaptc-Hyle in Thrace, opposite the island of Thasos, where he had some valuable gold-mines. (Compare Plutarch, *De Exilio*, p. 605.) It appears however not improbable that he visited several places during his exile: the intimate knowledge which he shows respecting the history of the Italiotes and Siceliotes almost inclines one to suppose that he may have visited Italy and Sicily after the failure of the Athenian expedition in the latter island. His property in Thrace would however naturally lead him to pass the greater part of his time in that country. This property, which was very considerable (Thucyd., iv. 105), was probably derived from his family, which came from Thrace, though Marcellinus says that he obtained it by marrying a Thracian heiress.

How long he lived after his return from exile, and whether he continued at Athens till the time of his death, is quite uncertain. According to some accounts he was assassinated at Athens, according to others he died at Thasos, and his bones were carried to Athens. He is said to have been buried in the sepulchre of the family of Miltiades.

The Peloponnesian war forms the subject of the History of Thucydides. He tells us that he foresaw it would be the most important war that Greece had ever known, and that he therefore began collecting materials for its history from its very commencement; that, where he had to rely upon the testimony of others, he carefully weighed and examined the statements that were made him; and that he spared neither time nor trouble to arrive at the truth, and that in consequence of his exile he was enabled to obtain information from the Peloponnesians as well as his own countrymen (i. 22; v. 26). Though he was engaged in collecting materials during the whole of the war, he does not appear to have reduced them into the form of a regular history till after his return from exile, since he alludes in many parts of it to the conclusion of the war (i. 13; v. 26, &c.). He did not however live to complete it: the eighth book ends abruptly in the middle of the year B.C. 411, seven years before the termination of the war. Even the eighth book itself does not seem to have received the last revision of the author, although there is no reason at all for doubting its genuineness, as it bears on every page indubitable traces of his style and mode of thought. Some antient writers however attributed it to his daughter, others to Theopompus or Xenophon. As the work of Thucydides is evidently incomplete, it would appear that it was not published in his lifetime; and there is therefore great probability that the statement is correct which attributes the publication of it to Xenophon. Niebuhr has brought forward reasons which seem to render it almost certain that Xenophon's 'Hellenics' consist of two distinct works, and that the last five books were not published till long after the first two. The first two, which seem to have borne the title of the 'Paralipomena' of Thucydides, complete the history of the Peloponnesian war, and were not improbably published by Xenophon, together with the eight books of Thucydides. (Niebuhr, in *Philological Museum*, i. 485, &c.)

The first book of Thucydides is a kind of introduction to the history. He commences by observing that the Peloponnesian war was more important than any that had been known before; and to prove this, he reviews the state of Greece from the earliest times down to the commencement of the war (c. 1-21). He then proceeds to investigate the causes which led to it, of which the real one was the jealousy which the Peloponnesians entertained of the power of Athens; and interrupts his narrative to give an account of the rise and progress of the Athenian empire down to the commencement of the war (c. 89-118). He had an additional reason for making this digression, since this history had either been passed over by previous writers altogether, or had been treated briefly, without attention to chronology (c. 97). He resumes the thread of his narrative at c. 119, with the negotiations of the Peloponnesian confederacy previous to the declaration of the war; but the demand of the Lacedæmonians, that the Athenians should drive out the accused, which was answered by the Athenians requiring the Lacedæmonians to do the same, leads to another digression respecting the treason and death of Pausanias (c. 128-134); and as proofs were found implicating Themistocles in the designs of the Spartan king, he continues the digression in order to give an account of the exile and death of Themistocles (c. 135-138). He then resumes the narrative, and concludes the book with the speech of Pericles which induced the Athenians to refuse compliance with the demands of the Peloponnesians. The history of the war does not therefore begin till the second book; but it would be out of place to give here an abstract of the remainder of the work.

Thucydides had formed a high opinion of the value and importance of the work he had undertaken. It was not his object to afford amusement, like former writers, but to

give such a faithful representation of the past as would serve as a guide for the future (i. 22). His observation of human character was profound; he penetrates with extraordinary clearsightedness into the motives and policy of the leading actors of the war; and he draws from the events he relates those lessons of political wisdom which have always made his work a favourite study with thoughtful men of all countries.

He claims for himself the merit of the strictest accuracy, and it is impossible to read his History without being convinced of the trustworthiness of his statements. His impartiality also is conspicuous: although he had been banished from his native city, he does not, like Xenophon, turn renegade, and try to misrepresent the conduct and motives of his own countrymen. Although a contemporary, and one who had taken an active part in public affairs, he writes as free from prejudice and party-feeling as if he had lived at a time long subsequent to the events he narrates.

His History is constructed on entirely different principles from those of his predecessors. He confines himself strictly to his subject, and seldom makes any digressions. He feels deeply the importance of his work, and constantly strives to impress the same feeling upon his readers. He had proposed to himself a noble subject, and writes with the consciousness of the value of his labours, and the presentiment that his work will be read in all future ages. There is consequently a moral elevation in his style and mode of treating a subject, which is scarcely to be found in any other writer except Tacitus.

In narrating the events of the war, Thucydides pays particular attention to chronology. He divides each year into two portions, the summer and the winter, and is careful to relate under each the events that took place respectively during that time. The speeches which he introduces are not mere inventions of his own, but contain the general sense of what the speakers actually delivered, although the style and the arrangement are his (i. 22).

The style of Thucydides is marked by great strength and energy. Not only his expressions, but even single words seem to have been well weighed before they were used; each has its proper force and significance, and none are used merely for the sake of ornament and effect. The style is not easy, and it is probable that Thucydides never intended it should be so, even to his own countrymen: his work was not to be read without thought. Still his style is open to serious objections. He does not sufficiently consult perspicuity, which is the first virtue in all writing. His sentences too are frequently unnecessarily long, and the constructions harsh and involved. These remarks are more especially applicable to the speeches inserted in the History, which Cicero found as difficult as we do. (*Orator.*, 9.)

The Greek text was first published by Aldus, Venice, 1502, and the scholia in the following year. The first Latin translation, which was made by Laurentius Valla, appeared at Paris in 1513, fol. The first Greek and Latin edition was that of Henry Stephens, the Latin being the translation of Valla, with corrections by Stephens, 1564, fol. Among the modern editions, those most worthy of notice are Poppo's, which contains two volumes of prolegomena, with the scholia and numerous notes, Leipzig, 10 vols. 8vo., 1821-1838; Haack's, with selections from the Greek scholia and short notes, which the student will find very useful, 2 vols. 8vo., Leipzig, 1820, reprinted in London, in 3 vols. 8vo. 1823; Göller's, 2 vols. 8vo., Leipzig, 1836, 2nd edition, reprinted in London; and Arnold's, 3 vols. 8vo., Oxford, 1830-1835, of which a second edition is in course of publication.

There are translations of Thucydides into most of the modern European languages. In English the first translation was made by Thomas Nicolls, from the French version of Seyssel, and was published in London, 1550, fol. This was succeeded by the translations of Hobbes and William Smith, which have been frequently reprinted. The most recent is by S. T. Bloomfield, 3 vols. 8vo., London, 1829. The most recent translation in German is by Klein, München, 1826, 8vo.; and in French one of the best is said to be by Gail.

Respecting the life of Thucydides, the reader may consult Dodwell, 'Annales Thucydidei et Xenophontei,' &c., Oxf., 1702, 4to.; and Krüger, 'Untersuchungen über das Leben des Thucydides,' Berlin, 1832.

THUG (from Hindustanee *Thagna*, to deceive) means a deceiver, and is the special appellation of secret murderers in India, whom since the year 1810 it has been the endeavour of the British government to root out. Of their origin nothing can be said with any degree of certainty. The Thugs themselves refer it to the remotest antiquity, and there is no doubt that the ceremonies with which they carry on their murderous trade can be traced as far back as the Kâlika Purâna, where we find them described with the utmost accuracy. But before we proceed to investigate their secret history, of which we have only a slight and unsatisfactory knowledge, we shall describe them as they were at the time of their discovery. Their gangs, consisting of from ten to two or three hundred men of all races, castes, sects, and religions, yet all joining in the worship of Kali, moved about all parts of India, sacrificing to their tutelary goddess every victim that they could seize, and sharing the plunder among themselves. Still they shed no blood, except when forced by circumstances; murder being their religion, the performance of its duties required secrecy, and the instrument of death was a rope or a handkerchief, which could excite no suspicion. They were stranglers. Every gang had its leader, the *Jemadar* or *Sirdar*; its teacher, the *Guru*, whose duty it was to initiate the novice into the secret of using the *roomal*, or handkerchief. Then come the *Bhuttotes*, that is stranglers, and the *Sothas*, or entrappers, and at last the *Lughaees*, or gravediggers. In a country like India, the striking character of whose inhabitants is an almost incredible apathy, it was easy for them to commit the most outrageous murders without exciting the interest of the victim's relations. The immense jungles which border the roads afforded the Lughaees every facility for effectually concealing the bodies; and the prevailing custom of travelling in parties prevented the designs of the Sotha from being suspected, whenever he succeeded in offering the protection of his Jemadar to travellers whom their wealth induced him to entrap. The Thugs generally assume the appearance of merchants, which increases the confidence of their victims, whom they despatch with the greatest celerity whenever they find a convenient place. Whilst the Bhuttotes arrange themselves in a manner to effect their purpose with facility, the Lughaees dig the hole; and at a given signal the noose is passed round the neck of the traveller, and, being taken unawares, he is strangled without being able to make any resistance. He is then thrown into the hole, and large incisions are made in the abdomen to prevent the corpse from swelling, and the whole is covered over with a layer of dry sand, another of thorns and bushes, and over all is thrown the earth which had been dug out, which they smooth down so as not to attract the notice of travellers. After every murder they offer a sacrifice to Kâli, which they call *Tapounee*. It is performed in the following manner:—A large sheet is spread over the cleanest spot they can select, and on this is cast a pile consisting of one rupee and four annas' worth of coarse sugar; near this they place the consecrated pick-axe (an instrument sacred to Siva and Bhâvanî), and a piece of silver as a *rûpa darsana*, or silver offering. The leader then sits down on the sheet, and the best stranglers place themselves on each side of him with their faces to the west. They then distribute the sugar and eat it in solemn silence. But for this as well as other ceremonies we must refer to the works of Colonel Sleeman and Captain Meadows, as well as to an article in the 130th number of the *Edinburgh Review*. Here it will suffice to state that many ceremonies to which the Thugs attach the greatest importance are scrupulously performed by them both before and after the murder is committed; such as consulting the omens, propitiating Devî, thanksgiving, &c.

We have already observed that Thugs were found exercising their fearful trade in all parts of India. In the Deccan they are called Phânsîgars (from Sanscrit *pâsa*, a noose) or noosers, and on them we have a very interesting paper in the 13th volume of the 'Asiatic Researches.' Their customs are the same as those of the northern Thugs; but, having fewer Mohammedans among them, they are more strict observers of the duties which their religion imposes; they kill neither women, nor old men, nor any of the subjects which the Kâlika Purâna (in the *Rudhira Adyâya*) declares to be unfit for a sacrifice to Devî. In the same volume of the 'Asiatic Researches' there is another article on them, by Mr. Shakespear: both were written in 1816.

The origin of this atrocious worship is undoubtedly Hindu. The Thugs maintain that their occupation is represented in the caves of Ellora, as well as all other trades. Moreover the terms they use are chiefly of Sanscrit origin; and the worship of Kâli corresponds so well to the religious ceremonies of the Thugs, that there can be no doubt as to their identity. To satisfy the reader on this head we refer to the 5th volume of the 'Asiatic Researches,' where a chapter from the Kâlika Purâna has been translated and communicated by Mr. Blaquière.

All the ceremonies of the Thugs are fixed by this Purâna, the date of which it is difficult to ascertain, but, frequent allusions being made to it in the Vîra Charita, a drama of Bhâvabhûti, who lived at the court of king Bhoja in the beginning of the eighth century of our æra, we have sufficient reason to refer it at least to his time, if not to a previous period.

The Thugs then are a degenerate sect of Kâlî worshippers. They are very numerous in Bengal; but they offer only buffaloes and kids (Colebrook, 'Essays,' i. 111), and shed their blood, which they present to the idol in cups that are kept for that purpose. In like manner as the Saktas left the pure worship of Siva in order to indulge their gross sensuality, the Thugs abandoned the original worship of Kâlî to get a livelihood by plunder. Both nevertheless adhere strictly to the injunctions of their religion, which is taught in the Tantras of the Saktas and in the tradition of the Thugs, and thereby convert crime into a sacred duty. As well may be expected, secrecy was dictated by prudence, and hence it is that we find the Thugs seldom mentioned by travellers.

Thévenot, in his Travels (part iii., ch. 22), is the first to notice them; he describes them as infesting the road from Agra to Delhi, and using a long rope furnished with a noose, which they throw with great dexterity round the traveller's neck, and he relates that their Sothas were frequently women. About ten years after Thévenot, Dr. Fryer found them at Surat, where a gang of them were executed. He describes them as Thévenot does, and it appears from the description that they belonged to the *Mooltaneas*, a peculiar class of Mohammedan Thugs.

Although the whole of the ceremonial is Hindu, the Thugs themselves, whether Hindu or Mohammedan, maintain that they descend from seven Mohammedan clans, Thugs, Bhys, Bursoté, Kachunee, Huttar, Ganoo, and Thundee ('Ramaseeana,' p. 11); the seven clans are admitted to be the most antient and the original stock on which all the others have been engrafted. This circumstance may lead us to suspect that Mohammedams were indeed the first to give a sort of political system to the Thugs; and the seven clans of Ismailis, whose occupation was murder as dreadful as that of the Thugs, may, when persecuted in the last days of their political existence, have joined themselves to the Hindu Phânsîgars, and, adopting their ritual, have given rise to their present institution. This point is investigated with much ingenuity in an article on the 'Secret Societies of Asia,' in the 49th vol. of 'Blackwood's Magazine' (part civ.). Shah Jehan and Aurengzebe instituted criminal proceedings against them. After this we again lose sight of them until the time of Hyder Ali, who proceeded against them in a summary way. Mysore however seems to have been their favourite residence; for in order to suppress them, in the reign of Tippoo Sultan, many of them were apprehended and sentenced to hard labour, and others suffered mutilation. It was in Mysore also that the English government first discovered them soon after 1799; but it was not before 1810 that any measures were taken for their extermination; and a plan for their suppression, which promises success, was adopted in 1830 by the then governor-general, Lord William Bentinck. Since that time their numbers have rapidly diminished, and it is to be hoped that they will soon be totally extinct.

(*Ramaseeana, or Vocabulary of the Peculiar Language used by the Thugs*, Calcutta, 1836; this work is written by Col. Sleeman; *The Confessions of a Thug*, by Captain Meadows, 1840, London; *Illustrations of the History and Practices of the Thugs*, London, 1837.)

THUJA, or THUYA, the name of a genus of plants belonging to the natural order Coniferæ. This name is derived from θύω, as, on account of the pleasant odour given out by the wood in burning, it was used in antient sacrifices. The species of the genus are more commonly known by the name of *Arbor Vitæ*, but why this name has been given to it is a matter of uncertainty. Clusius, who wrote in the sixteenth century, gives it this name, and Dr. Royle says that the Cypress, an allied genus, is called the tree of life in the East. It belongs to the section of Coniferæ called Cupressinæ by Richard, in which Cupressus, Callitris, Taxodium, and Juniperus are also included. The pistils and stamens are in separate flowers on the same tree. The male catkins are terminal and solitary; the pollen of each flower is included in four cases that are attached to the inner face of the scale towards its base. The female catkin is terminal; the ovary is united to the bractea, forming together a kind of receptacle; each receptacle has two ovules; the receptacles are semipeltate, imbricated, and smooth, or, in some cases, have a recurved beak near the tip; the seeds in some are slightly winged. The leaves are scale-like, closely imbricated or compressed. The species are evergreen, either trees or shrubs, and are inhabitants of Asia, Africa, and North America.

T. occidentalis, the Western or American Arbor Vitæ, has the branchlets 2-edged; the leaves imbricated in four rows, ovato-rhomboid, adpressed, and tuberculated; the cones are obovate with the interior scales truncate and gibbous beneath the apex. This plant is a large shrub or small tree, and is a native of North America, from Canada to the mountains of Virginia and the Carolinas. It is not so frequent in the Southern states, and is found there on the steep banks of mountain-torrents. In the Northern states of America it is sometimes called the white cedar, but more commonly arbor vitæ. It grows best in cool moist places, on the borders of rivers and lakes, and in swamps, some of which it covers to the extent of 50 to 100 acres. The stem of this tree seldom rises straight from the ground, but makes a short bend before it becomes straight. On this account it is difficult to obtain trunks of any length, and, although the timber is very durable, it is not much used in building. It makes good posts and rails, which last three or four times as long as any other species. Its branches are used for making brooms, a recommendation of which is, that they exhale an agreeable odour. In Great Britain the American arbor vitæ is planted as an ornamental shrub, for which purpose it flourishes best in low moist and sheltered situations. It will bear cutting well, and hence is employed for making hedges. It grows slowly, making 6 or 8 inches of stem in a year; the largest specimens in this country have attained a height of from 30 to 45 feet.

T. orientalis, the Oriental or Chinese Arbor Vitæ, has 2-edged branchlets; imbricated, ovato-rhomboid, adpressed leaves, furrowed in the middle and in 4 rows; the cones are elliptic with the interior scales blunt, and mucronate beneath the apex. It is a native of rocky situations in Siberia and China, and on the mountains of Japan. It is a low tree and easily distinguishable from the American species by its denser foliage and lighter green colour. It has a straight trunk, and seldom exceeds 18 or 20 feet in height. It is a hardy plant, and flourishes in the gardens about London, where it was first introduced by Miller in 1752.

T. pendula, the Pendulous or Weeping Arbor Vitæ, has opposite, decussating, spreading, lanceolate, mucronate, keeled, somewhat distant leaves; globose cones; convex smooth scales; filiform pendulous branches. It is a native of Tartary, and is an elegant shrub, but only a few specimens exist at present in this country.

T. articulata of Desfontaines is now called *Callitris quadrivalvis*, four-valved Callitris. The genus Callitris differs from Thuja in having the scales of the female catkins, from 4 to 6 in number, opening like the valves of a regular pericarp, and the seeds at the base of these scales winged on the margin. The four-valved Callitris has flattened articulated leaves; the female catkin with four oval pointed valves, two of which have seeds. It is a native of Barbary, and attains a height of from 15 to 20 feet. It was first discovered by Desfontaines on Mount Atlas in 1796. The gum-sandarac of commerce [SANDARAC], according to Broussonet, Brongniart, and others, is the produce of this tree, although it is often ascribed to the Juniperus communis. This substance is brought into the market in tears, which are clear, shining, and diaphanous, and of whitish-yellow colour. When reduced to a fine powder, it makes an excellent pounce. Dissolved in spirits of wine, it forms a delicate varnish. Under the name of *alerce*, the wood of this tree is in great repute in

the East for building religious edifices. Captain S. E. Cook ascertained that the roof of the celebrated mosque, now the cathedral of Cordova, which was built in the ninth century, is constructed of the wood of the *alerce*. It appears to be a hardy tree, and would probably grow well in this climate in the open air.

THULDEN, THEODOR VAN, born at Bois-le-Duc in 1607, was one of the most distinguished scholars and assistants of Rubens, with whom he was also a favourite. He was with Rubens in Paris, and is said to have executed the greater part of the celebrated series of the so-called Gallery of the Luxembourg, painted in honour of Mary de' Medici. Van Thulden is distinguished both as a painter and as an etcher. As a painter he excelled in various styles. There are several large pictures, both historical and allegorical, by him, dispersed over Germany and the Netherlands; he painted also small pictures from common life in the manner of Teniers, such as markets, fairs, and the like; and he was frequently employed by architectural and landscape painters to embellish their pictures with small appropriate figures, in which he was excellent; he painted many such in the pictures of Neefs and Steenwyck.

Van Thulden's style in his greater works is altogether that of Rubens, and, although inferior in boldness of design and colouring, his works may easily be mistaken for those of Rubens; the Martyrdom of St. Andrew, in St. Michael's church at Ghent, was long thought to be a work of Rubens. In chiar'oscuro, Van Thulden was quite equal to his master. A St. Sebastian, in the church of the Bernardines at Mechlin, and an Assumption of the Virgin, in the church of the Jesuits at Bruges, were considered two of his best altar-pieces. While at Paris he painted twenty-four pictures of the Life of St. John of Matha in the church of the Mathurins, which he himself etched on copper in 1633; the pictures have since been painted over. Van Thulden's etchings are numerous, and in a masterly style: he published a set of 58 plates from the paintings of Nicolò Abati at Fontainebleau, after the designs of Primaticcio, which are greatly valued, for as the paintings were destroyed in 1738, they are all that remains of the original designs. They have been copied several times; the original set appeared under the following title: 'Les Travaux d'Ulysse, desseignez par le Sieur de Sainct-Martin, de la façon qu'ils se voyent dans la Maison Royale de Fontainebleau, peint par le Sieur Nicolas, et gravés au cuivre par Theodore van Thulden, avec le sujet et l'explication morale de chaque figure.' He etched also 42 plates after Rubens, of the entrance of Ferdinand the Cardinal-Infant into Antwerp: 'Pompa introitus Ferdinandi,' &c. The eight plates of the History of the Prodigal Son, to which he put Rubens' name, are now said to be from his own designs; they are entitled, 'De verlooren Soon, door P. P. Rubens. Th. Van Thulden fec.' Van Thulden died in his native place, Bois-le-Duc, in 1676.

(Descamps, *La Vie des Peintres Flamands*, &c.; Füssli, *Allgemeines Künstler Lexicon*.)

THULITE, a mineral, the texture of which is usually granular. Lustre vitreous. Translucent on the edges. Hardness between 5 and 6; but the grains separate so easily that it is rather difficult to determine it. Colour rose-red; streak greyish-white. Specific gravity 3·1055.

Before the blowpipe fuses with carbonate of soda into a greenish-white bead; with borax forms a colourless transparent bead; but on the addition of nitre becomes violet.

It has been found in Norway; and, according to Gmelin, consists of—silica, 42·808; alumina, 31·144; lime, 18·726; soda and a trace of potash, 1·891; oxide of iron, 2·888; oxide of manganese, 1·635; water, 0·640: total, 99·732.

THÜMMEL, MORITZ AUGUST VON, a German writer who was greatly admired by his contemporaries, and who still continues to hold a high literary rank with his own countrymen. He was born at Schönfeld, near Leipzig, May 27th, 1738, where his father possessed considerable property, but lost much of it by the plundering of the Prussian troops in Saxony, 1745. Moritz, who was the second son of a family of nineteen, was sent to the university of Leipzig in 1756. There he found in Gellert not only an instructor, but a friend; and he also formed an acquaintance with Weisse, Rabener, von Kleist, &c., and, among others, with an old advocate named Balz, who at his death, in 1776, left him the whole of his fortune, twenty-four thousand dollars. This accession of wealth enabled Moritz to give up the places he held under Duke Ernest of Saxe-Coburg, first as Kammer-junker, and, from 1768, as privy councillor and minister, and to retire in 1783 to Sonneborn, an estate of his wife, at which place and at Gotha he continued chiefly to reside until his death, which happened while he was on a visit at Coburg, October 26th, 1817. Thümmel's literary reputation was established by his 'Wilhelmine,' a 'comic poem in prose,' first published in 1764. This short production, for it is in only five cantos or chapters, was received as something altogether new in German literature, and as a masterpiece of polished humour and playful satire. It was translated not only into French, but Dutch, Italian, and Russian; and it has been reprinted entire in Wolff's 'Encyclopädie' (1842). His poetical tale, 'Die Inoculation der Liebe,' 1771, and other pieces in verse, did not add much to his fame; but his last and longest work, 'Reise in den Mittaglichen Provinzen von Frankreich' (Travels in the Southern Provinces of France), in 9 vols., 1799-1805, is also his literary chef-d'œuvre. Instead of being, as its title would import, the mere record of his tours in that country, it is, like Sterne's 'Sentimental Journey,' to a great extent, a work of fiction, interspersed with fragments in verse, which breathe more of poetry than his other productions of that kind. It abounds with satiric humour and pleasantry, with witty and shrewd observations, and shows the author to have been an accomplished man of the world, intimately acquainted with human nature. That it is a work of no ordinary merit and pretension may be supposed from the notice it has obtained from Schiller, in his essay 'Ueber Naive und Sentimentalische Dichtung;' who, if he praises it with greater reserve than other critics, admits that, as a work of amusement, it is one of a superior kind, and will as such continue to enjoy the character it has obtained. A portrait of Thümmel, after Oeser, is prefixed to the 6th volume of the 'Neue Bibliothek der Schönen Wissensehaften,' a complete edition of his works, in six volumes.

(Jörden's *Lexicon*; Schiller's *Kleinere Prosaische Schriften*; Wachler's *Vorlesungen*.)

THUN, a town in the canton of Bern in Switzerland, situated on the river Aar, about a mile below its egress from the lake of the same name. Part of the town stands on an island formed by the river, and part is on the right bank, at the foot of a hill, on which is built the castle, the keep of which was, in the middle ages, the residence of the counts of Thun. On the opposite or southern side are seen the Alps of the Oberland, covered with perpetual snow. The parish church, with its lofty tower, is a remarkable building. There are also a handsome townhouse, an hospital, an orphan asylum, a public library of 7000 volumes, and a military school for the artillery and engineer corps of the federal service. [SWITZERLAND.] The population of Thun amounted, by the last census, to 4833 inhabitants. (Leresche, *Dictionnaire Géographique Statistique de la Suisse*, 1836.)

The lake of Thun, Thunersee in German, is 14 miles long from south-east to north-west, about three miles in its greatest width, and about 700 feet deep. Its surface is 1780 feet above the sea. The Aar, coming from the lake of Brienz, enters it at its south-east end, and issues from it at the opposite extremity. The Kander, swelled by the Simmen, also enters the lake from the south. The lake abounds with fish; and its banks, planted with vineyards in some places, and rising abruptly to steep mountains in others, afford a variety of scenery. A steam-boat plies on the lake.

THUNBERG, CARL PETTER, an eminent Swedish traveller and botanist, and professor of natural history in the university of Upsal, was born on the 11th of November, 1743, at Jönkoping in Sweden, where his father was a clergyman. He was early sent to the university of Upsal for the purpose of studying medicine, and became a pupil of the great Linnæus. Under his instruction he acquired that taste for natural history which so remarkably distinguished the school of Linnæus, and which has given to the world so many famous naturalists. Having completed his course of study, he graduated in 1770, and was honoured by having bestowed upon him the Kohrean pension for the space of three years. Although the sum was small, about fifteen pounds per annum, he determined to use it for the purposes of improvement, and accordingly

left Upsal for the purpose of visiting Paris and the universities of Holland. Whilst in Amsterdam, he became acquainted with the botanists and florists of that city, and, they suggested to him the desirableness of some person visiting Japan for the purpose of exploring its vegetable treasures. Thunberg immediately offered his services, and a situation as surgeon to one of the Dutch East India Company's vessels having been obtained for him, he left Amsterdam for Japan in the year 1771. He landed at the Cape of Good Hope for the purpose of learning amongst the Dutch settlers there the Dutch language, which is the only European language spoken extensively in Japan, and also in the hope of adding to his knowledge of natural objects by researches in Africa. Here he made several excursions into the interior, visiting various of the native tribes, and after having remained at the Cape three winters, where he collected much valuable information, he set sail in 1773 for Java and the Japan Isles. He remained in these islands five years, making large collections of the plants of these countries, as well as observations on the habits, manners, and language of their inhabitants. His ability to labour, however, during his residence both in Africa and Asia, was very much diminished by a frightful accident which he met with on first leaving Holland. The keeper of the stores in the ship, having inadvertently given out white lead instead of flour, it was mixed with flour and used for making pancakes, of which the whole crew partook. All were ill, and many suffered very severely at the time, but none was so bad as Thunberg; he only gradually recovered his health, and through his long life always laboured under the debility and derangement his system had thus received. He returned to his native country in 1779, making first a short stay in England. Here he formed the acquaintance of Sir Joseph Banks, Dryander, and Solander, and availed himself of the extensive collection of plants from all parts of the world, and valuable library of Sir Joseph, for the purpose of adding to his botanical knowledge. During his absence he had been made demonstrator of botany at Upsal in 1777, and in 1784 was installed in the chair of the great Linnæus as professor of botany. In 1785 he was made a knight of the order of Wasa, and in 1815 commander of the same order.

On gaining his home, Thunberg immediately commenced arranging the vast mass of materials he had collected in his travels for the purpose of publication. His first important work was a description of the Japanese plants, which was published at Leipzig in 1784, with the title, 'Flora Japonica, sistens Plantas Insularum Japonicarum, secundum Systema Sexuale emendatum,' 8vo., and illustrated with thirty-nine engravings. In this work a great number of new plants were described and arranged according to the Linnæan system, in which he ventured to dispense with the three classes called Monœcia, Diœcia, and Polygamia. He subsequently published some botanical observations on this 'Flora,' in the second volume of the 'Transactions' of the Linnæan Society.

In 1788 he commenced the publication of an account of his travels, under the title, 'Resa uti Europa, Africa, Asia, forattad åren 1770-1779,' Upsal., 8vo. This work was completed in four volumes, and contains a full account of his eventful life, from the time he started from Upsal with his Kohrean pension, till he returned to the same place laden with treasures from a hitherto unexplored region. In these volumes he has taken great pains to collect all possible information on the medicinal and dietetic properties of plants in the countries he visited, as well as their uses in rural and domestic economy. He recommends several new plants for cultivation in Europe as substitutes for those in present use. This work also gives a simple and pleasing account of the original natives of the places in which he sojourned, as well as of the European settlers.

It has been translated into German by Groskund, and published at Berlin in 1792. It appeared in English at London in 1793, and in French at Paris in 1796. His next work was a 'Prodromus Plantarum Capensium, Annis 1772-1775 collectarum,' Upsaliæ, 1794-1800; being an account of the plants he had collected at the Cape. From 1794 to 1805 he published in folio, under the title 'Icones Plantarum Japonicarum,' Upsaliæ, a series of plates illustrative of the botany of the Japan Isles. These were followed by the 'Flora Capensis,' Upsaliæ, 1807-13, 8vo. In this work the most complete view of the botany of the Cape of Good Hope is given that has hitherto been published. In 1807, in conjunction with Billberg, he published the 'Plantarum Brasiliensium Decas Prima,' Upsaliæ, 4to. In this work the plants collected by Freireiss and Sauerländer, in the province of Minas Geraës in Brazil, are described; but the subsequent parts were published by other hands.

Besides the above works, on which the reputation of Thunberg as a traveller and a botanist mainly rests, he was the author of almost countless memoirs and academical dissertations. The subjects of these were chiefly those which his long residence in Africa and Asia afforded. The majority of them are upon botanical topics, not a few however are devoted to a consideration of zoological subjects. Although botany was his primary object in his travels, he yet lost no opportunity of obtaining a knowledge of the new animals he met with, and several of his papers are descriptions of these. He published several memoirs in the London 'Philosophical Transactions,' and the 'Transactions' of the Linnæan Society, also in the Transactions of Russian, German, French, and Dutch scientific Societies and Journals, and a much greater number in those of Sweden. The academical dissertations bearing his name, and presented at the university of Upsal, are nearly one hundred in number, and were published between the years 1789 and 1813.

Thunberg was elected an honorary member of sixty-six learned societies. He died at the advanced age of eighty-five, on the 8th of August, 1828.

Retzius named a genus of plants in the natural order Acanthaceæ, in honour of him, *Thunbergia*. The following genera of plants have species named after him:—Ixia, Isolepis, Cyperus, Imperata, Spatalla, Convolvulus, Campanula, Gardenia, Atriplex, Hydrocotyle, Rhus, Crassula, Berberis, Erica, Passerina, Thalictrum, Coeculus, Equisetum, Hypnum, Fissidens, Cystoseira, Gyalecta, and Endocarpon. Of insects, the genera Harpalus, Lygæus, Pyralis, and Tinea have specific names after Thunberg.

Thunberg was an amiable kind man, and highly esteemed by his friends and pupils. The great additions that he has made to our knowledge of the plants of the world, as well as their uses to man, place him amongst the most distinguished botanists of the last and present century. He was not great as a vegetable physiologist, nor did he attempt anything more in systematic botany than a slight emendation of the system of Linnæus. In this he was followed by very few; and those who at the present day have recourse to that system for arranging plants, generally adopt the primitive plan of Linnæus. As a traveller, Thunberg is remarkable for the accuracy of his observations on the manners, habits, and domestic economy of the people that he visited.

(Bischoff, *Lehrbuch der Botanik; Resa uti Europa*, &c.; *Kongl. Vetensk. Acad. Handlingar*, 1829.)

THUNDER is an explosion accompanied by a loud noise, which is heard after a discharge of lightning from the clouds. The character of the noise is variable: it sometimes resembles that which is produced when a single piece of ordnance is fired; at other times it is a rolling sound like the successive discharges of several great guns; and occasionally it may be compared to a series of sharp reports from a fire of musketry.

The identity of lightning with the electric fluid is now well known [LIGHTNING], but the physical cause of the detonation which accompanies the flash is still the subject of conjecture; in general it is considered that lightning, by its heat, creates a partial vacuum in the atmosphere, and that the sudden rushing of air into the void space produces the sound; but various reasons have been assigned for its prolongation. It was formerly supposed that the rolling noise is merely the result of several echos caused by the sound being reflected from mountains, woods, buildings, or clouds, or from the latter alone when a thunder-storm takes place over the ocean: this opinion seems to have been founded upon the fact that the report of a fire-arm discharged in a mountainous tract is prolonged by the echos during at least half a minute, which is about the time that the rolling of thunder continues. But though the reflections of sound are, very probably, in part, or at times, the causes of the prolongation of the report arising from the explosion, yet it must be admitted that these will not always afford a satisfactory explanation of the phenomena. It may happen, for example, that, when the sky is

uniformly covered with clouds, a flash of lightning will dart from the zenith, and, after a few seconds, the crash of thunder will take place accompanied by a rolling sound: soon, a second flash may pierce the clouds in the zenith and thunder may follow, but now the crash, though loud, may not be prolonged. It is justly observed by M. Arago that this is very different from the phenomena of echoes; and the explanation which was first proposed by Dr. Hooke ('Posthumous Works,' 1705) is perhaps that which possesses the highest degree of probability. The flashes of lightning, Dr. Hooke observes, are either simple or multiple: the first occupies but one small portion of space, and gives rise to an instantaneous report; the multiple flash takes place at different parts of one long line: if these parts should be situated in a circular arc, and the observer should be in its centre, all the reports would arrive at his ear at the same time, and still one loud crash only would be heard; but if the parts were nearly in a straight line, and the observer were at one of its extremities, the reports, whether they take place at the same instant or in succession, would arrive at his ear at different times, depending wholly or partly on the distances. It may be considered therefore that the rolling arises from the circumstance that the points of explosion are at different distances from the observer; and it will follow that the duration of the noise is equal to the time in which sound travels through an interval equal to the difference between the lengths of two lines drawn from the observer to the two extremities of the flash. The flash of lightning and the report of the thunder take place in reality at the same moment; but since sound travels at the rate of 1100 feet per second, while the passage of light from the cloud to the observer may be considered as instantaneous, it follows that, on counting the number of seconds which elapse between the time of seeing the flash and hearing the report, the distance of the thunder-cloud from the observer may be ascertained if 1100 feet be multiplied by that number of seconds.

The experiments of Lavoisier and La Place have shown that the molecules of water, in evaporating, convey away from the earth a portion of the electricity which it contains, and which the water has acquired in being converted into vapour. This electricity becomes diffused in the upper regions of the atmosphere, and, when the vapours again become condensed so as to form globules of water, the electricity disposes itself on the surface of the globules in different quantities according to their magnitudes. When these globules have equal volumes, those quantities are equal; and, an equilibrium then subsisting with respect to electricity, no sensible effect is produced: but when a considerable difference takes place between the quantities of electricity on the different globules, the tendency of that element to return to a state of equilibrium causes it to pass rapidly in flashes from those globules which have more, to those which have less, than their mean quantity; and thus, if the condensation be great and take place suddenly, vivid flashes of lightning and loud peals of thunder may take place. The effect is probably the greatest when two masses of clouds in opposite states of electricity are carried rapidly against one another by winds blowing in contrary directions.

An opinion prevails that thunder has been heard when the sky was without a cloud, but the fact can scarcely be said to be satisfactorily established; for the sounds which, in countries subject to earthquakes, have been supposed to be thunder, proceed from under the ground, and may result from a different cause. Volney however relates that, being one day at Pontchartrain near Versailles, when no cloud was visible, he heard distinctly four or five claps of thunder: he adds that about an hour afterwards the sky became overcast, and a violent hail-storm followed. On this relation M. Arago observes that the sounds could not have been heard if they had come from clouds at a greater distance than six leagues; and if the clouds had been at, or a little within, that distance, they must have been visible, unless it be supposed that they were not more than a few yards above the ground: but the hail which followed the thunder must have proceeded from clouds having great elevation, though at the time the claps were heard they were too remote to allow any sound from them to reach the ear; and therefore he concludes that the sounds must have been produced in the air itself. For an account of death caused by electricity in the air when the thunder-cloud was very distant, and for the theory of the returning stroke, see the *Philosophical Transactions*, vol. lxxvii.; and Stanhope, Charles, Earl.

From the meteorological observations made by Dr. Scoresby, and Captains Phipps, Parry, and Ross, it appears that neither thunder nor lightning is known to take place beyond the 75th degree of north latitude: even so low as the 70th degree those phenomena are very rare; and in the tables of Captain Parry the occurrence of thunder and lightning is mentioned but once between June, 1821, and September, 1823. Captain Franklin also, in 67½° N. lat., heard thunder on one day only between September, 1825, and August, 1826.

THUNDER-ROD, a bar of metal attached generally to a side of a building, and extending from below the level of the ground to a point several feet above the highest part of the roof, or of the steeple, if the building have one, in order to secure the edifice from the effects of thunder or lightning: the upper extremity of the rod or bar terminates in a point.

When a thunder-cloud passes above an elevated object, it produces in the nearest part of the object the kind of electricity which is opposite to that of the cloud itself, so that a rapid and abundant communication takes place; either the electric matter in the cloud rushes towards the earth, or that of the earth rushes towards the cloud: and if the materials of the building are not good conductors of the fluid, the latter in its passage exerts an explosive action by which the building is destroyed or greatly injured. The thunder-rod, from the conducting property of its metallic substance, serves to convey the fluid harmlessly to the earth or air. When it has happened that there is an interruption of the communication, by the rod being broken, or even by being much diminished in magnitude in some part of its length, the electric fluid has been observed to pass between the parts of the rod above and below the place of fracture.

Buffon, and Dalibard, at his suggestion (1752), appear to have been the first persons who drew lightning from the atmosphere by means of pointed rods of metal; and in the following year M. de Romas elevated a paper kite to the height of 550 feet for the like purpose: this was about twelve months before Dr. Franklin, without any knowledge of what had been done in Europe, performed the like experiment in America. The object of the French philosophers was merely to obtain by those means, electrical sparks or flashes of fire; but it is to Dr. Franklin that the world is indebted for the idea of raising pointed rods in order to secure buildings from the effects of atmospherical electricity; and the recommendation was immediately adopted both for edifices on land and ships on the water.

Soon after the first employment of thunder-rods in Europe, an opinion prevailed that when their extremities were pointed they created a danger which did not exist before, and that they attracted lightnings which would, without the rods, have discharged themselves at a distance; and in order to diminish the risk, it was proposed to crown the summits of the rods with knobs or balls of metal. This notion was entertained by the Abbé Nollet, in France; but in the Royal Society of London the question concerning the relative efficacies of pointed and knobbed conductors was agitated with great vehemence, chiefly through the obstinacy of Mr. Wilson, one of the Fellows, who, in 1778, made himself the head of a party in support of the latter kind of conductors, in opposition to the president. [Pringle, John.] It is remarkable that both George III. of England and Frederick of Prussia placed themselves on the side of the opponents of Franklin; the first king giving the preference to balls over points, and the other, while he consented to have conductors raised on his barracks and powder-magazines, prohibited the erection of them on his palace of Sans Souci. It is now admitted that the prejudice against pointed thunder-rods was entirely without foundation: those conductors have been found not only to protect buildings when struck, but also to diminish the number of shocks which in a given time they have experienced. An experiment which was made by Beccaria, in 1753, might have shown the superiority of pointed conductors over those with balls; for that distinguished electrician set up on the roof of the church of San Giovanni, at Turin, a metallic rod bent near the top and terminating in a point: the upper part was capable of being turned round by means of a silk line, so that the point could be

directed upwards or downwards at pleasure, and the lower part of the rod terminated upon substances which were imperfect conductors of electricity. On directing the point towards the sky when a thunder-cloud passed over the church, electrical sparks issued in abundance from the foot of the rod; but when the point of the rod was reversed so that the bend was upwards, few or none were obtained. The conducting-rod set up by Professor Richman, at St. Petersburg, may be said to have been the cause of his death (in 1753); but the house would most probably have been struck if there had been no conductor. The immediate cause of the melancholy accident was that the rod led into the apartment, and the unfortunate Professor was standing too near its lower extremity. (*Phil. Trans.*, vol. xlviii.)

Some doubt however still exists concerning the distance to which the protecting influence of the rod extends, but it is generally supposed that this influence is limited by the circumference of a circle described about the rod with a radius equal to double its height above the top of the building.

When the magazine at Purfleet was struck by lightning in 1777, the shock took place on an iron cramp which united two stones of the cornice, at the distance of 24 feet from the thunder-rod, measured horizontally; and the upper extremity of the rod was 11 feet above the top of the roof on which it was erected. Again, in 1781, the workhouse at Heckingham in Norfolk, though provided with eight rods, was struck by lightning at a spot which was distant 55 feet measured horizontally from the nearest rod, while the pointed summit of the latter was 22 feet above the level of the part struck; and many other instances might be cited in confirmation of the supposition. It may be inferred therefore that large buildings ought to be secured by several rods, and that the less these are elevated the greater ought to be their number; also that no point of the building ought to be at a greater horizontal distance from the nearest rod than twice the height of the rod above the top of the building. Mr. Cavendish, Dr. Priestley, and other English philosophers, recommend them to stand 10 feet above the roof; but in France their height is sometimes more than 30 feet.

The most elevated objects are not always those which are struck by lightning; for in 1829, the sails of a mill at Toothill in Essex being at rest, the electric fluid left untouched the arm, which was in a vertical position, and fell on a knob of iron at the middle of one of those which was inclined to the horizon in an angle of 45°; and it has frequently happened that buildings containing in their walls conducting substances have been struck much below their summits by a lateral action of the fluid; bars or plates of metal in the side walls having served to attract it more powerfully than the materials on the roof. This happened to the cathedral at Lausanne in 1783.

In order that the points of rods may not become blunt by rust, they are generally made of copper and covered with gilding; but it appears to be the practice of late to make the upper part of the rod of platinum, this metal being not only unaffected by the corrosive power of the air or rain-water, but also incapable of fusion by heat. As the erection of a thunder-rod requires in general an expensive scaffolding, the latter metal, even though more costly than iron or copper, will from its durability be in reality more economical than either of the others.

Thunder-rods are frequently made to terminate at the upper extremity with one point in a vertical position, and about this a number of points diverge from the rod at different inclinations to the horizon: by this construction there is not only a probability that some of the points will be acute when others may have been blunted by the action of the atmosphere, but also among them there will always be one which presents itself in the most favourable position for attracting the electric fluid. Observations have not yet however been sufficiently multiplied to enable philosophers to decide whether conductors so terminated have any advantage over the more simple rods of Franklin.

The thunder-rod should be thick enough to carry the electric fluid to the ground without being melted by it; in general a cylindrical rod about half an inch in diameter will be sufficient to prevent this effect from taking place; whether of iron or copper, it should be covered above ground with a coating of paint; and the part under ground is usually formed with two or more branches in order to facilitate the passage of the electric fluid into the earth. It must be observed however that, if the lower part of an iron thunder-rod descends into water, it is liable to become corroded by rust; and a dry soil is not a good conductor of electricity. On the Continent it has been the practice to let the lower part of the rod enter into a pit filled with ashes of burnt wood or powdered coke. If the rod is made of a kind of metal which does not become corroded in water, its lower extremity may be allowed to enter about three feet below the surface: the water should be that of a natural pond, for, if it be in an artificial reservoir, the walls of the latter, being sometimes formed of, or covered with, conducting substances, may prevent the electric fluid from diffusing itself in the earth.

When a building is provided with several rods, each of these should be continued quite to the ground: at the level of the parapet the several rods should be connected together laterally by slender iron bars; and the plates of iron which enter into the construction of roofs should in like manner have a metallic communication with each other. As the thunder-rod is necessarily made to follow the outline of a cornice and roof, the part below that which projects above the roof may be made of metallic cords, in order to avoid the formation of angles in its length; for experience has shown that lightning in descending a rod has quitted the latter at its angles, and, after passing through the air, has struck objects which were situated in the line of its first direction. In the expectation of being able to attract the lightning entirely away from powder-magazines, or any building containing explosive materials, thunder-rods have been attached to masts at the distance of a few yards from the building: this practice has many advocates, and the only objection to it is, that it is attended with considerable expense.

Many lofty buildings contain in their construction the means of securing them from the effects of lightning, and such is the case with the Monument on Fish-Street Hill; this building, whose height is more than 200 feet, is crowned with a metallic ball surrounded by bands which terminate in points tending upwards. From the ball descend four bars of iron which serve to support a flight of steps, of the same metal, and one of them is in connection with the iron railing which extends from the balcony to the ground. In 1764 lightning struck the steeple of St. Bride's Church in Fleet Street, and descended from thence along an iron bar about 20 feet in length and two inches in breadth, which was almost buried in the stones: the electric fluid left no traces of its passage along this bar, but at the place where the metal terminated the damage commenced, the stones being destroyed or thrown to a considerable distance. A similar accident has this summer (1842) occurred to the church of St. Martin in Westminster.

A ship at sea, like an edifice on land, may, when there is an accumulation of electric matter in the upper part of the atmosphere, be struck aloft; or, when the atmosphere is in a contrary state, the lower part of the ship may be struck, the lightning in the latter case ascending along the mast: and ships unfurnished with metallic conductors have frequently suffered serious injury during thunderstorms, while those which have been so provided have generally escaped. When Captain Cook was at Batavia, lightning fell on the ship with such force that the shock resembled an earthquake; the conductor, which was very slender, appeared to be on fire from the mast-head to the sea, yet no damage was done to the ship. In 1814, while a great storm raged at Plymouth, of all the ships then in port only one was struck by lightning, and this alone was not provided with conductors. And in the roads at Corfu, three violent flashes struck the ship Etna, which had conductors, without doing any injury, while two ships not far distant, being destitute of such protection, were much damaged.

The rigid bars of Franklin are considered inapplicable, as conductors, to ships, and instead of them chains of copper have been generally employed; these are attached to the masts at their upper extremities; and, following the standing rigging, they pass down the ship's sides into the water. Objections have been made to them on account of their want of continuity, and their liability to be injured or broken during storms; and copper links attached to the masts by flexible spiral wires were suggested by Mr. Singer. M. le Roy also recommended a chain of copper rings which were to encircle the main-topmast backstay; but neither of these methods has been put in practice. In

1822 Mr. Snow Harris proposed ('Observations on the effects of Lightning on Floating Bodies'), and subsequently caused to be executed for ships, conductors consisting of slips of copper, of sufficient thickness to prevent them from being fused; these slips are inserted, in two layers, in a groove cut longitudinally along the mast, the joints of one layer being opposite the middle parts of the other, and they are fastened to the mast by copper screws. The whole line of metal passes down from the copper spindle at the top of the mast-head, and at the junctions of the upper and lower masts the slip is made to join a cylinder of copper which lines each sheave-hole: the lower part of the line is connected with a plate of copper which is fixed on the keelson, at the step, and from thence there is a communication with the water by three copper bolts which pass quite through the keel.

THURGAU, a canton of Switzerland, bounded on the north partly by the lake of Constance, and partly by the Rhine, which divides it from the canton of Schaffhausen; on the east and south by the canton of St. Gallen, and on the west by that of Zürich. The river Thur, which comes from the canton of St. Gallen and is joined by the Sitter from Appenzell, has given its name to the canton 'Thurgau,' or 'district of the Thur,' the river crossing the middle part of it from east to west. The valley of the Thur is separated from the basin of the lake of Constance by a succession of hills which rise in terraces on both sides, and are intersected by several valleys. On the south and west sides other hills divide the Thurgau from the valley of the Toss in the canton of Zürich. The whole country belongs to the plateau or table-land of Switzerland, and is a considerable distance from the Alpine region. The climate of the Thurgau is comparatively mild; a great part of the country is planted with fruit-trees, especially apple, pear, and cherry: the vine also thrives in several localities. The produce of corn is not sufficient for the consumption. According to a late return, there were in Thurgau about 28,000 head of horned cattle, 3500 sheep and goats, and 2550 horses. The rivers and the lake abound with fish. The area of the canton is estimated at about 365 English square miles; and the population in 1835 was 84,124 inhabitants, of whom about 66,000 follow the tenets of the Reformed or Protestant communion, and the rest are Roman Catholics. German is the language of the country. About one-third of the population is employed in trade and manufactures. The principal manufactures consist of cotton goods, in which above 3000 looms are employed. The average wages of a workman are about 7½ batzen, or eleven pence sterling per day. About 3000 pieces of fine linen from native flax are made annually; but this manufacture is on the decline. There are also spinning-factories which produce yarns of the quality from No. 40 to 60. The tariff of the German commercial league has much diminished the exportation of manufactured goods. Some silks are manufactured for the French market. The other exports consist of wine, cattle, oats, dried fruit, and cider. The principal imports are—iron and metal ware, chiefly from England; coarse woollen goods from Germany; fine woollen from France and Belgium; fine cotton yarns from England; salt from Bavaria and Würtemberg; colonial articles, and wheat.

The revenue of the canton amounts to about 102,000 florins, or 8500*l.* sterling, and is derived from duties on salt and other articles imported, stamps, transfers of property, and an income-tax.

Elementary education has been improved of late years. There are about 264 schools, 200 of which are for Protestants, 58 for Roman Catholics, and six mixed of both communions. About 17,000 children attend the schools. A school for teachers has been established at Kreutzlingen.

There is a fund, the capital of which amounts to about half a million of florins, for the support of the poor, besides which there is a small poor's rate on property. The annual expenditure for the poor varies from 15,000 to 30,000 florins. There is a special fund for hospitals and also a benevolent fund. Switzerland in general is a country remarkable for its charitable spirit.

Thurgau is divided into eight districts—Frauenfeld, Arbon, Bischofzell, Tobel, Weinfelden, Gottlieben, Steckborn, and Diessenhofen. The principle towns are—1. Frauenfeld, which is the head town of the canton, situated in a fertile valley near the confluence of the river Murg with the Thur. It consists of 162 houses, besides other buildings, forming three wide streets; the inhabitants amount to about 1300. The old castle, formerly the residence of the Swiss vogten or governors of Thurgau; the town-house, where the Helvetic diet used to assemble in the time of the old confederation; the arsenal; and the Protestant and Roman Catholic churches, are the chief buildings. 2. Steckborn, a small busy town pleasantly situated on the banks of the Zellersee, or smaller basin of the lake of Constance, has several manufactories, and about 1900 inhabitants. In the neighbourhood of Steckborn is the fine country-residence called Arenaberg, which was purchased by the countess of St. Leu, daughter of Josephine Beauharnais and wife of Louis Bonaparte, ex-king of Holland, and in which she died in 1840. 3. Diessenhofen, on the left or southern bank of the Rhine, is a place of considerable trade in agricultural produce, and has about 1000 inhabitants. 4. Bischofzell, at the confluence of the Sitter and the Thur, is a walled town, with a collegiate church of the ninth century, an old castle, a long bridge on the Thur, several schools, and about 1000 inhabitants. 5. Arbon, a small town on the southern bank of the Bodensee, or lake of Constance, of which it enjoys a splendid view, is said to be built on the site of a Roman station named Arbor Felix.

The canton of Thurgau is a representative democracy with a legislative assembly, 'Grosser Rath,' and an executive council, 'Kleiner Rath.' The right of voting for elections of members of the legislature is subject to some qualifications; but by the last accounts we have seen the constitution was undergoing a revisal.

THÜRINGER WALD. [GERMANY; PRUSSIA.]

THURINGIA (*Thüringen*) is the antient name of an extensive tract of country in the central part of Germany, situated between the Harz Mountains, the rivers Saale and Werra, and the Thüringerwald. These however are not the boundaries of the great kingdom of Thüringia, which extended to the Elbe, and northwards nearly to Magdeburg, southwards to the vicinity of the Danube, and comprehended on the west the greater part of the country afterwards called Franconia. It cannot be positively ascertained what people originally possessed Thuringia. According to Galetti, it was formerly inhabited by the Catti; according to F. Wachter and Wilhelm, by the Cherusci. Vegetius mentions the Thuringi about the year 404. Various conjectures have been made respecting the derivation of the name; and authors, misled by a similarity of names, have confounded them with others. The history of the country is very intricate, and has been the subject of numerous works, such as Galetti's 'History of Thuringia,' 6 vols.; and Wachter's History, in 3 vols. Thuringia long gave the title of margrave to the elector of Saxony. Properly speaking, there is no country now called Thuringia: it is divided among Prussia, Saxe-Weimar, Saxe-Coburg, Schwazburg-Sonderhausen, and Schwarzburg-Rudolstadt. The name is still preserved in Thüringerwald, a continuation of the Fichtelgebirge, from which it branches out near Münchberg and Gefrees, in the kingdom of Bavaria: near Eisenach, Marksuhl, and Salzungen it rises above the Werrathal; runs south-east along the frontier of the former circles of Upper Saxony and Franconia, till it turns, near Lobenstein, into the Saalthal (where however it receives the name of Frankenwald), and declines, near Kronach, into the Mainthal. The length is 70 English miles, and its breadth varies from 9 to 18 miles. It covers about 3400 square miles, and has a population of 220,000 inhabitants, living in 28 towns and 570 villages. It is a long mountain-chain with a narrow ridge, and it is only near the Schneekopf, on the road between Suhl and Ohrdruf, that there is a plateau two or three miles across. The two highest points are the Schneekopf, 2700 feet, and the Inselsberg, 2604 feet, above the level of the sea. The highest points consist of granite, clay-slate, and principally porphyry: the whole chain is clothed to the very summit with pine-forests, mixed in a few places with oak and other timber. Numerous rivers rise in this chain, which flow on one side into the Elbe, and on the other into the Weser.

(Hassel, *Geograph. Lexicon;* Stein's *Lexicon;* Brockhaus, *Conversations Lexicon.*)

THURLOE, JOHN, who held the office of secretary of state during the Commonwealth, was born in 1616, at Abbots Roding, in Essex, of which place his father, the Rev. Thomas Thurloe, was rector. He was designed for the profession of the law. Through the interest of Oliver St. John, who was his patron through life, he was appointed, in 1645, one of the secretaries to the parliament commissioners for conducting the treaty of Uxbridge. He was called to the bar after this, in 1647, by the society of Lincoln's Inn; and in March, 1648, he received the appointment of receiver or clerk of the cursitors' fines, 'worth at least 350*l.* per annum,' says Whitelocke; 'and in this place was Mr. Thurloe servant to Mr. Solicitor St. John.' (*Memorials*, p. 296.)

Thurloe has left behind him a distinct denial of knowledge of or participation in King Charles's death, which took place, as is well known, in January, 1649. Writing to Sir Harbottle Grimston for the purpose of contradicting reports that St. John had been Cromwell's counsellor on that and on other occasions, and 'that I was the medium or hand between them by which their counsels were communicated to each other,' he says, 'I was altogether a stranger to that fact and to all the counsels about it, having not had the least communication with any person whatsoever therein.' (Thurloe's *State Papers*, vol. vii., p. 914.) It was very unlikely that a person in Thurloe's subordinate position at that time should have been consulted; and if it were a question of any importance whether he approved of the king's death or not, his subsequent continual identification with the authors of that event is more than sufficient to fix him with responsibility.

On the 11th of February, 1650, Thurloe was appointed one of the officers of the treasury of the Company of undertakers for draining Bedford Level, a new effort to drain this tract of country having been set on foot the year before. [Bedford Level.] In a letter from St. John to Thurloe, dated April 13, 1652 (*State Papers*, vol. i., p. 205), which is interesting as showing the terms on which Thurloe and St. John were, we find that Thurloe was then on an official tour of inspection: 'Now you are upon the place, it would be well to see all the works on the north of Bedford river to be begun. Pray by the next let me know whether Bedford river be finished as to the bottoming.' In the same letter are directions from St. John, now lord-chief-justice, for the purchase of a place for him in the neighbourhood of London, from which it would appear that Thurloe was in the habit of managing St. John's private affairs for him. The same letter contains St. John's congratulations to Thurloe on his appointment as secretary to the council of state, which appointment had just taken place: 'I hear from Sir Hen. Vayne, and otherwise, of your election into Mr. Frost's place, with the circumstances. God forbid I should in the least repine at any his works of Providence, much more at those relating to your own good, and the good of many. No, I bless him. As soon as I heard the news, in what concerned you, I rejoiced in it upon those grounds. No, go on and prosper: let not your hands faint: wait upon Him in his ways, and he that hath called you will cause his presence and blessing to go along with you.' In the course of the previous year, 1651, Thurloe had been to the Hague, as secretary to St. John and Strickland, ambassadors to the states of the United Provinces.

When Cromwell assumed the Protectorship, in December, 1653, Thurloe was appointed his secretary of state. In consequence of his attaining to this distinction, he was, in the February succeeding, elected a bencher of the society of Lincoln's Inn. Thurloe was elected member for the Isle of Ely in Cromwell's second parliament, called in June, 1654, and framed on the model prescribed by the Instrument of Government. He was re-elected for the Isle of Ely in the next parliament, called in September, 1656. Cromwell obtained from this parliament an act settling the office of post of letters, both inland and foreign, in the state for ever, and granting power to the Protector to let it for eleven years at such rent as he should judge reasonable; and it was let by him to Thurloe, at a rent of 4000*l.* a year, as we learn from a memorandum drawn up by him when the Rump Parliament had cancelled the grant. (*State Papers*, vol. vii., p. 788.) It is to be inferred that he made much profit by this farming of the postage. The salary of his secretaryship of state was 800*l.* a year. He is described in a 'Narrative of the Late Parliament,' reprinted in the 'Harleian Miscellany' (vol. iii., p. 453), as 'secretary of state and chief postmaster of England, places of a vast income.

There is the following entry in Whitelocke's 'Memorials,' under the date of April 9, 1657:—'A plot discovered by the vigilancy of Thurloe, of an intended insurrection by Major-General Harrison and many of the Fifth-Monarchy men' (p. 655). Thurloe afterwards, by Cromwell's desire, reported on the subject of this plot to the parliament, and received in his place the thanks of the house, through the Speaker, for his detection of the plot, and 'for the great services done by him to the commonwealth and to the parliament, both in this and many other particulars.' On the 13th July, 1657, he was sworn one of the privy council to the Protector, appointed in accordance with the 'Humble Petition and Advice.' Honours now came thick upon him. In the year 1658 he was elected one of the governors of the Charter-House and chancellor of the university of Glasgow.

In September, 1658, Cromwell died, and his son Richard was proclaimed in his stead. In the parliament that was called in December, Thurloe was solicited to sit for Tewksbury, in a letter which is worth extracting, as showing his estimation and position at this time, and the spirit of constituencies:—'Noble Sir, We understand that you are pleased so much to honour this poor corporation as to accept of our free and unanimous electing you one of our burgesses in the next parliament, and to sit a member for this place. Sir, we are so sensible of the greatness of the obligation, that we know not by what expressions sufficiently to demonstrate our acknowledgments; only at present we beseech you to accept of this for an earnest, that whomsoever you shall think worthy to be your partner shall have the second election; and our zeal and hearty affections to serve and honour you whilst we are, as we shall ever strive to be, Sir, your most humble and obliged servants,' &c.: signed by the bailiffs and justices of Tewksbury. (*State Papers*, vol. vii., p. 572.) He was not after all chosen for Tewksbury. He was elected for Wisbech, Huntingdon, and the university of Cambridge. His election for the last was communicated to him in a letter from the celebrated Dr. Cudworth, who wrote to him in this strain:—'We being all very glad that there was a person of so much worth and so good a friend to the university and learning as yourself, whom we might betrust with the care of our privileges and concernments.' (*State Papers*, vol. vii., p. 587.) Thurloe made his election to sit for the university of Cambridge.

The meeting of this parliament was the beginning of discontents and of Richard Cromwell's fall. We find Thurloe, in a letter to Henry Cromwell, viewing the complaints of the army and of the opposition in parliament as pointed principally against himself, and stating that he had asked the Protector's permission to retire from his office. 'I trust,' he adds, 'other honest men will have their opportunity, and may do the same thing with myself with better acceptance, having not been engaged in many particulars, as I have, in your father's lifetime, which must be the true reason of these stirrings; for they were all set on foot before his now highness had done or refused one single thing, or had received any advice from any one person whatsoever.' Thurloe remained however secretary of state. It was one of the objects set before themselves by the royalists in this parliament, who, by uniting with the republican party, formed a most troublesome opposition to Richard Cromwell's government, to impeach Thurloe; but this object was yet undeveloped when the parliament was dissolved. Thurloe appears to have given strong counsel against the dissolution.* . The immediate consequence of the dissolution was the summoning, by Fleetwood and the council of officers, of the Rump of the Long Parliament, and Richard Cromwell's deposition.

* It is generally stated otherwise, on the authority of the following passage in Whitelocke:—'Richard advised with the Lord Broghill, Fiennes, Thurloe, Wolsey, myself, and some others, whether it were not fit to dissolve the present parliament: most of them were for it; I doubted the success of it' (p. 677). Those mentioned are very few of the council, and, even if there had been no others, it would be quite consistent with the words of this passage that Thurloe should have sided with Whitelocke. That Thurloe strenuously opposed the dissolution is distinctly stated, and with circumstantial mention of the authority, in Calamy's Life of Howe, prefixed to Howe's Works, p. 9, ed. 1724, fol. We know further that the dissolution was urged on Richard Cromwell by the Republican and Royalist parties, which were united against Thurloe. Whitelocke says, a little afterwards, of the dissolution, that it 'caused much trouble in the minds of many honest men; the Cavaliers and Republicans rejoiced at it.' One of the 'many honest men' was doubtless Thurloe. See also Clarendon's 'State Papers,' vol. iii., pp. 420-60.

The letters written during Richard Cromwell's short Protectorate, in the third volume of Clarendon's 'State Papers,' are full of acknowledgments of Thurloe's influence with Richard Cromwell, and of the importance attached to him by the intriguing Royalists. Thus, Cooper, one of Hyde's spies, writes to him, February 13, 1659, 'Cromwell is governed by Thurloe, whether for fear or love I know not; but sure it is, he hath power to dispose him against the sense of right, or indeed his own interests. Thurloe's malice, I doubt, will never suffer him to do us good' (p. 425). Again Hyde writes to another of his agents, Brodrick, 'There is nothing we have thought of more importance, or have given more in charge to our friends since the beginning of the parliament, than that they should advance all charges and accusations against Thurloe and St. John, who will never think of serving the king; and if they two were thoroughly prosecuted, and some of the members of the High Court of Justice, Cromwell's spirits would fall apace' (p. 428). 'It is strange,' Hyde writes a month after, March 10, 1659, 'they have not in all this time fell upon Thurloe and those other persons who advanced Cromwell's tyranny' (p. 436). Then overtures to Thurloe to aid the king are thought of. 'I do confess to you,' Hyde writes, 'I cannot comprehend why Thurloe, and even his master St. John, should not be very ready to dispose Cromwell to join with the king, and why they should not reasonably promise themselves more particular advantages from thence than from anything else that is like to fall out' (p. 449). After the dissolution of the parliament, serious thoughts seem to have been entertained of soliciting Thurloe's and St. John's aid (p. 477). But Thurloe afterwards becomes again an object of fear to Hyde. During the government by the army, he writes, 'I do less understand how Thurloe shapes, and is in danger to be exempted out of the Act of Oblivion, and at the same time employed in the greatest secrets of the government, for I have some reason to believe that he meddles as much as ever in the foreign intelligence' (p. 532).

On the 14th of January, 1660, Thurloe was succeeded in his office of secretary of state by Scot, one of the republican party; but he was reappointed on the 27th of February. His patent as chief postmaster had been cancelled in the interval, on the 2nd of February. (*Commons' Journals*, vol. vii., p. 533.) In the movements that followed for the restoration of Charles II., Thurloe made an offer of his services to those who were bringing about that event. Sir E. Hyde writes to Sir John Grenville, April 23rd, 1660, 'We have, since I saw you, received very frank overtures from Secretary Thurloe, with many great professions of resolving to serve the king, and not only in his own endeavours, but by the services of his friends, who are easily enough guessed at. This comes through the hands of a person who will not deceive us, nor is easily to be deceived himself, except by such bold dissimulation of the other, which cannot at first be discerned. . . . The king returned such answers as are fit, and desires to see some effects of his good affection, and then he will find his service more acceptable.' (Thurloe's *State Papers*, vol. vii., p. 897.) And Hyde goes on to instruct his correspondent to consult Monk as to Thurloe's character, and as to his power to be of use, supposing he were sincerely willing. On the 15th of May Thurloe was accused by the parliament of high treason, and ordered to be secured; but on the 29th of June a vote was passed allowing him 'liberty to attend the secretary of state, at such times as they [the House] shall appoint, and for so long a time as they shall own his attendance for the service of the state, without any trouble or molestation during such his attendance, and in his going and returning to and from the secretary of state, any former order of this House notwithstanding.'

After his release from imprisonment, he retired to Great Milton in Oxfordshire, where he generally resided, except in term-time, when he occupied his chambers in Lincoln's-Inn. It is said that he was often solicited by Charles II. to resume public business, and always refused, telling the king that he despaired of serving him as he had served Cromwell, whose rule was to seek out men for places, and not places for men. (Birch's *Life of Thurloe*, prefixed to *State Papers*, p. xix.) Thurloe died at Lincoln's-Inn on the 21st of February, 1668.

He had been twice married, and left four sons and two daughters, all by his second wife, a sister of Sir Thomas Overbury. He was possessed, during the days of power, of the manors of Whittlesey St. Mary's and Whittlesey St. Andrews, and the rectory of Whittlesey St. Mary's, in the Isle of Ely, and of Wisbech Castle, which he rebuilt. But after the Restoration they reverted to the Bishop of Ely. There is an entry in the Commons' Journals of the 18th of May, 1660: 'Mr. Secretary Thurloe put out of the ordinance for assessment of the isle of Ely:' (vol. viii., p. 36.) Dr. Birch says he had an estate of about 400*l.* a-year at Astwood in Buckinghamshire. In a monumental inscription to the memory of his son-in-law in St. Paul's Church, Bedford (*Cole's MSS.*, vol. iii., p. 43), Thurloe is described as of Astwood, Bucks.

Thurloe does not appear to have possessed any striking qualities, either moral or intellectual, to impress the minds of his contemporaries; and we know little else of him than that he had great powers of business. Burnet describes him as 'a very dexterous man at getting intelligence.' (*Hist. of his own Times*, i. 66.) From a story in Burnet relative to Syndercomb's conspiracy against Cromwell, and from what is said by Pepys of Morland, when assistant to Thurloe, who played his master false, and gained a baronetcy from Charles II. for his treachery, it might appear that he was not of a very generous disposition, or much liked by those who were under him. Morland attributed his misconduct to 'Thurloe's bad usage of him.' (Pepys, vol. i., p. 133.) [Morland, Sir Samuel.] Burnet's story is, that Thurloe treated lightly information which had been given him of the design on Cromwell's life, and that when, on the subsequent discovery of this design, Cromwell became aware that information had been given to Thurloe, on which he had not acted, and blamed Thurloe for his conduct, Thurloe availed himself of his influence with the Protector to malign his informant; 'So he (the informant) found,' says Burnet, 'how dangerous it was even to preserve a prince (so he called him), when a minister was wounded in the doing of it, and that the minister would be too hard for the prince, even though his own safety was concerned in it' (vol. i., p. 79).

Thurloe's 'State Papers,' 7 vols. fol., 1742, contain a large mass of records of his official transactions, together with a number of private letters and papers. They were edited by Dr. Birch, who gives the following history of Thurloe's papers: 'The principal part of this collection consists of a series of papers discovered in the reign of King William, in a false ceiling in the garrets belonging to Secretary Thurloe's chambers, No. xiii., near the chapel in Lincoln's-Inn, by a clergyman who had borrowed those chambers, during the long vacation, of his friend Mr. Thomlinson, the owner of them. This clergyman soon after disposed of the papers to the Right Honourable John Lord Somers, then lord high chancellor of England, who caused them to be bound up in 67 volumes in folio. These afterwards descended to Sir Joseph Jekyll, master of the rolls; upon whose decease they were purchased by the late Mr. Fletcher Gyles, bookseller.' They were published by Mr. Gyles's executors. Dr. Birch, the editor, received many other papers from different individuals, especially from Lord Shelburne and the then archbishop of Canterbury, which he has incorporated in the collection. For historical purposes this is an invaluable collection.

THURLOW, EDWARD, LORD, was born in the year 1732, at Little Ashfield near Stowmarket in Suffolk. His father, Thomas Thurlow, was a clergyman, and held successively the livings of Little Ashfield, and of Stratton St. Mary's in Norfolk. After receiving the rudiments of his education from his father, young Thurlow was sent to the grammar-school at Canterbury at the suggestion of Dr. Donne, who sought (as Mr. Southey states in his 'Life of Cowper' upon the authority of Sir Egerton Brydges) to gratify a malignant feeling towards the head-master, by placing under his care 'a daring, refractory, clever boy, who would be sure to torment him.' The motive ascribed to Donne is far-fetched, and seems improbable; but there is no doubt that Thurlow was educated at the Canterbury school, and that he continued there several years, and until he was removed to Caius College, Cambridge. His character and conduct at the university did not promise any meritorious eminence in future life. He gained no academical honours, and was compelled to leave Cambridge abruptly in consequence of turbulent and indecorous behaviour towards the dean of his college. Soon after he quitted Cambridge he was entered as a member of the Society of the Inner Temple. In Michaelmas term, 1754,

he was called to the bar, and joined the Western circuit in the ensuing spring.

Thurlow immediately applied himself to the practice of his profession with great assiduity; and although he brought with him an indifferent character from the university, he attained unusually early to reputation and employment both in Westminster Hall and on the circuit. His name appears frequently in the Law Reports soon after he was called to the bar; and his success in the profession he had chosen was clearly ascertained in less than seven years from the commencement of his practice. In 1761 he obtained the rank of king's counsel; and it may perhaps be inferred from an anecdote which is related by his early friend and associate Cowper, in one of his letters (Cowper's *Works*, vol. v., p. 254, Southey's edit.), and which refers to this period, that Thurlow had then acquired a degree of reputation which suggested the prediction that he would eventually rise to the highest office in his profession. A more convincing proof of his position in the law is however recorded in the Reports, from which it appears that immediately after his appointment as king's counsel his practice in the courts rapidly increased, and, during ten years preceding his appointment as solicitor-general, was exceeded only by that of Sir Fletcher Norton, and one or two others of the most eminent advocates of his time. To have succeeded so early and to so great an extent, without adventitious aid from influence or connection, and in competition with advocates of unquestioned ability and learning, is a substantial argument of professional merit. His employment in preparing and arranging the documentary evidence for the trial of the appeal in the House of Lords against the decision of the Court of Session in the Great Douglas Cause (which, according to professional tradition, resulted from mere accident) may have had the effect of bringing his talents, industry, and legal acquirements under the immediate notice of persons of power and influence, and of thus opening the way to his subsequent elevation.

In the new parliament called in 1768 he was returned as member for the borough of Tamworth, and became a constant and useful supporter of Lord North's administration. Upon Dunning's resignation of the office of solicitor-general in March, 1770, and Blackstone's refusal to accept it ('Life of Sir William Blackstone,' prefixed to Blackstone's *Reports*), Thurlow received the appointment, and in January, 1771, he succeeded Sir William De Grey as attorney-general. Soon after his introduction to office, he attracted the particular notice of George III. by the zeal and energy displayed by him in supporting the policy of Lord North's government respecting America, and in which the king is known to have taken the warmest interest. Thurlow's strenuous and steady support of the minister in the great parliamentary contest which ensued respecting that policy, procured for him a degree of confidence and even of personal regard on the part of the king, which continued unabated for upwards of twenty years, and had unquestionably great influence in the remarkable vicissitudes of party which occurred in that period.

In the summer of 1778 lord chancellor Bathurst resigned his office; and on the 2nd of June in that year Thurlow was appointed his successor, and raised to the peerage with the title of Baron Thurlow of Ashfield in the county of Suffolk. Four years afterwards, in March, 1782, when Lord North was removed from power, and the ephemeral Rockingham administration was formed, Thurlow remained in possession of the great seal by the express command of the king, and in spite of Mr. Fox's opposition to his continuance in office; thus furnishing an instance without a parallel in the history of English party, of a lord chancellor retaining office under an administration to all the leading features of whose policy he was resolutely opposed. Nor was he content in this inconsistent association to differ from his colleagues in opinion only; on the contrary, he took no pains to conceal his hostility to their principles, and even opposed in the House of Lords with all his characteristic energy the measures which they unanimously supported. Thus, after the bill for preventing government contractors from sitting in the House of Commons had been introduced into the House of Lords, where it was supported by Lord Shelburne and all the ministers in that house, the lord chancellor left the woolsack, and himself moved that 'the bill be not committed,' denouncing the measure as 'an attempt to deceive and betray the people,' and designating it 'a jumble of contradictions.' (Hansard's *Parl. Hist.*, vol. xxii., pp. 1356-1379.) The inconvenience produced by this embarrassing disunion of councils was deeply felt, and was one of the principal reasons for Mr. Fox's retirement from administration on the death of the marquis of Rockingham; and when the administration was dissolved in February, 1783, upon the coalition formed between Lord North and Mr. Fox, Lord Thurlow was compelled to retire from office, notwithstanding the exertions of the king to retain him. But though no longer chancellor, he still continued to be one of those who were described by Junius as 'the king's friends,' and was supposed to have been his secret and confidential adviser during the short reign of the Coalition ministry. Upon the dissolution of that ministry at the end of the same year in which it was formed, the great seal was restored to Lord Thurlow by Mr. Pitt, who then became prime minister. He continued to hold the office of lord chancellor for nine years after his reappointment; and until the occurrence of the king's madness in 1788, appeared to act cordially with the rest of the cabinet; but when that event rendered a change of councils by means of a regency probable, he was suspected, with good reason, of some intriguing communications with the Prince of Wales and the Whigs (Moore's *Life of Sheridan*, vol. ii., chap. xiii.), and was always subsequently regarded with distrust by Mr. Pitt and his colleagues. On the other hand, Lord Thurlow took no pains to conceal his dislike of Mr. Pitt; and that minister felt himself so embarrassed by the chancellor's personal hostility to him, that in 1789 he complained to the king, who immediately wrote to Thurlow upon the subject, and obtained from him a satisfactory answer. His angry feeling however still continued, until at length, in 1792, probably relying upon his personal influence with the king, he ventured to adopt a similar course to that which he had followed in very different circumstances under the Rockingham administration, and actually opposed several measures brought into parliament by the government. In particular he violently opposed Mr. Pitt's favourite scheme for continuing the Sinking Fund, and voted against it in the House of Lords, though he had never expressed his dissent from the measure in the cabinet. This kind of opposition, though submitted to from necessity by a weak government like that of the marquis of Rockingham, could not be endured by so powerful a minister as Mr. Pitt; and on the next day he informed the king that either the lord chancellor or himself must retire from the administration. The king, without any struggle or even apparent reluctance, at once consented to the removal of Lord Thurlow, who was acquainted by command of his majesty that he must resign the great seal upon the prorogation of parliament. Lord Thurlow is said to have been deeply mortified by this conduct on the part of the king; and he is related to have declared in conversation that 'no man had a right to treat another as the king had treated him.' Subsequently to his notice of dismissal, and before he quitted office, his ill humour was displayed by his opposition to another measure prepared and supported by Mr. Pitt, the object of which was the encouragement of the growth of timber in the New Forest. On this occasion he reflected severely upon those who had advised the king upon this measure, and went so far as to say that his majesty had been imposed upon. (Tomline's *Life of Pitt*, vol. iii., p. 398-9.) One of his latest acts as lord chancellor was to sign a protest in the House of Lords against Mr. Fox's Libel Act. The opportunity of his retirement from office was taken to grant him a new patent, by which he was created Baron Thurlow, of Thurlow, in the county of Suffolk, with remainder, failing his male issue, to his three nephews, one of whom afterwards succeeded to the title under this limitation.

After his retirement from office in 1792, Lord Thurlow ceased to take any leading part in politics, and having little personal influence with any party, became insignificant as a public character. He occasionally spoke in the House of Lords on the subjects of interest which were discussed at the period of the French revolution; and it is worthy of remark that he frequently opposed the measures adopted by the Tory government at that time for the suppression of popular disturbances. Instances of this occur with respect to the Treasonable Practices Bill and the Seditious Meetings Bill, in 1795; and a comparison of the sentiments expressed by him on these occasions, with his

speeches respecting America during Lord North's administration, affords a striking example of political inconsistency. A circumstance is recorded in the 'Memoirs of Sir Samuel Romilly' (vol. ii., p. 124), which proves that till within a few months of his death Lord Thurlow was still confidentially consulted by members of the royal family. On occasion of the first communication of the charges made by Lady Douglas against the princess of Wales in 1805, the prince (afterwards George IV.) directed that Thurlow should be consulted, and the particulars of the interview between him and Sir Samuel Romilly are characteristic and interesting.

Lord Thurlow died at Brighton, on the 12th of September, 1826, after an illness of two years.

THURMER, JOSEPH, a German architect of some note, was born at Münich, November 3, 1789, but did not begin to apply himself to architecture professionally until 1817, when he became a pupil of Professor Fischer's, and had for his fellow-students Gärtner, Ziebland, Öhlmuller [Öhlmuller], and many others who have since rendered themselves more or less distinguished. At the end of the following year (after a previous visit to Rome at the commencement of it) he joined Hübsch, Heger (died 1837), and Koch, in a professional excursion to Greece, where he spent five months in studying and drawing the remains of buildings at Athens, some few of which he published on his return, with the title of 'Ansichten von Athen und seine Denkmaler,' 1823-6. He did not however confine himself to the study of the Grecian style, nor was he such a prejudiced admirer of it as to have no relish for any other; on the contrary, he considered the Italian style of the time of Leo X. to be equally worthy of the architect's attention, and to deserve to be far better, more faithfully and tastefully, represented by means of engravings than it previously had been. He accordingly joined with Gutensohn in bringing out a 'Sammlung von Denkmaler,' &c., 'Collection of Architectural Studies, and Decorations from Buildings at Rome, of the fifteenth and sixteenth centuries,' the first number of which appeared in 1826; but, unfortunately, it did not meet with the encouragement it deserved, and was therefore given up, when very little progress had been made with it. The publication however was so far advantageous to Thurmer, since it recommended him to notice, and led to his receiving (1827) at the same time two different invitations, one from Frankfort, the other from Dresden, to which last he gave the preference. He was there made professor-extraordinary at the school of architecture, and in 1832 was promoted to be first professor of architecture, in which capacity he did very much for the advancement of the art and the improvement of taste. Though he has left very little executed by himself in that city, the only public building in it entirely by him being the post-office (for though the 'Hauptwache,' or guard-house, was erected by him, it was after Schinkel's designs), his opinions had a very beneficial influence. That he should have had so few opportunities for displaying his ability, is not very surprising, nor does it detract from his reputation, since he did not long survive the completion of his first edifice: he died November 13th, 1833, while staying at Münich. What he might have done, had a longer life been granted him, is shown by the number of designs he left, all more or less stamped by originality and artistical feeling. That the grateful regard expressed for his memory and his talents by his friends and pupils was not a mere temporary effusion, is proved by their having erected a bronze bust and monument to him, in 1838, at the Academy of Arts.

(*Convers. Lex. der Neuesten Zeit; Morgenblatt*, 1838.)

THURNEYSSER ZUM THURN, LEONARD, a celebrated alchemist and astrologer, was born in 1530 at Basle, where his father carried on the trade of a goldsmith. He was himself brought up to this employment, but he was obliged to leave his native place when eighteen years of age, on account of having sold to a Jew a piece of gilt lead for pure gold. He first went to England, thence to France, and afterwards to Germany, where he enlisted among the troops of the margrave of Brandenburg. The following year he was taken prisoner; from that time he gave up a military life, and having visited the mines and foundries of Germany and the north of Europe, he came back in 1551 to Nürnberg, Strassburg, and Kostnitz. Here he again carried on the trade of a goldsmith, and made much money by it, till, on account of his reputation for skill in the art of mining, he was sent for to the Tyrol to superintend different mineral works. Accordingly in 1558 he went to Tarenz in Upper Innthal, and established on his own account in that place, as well as at St. Leonard, foundries for the purifying of sulphur, the success of which contributed still more to his celebrity. The Archduke Ferdinand had so much confidence in him that he sent him to travel in Scotland, the Orkney Islands, Spain, and Portugal. Thurneysser also visited the coasts of Barbary, Ethiopia, Egypt, Arabia, Syria, and Palestine, and returned to the Tyrol in 1567. Two years afterwards, at the request of the same prince, he again visited the mines of Hungary and Bohemia. The publication of his works made him determine to go to Münster and Frankfort on the Oder, at which latter place he became acquainted with the elector of Brandenburg, whose wife he cured of a dangerous illness, and who resolved to attach him to his service in the hope that he might discover in his estates some unknown mineral treasures. Thurneysser accepted the office of physician to the prince, and accompanied him to Berlin, where, from his skill in profiting by the prejudices and weaknesses of his contemporaries, and from being acquainted with all the resources of charlatanism, he soon succeeded not only in acquiring considerable wealth, but also in passing himself off for one of the most learned and scientific men of his age. At length however, by the envy of others, and still more by his own imprudence, his deceptions were discovered, and he was, in 1584, obliged to leave Berlin. He went to Prague, Cologne, and Rome; and after having thus led a wandering life for some years, he died at last in a convent at Cologne, at the age of sixty-six, in 1596. He was an advocate for the pretended sciences of alchemy and aromancy, and his whole history (like that of most similar characters) is a proof of the influence that may be acquired in an ignorant age by a bold and enterprising man, when he possesses some little information above the generality of his contemporaries. His writings were numerous, but of little worth, and they are now very seldom looked into. The titles of twelve of them are given in the *Biographie Médicale*, from which work the preceding account is taken.

THUROTZ, or THUROCZ, is a small county in Hungary, in the circle on this side the Danube. It is bounded on the north by Arva, on the east by Leptau and Sohl, on the south by Bars, and on the west by Neitra and Trentsin. Its area is 445 square miles, and the population 42,000 inhabitants, chiefly Slowaes, of whom about two-thirds are Lutherans and one-third Roman Catholics, except about 500 Jews. 'This country is justly called a beautiful garden' (says the anonymous author of the description of Hungary, Croatia, and Slavonia), 'for it is surrounded on all sides with lofty mountains, as with walls, within which nature has been lavish of the most beautiful scenery. This garden has only two entrances in the northern part, through which the river Waag enters and leaves the country. The first entrance is between the two mountain-chains called the Great and the Little Fatra, and the other near Sztreesno. The Great Fatra has two summits, the Stock, 4876 feet high, and the Thurocz Krivan, 5300 feet high.' The climate is cold, but healthy. Though the soil is fertile, there is no superfluity of natural productions: it produces no wine, but nearly sufficient corn (chiefly buckwheat) for the consumption of the inhabitants; and so much barley and oats, that some portion can be exported. Pulse of different kinds abounds, especially large and excellent peas. Potatoes are extensively cultivated, and also a species of turnip peculiar to this country. The inhabitants collect a considerable quantity of a balsam from the mountain-pines, which is sold to the common people, and extolled as possessing great medicinal virtues: it is exported to Germany, and even to America. There are numerous flocks of sheep on the mountains and in the numerous valleys. Of 158,820 acres of productive land, only 62,442 acres are arable, and 83,758 acres are covered with forests. The chief town is St. Martin, on the river Thurocz, which has about 2000 inhabitants. It has a handsome county-hall, and five large Roman Catholic churches. (Hassel, *Geography*; Blumenbach, *Oesterreichische Monarchie.*)

THYLACOTHE'RIUM. [Marsupialia, vol. xiv., p. 464.]
THYME. [Thymus.]

THYMELA'CEÆ, a natural order of plants belonging to the tubiferous group of Incomplete Exogens. The name of this order is derived from Thymelæa, a plant spoken of by the antients, and which some have supposed to be the Daphne Gnidium, a plant belonging to the present order. This order consists of shrubs or small trees, very rarely herbaceous, with non-articulated, sometimes spiny branches having a very tenacious bark. The leaves are entire, simple, without stipules, and alternate or opposite. The flowers are capitate or spiked, terminal or axillary, occasionally solitary. The calyx is tubular, coloured, 4-cleft with an imbricate æstivation; the stamens 2-4 or 8 in number, inserted into the tube with 2-celled anthers, dehiscing lengthwise in the middle; the ovary is solitary, with a solitary pendulous ovule; the fruit is hard and dry, or drupaceous; the seed has little or no albumen, a straight embryo, with a short radicle and entire cotyledons. This order is related to Santalaceæ, from which it differs in its inferior calyx. It is also allied to Elæagnaceæ and Proteaceæ, from both of which it is distinguished by its pendulous ovules. Lindley refers to this order Bartling's Anthoboleæ, on account of their superior fruit. [Exocarpus.] The species are found in Europe, but are not common; they occur in greatest abundance in the cooler parts of India and South America, at the Cape of Good Hope, and in New Holland.

The most prominent property of this order is their causticity, which resides in their bark. When applied to the skin, it produces vesication, and pain in the mouth when chewed. The bark of several of the species is very tough, and may be manufactured into cordage. Passerina tinctoria yields a dye which is used in the south of Europe to colour wool yellow. The various species of Daphne possess active properties; some are used for dyeing, some are poisonous, and the Daphne Lagetta is the Lace-bark-tree of Jamaica. [Daphne.]

Daphne Mezereum.

1, Cutting with flowers; 2, ditto with fruit; 3, single flower; 4, calyx opened, showing the insertion of the stamens; 5, section of ovary, showing the single pendulous seed.

THYMUS (*θύμος*), the name of a genus of plants belonging to the natural order Lamiaceæ or Labiatæ. It has an ovate bilabiate calyx with thirteen ribs; the upper lip is trifid, the lower lip is bifid with ciliated subulate segments, and throat villous inside; the corolla with the upper lip erect, nearly plane, notched, lower patent and trifid; stamens straight, exserted; anthers 2-celled; styles bifid at apex. All the species are small under-shrubs with usually purplish flowers. Between twenty and thirty species have been described by botanists, most of them inhabitants of Europe, especially the region of the Mediterranean: one only is a native of the British Isles.

T. vulgaris, Common or Garden Thyme, is an erect plant, or sometimes procumbent at the base, or clothed with a hoary pubescence; the leaves are sessile, linear, or ovato-lanceolate, acute, with revolute edges, fascicled in the axils; the teeth of the upper lip of the calyx are lanceolate, but the segments of the lower lip are subulate and ciliated. This plant is a native of the south-west parts of Europe, in dry plains and on hills, and uncultivated places free from woods. The plant is very much branched, and has purplish flowers. This species is cultivated for culinary purposes, and many varieties of it are met with in gardens. It has a pungent aromatic odour and taste. These properties are communicated to water by infusion only to a slight extent. They depend upon an essential oil, an ounce of which may be obtained from thirty pounds of the plant.

T. serpyllum, Wild Thyme, or Mother-of-Thyme, is a suffruticose plant, with capitate flowers, branched decumbent stems, with plain, ovate, obtuse, entire, petiolate leaves, more or less ciliated at the base. It is a native of Great Britain, on hills and in dry pastures, and throughout Europe and the north of Asia. This plant has the same sensible properties as the last, but is more inclined to produce varieties, several of which have been described as species. These vary principally in the colour of the flowers and the size of the leaves and plant. One of the varieties, *T. s. citratus*, is known by the name of Lemon-Thyme on account of its scent resembling the lemon. The seeds will not however maintain this property: if required to be preserved, the plants must be propagated by means of slips or cuttings.

Both this and the former species, when cultivated, are best raised by means of seeds, although they may be easily propagated by parting the roots or planting slips and cuttings. The seed may be sown in March or April, in a light fine soil, and when the plants are two or three inches high, they should be transplanted. Roots or slips should be planted in the autumn. The plants produce abundance of seeds in the summer and autumn, which, when gathered, should be rubbed out, and preserved for planting in the following spring.

These plants are not so much used in medicine as for culinary purposes. The volatile oil is frequently used as an application to carious teeth. Linnæus recommends them as a remedy for dissipating the effects of intoxicating liquors, and a decoction is used in France as an application for the itch.

T. mastichina, Mastich-Thyme, or Herb-Mastich, has ovate or oblong, obtuse, petiolate leaves, narrowed at the base and not ciliated; the calyx is villous, with feathery subulate teeth, which are longer than the tube. It is a native of dry, sandy, uncultivated places in Spain, Portugal, and Barbary. It exhales a scent resembling mastich. It is the *Marum vulgare* of older botanists, and at one time had some reputation as an errhine. Several other species of thyme are cultivated; they do not require much care; the more delicate and rarer kinds are found amongst collections of alpine plants.

THYMUS GLAND, which in the calf and lamb is called the sweetbread, is an organ situated behind the sternum, in the anterior mediastinum, in front of the pericardium and the large vessels arising from the base of the heart. In the embryo and the infant it has, in proportion to the rest of the body, a very considerable size; in after-life it becomes comparatively smaller, and at last nearly disappears. It is of an elongated form, its greatest dimension being from above downwards, and is composed of two chief portions, which, by careful dissection, may be separated in the middle line. At each end it bears two processes or *horns*, of which the upper are longer and more slender than the lower, and the right are usually longer than the left. It is supplied by several branches from the internal mammary, inferior thyroid, and mediastinal arteries, to which veins of considerable size correspond. Its absorbent vessels are numerous and large, but not more so than in other glands of equal vascularity.

The thymus gland is composed of a great number of similar small masses or lobules, which may be separated

by dissection, and are held together by fine cellular tissue continued from that which invests the whole gland. The lobules vary in size from half a line to three lines in diameter, and have simple or complex cavities filled with a milky fluid. Sir Astley Cooper (*The Anatomy of the Thymus Gland*) says that the lobules are arranged in spiral lines, so that the gland may be unravelled into a sort of knotted rope of lobules, which are wound around a central cavity or reservoir, with which the cavities of the lobules communicate. But the existence of such a central cavity is not generally admitted.

The fluid contained in the cells of the thymus gland is, in young and healthy animals, opaque and creamy. It has been particularly examined by Mr. Gulliver (Appendix to Gerber's *General Anatomy*), who has found that both in its chemical composition, and in the abundance and structure of the globules which it contains, it closely resembles the fluid of the lymphatic glands.

Of the function of the thymus gland scarcely anything probable is known. Whatever it be, it is performed most actively during fœtal life and the first year of extra-uterine life: for during this time the thymus gland grows at the same rate as the rest of the body, its cells are full of fluid, and the fluid is thick and abundant in globules. From the end of the first to the end of the third year its size does not materially vary; but after this time it gradually diminishes, and after the twelfth or fourteenth year it is rare to meet with more than a slight trace of it. It is also of considerable size and is full of fluid in hybernating animals: and this, together with its activity during fœtal life, has suggested that its office is in some way connected with the preparation of the blood, when respiration is either inactive or has not commenced. But, in these same circumstances, digestion is not going on, and it is therefore just as probable that the thymus gland may have the office of preparing a fluid and globules, like those of the chyle, from the materials which have served for the nutrition of the body and have been re-absorbed; in other words, that its function is analogous to that of the lymphatic glands. This was the opinion of Hewson (*Experimental Enquiries*); it is supported by the observations of Mr. Gulliver and many others, and is on the whole more probable than any other yet advanced.

The thymus gland is rarely diseased. The only affections of it yet described are an unnatural enlargement of it, and its persistence in the dimensions which it has in fœtal life. When it is enlarged there is generally a more than usual development of all the lymphatic glands; and not unfrequently there are at the same time signs of serious general disorder of the health, such as rickets, hydrocephalus, &c. It has been supposed, especially by the German pathologists, that a peculiar affection of the respiration, which has been called Thymic Asthma, is the general result of enlargement of this gland; but the connection of the two affections is not yet clearly established.

THYO'NE. [Holothuria, vol. xii., p. 269.]

THYROID GLAND is an organ situated in the middle and fore part of the neck, in front and by the sides of the thyroid cartilage of the larynx (from which it has its name), and of the cricoid cartilage and the upper part of the trachea [Larynx], to which it is closely fixed by cellular tissue. It is composed of two chief lateral portions or lobes, and a smaller portion or isthmus connecting them. A fourth portion, which is long and slender, and is named the middle column or horn, usually passes upwards from the isthmus in front of the larynx. The lateral lobes are of a somewhat pyramidal form, about two inches long, and an inch wide at their bases. The whole gland is proportionally larger in the embryo than in the adult, and in women than in men.

The substance of the thyroid gland is firm, fleshy, and very vascular. It receives a copious supply of blood from two superior and two inferior thyroid arteries; the former are branches of the external carotid, the latter of the subclavian arteries; their branches communicate freely in the gland, and they are accompanied by veins and lymphatics of corresponding size. The interior of the gland contains numerous very minute cells, lined by polished membranes, and in young persons filled by a clear albuminous fluid, in which, or in the walls of the cells, there are numerous granular corpuscles.

Of the function of the thyroid gland no more is known than of those of the spleen and thymus gland, between which it seems, in structure, to hold an intermediate place; resembling the spleen in its vascularity, which is far greater than is required for its nutrition, and the thymus in the existence of cells containing a fluid, and in its development during early life. What has been said of their probable functions might be repeated here.

The thyroid gland is subject to several changes of structure, most of which, being attended with enlargement, are comprehended in the name of bronchocele or goître [Bronchocele], to which the reader is referred. In many cases the cells of the gland are enlarged, and its structure, which in health is with difficulty discernible, may in these be easily demonstrated.

THYSANO'PODA. [Stomapods, vol. xxiii., p. 81.]

TIA'RA (τιάρα or τιάρας), a high kind of hat, which was in antient times worn by the inhabitants of Middle and Western Asia, especially by the Persians, Parthians, Armenians, and Phrygians. There were two kinds of tiaras: the upright tiara was only used by kings, priests, and other persons of the highest rank, and the upper part had frequently the shape of a crown; the tiara worn by other people was of a soft and flexible material, so that it hung down on one side, as in the case of the so-called Phrygian bonnet. (Hesychius and Suidas, *s. v.* τιάρα.) The tiaras of persons of high rank were of the most costly colours, such as purple, and adorned with gold and precious stones. (Ovid, *Metamorph.*, xi. 181; Valerius Flaccus, vi. 699; compare *Dictionary of Greek and Rom. Antiq.*, under 'Tiara.')

In modern times the term tiara is applied to the headdress of the popes, which is worn on solemn occasions, and consists of a triple crown. Hence it is also used in a figurative sense to designate the papal dignity.

TIA'RA, Mr. Swainson's name for a genus of 'Mitrinæ,' his term for the subfamily of testaceous mollusks, the shells of which are termed 'Mitres' by collectors. [Volutidæ.] N.B. This generic name comes too near to Tiaris.

TIARI'NI, ALESSANDRO, one of the most celebrated painters of the Bolognese school, was born at Bologna in 1577. He first studied under Prospero Fontana, and, after Fontana's death in 1597, under Bartolomeo Cesi; but having in a quarrel discharged a pistol or similar weapon at a fellow-scholar, without however doing him any injury, he was obliged to fly from Bologna. He went to Florence, and there engaged himself with a portrait-painter, for whom he painted hands and draperies, and some of his performances having attracted the notice of Domenico da Passignano, he was admitted by that painter into his studio as a scholar. Tiarini remained with Passignano seven years, and by that time acquired so great a reputation, that he received invitations from Bologna to return to that city. In Bologna his works excited universal admiration for their invention and earnestness of character, and for their boldness of foreshortening, correctness of design, and propriety of colouring: the tone of Tiarini's pictures is sombre; he used little red, and avoided gay colours generally. His works, which are very numerous, consist chiefly in oil-paintings; he executed comparatively little in fresco: those in public places alone, in Bologna and its vicinity, and in Mantua, Modena, Reggio, Parma, Cremona, and Pavia, amount to upwards of two hundred: their subjects are generally of a melancholy or serious nature. The following are the most celebrated:—A Miracle of St. Dominic, in the Capella del Rosario, in the church of San Domenico at Bologna, painted in competition with Lionello Spada, in which the saint restores a dead child to life; the exhumation of a dead monk, in the convent of San Michele in Bosco; and St. Peter repenting his Denial of Christ, standing outside the door of the house of the high priest, with the Mocking of Christ in the background, illuminated by torchlight.

Ludovico Carracci, whose style Tiarini ultimately adopted, was a great admirer of his works: when he first saw Tiarini's picture of the Miracle of San Domenico, he is reported to have exclaimed that he knew no living master that could be compared with Tiarini. Many of Tiarini's pictures, out of Bologna, have been attributed to one or other of the Carracci: such was the case with the celebrated Deposition from the Cross, now in the Gallery of the Academy of Bologna, formerly in the church of the college of Montalto: it is engraved in the work of Rosaspina, 'La Pinacoteca della Pontificia Accademia delle Belle Arti in Bologna.'

Several of Tiarini's pictures have lost their colour, owing to his practice of glazing; in some the colouring consists entirely of glazed tints, the design being executed in grey. He opened a life academy in Bologna, and had many scholars. Malvasia has preserved the name of a famous model that he used frequently to engage, Valstrago. Tiarini died in 1668, aged ninety-one.

(Malvasia, *Felsina Pittrice;* Lanzi, *Storia Pittorica*, &c.)

TIA'RIS, *Crestlet*, Mr. Swainson's name for a genus of FRINGILLIDÆ, placed by him in the subfamily *Coccothraustinæ*, between *Amadina* and its subgenera and *Carduelis*.

Generic Character.—Bill perfectly conic, entire; commissure sinuated, and consequently angulated. Nostrils almost naked, round. Wings moderate; first quill rather shorter than the second, third, and fourth, which are equal and longest. Tail even or slightly rounded. Feet moderate. Middle toe and tarsus of equal length; lateral toes equal; hinder toe much shorter than the tarsus. Claws small, fully curved. Head crested. *Locality*, South America only.

Example, *Tiaris ornatus*. Pl. Col., 208 (*Classification of Birds*).

Mr. G. R. Gray arranges this genus in the subfamily *Fringillinæ*, between *Pytelia*, Sw., and *Carduelis* (Antiq.), Briss. (*List of the Genera of Birds.*)

TIBALDEO. [TEBALDEO.]

TIBALDI, PELLEGRI'NO, otherwise called Pellegrino Pellegrini, or sometimes Pellegrino da Bologna, distinguished himself both in painting and in architecture. He was born in 1527, at Bologna, where his father, who originally came from Valsolda in the Milanese territory, was only a common mason. How, so circumstanced, the father was able to bring up his son to a profession requiring means beyond those of his own condition in life, does not appear; neither is it known from whom Tibaldi received his first instruction in painting. In 1547 he visited Rome, with the intention, it is said, of studying under Pierino del Vaga, but as the latter died in that same year, he could hardly have received any lessons from him. Whether he became a pupil of Michael Agnolo is unknown: he certainly studied his works very successfully, for while he caught from them grandeur of style and energy of forms, he so attempered their severity by the freedom and grace of his pencil, that he afterwards acquired from the Carracci the name of 'Michelagnolo Riformato,' and may be considered as the originator of that style which they perfected. We must, however, conclude that although he was employed there in the church of S. Lodovico di Francesi, he did not display any great ability with his pencil during his residence at Rome, it being related of him that he felt so discouraged as to have determined to starve himself to death, from which desperate resolution he was withheld only by Ottaviano Mascherino, who advised him to give up painting and devote himself entirely to architecture, for which he had shown considerable taste. In all probability this anecdote has been strangely exaggerated, nor are we informed how he set about putting Mascherino's advice into practice. That he partly adopted it, is certain, and equally certain that if he renounced painting for a while, he returned to it: in fact, not very long after the circumstance just spoken of, he was sent to Bologna by Cardinal Poggi to adorn his palace (afterwards occupied by the Academia Clementina), where he painted the history of Ulysses. For the same prelate he also painted the Poggi Chapel, which had been erected after Tibaldi's own designs, and it was those productions which excited the admiration of the Carracci. He was next employed at Loretto and Ancona, where he executed several works in fresco, and among them those with which he adorned the Sala de' Mercanti, or Exchange, in the last-mentioned city.

His reputation as an architect in the meanwhile increased, and after being employed to design, if not to execute, several buildings at Bologna, and the Palazzo della Sapienza, or Collegio Borromeo, at Pavia (which last was begun by Cardinal Carlo Borromeo in 1564), he restored the Archiepiscopal Palace at Milan, and was appointed chief architect of the Duomo, or cathedral, in that city (1570). He suggested the idea or first design of the modern façade attached to that celebrated Gothic structure,—a design which has obtained him both praise and censure in almost equal degree. Among other buildings by him at Milan are the church of San Lorenzo, that of S. Fedele, and that of the Jesuits. But the work which, if less celebrated than some of his others, is considered by one of his critics his chef-d'œuvre, and a masterpiece for the contrivance and ability shown in it, is the 'Casa Professa,' or that of the Jesuits at Genoa, with its church, &c., where he completely mastered all the difficulties arising from the inconvenience of the site. Neither his fame nor his works were confined to Italy, for the former caused him to be invited to Spain in 1586, by Philip II., where he was employed both in his capacity of architect and in that of painter, in which last he executed many admirable frescoes in the Escurial. Liberally rewarded by Philip, who also conferred on him the title of Marquis of Valsolda (his birth-place), Tibaldi returned to Italy after passing about nine years in Spain, and died at Milan in 1598; such at least is the date assigned by Tiraboschi, though some make it much earlier, 1590 or 1591, and others about as much later, viz. 1606.

(Tiraboschi; Lanzi; Milizia; Nagler.)

TIBALDI, DOMENICO, younger brother, not son of the preceding, as he is sometimes called, was born in 1541, and was, if not equally celebrated, like him both a painter and architect, but ranks far higher in the latter than in the other character. He executed many buildings at Bologna, the principal among which are the Palazzo Magnani, the Dogana, or custom-house, the chapel in the cathedral, so greatly admired by Clement VIII. as being superior to anything of the kind at Rome, and the small church of the Madonna del Borgo. Domenico also practised engraving with success, and in that branch of art was the instructor of Agostino Carracci. He died at Bologna in 1583.

(Milizia; Nagler.)

TIBBOOS. [SAHARA.]

TIBER. [PAPAL STATE.]

TIBE'RIAS. [PALESTINE; SYRIA.]

TIBE'RIUS CLAU'DIUS NERO was born in Rome, on the 16th November, 42 B.C., according to Suetonius. He belonged to the gens Claudia, an old patrician family of great distinction, which was known for its aristocratical pride. Tiberius belonged to this house by the side of his father, Tiberius Claudius Nero, as well as his mother, Livia Drusilla, who was the niece of her husband, being the daughter of Appius Pulcher. This Appius Pulcher was a brother of Tiberius Claudius Nero the elder, and they were both sons of Appius Cæcus. His father was quaestor to C. Julius Cæsar, and distinguished himself as commander of the fleet in the Alexandrian war. He became successively praetor and pontifex, and in the civil troubles during the triumvirate he followed the party of M. Antonius. Being compelled by Octavianus to fly from Rome, he escaped by sea, and hastened to M. Antonius, who was then in Greece. His wife and his infant son accompanied him in his flight, and they happily escaped. Tiberius the elder soon made his peace with Octavianus; he gave up to him his wife, Livia Drusilla, who was then pregnant with Nero Claudius Drusus, and he died shortly afterwards (38 B.C.). Thus Tiberius the younger and his brother Nero Claudius Drusus became step-sons of Octavianus, who from the year 27 B.C. was Augustus.

The great talents of Tiberius were developed at a very early age. In his ninth year he delivered a public speech in honour of his father; in 29 B.C. he accompanied Octavianus in his triumph after the battle of Actium, and rode on his left side, Marcellus being on the right. After having assumed the toga virilis, he distinguished himself by splendid entertainments which he gave to the people. He married Vipsania Agrippina, the daughter of Agrippa, and the granddaughter of Cicero's friend T. Pomponius Atticus. She brought him a son, Drusus, and she was again with child when Tiberius was obliged to sacrifice her to the policy of Augustus, who compelled him to marry his daughter Julia, the widow of Marcellus and of Agrippa, and the mother of Caius and Lucius Cæsar. (12 B.C.) Tiberius obeyed reluctantly, but he never ceased to love Vipsania. Such was his affection for her, that whenever he saw his repudiated wife he would follow her with tears; and accordingly an order was given that Agrippina should never appear in sight of Tiberius. For some time Tiberius lived in harmony with Julia, and had a son by her, who died young. But the scandalous conduct of Julia soon disgusted him, and he withdrew from all intimate intercourse with her.

During this time Tiberius took an active part in public affairs. He defended the interests of king Archelaus (of Judæa, or of Cappadocia), of the Tralliani, and of the Thessalians: he was active in obtaining relief for the inhabitants of Laodicea, of Thyatira, and of Chios, who, having suffered from an earthquake, had implored the assistance of the senate; he pleaded against Fannius Cæpio, who had conspired against Augustus, and who was condemned for high treason; and he was twice intrusted with the 'cura annonae.' Tiberius made his first campaign as Tribunus militum in the Cantabrian war. From Spain he went to Asia Minor, and succeeded in restoring Tigranes to the throne of Armenia, and in forcing the Parthians to surrender the eagles which they had taken from M. Crassus. He returned to Rome in 18 B.C. During a year he had the command in Gallia Comata, the peace of which province was troubled by disputes between the princes and by incursions of the barbarians.

In 15 B.C. he and his brother Drusus brought the Alpine nations of Rhaetia to obedience. He also put an end to the war in Pannonia, which had lasted since 18 B.C., and which he terminated by subduing the Breuci, the Scordisci, and the Dalmatae, who were allied with the Pannonians. (14 B.C.) The Germani having defeated M. Lollius and taken the eagle of the fifth legion in 16 B.C. (Velleius Paterculus, ii. 97), Drusus was sent to the Rhine, and Tiberius returned to Rome, where he celebrated his first triumph. In the Rhaetian war Tiberius had shown great military skill, but the Romans carried on the war with unheard of cruelties against the inhabitants, of whom the majority were killed or carried off as slaves. In memory of his victories, a monument was erected at Torba (now Monaco, in the neighbourhood of Nizza), on which the names of forty-five Rhaetian tribes were inscribed. (Plinius, *Hist. Nat.*, iii. 24.) In 13 B.C. Tiberius was appointed consul, together with P. Quintilius Varus. Meanwhile Drusus carried on the war in Germany with great success; but in 9 B.C., on his retreat from the banks of the Elbe to the Rhine, he had a fall from his horse, which proved fatal. Tiberius was then at Pavia, but as soon as he was informed of this accident, he hastened to Germany, and arrived in the camp of his brother, near the Yssel and the Rhine, just before he died.

Tiberius led the army to Mainz (Moguntiacum). He ordered the body of his brother to be carried to Rome, and he accompanied it on foot. After discharging this pious duty, he returned to Germany. In the new war with the Germani, Tiberius at first defeated them, and transplanted 40,000 Sigambri from the right bank of the lower Rhine to the left bank; but he afterwards employed peaceable measures, and by negotiation he obtained more influence over them than his brother Drusus by all his victories. (Velleius Paterculus, ii. 97; Tacitus, *Annal.*, ii. 26.) He left the command in Germany in 7 B.C., and returned to Rome, where he celebrated his second triumph, and he was consul for the second time in the same year.

Tiberius was now at the height of his fame; he was respected by the army, and admired by the people; and he enjoyed the confidence of the emperor. He nevertheless suddenly abandoned his important functions, left Rome, and, without communicating his motives to anybody, retired to the island of Rhodes. So firm was his resolution to retire from public affairs, that he refused to take any nourishment for four days, in order to show his mother that her prayers and tears could not keep him any longer in Rome. (Suetonius, *Tiberius*, c. 10.) During eight years he led a private life at Rhodes, renouncing all honours, and living in the Greek style, and on terms of equality with those around him, with whom he kept up a friendly intercourse, especially Greek philosophers and poets. The Romans were surprised to see the step-son of their emperor retire to a distant island; and various hypotheses were raised to explain the motive of his voluntary exile. The disgusting conduct of his wife Julia was supposed to be a sufficient cause for this extraordinary resolution; but Tiberius himself afterwards avowed that he had renounced public business in order to escape all charges of having formed ambitious schemes against his stepsons, Caius and Lucius Cæsar, who were created 'principes juventutis,' and appointed successors of Augustus in the very year in which Tiberius went to Rhodes. It seems that he was dissatisfied with the elevation of these two young men, and that there was discord between him and them; for when he afterwards wished to go back to Rome, Augustus would not allow it until Caius Cæsar had consented, and it was also on condition that he should take no part in the government of the state. From all this we may conclude that Tiberius and his mother Livia had perhaps been intriguing to exclude Caius and Lucius Cæsar from the succession, and that he preferred a voluntary exile to a compulsory banishment, such as was inflicted by Augustus upon his own daughter Julia. But this is mere supposition, and there are no facts on which a direct accusation against Tiberius can be sustained. With regard to his banished wife Julia, Tiberius acted with great delicacy, notwithstanding her conduct, and he besought Augustus to leave her all those presents which he had formerly given to her. (Suetonius, *Tiberius*, c. 12, 13.) At last Tiberius returned to Rome (A.D. 2), and was received by the people with demonstrations of great joy. In the same year Lucius Cæsar died at Massilia (Marseille), and his death was followed by that of his brother, who died in 4 A.D., in consequence of a wound which he had received in the Parthian war. Augustus then adopted Tiberius as his future successor, in 4 A.D., and Tiberius in his turn was compelled by Augustus to adopt Drusus Germanicus, the son of his late brother Drusus Nero. Augustus also adopted M. Agrippa, the posthumous son of Agrippa and Julia, but he did not designate him as a successor in the empire. The imperial throne was thus secured to the house of the Claudii. In the same year (4 A.D.) Tiberius was appointed commander-in-chief in Germany, and he was accompanied by the historian Velleius Paterculus, who was præfectus equitum. After having subdued the Bructeri, and renewed the alliance with the Chatti, Tiberius in 5 A.D. made a campaign against the Longobards; who were defeated, and he obliged the whole north-west of Germany to acknowledge the Roman authority. In the following year (6 A.D.) he led 70,000 foot and 4000 horse against Maroboduus, the king of the Marcomanni, who was saved from ruin by a rising of the inhabitants of Pannonia and northern Illyricum, who intercepted the communications of the Roman army with Italy. Tiberius employed fifteen legions and an equal number of auxiliaries against these nations, and, in spite of difficulties of every description, he quelled the outbreak within three years. This war was especially dangerous because the Germani threatened to join the Pannonians, but Tiberius prevented their junction by negotiations and by the success of his arms. After having celebrated his third triumph, he was again sent against the Germani, who had slain Varus and his army (9 A.D.). Tiberius, who was accompanied by Germanicus, succeeded in preventing the Germani from invading the countries on the left bank of the Rhine, and he then celebrated his fourth triumph. Velleius Paterculus, an able judge of military talents, gives us a most favourable idea of him as a general. Suetonius says also that, sharing in all the hardships of the common soldiers, he maintained a severe discipline, but that at the same time he carefully watched over the security and the comfort of the soldiers.

Augustus died at Nola on his return from Naples, where he had accompanied Tiberius, who was going to conduct the war in Illyria (29th of August, A.D. 14). Anxious to see her son at that critical moment in Rome, Livia concealed the emperor's death until Tiberius, who was informed of it by messengers, had arrived at Nola. (Dio. Cassius, vi. 30, 31.)

Tiberius became emperor in his fifty-fifth year, at an age when both the virtues and the vices have acquired strength from habit, and when a man's character seldom changes. Until that time he was generally supposed to be a virtuous man; his virtues were imbued with the severe gravity of his character. Among his biographers none has blamed his early life; yet no sooner was he emperor, than he was charged with crimes the most dreadful and disgusting. His former life is represented as dissimulation and hypocrisy. An example of such dissimulation is known in history. Sixtus V. concealed his real intentions for thirty years; however, it was not his real character which he thus concealed, but by retiring from affairs, and by simulating disease and infirmity, he made the cardinals believe that by choosing him pope they would make him their instrument, because his infirmities would not allow him to act with energy. Tiberius however, except the eight years that he spent

in Rhodes, was constantly employed in matters which, although they would have allowed him to conceal his real disposition, he could never have managed with such success, unless his conduct had been directed by the force of his real character.

Augustus succeeded in making himself master of the republic by accumulating in his person the different high functions of the state. Tiberius, proud and energetic, abolished even the shadow of the sovereignty of a nation which he despised. The Romans being sufficiently disposed to obedience, the only obstacles in his way were the worn-out institutions of the antient republic. Immediately upon the accession of Tiberius, Agrippa Postumus was put to death, probably by order of Tiberius (Suetonius, *Tiberius*, c. 22; Tacitus, *Annal.*, i. 6.) About this time the supreme power was offered by the troops on the Lower Rhine to Germanicus, who however refused it; and the mutiny was quelled by him and by Drusus, the son of Tiberius, who commanded in Pannonia. Tiberius began by some enactments which tended to ameliorate the state of morals; he abolished the comitia for the election of the various officers of the state, and transferred the election to the senate, the members of which were subservient to him. It has been already said that Tiberius intended to destroy the last remnants of the antient sovereignty of the people, and to supplant the majesty of the Roman nation by the majesty of the emperor. Augustus had already employed the Lex Julia Majestatis to punish the authors of libels against his person (Tacitus, *Annal.*, i. 72); and his example was followed by Tiberius, who established the Judicia Majestatis, by which all those who were suspected of having impugned the majesty of the emperor, either by deeds or by words, were prosecuted with the utmost severity. The number of the delatores, or denouncers of such crimes, daily increased, and a secret police was gradually established in Rome, as well organised, and as well supported by spies, as the secret police of Napoleon. The property, honour, and life of the citizens were exposed to the most unfounded calumnies, and a general feeling of anxiety and moral disease prevailed through the empire. The natural severity of Tiberius gradually degenerated into cruelty, and he showed symptoms of that misanthropy and that gloomy state of mind which increased with years. In the mean time Germanicus, the favourite of the army, had avenged the defeat of Varus, but Tiberius recalled him from Germany, and sent him into the East (17 A.D.). Germanicus conquered Cilicia and Commagene, and he renewed the alliance with the Parthians, but he died suddenly at Antioch (19 A.D.): public opinion accused Cneius Piso, the commander in Syria, of having poisoned Germanicus by order of the emperor; but before Piso could be sent to trial, he was found dead.

Seianus, the son of a Praefectus Praetorio, succeeded in obtaining the confidence of the emperor (19-22 A.D.), who henceforth gradually abandoned to him the direction of public affairs, of which Scianus became the absolute master from the year 22 A.D. Drusus, the son of Tiberius, who had governed the Roman part of Germany with great ability, was poisoned by Seianus (23 A.D.), and this crime was followed by a great many others, with which it is possible that the emperor was very imperfectly acquainted. His practice was to shut himself up within his palace, and to spend his time in the most revolting debauchery. After the death of Drusus, Tiberius recommended to the senate as his successors, Nero and Drusus, the sons of the unfortunate Germanicus and of Agrippina, who was still alive. In 26 A.D., Scianus at last persuaded him to retire from public affairs. Tiberius followed his advice and went to Capua and Nola, until at last he fixed his residence on the island of Capreae in the Gulf of Naples. The life which he led at Capreae was a series of infamous pleasures.

From this time all public affairs were directed by Seianus; the emperor was inaccessible. T. Sabinus, a friend of Nero, was put to death; statues were erected to Seianus, and received divine honours. After the death of Livia, in 29 A.D., the authority of Seianus was at its height; but at last Antonia, the aged mother of Germanicus, penetrated through the barriers of Capreae, and informed the aged Tiberius that Seianus had left him only the name of emperor. She was supported by Macro, the commander of the Praetorian guard. In consequence of this information, Tiberius ordered the senate to condemn Scianus; and the senate obeyed: Seianus, his family, and his friends were put to death in 31 A.D. Some time after this event, Tiberius retired from Capreae, and took up his residence at a villa near Misenum, which had formerly belonged to Lucullus. (Suetonius, *Tiberius*, c. 73.) On the 16th March, 37 A.D., he fell into a lethargy, and everybody believing him to be dead, Caligula, the third son of Germanicus, the favourite of old Tiberius, was proclaimed emperor. However Tiberius recovered, and Macro, in order to save himself and the new emperor, ordered him to be suffocated in his bed. Thus died Tiberius, at the age of seventy-eight, after a reign of twenty-three years. (Tacitus, *Annal.*, vi. 50; Suetonius, *Tiberius*, c. 73.)

There is little doubt that the crimes said to have been committed during the reign of Tiberius, either by himself or by others in his name, are real facts. But the question is whether they are all to be imputed as crimes to Tiberius. His insanity is a fact which can hardly be doubted; a dark melancholy, disgust of life, and misanthropy, had taken possession of him, and his struggle with the idea of self-destruction often threw him into wild despair. He found consolation in the sufferings of others, and thus gave those bloody orders which he afterwards regretted. The unnatural pleasures to which he was addicted were only another mode of soothing the despair of his soul. It is probable that his insanity was complete when he retired to Capreae. Sometimes he had lucid intervals, in which he wrote those letters of which Suetonius gives some extracts (*Tiberius*, c. 67), and in which he confesses the wretched state of his soul. His physical health was excellent, until some days before his death. Tiberius loved the arts and literature. According to Suetonius he wrote a lyric poem, 'Conquestio de L. Cæsaris Morte;' he also wrote poems in Greek, choosing for his models Euphorion, Rhianus, and Parthenius, the author of an erotic poem which has come down to us.

(Suetonius, *Tiberius;* Velleius Paterculus, ii., c. 94, &c.; Tacitus, *Annal.*, lib. i.-vi.; Dion Cassius, lib. xlvi.-xlviii.; Horn, *Tiberius, ein Historisches Gemälde.* The character of Tiberius has been defended by Buchholz, *Philosophische Untersuchungen*, vol. ii., p. 49, &c.)

TIBE'RIUS II., ANI'CIUS THRAX, FLA'VIUS CONSTANTI'NUS, one of the greatest and most virtuous emperors of the East. He was born in Thrace towards the middle of the sixth century A.D., and belonged to a rich and very distinguished family, the history of which is unknown to us. He was educated at the court of Justinian, whose successor, Justin II. (565-578), loved him as his son, and employed him in various civil and military offices. In 573 Tiberius, who was then general of the Imperial guards, commanded the army against the Avars, who were powerful north of the Save and the Danube. His lieutenant having neglected to watch the passages of the Danube, Tiberius was surprised by the Avars and lost a battle. However, he recovered this loss, and concluded a peace, by which the possession of the important fortress of Sirmium, now Mitrowicz, on the Save, near its junction with the Danube, was secured to the Romans. This was one of the few advantages obtained by the Greek armies during the unfortunate reign of Justin II. Italy, which had been conquered by Justinian, was overrun by the Longobards; the Berbers ravaged the kingdom of Carthage, which had been taken from the Vandals; and on the Persian frontier Chosroes (Khosrew) made various conquests. Justin, feeling his incompetency, and having lost his son, looked for a coregent, and his choice fell upon Tiberius. The great talents of Tiberius, his amiable character, his generosity and love of justice, and his sincere piety, had won him the hearts of the nation, and the esteem of the emperor and his ministers. Justin was confirmed in his choice by the empress Sophia, whose private views on this occasion harmonised with the interest of the state. Tiberius was the handsomest man at the court, and it seems that Sophia intended to marry him on the death of Justin. However this may be, before she declared in his favour, she asked him whether he was married. Tiberius immediately guessed the motive of the question, and answered that he was not, although he was secretly married to a lady named Anastasia. He thus gained the protection of the empress, and was proclaimed Cæsar by Justin on the 7th of December, 574, in a most solemn assembly of

the civil and military officers, and of the clergy under the presidency of the patriarch Eutychius, by whom Tiberius was crowned with the imperial diadem. In this assembly the emperor Justin addressed to his future successor the following remarkable speech (Theophylactus, iii. 11), which Gibbon translates thus:—'You behold the ensigns of supreme power. You are about to receive them, not from my hand, but from the hand of God. Honour them, and from them you will derive honour. Respect the empress your mother—you are now her son—before, you were her servant. Delight not in blood, abstain from revenge, avoid those actions by which I have incurred the public hatred, and consult the experience rather than the example of your predecessor. As a man, I have sinned; as a sinner, even in this life I have been severely punished: but these servants (his ministers), who have abused my confidence and inflamed my passion, will appear with me before the tribunal of Christ. I have been dazzled by the splendour of the diadem: be thou wise and modest; remember what you have been, remember what you are.' To this speech of a dying sinner, Tiberius answered:—'If you consent, I live; if you command, I die: may the God of heaven and earth infuse into your heart whatever I have neglected or forgotten.'

The burden of government devolved upon Tiberius, whose authority was never checked by Justin. The war with Persia prevented Tiberius from expelling the Longobards from Italy; but he sent there all the troops he could dispose of, and succeeded in maintaining the imperial authority in the Exarchate of Ravenna, on the Ligurian coast, in the fortified places in the Cottian Alps, in Rome, in Naples, and in the greater part of Campania and of Lucania. He saved Rome and pope Pelagius II. from the Longobards by sending a fleet laden with provisions (773). Some years later he concluded an alliance with the Frankish king Chilperic, who checked the Longobards in the north of Italy, and Tiberius succeeded in bribing several of the thirty Longobardian dukes, who, after the murder of king Clepho (573-574) and during the minority of Antharis, imitated in Italy the Thirty Tyrants of Athens. The daughter of king Alboin and Rosamond, who had fled from Italy, was then living at the court of Constantinople.

The most important event in the reigns of Justin and Tiberius was the war with Persia. Khosrew, the king of Persia, had made extensive conquests in Asia Minor during the reign of Justin. In 575 Tiberius concluded a partial truce for three years with him, on condition that hostilities should cease except on the frontiers of Armenia, where the war was still carried on. These frontiers being easily defended on account of the great number of defiles in the Armenian mountains, Tiberius levied a strong army while Khosrew lost time in forcing passages or in besieging small fortified places. For several centuries the Eastern empire had not seen such an army as was then raised by Tiberius. A hundred and fifty thousand men, among whom were many Teutonic and Slavonic barbarians, crossed the Bosporus in 576, under the command of Justinian, and advanced to the relief of Theodosiopolis, the key of Armenia. Theodore, the Byzantine general, defended the fortress against the whole army of Khosrew. At the approach of Justinian the Persian king left the siege and advanced to meet the Greeks. The encounter took place near Melitene (in the district of Melitene in Armenia Minor). The Persians were routed, and many of them were drowned in their retreat across the Euphrates; twenty-four elephants, loaded with the treasures of Khosrew and the spoil of his camp, were sent to Constantinople. Justinian then advanced as far as the Persian Gulf, and a peace was about to be concluded in 577; but Khosrew broke off the negotiations on account of a victory which his general Tamchosroes (Tam-khosrew) unexpectedly obtained over Justinian by surprising him in Armenia. Tiberius now recalled Justinian, and appointed in his place Mauritius, who was afterwards emperor. Mauritius restored the old Roman precaution of never passing the night except in a fortified camp; he advanced to meet the Persians, who had broken the truce of 575, and attacked the empire on the side of Mesopotamia (577). The Persians retired at the approach of Mauritius, who took up his winter-quarters in Mesopotamia (577-8).

On the 26th of September, 578, Tiberius became sole emperor by the solemn abdication of Justin, who died on the 5th of October next. After the funeral of Justin, when the new emperor appeared in the Hippodrome, the people became impatient to see the empress. The widow of Justin, who was in the Hippodrome, expected to be presented to the people as empress; but she was soon undeceived by the sight of Anastasia, who suddenly appeared at the side of Tiberius. In revenge, Sophia formed a plot against Tiberius, and persuaded Justinian, the former commander in the Persian war, to put himself at the head of the conspiracy. Tiberius however was informed of this design. Justinian was arrested, and the emperor by pardoning him made him for ever his faithful friend. Sophia was deprived of her imperial pension and palaces, and she died in neglect and obscurity.

A quarrel broke out between Eutychius, the patriarch, and Gregorius, the apocrisiarius of Constantinople, who could not agree on the state of the soul after death. The Greeks were then the most disputatious people in the world about religious matters, and their disputes often led to serious trouble. The emperor accordingly undertook to settle this dispute. Adhering to the opinion of Gregorius, he convinced the patriarch that he was wrong, and he persuaded him to burn a book which he had written on the corporeal nature of the soul after death.

Khosrew died in 579, after a reign of forty-eight years. He had entered into negotiations with the Greeks, but his successor, Hormisdas (Ormuz), broke them off and recommenced the war. Hormisdas was defeated by Mauritius and his lieutenant, Narses, a great captain, who must not be confounded with Narses, the victor of the Ostro-Goths. They overran Persia in one campaign (579), and in 580 they routed the army of Hormisdas in a bloody battle on the banks of the Euphrates, and took up their winter-quarters in Mesopotamia. At the same time the Greeks obtained great advantages in Africa. Gasmul, king of the Mauritani or Berbers, had defeated and killed three Greek generals, Theodore, Theoctistes, and Amabilis. But in 580 he was defeated by the exarch Gennadius, and put to death. Tiberius was less fortunate in Europe, the Avars having surprised and taken the town of Sirmium. But in the following year (581) Mauritius destroyed the Persian army in the plain of Constantine, and their general, Tam-Khosrew, lost his life. Mauritius had a triumph in Constantinople, and on the 5th of August he was created Cæsar by Tiberius, who was then worn out by illness, and who had no male issue. After having given his daughter, Constantina, in marriage to Mauritius, Tiberius died on the 14th of August, 582, and, since the time of the great Theodosius, no emperor's death caused regret so universal. It is a remarkable circumstance in the reign of this emperor, that he was always provided with money without oppressing the people by taxation; and yet his liberality was so great that the people used to say that he had an inexhaustible treasure. But all these resources did not enable him to save Italy, which may be accounted for thus:—During the invasions of Italy and other parts of the Roman empire by the barbarians, many rich men saved great quantities of gold and silver, which they carried to Constantinople, then the only safe place in Europe. This city being the centre of the arts, and the commerce and industry of the East being very extensive, even the money which fell into the hands of the barbarians gradually found its way into the Greek empire, where the barbarians purchased all those articles which they had not skill enough to fabricate themselves. This view is corroborated by the fact, that notwithstanding the immense tribute which the Greek emperors often paid to the barbarians, there was always a want of coin in the barbarian kingdoms. On the other hand, the Greeks having lost their martial habits, the emperors were obliged to recruit their armies among the barbarians. These people however were as ready to fight against the emperors as for them; and it would have endangered the existence of the empire if too large a number had been engaged in its service. Thus Tiberius preferred bribing the Longobardian dukes to raising a large army of barbarians, who would probably have joined the Longobards as soon as they had got their pay.

(Cedrenus; Theophanes; Theophylactus; Zonaras; Gregorius Turonensis; Paulus Diaconus; Gibbon, *Decline and Fall*; Le Beau, *Histoire du Bas Empire*.)

TIBE'RIUS ALEXANDER, prefect of Egypt, was the son of Tiberius Alexander who was alabarcha of Alexandria, and the brother of Philo Judæus, the well-known

writer. Tacitus calls him an Egyptian, but this only means that he was a native of Alexandria; for he was a Jew, though he afterwards adopted paganism. Nero appointed him governor of Judaea, where he succeeded Cuspius Fadus, and he made him a Roman eques. In the last campaign of Corbulo against the Parthians, Tiberius Alexander and Vinianus Annius, the son-in-law of Corbulo, were given as hostages to king Tiridates, who came to the Roman camp for the purpose of settling his differences with the Romans (A.D. 63). Tiberius Alexander was afterwards appointed prefect of Egypt, in which capacity he quelled a dangerous insurrection of the Jews of Alexandria, who were jealous of the favour which Nero showed the Greek inhabitants of that town. The resistance of the Jews was so obstinate, that Tiberius was obliged to employ two legions and five thousand Libyan soldiers against them; and it is said that more than fifty thousand Jews perished on this occasion. On the 1st of July, 69, Tiberius Alexander proclaimed Vespasian emperor, pursuant to a scheme which had been concerted by Vespasian, Titus, and Mucianus, the proconsul of Syria. In consequence of this event, the 1st of July, 69, is regarded as the beginning of the reign of Vespasian, who showed great regard for his governor of Egypt. When Titus, the successor of Vespasian, was about to undertake the siege of Jerusalem, which resulted in its capture, he was accompanied by Tiberius Alexander.

(Josephus, *Antiq. Jud.* and *De Bello Jud.*; Suetonius, *Vespasianus*; Tacitus, *Annal.*, xv. 28; *Hist.*, i. 11; ii. 74, 79; the notes of Ernesti to Suetonius and Tacitus.)

TIBERIUS (Τιβέριος), an Alexandrine grammarian, who probably lived in the fourth century of our æra. Suidas (*s. v.* Τιβέριος), who calls him a philosopher and a sophist, ascribes to him a long list of rhetorical works, all of which are lost, with the exception of one, which formerly used to be called *περὶ τῶν παρὰ Δημοσθένει σχημάτων*, and which is one of the best works of the kind that were produced at the time. The editio princeps of it, which is ascribed to Leo Allatius, appeared at Rome in 1643. The next edition is that of Gale, who incorporated the work of Tiberius in his 'Rhetores Selecti,' Oxford, 1676, 8vo. A reprint of this collection of rhetoricians was edited by J. F. Fischer, Leipzig, 1773, 8vo. In all these editions the work of Tiberius contains only 22 short chapters, which treat on Schemata, that is, those forms of expression which are not the natural forms, but are adopted for ornament or use. In the year 1815, J. F. Boissonade published at London a new edition, in 8vo., from a Vatican manuscript, in which the work is called *περὶ σχημάτων ῥητορικῶν*, and in which there are 26 chapters more than had ever before been published; and this second part of the work treats on the so-called 'figurae elocutionis,' or the ornamental forms of elocution. This edition of Boissonade also contains a work of Rufus, entitled *τέχνη ῥητορική*, the author of which has only become known through the Vatican MS. containing the complete work of Tiberius: in the editions of Gale and Fischer it was called the work of an anonymous writer. A few fragments of other works of Tiberius are preserved in the scholiast on Hermogenes, ii., pp. 385 and 401, edit. Aldus.

(Groddeck, *Initia Historiae Graecorum Literariae*, ii., p. 173; Westermann, *Geschichte der Griech. Beredtsamkeit*, p. 251, &c.)

TIBE'RIUS ABSI'MARUS became emperor of the East, in A.D. 698, under the following circumstances:—Leontius dethroned and banished the tyrant Justinian II., and having assumed the imperial title in 695, continued the war with the Arabs in Africa. Notwithstanding the Greeks were assisted by the Berbers, they lost Carthage in 697; they reconquered it shortly afterwards, but in 698 the Arabs retook the town from the Greeks and entirely destroyed it. A powerful fleet, commanded by the patrician John, was then off Carthage; but although John entered the harbour with a division of his fleet, and landed a body of troops, his measures had only a partial effect, and he was obliged to leave Carthage to her fate. The destruction of this famous town was attributed by the Greek officers to the incompetency of John, and they were afraid to return to Constantinople without having prevented the ruin of Carthage. Absimarus, the commander of the Cibyratae, or the troops of the province of Cibyra, then the collective name of Caria and Lycia, turned the discontent of the soldiers to his own profit. He persuaded his men that the emperor would punish them severely for not having obtained some advantage over the Arabs, and that they ran the risk of suffering for the faults of their commander-in-chief. When the fleet was off Crete, a mutiny broke out. The Cibyratae proclaimed Absimarus emperor, the rest of the fleet followed their example, and John was massacred.

Absimarus having arrived at Constantinople, cast anchor in the bay of Ceras (now the Golden Horn), between this city and the suburb of Sycae. . Leontius prepared a vigorous resistance; but the courage of his soldiers and of the inhabitants was weakened by an epidemic disease, and at last Absimarus found his way into the town by bribing some sentinels.

Absimarus assumed the name of Tiberius and was acknowledged emperor: his rival, Leontius, had his nose and his ears cut off, and was confined in a monastery. Tiberius Absimarus continued the war with the Arabs, and appointed his brother Heraclius commander-in-chief. This experienced general conquered Syria in 699 and 700, and treated the Mohammedan inhabitants most barbarously: it is said that two hundred thousand of them lost their lives by the sword of the Greeks. This war continued during 701, 702, and 703; and, although the Greeks did not recover Carthage, they obtained many signal advantages. Tiberius Absimarus had great influence in Italy, where popes Sergius and John VI. were continually harassed by John Platys, and afterwards by Theophylact, the Greek exarch of Ravenna.

Tiberius Absimarus lost his crown by a sudden revolution. When Leontius dethroned Justinian II., this prince had his nose cut off, and was banished to the town of Cherson, in the present Crimea. Some years after, he fled to the khaghan, or khan, of the Khazars [TARTARS, *Khazars*], who received him respectfully, and assigned for his residence Phanagoria, once an opulent city, on the island of Tamatarcha. [TAMAN.] The khaghan, whose name was Busirus, gave him in marriage his sister Theodora; but Tiberius Absimarus bribed the khan with a large sum of gold, and Justinian was only saved by the affection of Theodora, who discovered to him the treacherous design of her brother. After strangling with his own hand the two emissaries of the khaghan, Justinian rewarded the love of his wife by repudiating her and sending her back to her brother Busirus; and he fled to Terbelis, or Terbellus, the king of the Bulgarians. He now formed the plan of recovering his throne, and he purchased the aid of Terbelis by promising him his daughter and a part of the imperial treasury. At the head of fifteen thousand horse, they set out for Constantinople. Tiberius Absimarus was dismayed by the sudden appearance of his rival, whose head had been promised by the khaghan, and of whose escape he was yet ignorant. Justinian had still some adherents in Constantinople, who introduced his troops into the city by means of an aqueduct. Tiberius escaped from Constantinople, but he was seized at Apollonia on the Pontus Euxinus (705), and Justinian ordered him, his brother Heraclius, and the deposed Leontius, who was still alive, to be dragged into the Hippodrome. Before their execution, the two usurpers were led in chains to the throne, and forced to prostrate themselves before Justinian, who had sworn not to spare one of his enemies. Planting his feet on their necks, the tyrant watched the chariot-race for more than an hour, while the people shouted out the words of the Psalmist, 'Thou shalt trample on the asp and basilisk, and on the lion and dragon shalt thou set thy foot.' He then gave orders to behead Tiberius, Leontius, and Heraclius. Justinian II. reigned till 711. The Greeks gave him the surname of Rhinotmetus, that is, 'he whose nose is cut off.' Tiberius Absimarus had two sons, Theodore and Constantine, who probably perished with their father. It is said however that Theodore, who is also called Theodosius, survived his father, and became bishop of Ephesus and one of the leaders of the Iconoclasts; but this is doubtful.

(Theophanes; Cedrenus; Zonaras; Gibbon, *Decline and Fall*; Le Beau, *Histoire du Bas Empire*.)

TI'BET is the most southern of the three great tablelands of Middle Asia. The name Tibet is derived from 'Thu-pho,' that is, the country of the 'Thu,' who founded an empire in Northern Tibet in the sixth century A.D. The name 'Thu-pho' has been mutilated by foreigners, and especially by the Mongols, into Thupo, Tobut, Töböt,

Tebet, and Thibet. The orthography Tibet was introduced by the Jesuit missionaries. Sanang Setsen, the historian of the Mongols, and the modern Chinese, write it Tübet, and this latter orthography has been adopted by Ritter. Another name of this country is 'Pue-Koa-chim,' which, according to Turner, signifies the 'snowy country in the north.' Sanang Setsen often calls it 'Gang-d'yan-yul,' which signifies the 'country of the snow' in the Mongol language, a name which is analogous to 'Iceland.'

Our knowledge of Tibet is very imperfect. We are only acquainted with some lines of road and certain points which have been visited by travellers. The Chinese geographers have furnished very valuable notices concerning this country, but the Tibetan sources are almost unknown to Europeans. Marco Polo visited Tibet; in the beginning of the eighteenth century (from the 17th of August, 1715, to the 18th of March, 1716) Father Desideri travelled through nearly the whole extent of Southern Tibet, from Leh in the west, to H'Lassa or Lassa in the east; Father de la Penna was also in Tibet; and in our own days Turner, Moorcroft, and Gerard have visited parts of it.

Boundaries.—Tibet, in the largest sense of the word, has the following frontiers. The Bolor Mountains, a branch of the Hindu Kush, which stretches towards the north-west, in 72° 30′ E. long., form the western boundary. The length of this frontier is about 87 miles. It is bounded on the south-west by the Hindu Kush, from Mount Tutukan Mutlami and the north-western part of the Himalaya as far as the western frontier of Nepal, a distance of about 480 miles. The southern boundaries are formed by the range of the Himalaya from the western frontier of Nepal to the eastern frontier of Bootan, a distance of about 740 miles, and by the northern boundaries of Assam, Burma, and part of the Chinese province of Yunnan. This latter part, which is nearly unknown, runs in a south-eastern direction, and most probably as far as the junction of the Yu-leang-Ho, or Li-tchou, with the Kincha-Kiang, or Yang-tse-Kiang, in Yunnan, between 102° and 103° E. long. The length of this part of the frontier in a straight line between the two extremities is about 320 miles. The whole length of the southern frontier, according to a rough estimate, is 1540 miles, but as this frontier forms a curve, its real length is much more. The eastern frontier of Tibet is formed by the western boundaries of the Chinese provinces of Sütchuang (Setchuen), Shensi, and Kansu. This frontier has been fixed by the Chinese, but Europeans only know some points of it which are marked in the Itineraries of the Chinese geographers. From the junction of the Yu-leang-Ho with the Kincha-Kiang it stretches northwards, and probably along the river Ya-long-Kiang as far as the 30th degree of N. lat. It then takes a north-eastern direction, and stretches as far as Kiai, along a range of wild and snowy mountains, which, on some maps, are called the Yun-ling Mountains. At Kiai it takes a north-west direction, crosses the Hoang-Ho, or Yellow River, runs to the east as far as Hongchin, and then takes a north-west direction as far as a point situated in the mountains of Amegangar, in 38° 25′ N. lat. and 100° E. long. That part of Tibet however which lies south of the 29th degree of N. lat., and east of the Kincha Kiang, or the mountains of Batang, was ceded to China in 1727, and is now under the immediate sovereignty of the emperor of China. The whole extent of the eastern frontiers of Tibet is at least 900 miles. We have no positive knowledge of the northern frontiers. They begin in the Bolor Mountains, east of which they were traversed by F. Desideri (*Nouv. Journal Asiatique*, tom. viii., p. 117) on his way from Yarkand to Leh. From thence they are said to stretch east-south-east along the mountains of Kárákorum as far as a point situated in the mountains of Kuenlun (Oneuta, or Kulkoun), in 35° N. lat. and 85° E. long., across the deserts of Khor and of Katchi, or Katche. Thence they run north-east and east, until they reach the eastern frontier at that point which we have mentioned above, as situated in 38° 25′ N. lat. and 100° E. long. The whole length of the northern frontier, including the larger bends, amounts to about 1300 miles. It is however doubted whether the extensive country of Khu-khu-Nor, in north-eastern Tibet, belongs to Tibet in the political sense of the word; and if so, the northern frontier of Eastern Tibet will not extend beyond 36° N. lat. (Ritter, iv., p. 173.) But geographically speaking, Khu-khu-Nor belongs to Tibet. It is a very remarkable fact that the northern frontiers, as they have been here described, form a curve almost parallel to the curve of the Himalaya, although they diverge in proportion as they stretch towards the east. From this parallelism we may conclude that these northern frontiers are perhaps identical with the natural frontier of the Tibetan table-land. Thus Tibet is bounded on the west by Independent Turkistan; on the south-west and south by Punjab, British Hindustan, Nepaul, Bootan, and Assam; on the south-east by Assam and China; on the east by China; and on the north by the desert of Gobi and Chinese Turkistan.

Tibet, comprised between these limits, resembles an immense cornucopia, the handle of which is in the west, between the Hindu Kush and the mountains of Kárákorum, and through its wide opening, 1500 miles to the east, the largest rivers of eastern Asia flow, and carry fertility and abundance to Burma, Siam, and China.

Mountains.—Tibet is a table-land, the highest plains of which are more than 10,000 feet above the level of the sea. This table-land is divided into three great and distinct parts. The first, which is long, and not very wide, begins in the east, near Mount Kailasa, in the Himalaya, and stretches to the north-west, between parts of the Himalaya and of the Hindu Kush in the south-west, and the range of the mountains of Kárákorum in the north-east. It is traversed in its whole length by the upper part of the Indus. Its lower or north-western part, Balti or Baltistan, is also called the First Tibet, or Little Tibet, and is an independent state. Its upper or south-eastern part has the name of Ladakh, and is also called the Second Tibet, or Great Tibet, because it is larger than Baltistan. Sometimes the name of Little Tibet is given to the whole valley of the Indus. Ladakh is also an independent state, but the most eastern part of it, as far as Teshigang on the Indus, belongs to China. Baltistan and Ladakh have been described under the heads of Himalaya and Hindustan (vol. xii., p. 219, &c.). Baltistan and Ladakh belong only to Tibet in the most extensive sense of the word. The second great division of Tibet begins in the south, near Mount Kailasa, and is an immense elevated desert, the western part of which is called Khor, and the eastern part Katchi. Its boundaries are the range of Kárákorum on the west; the Kuenlun mountains on the north; the snowy mountains around the sources of the Kincha Kiang, the Om-Tsiu, and the lake of Tengri-Nor in the east; and the mountains of Dzang and Ngari in the south. Khor and Katchi have never been visited by Europeans, though the eastern part is traversed by the great road which leads from H'Lassa to Yarkand, in Chinese Turkistan. The third great division of Tibet contains the remainder of this country, which lies east and south of Khor and Katchi.

The second and third natural divisions have the common name of Eastern or Third Tibet, or Tibet in the proper sense of the word. Eastern Tibet is subject to China.

All that we can say about Khor and Katchi is that they are an immense table-land, some parts of which are 10,000 feet above the level of the sea. This table-land, however is not a level plain. It is a country traversed by chains of mountains, which have a height varying from 3000 to 4000 feet above their base, or from 13,000 to 14,000 feet above the sea. The middle part seems to be less elevated than the boundaries, as the country contains several rivers which terminate in the table-land; and the southern and western parts are higher than the eastern and northern parts, the direction of the greater number of those rivers being from the west to the east, and from the south to the north.

The aspect of the southern and eastern parts of Third Tibet is very different from that of Khor and Katchi. Third Tibet is traversed by numerous ranges of lofty mountains, the direction of which is from west to east and from north-west to south-east. From these ranges lateral branches run out in different directions, and contain deep valleys between them. In proportion as the principal chains advance towards the south-east, they converge towards one another, and thus the valleys between them gradually become narrower, until at last, on the frontiers of Yunnan and Burma, they are mere mountain-passes. On this spot there are four parallel valleys, traversed by four of the greatest rivers of the world, and the breadth of these four valleys together seems not to be more than one hundred miles. But the range of the mountains of Ngari and Dzang diverges from the Himalaya; and the valley between them, which is traversed by the Dzangbo, be-

comes broader as it advances towards the east. The chain which, in the south-eastern corner of Tibet, separates the Kincha-Kiang in the east from the Lang-tsang-Kiang in the west, has the name of Ning-tsing-Shan, or Mang-li (Moung-lan); and, since 1727, the frontiers between Tibet and China run along the foot of this chain, the summits of which are covered with eternal snow. The height of the mountains in south and eastern Tibet is much greater than in the northern and central parts of the country, and the whole tract towards China, Nepaul, and Bootan, is an immense alpine country. Several passes in the Mang-li mountains are from 10,000 to 11,000 feet above the sea; the region of perpetual snow seems to begin at 12,500 feet, and as the snow always covers an immense number of summits and whole ranges, it is evident that the number of summits which have an absolute elevation of above 12,500 feet must be very considerable. Some of them probably attain the height of 26,000 feet above the sea. The extent of the Mang-li mountains between Bathang on the Kincha-Kiang, and Tsiamdo on the Lang-tsan-Kiang, according to the Chinese itineraries, is 1405 li, of 250 to a degree. (Ritter, iv. 202.) All this country is intersected by deep valleys and chasms. The summits of the mountains are covered with eternal snow, and the traveller crosses the chasms by means of bridges which are enveloped in the clouds. The mountains north of the Mang-li, around the sources of the Lan-tsan-Kiang, in the province of Tsiamdo, are no less elevated, but they have never been visited by Europeans. A very extensive range begins at Mount Kailasa in the Himalaya, and stretches to the east as far as the ninetieth degree of east longitude, in a direction diverging from the Himalaya in Nepaul and Bootan. These are the mountains of Ngari and Dzang, the most western part of which is called Gangdisri, or the country of the snow mountains. At the beginning of this westernmost part, and in the north-eastern part of the province of Ngari, is situated the celebrated Mount Kailasa, which is said to be higher than the Dhawalagiri. The Kailasa is steep on all sides, and is 140 li in circumference; its summit is always covered with snow, and the water tumbles down from it in cataracts into the surrounding valleys. This mountain has also the name of Oneuta. East of the Kailasa are situated four mountains, or perhaps groups of mountains, the K'habhabhs, each of which resembles a different animal. The first is the Horse-mountain, or Tam-tsiogh-K'habhabh; the second is the Elephant-mountain, or Lang-tsien-K'h; the third is the Lion-mountain, or Sengghe-K'h; and the fourth is the Peacock-mountain, or Mabghia-K'h. The length of these four mountains is said to be 800 li, and with respect to the valleys which begin at their foot and stretch in different directions, they resemble Mount St. Gothard in Switzerland. The mountains on the southernmost part of Tibet have been described in the article HIMALAYA.

Rivers.—The sources of the Dzangbo are on the east side of the K'habhabhs, in the province of Ngari. Its complete name is Yaru-Dzangbo-tsu, that is, the pure frontier river of the west. According to the Chinese geographers, the source of the Dzangbo is on Mount Tam-tsiogh, in 30° 10′ north latitude, and 79° 35′ longitude east of Paris. It flows in an east-south-eastern direction, through the whole of Southern Tibet, a distance of about 700 miles, and waters the provinces of Ngari, Dzang, and Wei. The valley of this river is formed by the Himalaya on the south, and the mountains of Ngari and Dzang on the north. The country through which it flows being very extensive, and all the mountains being covered in winter with snow, of which an immense quantity melts in the summer, the volume of water in this river must be very considerable. The tributary rivers of the Dzangbo, on its left or northern side, are: the Nauk-Dzangbo; the Dzang-tsu, or Galdjao-muren, that is, the 'furious river,' which has its sources in the north-east, about 200 miles from its junction with the Dzangbo near H'Lassa, and which is sometimes confounded with the Dzangbo itself. There are five considerable rivers between the Nauk-Dzangbo and the Dziang-tsu. The tributary rivers on the right or southern side are: the Guyang, which has its source near Mastang, in the Himalaya (there are five other considerable rivers, which come down from the Himalaya of Nepal); and the Pai-nom-tsu, or Fuang-dze, along which Turner travelled, from its source at Phari to its junction with the Dzangbo, and which has a fine iron bridge of thirteen arches. An iron suspension-bridge is thrown over the Dzangbo, south of H'Lassa, on the great road from the west to this town. The course of the Dzangbo is known as far as a point which is situated about 100 miles east of H'Lassa, in 26° 30′ N. lat. according to D'Anville; in 28° 30′ N. lat. according to Klaproth; and in 29° 15′ N. lat. according to Berghaus. It has been conjectured that the Brahmaputra is the continuation of the Dzangbo [BRAHMAPUTRA], but it is now known that they are different rivers. The continuation of the Dzangbo is the Irawaddy. We owe this discovery to Julius von Klaproth, who published several memoirs on the course of the Irawaddy, of the Brahmaputra, and the Dzangbo.

All that we know about the Southern Nu-kiang is conjectural. Ritter says that the Nu-kiang is a southern tributary river of the Dzangbo, but this is impossible, and instead of 'southern' we must read 'northern.' (Ritter, iv., pp. 212-223.) The sources of the Gakbo-dzangbo-tsu, or the clear river of Gakbo, are situated in 31° 30′ N. lat., between the mountains of Sangtsen-sum-do-ri and Barkala, on the frontiers of the provinces of K'ham and of Wei. Its upper course has the name of Sang-chu or Dziangbo-tsiu. Its direction is at first south-east. The great road from China to H'Lassa crosses this river some distance east of the celebrated temple of H'Lari. The Gakbo-dzangbo-tsu then enters the country of Gakbo, where it receives a considerable river called Bo-Dzangbo, which enters it on the left or eastern side. After having entered the country of H'Lokba, it probably takes a southern direction, but we have no positive knowledge of it. According to the Chinese map of the emperor Khien-Long, of which the 'Carte de l'Asie Centrale' of Klaproth is a reduction, the Gakbo-dzangbo-tsu enters the Chinese province of Yunnan, and there receives the name of Lung-chuan-Klang. As to the Om-tsu, or Oui-tsu, another great river, there is great difference of opinion. According to the Chinese maps, the Om-tsu is formed by the junction of three rivers, the Ser-Sumbu, or Ser-tsu, in the east, the Uir-chu in the west, and the Kárá-us-su, the largest river, in the middle. The source of the Kárá-us-su is said to be in the table-land of Middle Tibet, about 32° 30′ N. lat. and 90° to 91° E. long. The Om-tsu has a south-east course, and flows in a very deep and narrow valley, enclosed by steep rocks of an immense height; it enters the province of Yunnan in China, where it receives the Chinese name Nu-Kiang, that is, 'the river of the barbarians.' The latter part of its course within Tibet is unknown to European geographers. The Lang-tsang-Kiang traverses almost the whole extent of eastern Tibet, from north-west to south-east. Two rivers, the Om-chu in the west, and the Dzo'chu in the east, the sources of which are situated north of the upper part of the Om-tsu, in the province of K'ham, join at Tsiamdo, and thus form the Lang-tsang-Kiang, the direction of which is from north-west to south-east. From the 30th to the 27th degree of N. lat. the Lang-tsang-Kiang traverses a country quite unknown to Europeans. This river is also called La-chou, La-tsu, Lo-tsau, and Lo-tsu. After having traversed Yunnan, it enters Lao, forms the frontier between Siam and Cochin-China, and flows into the Chinese Sea in 10° N. lat., after a course of more than 1700 miles. The sources of the Kincha-Kiang, or Yang-tse-Kiang, which traverses China from west to east, are situated between 37° and 38° N. lat., and between 89° and 92° E. long., on the table-land towards the north-western frontiers of Eastern Tibet. Its upper part is called Muru-us-sú by the nomadic Mongols of that country; its middle part has the Tibetan name of Bourei-tsu; and it is only in China that it is called Kincha-Kiang. Its direction is east as far as 95° E. long.; from this point to Batang the direction is south-east and south; from Batang to its junction with the Litchu (the old frontier of Tibet), it is again south-east. This latter part of the Kincha-Kiang forms a part of the present frontier between Tibet and China. The Ya-long-Kiang is an important tributary of the Kincha-Kiang. Its sources are about 29° N. lat. and 97° 30′ E. long., in the Bayan-Khara, a range of high and wild mountains stretching in a south-east direction, between the Kincha-Kiang and the Ya-long-Kiang in the south, and the sources of the Hoang-Ho in the north. The direction of the Ya-long-Kiang is at first south-east for about 200 miles: east of 100° E. long. it runs southward for about 300 miles: during the latter part of its course the direction is at first east, as it seems,

and then again south for about 100 miles. But all this is conjectural. The Hoang-Ho, or Yellow River, has its sources north of the Bayan-Khara, in the province of Sifan. Only its sources and a part of its upper course are in Tibet and in Khu-Khu-Nor (Köke-Nor), the most northern part of Tibet, of which we have already spoken. The description of this river has been given under CHINA. The whole country between the upper part of the Hoang-Ho in the north and in the west, the Ya-long-Kiang in the south-west, and the frontier of China in the east, or the eastern parts of Sifan and Khu-Khu-Nor, is traversed by ranges of high mountains covered with perpetual snow; it is an unknown country to us.

Lakes.—The Tengri-Nor, the largest lake of Tibet, is nine days' journey north of H'Lassa. The Chinese call it Thian-chhi, or the Celestial Lake. This lake appears to be surrounded by high mountains and rocks covered with snow and ice. It receives the Turku-Dzangbo, a river which comes from the west. The lake of Palte, which is situated south-west of H'Lassa, in the valley of the Dzangbo, resembles a large ditch surrounding an extensive island which fills up the middle of the lake. On the Tibetan maps it has the name of Bhaldi-Yumtso, and the Chinese call it Yar-brok-Yumtso. According to the Chinese geographers there is a nunnery on that island which has the name of Dhordze-phagh-mo, or the 'Palace of the Holy Sow,' which is said to be one of the finest in Tibet. It is said that north of this lake there is a high mountain called Kambala, from the summit of which extensive ranges of high snowy Alps may be seen to the north. These are most probably the mountains which surround Lake Tengri-Nor. In the extreme north of Tibet is situated the Lake Khu-Khu-Nor, or Köke-Nor, that is, 'the Blue or the Celestial Lake,' which name has been given to all the surrounding country. The lakes of Kailasa, in the southern part of Tibet, have been described under HIMALAYA.

Climate.—Tibet is known in India and China as a country of hunger and misery, and as such it is represented by the Mongol historian Sanang Setsen. However cold and barren the table-lands and the mountains may be, on account of their extreme elevation and of the snow which perpetually covers whole tracts, the climate of the valleys, and especially of the valley of the Dzangbo, is hot. From March to September the weather is fair, interrupted only by some showers; the winds are not regular, as in India. In H'Lassa the trees bud at the end of April and in the beginning of May. Corn and peas are sown towards the end of the spring and in the beginning of the summer; and the harvest is reaped in the months of August and September. Dew falls in the summer nights; it hails often; the snow is not deep in the winter. On the high table-lands the climate is very different. Turner, who visited a part of them on his way from Bootan to Teshu Lumbu, gives an interesting description of it. From May to October the sky is always clear, and the sun shines with uncommon brightness. From October to May there are violent gales. The surface of the weather-beaten rocks breaks in pieces, which the air dissolves into fragments as small as dust; and clouds of this dust, raised by whirlwinds, are driven from the plain to the summits of the mountains, and from the mountains down to the houses of the inhabitants. The air is excessively dry, and its effects resemble those of the dry heat of the Sahara.' The trees wither; their leaves may be ground to powder between the fingers; planks and beams break, and the inhabitants cover the timbers of their houses with wet towels in order to preserve them against the destructive effects of excessive dryness. The timber never rots. The flesh of sheep exposed to the open air becomes dry, and may be ground like bread, and thus preserved during years. This flesh-bread is a very common food in Tibet.

Productions.—Among the minerals there are gold, silver, copper, tin; salt, which is taken from the salt-lakes of Jayek and Deng-tsavga; corundum stone, lapis lazuli, turquois, and agate. Besides a great number of grasses which are common in Europe, Tibet produces a kind of grey barley, grapes in Bathang, and, near H'Lassa, Ingwei, assafœtida, rhubarb, madder, safflower, apples, nuts, apricots, peaches, pomegranates, and figs in the valleys. The cedar grows in Tibet. Among the animals there are wild-oxen with long hair, buffaloes, the buffalo which is called the yak, goats with a very fine fleece, goats with long fine hair, silk-worms, wild-cats, tigers, leopards, lynxes, argali with horns of one hundred pounds weight, pigs, white eagles, and swans. All our domestic animals are known in Tibet, and the horses are excellent. Fish are abundant in the rivers, but they are not eaten, being prohibited by the religion of Buddha.

Political Division.—1. The territory of the Dalai-Lama contains the eastern and north-eastern parts of Tibet. The capital, H'Lassa or Lassa, is situated in a beautiful plain on the banks of the Dzang-tsu, about twelve leagues from its junction with the Dzangbo. It is a populous and very commercial town, and distinguished by many fine public buildings, especially convents, among which there is the first temple of the Buddhists. There are a small-pox hospital, a printing-office, and several schools, especially for divinity. The town has walls and five fortified gates. In the neighbourhood of the town, in the north, the east, the south, and the west of it, are four magnificent convents, the largest among the 3000 convents of Tibet, a great number of which contain several thousand monks. The residence of the Dalai-Lama is in the convent of Pobrang-Marbu (the red town) on Mount Botala, north-west of H'Lassa. It is said that the principal building of this residence, or the Lapranga, is 367 feet high, and that it contains 10,000 rooms. (Ritter, iv. 243.) On the walls of one of its large rooms are most probably suspended those chorographical tables which Father de la Penna admired when he was in H'Lassa. The environs of H'Lassa are full of convents and palaces, of which the most magnificent is that of Dzundzio-lu-Khaag. Besides the capital we only know some points on the great roads which lead to H'Lassa from the east and from the west, but no considerable towns are mentioned on these roads, except Yiga-gung-ghar, a town which is inhabited by 20,000 families, and which is situated east of H'Lassa on the Dzang-bo.

2. The territory of the Teshu-Lama contains the provinces of Dzang and Ngari, and perhaps also the countries of Khor and of Katchi. His residence is at the palace, or rather the convent of Teshu-H'Lumbu, in 29° 4′ N. lat. and 89° 7′ E. long., according to Turner, who visited this place in 1783. It was founded in 1447, on a small plain surrounded by lofty mountains; but as this plain is a part of the high table-land, the environs are cold and desert. Teshu-H'Lumbu lies almost opposite to a pass across the Himalaya of Bootan, which is defended by the fortress of Dzigadze-Jeung. Teshu H'Lumbo, or, more correctly, Iachi H'Lumbo, contains from 300 to 400 houses, convents, temples, and palaces, which are surrounded by a wall, and all communicate with each other. The chief building, where the Lama resides, has the name of Lapranga, the most remarkable part of which is the mausoleum of the Teshu-Lama, who died in Peking in 1781. This mausoleum, of which Turner gives a careful description, has a most beautiful appearance, and is a fine specimen of Tibetan sculpture. It is said that 3700 Gylongs or monks are daily occupied in the performance of their various religious duties in the palace of Teshu H'Lumbu. The greater part of the country between Teshu H'Lumbu and H'Lassa is a fertile and beautiful tract, which extends along the river Dzangbo from west to east. At one day's journey east of Teshu H'Lumbo is Pina (Bainam), a small town with a fortified castle. Baldi or Bedi, another small town, lies on the northern bank of Lake Palte.

Inhabitants and History.—According to the legend Tibet was originally inhabited by animals and demons. At a certain period God sent to Tibet the king of the monkeys, who led there the life of a hermit: his exclusive occupation was the performance of religious duties, and he was absorbed in the pursuit of the knowledge of nonentity. When he was just on the point of attaining the object of his pursuit, he was disturbed in his contemplations by the visit of a female Manggus. The Manggus, whose Sanscrit name is Rakshas, are ugly demons, who however can adopt any figure they please. The Manggus who came to the king of the monkeys had assumed a beautiful figure, and proposed to the king to marry her. The king at first alleged his monastical duties, but at last he married the Manggus, and their descendants are the people of Tibet. (Schmidt, *Forschungen*, p. 211.) This account however, ridiculous as it may appear to a European, is all-important to a nation which believes in the metempsychosis, and is proud of its descent from a monkey, because he is one of the most cunning of animals. The first ac-

counts of the history of Tibet are in the annals of the Mongols and of the Chinese. The Tibetans belong to the Mongol race: they were at first divided into many independent tribes which led a nomadic life, like all the other Mongol tribes before the time of Genghis Khan. The first king of Tibet, according to Sanang Setsen, was Seger-Sandilitu-Khaghan-Tül-Esen, whose youth resembles that of Moses, for he was exposed by his father, and afterwards found in a copper box swimming on the river Ganga. He became king in 313 B.C., and united the four great tribes of Ngari, of Dzang, of K'ham, and of H'Lassa or Wei. One of his descendants was H'latotori, who was born in 348 A.D., and who became king in 367 A.D. In the fortieth year of his reign (407) Buddhism was introduced into Tibet. [BUDDHA.] The history of Tibet becomes more certain from the reign of king Srongdsan-Gambo, who was born in 617, and who ascended the throne in 629. He founded the town of H'Lassa, where he held his residence, and he built a splendid palace on Mount Pudala. His reign is particularly remarkable for the invention, or rather introduction, of the Tibetan alphabet. Tongmi Sambhoda invented this alphabet, which is only a modification of the Sanscrit alphabet; and he made the first Tibetan grammar. Srongdsan-Gambo, who is also renowned as a legislator and administrator, died in 699. His successors carried on war with China, in which they were often successful; but in 821 Tibet was compelled to pay tribute to China. Under king Dharma, who ascended the throne in 901, Buddhism was almost destroyed, the king having adopted the Black religion, or the Islam. Buddhism again became the dominant religion after Dharma had been murdered by a priest in 925.

In the beginning of the eleventh century each of the seven grandsons of king Bilamgur-Dzang became an independent prince; and from this event dates the entire decline of the kingdom of Tibet, the power of which had been already broken by the civil troubles which accompanied the persecution of Buddhism. One of the new kingdoms was Tangut, in the northern part of Tibet. Genghis Khan subdued all Tibet in 1206, according to Sanang Setsen, but Schmidt affirms that the Chinese and Mohammedan historians do not mention this fact. It is nevertheless a fact that Tibet was conquered and ravaged by the Mongols; and it was not before the end of the thirteenth century that the country recovered from the calamity of the Mongol war by the careful administration of Khublai-Khan. The easternmost parts of Tibet, which during the middle ages extended much farther to the east than they do at present, were gradually conquered by the Chinese in 1125, 1255, 1362, and 1371; and in 1727 another part of Tibet was incorporated with China, which has been mentioned above. Since the year 1720 all Tibet has been a vassal state of China, and Chinese garrisons are in its towns, and they watch the passes in the frontier mountains: the number of Chinese troops in Tibet amounts to 64,000 men. The tribute which Tibet pays to the emperor of China is composed of a great many different articles, which Ritter (iv., p. 233, 234) enumerates. The national government of Tibet is supported by a perfectly organized hierarchy. The name of the chief priests is Lama; and the Dalai-Lama is the first of them. The second is the Teshu, or Bogdo-Lama. The people are kind, tolerant, polite, and much more civilized than the Mongols, although they are generally poor. They live in a state of polyandry, that is, several men cohabit with one woman; but it is only brothers who are allowed thus to have one woman in common. Arts and literature are cultivated, but the works and the language of the Tibetans are almost unknown in Europe. The extreme north of Tibet is inhabited by nomadic Mongols, and Turkish hordes sometimes appear in the deserts of Khor and of Katehi. Both the Lamas are absolute princes in religious matters, but their sovereignty is checked by the authority of the emperor of China, who has two lieutenants or generals in Tibet, who control the Lamas, and who have the command of the army and the direction of temporal affairs. The high functionaries are almost all Chinese. A great number of officers are employed in the administration of the studs for breeding horses, and of the stores for the army.

TI'BIA. [SKELETON.]

TIBIA'NA, a genus of Polypiaria. [SERTULARIÆA.]

TIBULLUS, A'LBIUS, lived in the time of Augustus, and was a friend and contemporary of Horace. He was of equestrian rank, and originally possessed considerable property, of which he lost the greater part (Tibull., i. 1, 19, &c.; iv. 1, 128, &c.), probably, as it is conjectured, in consequence of the assignments of lands among the veterans of Augustus; and this supposition is rendered still more probable by the circumstance that Tibullus never celebrates the praises of Augustus, like the other poets of his time. He was not however reduced to absolute poverty; the estate on which he resided at Pedum (Horace, *Ep.*, i. 4), a town between Præneste and Tibur, appears to have been his own, and to have descended to him from his ancestors. (Tibull., i. 10, 15, &c.) Here he passed the greater part of his time in the enjoyment of a quiet country-life, which had for him the greatest charms. He left it however to accompany his patron, Valerius Messalla, into Aquitania, and was present with him through the campaign, either in B.C. 28 or 27. (Tibull., i. 7, 9.) He afterwards set out with him to Asia, but was taken ill at Corcyra; but that he died at Corcyra, as is stated by some modern writers, is only a conjecture, unsupported by any antient authority, and is directly contradicted by what Ovid says. It appears from an epigram of Domitius Marsus (in Tibull., iv. 15), who lived in the age of Augustus, that Tibullus died soon after Virgil; and as Virgil died in B.C. 19, we may perhaps place the death of Tibullus in the following year, B.C. 18. It has been already mentioned that Tibullus was the friend of Horace; two poems have come down to us addressed to him by the latter (*Carm.*, i. 33; *Epist.*, i. 4). Ovid too laments his death in a beautiful elegy, from which it appears that his mother and sister were present at his death (*Amor.*, iii. 9).

It is difficult to determine at what time Tibullus was born; and we can but at best make some approximation to it. In the epigram of Domitius Marsus, already referred to, he is called *juvenis*, and Ovid deplores his untimely death. We must not however be misled by the expression *juvenis* into supposing that he was quite a young man, in our sense of the word, at the time of his death, since the antients extended the meaning of *juvenis* to a time which we consider to be that of mature manhood. Several circumstances tend to show that he could not be much less than forty at his death. Ovid speaks of Tibullus as preceding Propertius, and of Propertius as preceding himself; and as Ovid was born B.C. 43, we must place the birth of Tibullus a few years at least before that time. Again. Horace in the first book of his Odes addresses Tibullus as an intimate friend, which hardly allows us to suppose that Tibullus was a mere youth at the time. If Bentley's supposition is correct, that the first book of the Odes was published about B.C. 30 or 28, Horace was then about 35, and Tibullus may have been a few years younger. Moreover he does not appear to have been a very young man when he accompanied Messalla into Aquitania in B.C. 28 or 27. We may therefore perhaps place his birth at about B.C. 57. There are indeed two lines in Tibullus (iii. 5, 17, 18), which expressly assign his birth to B.C. 43, the same year in which Ovid was born; but these are, without doubt, an interpolation derived from one of Ovid's poems (*Trist.*, iv. 10, 6).

We have thirty-six poems of Tibullus, written, with one exception, in elegiac metre, and divided into four books. The first two books are admitted by all critics to have been written by Tibullus, but of the genuineness of the last two, considerable doubts have been raised. J. H. Voss and others attribute the third book to a poet of the name of Lygdamis, but the style and mode of treating the subjects resemble the other elegies of Tibullus, and there do not appear sufficient reasons for doubting that it is his composition. There are however stronger grounds for supposing the first poem in the fourth book, written in hexameters, not to be genuine. It differs considerably in style and expression from the other poems, and is attributed by some writers to Sulpicia, who lived under Domitian, by others to a Sulpicia of the age of Augustus; but we know nothing with certainty respecting its author. Of

the other poems in this book, almost all bear traces of being the genuine works of Tibullus.

The elegies of Tibullus are chiefly of an amatory kind. In the earlier period of his life Delia seems to have been his favourite, and afterwards Nemesis, and their names occur most frequently in his poems. Several of his elegies are devoted more or less to celebrating the praises of his patron Messalla, but these are the least pleasing parts of his works, for he does not appear to have excelled in panegyric.

Tibullus is placed by Quinctilian at the head of the Roman elegiac poets (*Inst. Orat.*, x. 1). His poems are distinguished by great tenderness of feeling, which sometimes degenerates into effeminacy, but they at the same time excite our warmest sympathies. He seems to have been of a melancholy temperament, and to have looked at things from a gloomy point of view; hence we find the subject of death frequently introduced, and the enjoyment of the present interrupted by dark forebodings of the future. He constantly describes the pleasures of a country-life and the beauties of nature, for which he had the most exquisite relish; and there is in these descriptions a naturalness and truthfulness which place him above his contemporary Propertius. His style too is not of the artificial character which distinguishes the elegies of Propertius; and his subjects are not, like the latter, mere imitations or translations of the Greek poets, but essentially original works.

Tibullus was formerly edited together with Catullus and Propertius, the earlier editions of which are mentioned under PROPERTIUS. The principal separate editions are by Brockhusius (Amst., 1708, 4to.), Vulpius (Padua, 1749, 4to.), Heyne (Leipz., 1777, 8vo., often reprinted, of which the fourth edition, containing the notes of Wunderlich and Disseu, appeared in 1817-19, 2 vols. 8vo., Leipz.), J. H. Voss (Heidelberg, 1811, 8vo.), Bach (Leipz., 1819, 8vo.), Goldbéry (Paris, 1826, 8vo.), Lachmann (Berlin, 1829, 8vo.), and Dissen (Göttingen, 1835, 2 vols. 8vo.), of which the two last contain the best text.

Tibullus has been translated into English by Dart (1720), and Grainger (1759). The most modern German translations are by J. H. Voss (Tübingen, 1810), Günther (Leipz., 1825), and Richter (Magdeburg, 1831). There are also French and Italian translations.

Respecting the life of Tibullus and the Roman elegy in general, the reader may consult with advantage Gruppe's 'Die Römische Elegie,' Leipz., 1838.

TICHFIELD. [TITCHFIELD.]

TICHO'DROMA. [CREEPER, vol. viii., p. 147.] Mr. Swainson places the genus in the subfamily *Troglodytinæ* (family *Certhiadæ*). (*Classification of Birds.*) Mr. G. R. Gray arranges it under the subfamily *Certhinæ*, between *Climacteris*, Temm., and *Geobates*, Sw. (*List of the Genera of Birds.*)

TICI'NO, CANTON OF (*Tessin*, in French and German), one of the cantons of the Swiss Confederation, is situated south of the Lepontine and Rhætian Alps, and the surface slopes towards and merges in the great plain of Lombardy. It is the only Italian canton in the Confederation; and the inhabitants speak a Lombard dialect resembling the Milanese, and are Italian in their habits and manners: they are all Roman Catholics. The canton takes its name from the river Ticino, which has its sources in the great central group of the St. Gothard, flows southward along the Val Leventina, passes by Bellinzona, and then enters the Lago Maggiore at its northern extremity, and issues out of it at the opposite end by the town of Sesto in Lombardy. [PO, BASIN OF.] The canton is very mountainous, being intersected by several offsets from the great chain of the Lepontine and Rhætian Alps. A number of valleys, large and small, lie between these offsets, the largest running nearly parallel to each other, and sloping towards the south. The principal valleys are—1, the Val Leventina, already mentioned, called Livinen Thal in German, which runs in a southern direction through the centre of the canton. East of the Val Leventina are—2, the Val Blegno, drained by the river of the same name, which flows from the southern slope of the Grisons Alps and joins the Ticino below Poleggio; 3, the Val Moesa, which is a continuation of the Val Misocco, belonging to the canton of the Grisons; 4, the Val Morobbia, which slopes down from the Iöri Berg on the frontiers of Valtellina, and the water-drain of which falls into Ticino below Bellinzona. West of the Ticino are—5, the Val Maggia, one of the largest in the canton, which in its upper part is called Val Lavizzara; it is drained by the river Maggia, a rapid Alpine stream, which enters the Lago Maggiore near Locarno; 6, the Val Verzatca, which lies between the Val Leventina and the Val Maggia, and runs parallel to them, but is not so large as either; 7 and 8, the Val d'Onternone and the Centovalli, west of the Val Maggia, which they both join at its lower end near the Lago Maggiore.

A ridge called Monte Cenere runs across the southern part of the canton of Ticino from north-east to south-west. It detaches itself from the Iöri Berg, and runs to the east bank of the Lago Maggiore. South of this ridge lies the basin of the lake of Lugano, which is thus separated from the rest or northern part of the canton, the waters of which run into the Lago Maggiore. The lake of Lugano, called also Ceresio, lies within the territory of the canton, with the exception of its north-east extremity, which stretches into Austrian Lombardy. Its form is very irregular: its length is about 20 miles, but the breadth is little more than a mile, except in front of the town of Lugano, where it is about two miles wide: the surface is about 800 feet above the sea, and the greatest depth is 500 feet. A number of trading-boats ply on the lake. Its outlet is formed by the river Tresa, which runs into the Lago Maggiore. The lake of Lugano separates the southern part of the canton, consisting of the district of Mendrisio and the circle of Ceresio, which form part of the district of Lugano, from the rest of the canton, which lies north of the lake.

Only the northern extremity of the Lago Maggiore belongs to the canton Ticino. [LAGO MAGGIORE.] The canton of Ticino is bounded on the north by the cantons of Uri, Valais, and the Grisons; on the east partly by the Grisons and partly by the province of Como in Austrian Lombardy, on the south by the province of Milan, and on the west by the Sardinian states. The surface of the canton of Ticino may be divided into five regions: 1, the region of the vine, the fig, and the peach, which includes the lower valleys and hills, and extends to the height of 2400 feet above the Lago Maggiore. The olive, orange, and lemon-trees thrive in some favoured spots. 2, The region of the chestnut, the pear, the apple, and cherry-tree, which rises about 1000 feet higher. 3, The region of the fir-tree, which rises to about 4500 feet above the level of the lake. 4, The Alpine pastures, which reach as high as 6000 feet. 5, The region of perpetual snow, which includes several Alpine summits between 8000 and 9000 feet high. There is consequently a great variety of climate as well as of productions in the canton, but the people are not, generally speaking, as industrious as they might be. The horned cattle amount to about 52,000 head, the sheep to 23,000, goats to 75,000, and pigs to 27,000. The number of horses and mules is about 2000. Wolves and bears are hunted in the mountains. The rivers and lakes abound in fish. The principal articles of export are cattle, cheese, wine and fruits, hay, hides, and marble from the numerous quarries. Corn is imported from Lombardy. The manufactures are of no very great importance; they consist chiefly of coarse cloth, leather, platted straw, and tobacco. The silkworm is reared in some localities.

The population of Ticino amounted in 1833 to 109,000. The area is computed at about 1100 square miles. Several thousand people emigrate every year to work in other countries, as masons, porters, glaziers, chocolate-makers, and sellers of barometers. Many of them return home after a year or two, bringing with them some savings.

The canton is divided into eight districts, which are subdivided into circles. The districts are—1, Val Leventina, the northernmost part of the canton, lying at the foot of the high Alps; 2, Bellinzona, south of the Val Leventina; 3, Locarno, at the northern extremity of the Lago Maggiore; 4, Val Maggia; 5, Val Blegno or Blenio; 6, Riviera, on the borders of the canton of the Grisons; 7, Lugano, which stretches on both banks of the lake of the same name; 8, Mendrisio, south of Lugano, and which borders upon the lowland of Lombardy. The principal towns are—1, Lugano, a pretty-looking thriving town on the north-west bank of the lake of the same name, in a lovely situation, enjoying an Italian climate, has some fine churches

with paintings by Luvini, a pupil of Leonardo da Vinci, some large mansions or palaces, as they are called in Italy, an hospital, a theatre, manufactories of silk, paper, tobacco, leather, and iron and copper works, and 4500 inhabitants. There are at Lugano many merchants, it being one of the great high roads between Switzerland and Italy. The fair, which is held in the month of October, is well attended. Lugano has a college under the direction of the Fathers Somaschi, which is attended by more than one hundred pupils, several elementary schools, a school of drawing, a reading-room, and three newspapers in the Italian language. The country around Lugano is planted with vines, olives, and other southern trees, and full of country-houses. 2, Bellinzona, a walled town situated in the valley of the Ticino, on the high road of the St. Gothard, has a very fine church, a college, an arsenal, and about 1500 inhabitants. There are several ruined castles of the middle ages in the neighbourhood. 3, Locarno, a small town with a fort on the Lago Maggiore, in a romantic situation, has several churches worthy of notice, a castle, which is now the government-house, and about 1700 inhabitants. It was once a thriving town with 5000 inhabitants, but many of the principal families, being banished about the middle of the sixteenth century, for having embraced the doctrines of the Reformation, carried away their fortunes and their industry to Zürich and other places, and Locarno has never since recovered from the blow. The families of Orelli and Muralt, long established at Zürich, were originally from Locarno. 4, Mendrisio, a town of 1700 inhabitants, in a fertile country, and on the high road to Como and Milan, has a college, several churches and convents, a printing-press, and some silk manufactories. 5, Capolago, at the southern extremity of the lake of Lugano, known for its printing-press, where many Italian works are printed to avoid the censorship of the government of Italy.

The valleys and highlands of which the canton of Ticino consists were inhabited in the ante-Roman times by the Lepontii and other aboriginal tribes of mountaineers, who were finally reduced to subjection under Augustus. After the fall of the empire, the Longobards spread their dominion over the country. After several more vicissitudes in subsequent centuries, we find the country partly under the dominion of the Visconti, dukes of Milan, and partly under the feudal barons of Sax and other Rhætian lords, till the fifteenth century, when the Swiss of the Forest cantons conquered the Val Leventina, and soon after acquired Bellinzona and the country north of Mount Cenere by a formal cession from the barons of Sax. In the Italian wars of Louis XII., at the beginning of the sixteenth century, the Swiss obtained possession of Locarno, Lugano, and the rest of the country, which they formed into several Landvogteyen, or bailliages, some of which were under the exclusive dependence of the three Forest cantons, and others, such as Lugano and Locarno, were subject to the whole Swiss confederation. This state of things continued till the French invasion of Switzerland and the dissolution of the old confederation in 1798; the Cisalpine republic attempted to annex them by force to its territory, but the people of Lugano stood firm to their Swiss connection and repulsed the Cisalpines, and took from them several standards, which are still seen in the church of San Lorenzo of Lugano. The distinction between sovereign and subject states having at the same time disappeared from Switzerland, the whole district was united into one canton of the new Swiss confederation by the name of Ticino, and as such it was acknowledged by Bonaparte in his Act of Mediation, and afterwards by the allied powers in 1814. In June, 1830, the canton of Ticino changed its constitution and adopted one by which the franchise is given to all natives of the canton not younger than twenty-five years, and who are burgesses of a commune and are possessed of real property or capital placed at interest of the value of at least 300 francs. The qualification required for members of the Great Council is four thousand francs. The Great Council, or legislature, consists of 114 members, elected for four years, and appoints the members of the Little Council, or Executive, as well as the judges of the various courts. In ecclesiastical matters the canton of Ticino depends partly on the bishop of Como and partly on the archbishop of Milan. The public revenue amounts to about 800,000 francs, derived chiefly from customs, stamps, salt monopoly, and other taxes. There is a public debt of about four millions of francs. New codes have been lately framed, but much remains to be done to ensure the proper administration of justice in the canton, where venality, corruption, and infractions of the laws are evils of antient date, and still of not unfrequent occurrence. The standard of the intellectual and moral condition of the people in general is considered to be lower than that of most other cantons of Switzerland. Yet the canton of Ticino has produced several distinguished men in various branches, such as Professor Soave, the Abbé Fontana, Franscini, who is still living, the architects Fontana, Borromini, Maderna, Albertolli, and Bianchi, several sculptors and painters, several members of the family of Quadri, one of the principal families in the canton, and others. The people of Ticino are not deficient in intelligence, but they want instruction.

(Leresche, *Dictionnaire Géographique Statistique de la Suisse;* Franscini, *Statistica della Svizzera*, and his more especial description of his native canton.)

TICINO, River. [Po, Basin of the.]

TICKELL, THOMAS, an English poet of unblemished mediocrity. He was born in 1686, at Bridekirk in Cumberland. He was sent to Queen's College, Oxford, and he took his degree of Master of Arts in 1708. Two years afterwards he was chosen fellow of his college, and as he did not comply with the statutes by taking orders, he obtained a dispensation from the crown for holding his fellowship, till he vacated it by marrying in 1726.

His praises of Addison were so acceptable that they procured him the patronage of that writer, who 'initiated him,' says Johnson, 'into public affairs.' When the queen was negotiating with France, Tickell published 'The Prospect of Peace,' in which he raised his voice to reclaim the nation from the pride of conquest to the pleasures of tranquillity. This, owing perhaps to Addison's friendly praises of it in 'The Spectator,' had a rapid sale, and six editions were speedily exhausted.

On the arrival of King George I. Tickell wrote 'The Royal Progress,' which was printed in the 'Spectator.' Johnson says of it that 'it is neither high nor low,' a very equivocal criticism, considering Johnson's habitual tastes.

The translation of the first book of the 'Iliad' was the most important thing in Tickell's poetical career, having been published in opposition to Pope's; both appeared at the same time. Addison declared that the rival versions were both excellent, but that Tickell's was the best that was ever made. This praise ceases to surprise us when we find strong suspicions of Addison himself being the translator, as Pope, Young, and Warburton asserted. Dr. Johnson says, 'To compare the two translations would be tedious; the palm is now universally given to Pope. But I think the first lines of Tickell's were rather to be preferred; and Pope seems since to have borrowed something from them in connection with his own.'

During the dispute on the Hanoverian succession Tickell assisted the royal cause with his 'Letter to Avignon,' of which five editions were sold. Addison now employed him in important public business, and when, in 1717, he himself rose to be secretary of state, he made Tickell under secretary. On Addison's death, Tickell published his works, to which he prefixed an elegy on the author, which Johnson pronounces to be equal to any funeral poem for sublimity and elegance in the English language. Considering that we have the 'Lycidas' of Milton, this sounds oddly: on turning to this elegy, we are forced to admit, with Steele, that it is only 'prose in rhyme,' and very bad prose too. Such lines as—

'O'er my dim eyeballs glance the sudden tears.'

indicate the substitution of sound for sense, which writers like Tickell delight in. He never asked himself whether it was his eyeballs that were dim or whether tears glanced: all he knew was that dim, eyeballs, glance, tears, were common poetical phrases, and therefore suited his purpose. In 1725 Tickell was made secretary to the Lords Justices of Ireland, a place of honour in which he continued till his death, on the 23rd April, 1740.

(Johnson's *Lives of the Poets;* Campbell's *Specimens of British Poets.*)

TICKHILL. [Yorkshire.]

TICONDEROGA. [New York.]

TICOZZI, STEFANO, born in 1762, in the Val Sassina, in the province of Como, studied at Milan, and afterwards at Pavia, took priest's orders, and afterwards was appointed incumbent of a country parish near Lecco, in his native province. When the French invaded Lombardy in 1796, he and his brother Cesare Francesco, who was an advocate, favoured the revolutionary movement; but when the Austrians came back in 1799, Ticozzi was obliged to emigrate into France, and his brother was seized and sent prisoner to Cattaro. Ticozzi returned with the victorious French in the following year, and was appointed to several political offices under the Italian republic, and in 1806 was made sub-prefect of the department of the Piave under Napoleon's administration. In 1810 he published some disquisitions on monastic institutions: 'Degli Istituti Claustrali Dialoghi Tre,' 8vo., Belluno. He lost his situation on the fall of Napoleon, and retired to Milan, where he lived mainly by literary labour. He translated into Italian Sismondi's 'History of the Italian Republics,' Llorente's 'History of the Inquisition,' Agincourt's 'History of the Arts,' and other works. In 1818 he published his 'Dizionario dei Pittori dal Rinnovamento delle Arti fino al 1800,' which he afterwards merged in his larger work, 'Dizionario degli Architetti, Scultori, Pittori, Intagliatori in rame e in pietra, Coniatori di Medaglie, Musaicisti, Niellatori, Intarsiatori d'ogni Età e d'ogni Nazione,' Milan, 4 vols. 8vo. This is a really useful compilation, although not always exact about dates. He also published—1, 'Memorie Storiche,' Florence, 12 vols. 8vo., being a series of historical tales taken from the history of Italy in the middle ages; 2, 'Viaggi di Messer Francesco Novello da Carrara, Signore di Padova, e di Taddea d'Este, sua consorte, a diverse parti d'Europa,' 2 vols. 8vo., a work also illustrative of the same period; 3, a continuation of Corniani's biographical work, 'I Secoli della Letteratura Italiana,' down to our own times, and also a continuation of Bottari's collection of letters concerning the arts: 'Raccolta di Lettere sulla Pittura, Scultura, ed Architettura, scritti dai più celebri Personaggi dei Secoli xv., xvi., e xvii., continuata fino ad nostri Giorni,' 8 vols. 8vo.; and likewise a continuation of Verri's 'History of Milan:' 'Storia di Milano del Conte Pietro Verri, dai suoi più rimoti Tempi fino al 1525, continuata fino alla presente Eta,' Milan, 6 vols. 12mo., besides several dissertations upon various paintings and other minor works. He left inedited and unfinished a Life of Correggio, and 'A Treatise on the Art of distinguishing Copies from the Originals in Paintings.'

Ticozzi died in 1836. He married a granddaughter of the historian Giannone, by whom he had several children.

(Tipaldo, *Biografia degli Italiani Illustri.*)

TIDE-MILL, a kind of water-mill in which the machinery is impelled by the alternate flow and ebb of the tide, instead of a stream continually flowing in one direction and at a nearly uniform level. Although tide-mills have never been brought into very common use in this or in other countries, they are by no means of recent origin. Beckmann, in his 'History of Inventions' (English edition of 1814, vol. i., p. 245), states that 'at Venice and other places there were mills which righted themselves by ebbing and flowing of the tide, and which every six hours changed the position of the wheels;' and he adds that 'Zanetti has shown, from some old charters, that such mills existed about the year 1044, and with still more certainty in 1078, 1079, and 1107.' Belidor, in his 'Architecture Hydraulique,' describes a tide-mill which was used at Dunkerque early in the last century, and attributes the invention to a master-carpenter of that place, named Perse. The expense attending the construction of tide-mills renders their adoption unadvisable in ordinary cases; but in many situations in which other mills are inapplicable, owing to the want of a sufficient current, or the necessity of avoiding any interference with the navigation of a stream, they may be erected with advantage. The water required for impelling their machinery may be admitted either from the side of a tidal river or immediately from the sea.

The late Dr. Gregory, in the second volume of his 'Treatise on Mechanics,' has devoted several pages to an account of various plans for obtaining a moving-power from the rising and falling of the tide; and, although he does not pretend to notice all the contrivances which have been proposed for the purpose, he divides the most important into four classes, varying from each other in the manner in which the motion of the water-wheel is effected and applied to the machinery of the mill. In the first of these the wheel turns in one direction while the tide is rising, and in the opposite direction while it falls; in the second the passage of the water is so regulated by sluices, that the wheel may always turn in one direction; in the third the wheel itself rises and falls with the tide, so as to preserve a tolerably equal degree of immersion, or a uniform head of water to act upon its float-boards; and in the fourth the axle of the wheel is permanently fixed at one level, and the wheel is so constructed as to revolve whether partially or completely immersed in the water. Of these conditions it is observed that the first and third have been usually exemplified in one machine, and that the second and fourth may readily be united in another. Dr. Gregory therefore treats of tide-mills under two heads, which are as follow:—1. Tide-mills in which the water-wheel rises and falls, and turns one way with the rising tide, and the contrary when it ebbs; and, 2. Tide-mills in which the axle of the water-wheel neither rises nor falls, and in which that wheel is made always to revolve in the same direction.

Of the first of these varieties of tide-mill a good example is given from a corn-mill erected on the bank of the Thames, at East Greenwich, by Mr. Lloyd. The details of the mechanism are fully explained by Gregory, and also by Professor Barlow, in his 'Treatise on Manufactures and Machinery' in the 'Encyclopædia Metropolitana:' but the essential features of the contrivance may be briefly described. The side of the mill which is parallel to the river is forty feet wide, and is capable of being opened to the river by sluice-gates, which are carried down to low-water mark. Thus there is a water-way forty feet wide through the mill, by which the rising tide enters a reservoir, which covers about four acres of land. A smaller reservoir beyond the principal one affords the means for cleansing the whole apparatus by flushing or scouring at low-water. The water-wheel is a cylinder twenty-six feet long and eleven feet in diameter, with thirty-two float-boards, arranged in four divisions on the same principle as the divided paddle-wheel described under STEAM-VESSEL, vol. xxii., p. 509, in order to equalize the action of the water; and its axis is laid in a position parallel to the side of the river, so that it may be turned with equal facility by a stream flowing from the river into the reservoir, or from the reservoir into the river, according to the direction in which the tide is moving, and the positions of the sluices for admitting the head of water on one side, and allowing free vent for the tail-water on the other. At each end of the water-wheel is fixed, upon the same axis, a large bevil-wheel, from which the rotatory motion is communicated to an upright shaft, by means of two small horizontal bevil-wheels, called wallowers, either of which may be readily thrown into connection with the large wheel, while the other revolves freely, without coming in contact with it. Thus, by throwing the upper wallower into gear while the water-wheel revolves in one direction, and the lower one when its motion is reversed, the vertical shaft is made to revolve continually in one direction. The water-wheel, and the parts immediately connected with it, forming an apparatus of the weight of nearly twenty tons, are so mounted as to rise and fall by the action of the water, with very little attention; the bottom of the wheel-frame being connected with a kind of horizontal folding-door, which prevents any communication between the river and the reservoir, excepting in the required direction, whatever may be the position of the wheel-frame. The motion of the vertical shafts is communicated to the machinery of the mill by large horizontal wheels which turn with the shafts, but do not rise and fall with them. The weight of these horizontal wheels is supported by a series of friction-rollers resting upon a stationary part of the machinery, so that the vertical shafts, which are squared to fit the naves, may slide freely up and down, although they cannot turn round without turning the wheels.

Of the means for effecting the objects required in the second of the above-mentioned varieties of tide-mills, a very slight notice will suffice. Belidor describes a water-wheel contrived by MM. Gosset and De la Deuille, in which the float-boards are hinged in such a manner that, while at the bottom of the wheel, they would press against

the radii or arms of the wheel, and would present their full surface to the action of the current, while in any other position they would, by turning on their hinges, present little more than their edges to it. Such a wheel will revolve when completely immersed in water, although an ordinary water-wheel would be quite stationary. Gregory deseribes also a bucket-wheel invented by Mr. Dryden, which will work with nearly equal force, whether the head of water be within one or two feet of the top of its periphery, and the tail-water above the level of the axle, or the tail-water level with the bottom of the wheel, and the head at a proportionate elevation, but below the level of the axle. The float-boards, or divisions between the buckets, are all set at one angle with the radii of the wheel, and a small space is left between each float and the drum-boarding, or soling of the wheel, to allow air to enter the buckets freely as they rise out of the water, and thereby to prevent the loss of power occasioned by the formation of a partial vacuum in the rising bucket, causing it, in the language of the miller, to 'suck up the tail-water.' The uniform rotation of the wheel in one direction must be provided for by having two passages, provided with sluices, from each end of the water-way in which the wheel is placed; one passage leading to the river, and the other to the reservoir. By opening and closing the sluices alternately, the current, whether from the river to the reservoir or from the reservoir to the river, may always be made to pass under the wheel in the same direction. M. Navier, in his notes to the new edition of Belidor, published at Paris in 1819 (in which tide-mills are treated of at considerable length), states that the former kind of wheel, with hinged floats, had been tried successfully in Spain, by M. Dussaussoy, an officer of artillery. A work by Aldini on the tide as a moving-power for mills was published early in the present century.

TIDEMAN, PHILIP, was a native of Nürnberg, where he was born in the year 1657. He studied first under a painter named Nicholas Raes, with whom he remained eight years, and was distinguished by his diligent application to his art, in which he attained great proficiency. Desiring however to improve his knowledge and taste, he went to Amsterdam to study the capital works of the great masters in the collections in that city.

Lairesse being at that time in great esteem at Amsterdam, Tideman resolved to place himself under his direction; and so gained the good opinion of his teacher by his pleasing manners and his talents, that Lairesse conceived a great affection for him, and not only gave him the best instruction in the art, but employed him to assist in some important works on which he was engaged. In executing these works Tideman gave such evident proof of his abilities, that he soon obtained sufficient employment independent of Lairesse.

His compositions of fabulous history and allegory indicate a lively fancy, genius, and invention; insomuch that in this respect his designs have been recommended as models to succeeding artists. Two of his capital compositions were Venus complaining to Jupiter of Juno's persecution of Æneas, and Juno applying to Æolus to destroy the Trojan fleet. He died in 1715, at the age of fifty-eight, leaving a very great number of sketches and designs, which afford proofs both of his industry and the fertility of his invention.

(Pilkington; Fuseli; Bryan.)

TIDES. [Wave.]

TIDESWELL. [Derbyshire.]

TIDORE, one of the Moluccas, is situated in the strait which divides the island of Gilolo from that of Celebes, and is traversed by 45′ N. lat. and by 127° 25′ E. long. It is only about 21 miles in circumference. Near the southern coast rises a mountain in the form of a cone, which is of volcanic origin. According to an estimate its summit may be about 4000 feet above the sea-level. The soil is composed of volcanic matter mixed with a considerable portion of vegetable mould, and abundantly watered by numerous rivulets which descend from the mountain: it is of great fertility, well cultivated, and produces rice in abundance. The sago-tree, as well as the clove and nutmeg-tree, grow wild, though the Dutch have been at great pains to extirpate the trees, to secure the monopoly in spices. The island is very populous, and governed by a sultan, who also possesses the southern and middle portions of Gilolo, where the towns of Maba, Wida, and Patang belong to him. He claims also the islands which are situated between Gilolo and Papua, namely, Wageeow, Battanta, and Mysole, and lives in great state. The inhabitants are Malays and Mohammedans. At the time of Forrest's visit (1774) there were twenty-five mosques on the island.

This island was first visited by the vessels with which Magalhaens sailed round the globe in 1521, and the Spaniards loaded their ships with spices. They returned five years after, and found that the Portuguese had begun to establish their authority on the Moluccas. This gave rise to a war between the Spaniards and Portuguese, which ended, in 1529, by the emperor Charles V. renouncing his rights to the Moluccas, and receiving from the king of Portugal as an equivalent a loan of 350,000 ducats. Tidore was visited by Sir Francis Drake in 1579. In 1613 the Dutch took all the Portuguese settlements on these islands, and began to subject their sovereigns to a more strict obedience for the purpose of establishing their monopoly in the spice trade. They treated them for some time with great harshness. In 1778 the sultan of Tidore was dethroned and exiled to Batavia, but he was afterwards re-established. In 1796, when the British took Amboyna under Admiral Rainier, Tidore, being dependent on its government, fell also into their power: it was restored by the peace of 1801. In 1808 the sultan of Tidore, disagreeing with the Dutch at Amboyna, was expelled and obliged to fly to Papua. He applied to the English for assistance, and with their aid he recovered the greater part of his possessions. Soon afterwards (1810), the English having again taken possession of Amboyna, the sultan of Tidore became dependent on them; but in 1814 all the settlements on the islands of the Indian Archipelago which had been taken by the English, were again restored to the Dutch, and the sultan of Tidore is now dependent on the Dutch government.

(Forrest's *Voyage to New Guinea and the Moluccas;* Stavorinus, *Voyages to the East Indies.*)

TIEDEMANN, DIETRICH, a German philosopher, was born the 3rd of April, 1748, at Bremervörde, near Bremen, where his father was burgomaster. He received his earliest education at home, and as he was scarcely allowed to have any intercourse with other children, his leisure hours were spent in reading. His father sent him in 1763 to Verden, where he was chiefly engaged in acquiring a knowledge of the antient and some modern languages. After a stay of two years there he entered the Athenæum of Bremen. The system of education and the distinguished masters of this institution had great influence on young Tiedemann. It was here that he first conceived a love for philosophy and its history, and he began his philosophical studies by reading the works of Descartes, Locke, Helvetius, and Malebranche. After spending eighteen months at Bremen, he entered the university of Göttingen, with the intention of studying theology pursuant to his father's wish; but he continued the study of classical literature, mathematics, and philosophy. The study of philosophy raised in his mind strong doubts respecting certain main points of the Christian religion, which he was unable to overcome, and this led him to abandon the study of theology. He now tried jurisprudence, but notwithstanding the entreaties of his father to devote himself to some profession, he abandoned the study of the law also, and at last determined to follow his own inclinations, and to give himself up entirely to philosophy and its history. His father, dissatisfied with his son's conduct, refused to send him further means of subsistence. After having spent two years and a half at Göttingen, Professor Eyring proposed to him to take the place of tutor in a nobleman's family in Livonia, which Tiedemann accepted very reluctantly. In 1769 he entered his new situation, in which he remained four years, although he was shut out from all means of prosecuting his own studies, and had to devote almost all his time to his pupils. Nevertheless he found time to write a little work on the origin of language, a favourite topic with the philosophers of that time. It was published under the title, 'Versuch einer Erklärung des Ursprungs der Sprache,' Riga, 1772, 8vo. In the year following he returned to his native place, and after having spent a year there in studying various subjects which he had neglected in Livonia, he again went to Göttingen. His friend Meiners, who was now a professor in the university, introduced him to Heyne, who immediately made him a member of the philological seminary. The small income

derived from this institution and from private instruction, together with what he got by writing, enabled him to live in independence. His work on the Stoic philosophy appeared under the title of 'System der Stoischen Philosophie,' Leipzig, 1776, 8vo., with a preface by Heyne, who had recommended the publication. In this year Heyne was applied to in order to recommend a competent person for the professorship of antient literature at the Carolinum in Cassel. Heyne recommended Tiedemann, and accepted the place for him without telling him of it. Tiedemann was delighted with the place, as it did not occupy too much of his time, and put him in connection with some of the most distinguished men in Germany. The study of philosophy and its history was now prosecuted with fresh zeal and vigour. The philosophical views which he had imbibed from the authors whom he had most studied tended towards materialism; but his friend Tetens vigorously counteracted them, and at length succeeded in turning his mind in a different direction. In the year 1786, when the Carolinum was broken up, Tiedemann was transferred with the other professors to Marburg. Here he lectured at different times on logic, metaphysics, the law of nature, on moral philosophy, psychology, universal history, history of philosophy, and sometimes also on some classical Greek writer. His lectures were very popular, and his kind disposition made his hearers look upon him more as a friend than as a master. Sometimes, especially during the last period of his life, he did not conduct himself with the calmness and dignity of a philosopher in combating the philosophy of Kant, to which he was opposed. He died in the midst of literary undertakings, after a short illness, on the 24th of May, 1803.

Tiedemann was beloved and esteemed by all who knew him. His life was spent in intellectual occupations and bodily exercise, of which he was very fond. His striking qualities were great self-control, cheerfulness, and a total absence of all pretension to literary superiority, although his works were extremely popular. Besides the works already mentioned, the following deserve notice:—'Untersuchungen über den Menschen,' Leipzig, 1777, &c., 3 vols. 8vo.; 'Griechenlands erste Philosophen, oder Leben und Systeme des Orpheus, Pherecydes, Thales, und Pythagoras,' Leipzig, 1780, 8vo.; 'Hermes Trismegists Poemander, oder von der gottlichen Macht und Weishiet,' Berlin and Stettin, 1781, 8vo. This work is a translation from the Greek of Hermes Trismegistus. 'Geist der Speculativen Philosophie,' Marburg, 1791-97, 6 vols. 8vo. This work is a history of philosophy from the time of Thales down to Leibnitz and Christian Wolff, and is still useful for the materials which it contains. In style and arrangement it is deficient, and the author did not possess that critical and profound knowledge of philosophy which would have enabled him to perceive the organic connection and the necessary succession of the various philosophical systems. 'Theaetet, oder über das menschliche Wissen,' Frankfurt, 1794, 8vo.; 'Handbuch der Psychologie.' This work was edited after the author's death (Leipzig, 1804, 8vo.) by L. Wachler, who has prefixed to it a biographical memoir of Tiedemann. Besides these greater works Tiedemann wrote numerous smaller treatises and made many translations from the French: he also contributed papers to several periodicals. He is the author of some Latin dissertations, among which we may mention three programs: 'De Antiquis quibosdam Musei Fridericiani Simulacris,' Cassel, 1778-80, 4to.; 'Dialogorum Platonis Argumenta exposita et illustrata,' Bipont, 1786, 8vo.; 'Dissertatio de Quaestione: quae fuerit artium magicarum origo, quomodo illae ab Asiae populis ad Graecos atque Romanos et ab his ad exteras gentes sint propagatae,' &c., Marburg, 1787, 4to.

(L. Wachler's Memoir of Tiedemann, in his *Handbuch der Psychologie;* Creuzer, *Memoria Diterici Tiedemanni*, Marburg, 1803, 4to.; and Jorden's *Lexikon Deutscher Dichter und Prosaisten*, vol. v., p. 76-86.)

TIEDGE, CHRISTOPH AUGUST, 'The Nestor of German Poetry,' and one who has now taken his place among the German classics, was born at Gardelegen in Altmark, Dec. 14th, 1752. His early prospects in life were by no means flattering, for the death of his father (Conrector at the Magdeburg gymnasium), in 1772, left him and a family of younger children in a very destitute situation. He completed however his legal studies at Halle; but notwithstanding the favourable opinion his talents had acquired for him, he soon abandoned the profession for which he had prepared himself, and, in 1776, accepted the situation of private teacher in the Arnstadt family at Elrich in Hohenstein. The choice he had made proved a fortunate one, since it eventually led to connections and friendships that proved very advantageous. The immediate result of the course he had adopted was an intimacy with Gökingk, Gleim, and other literary persons of that day, including the Baroness von der Recke. The friendships thus formed, laid the foundation of the prosperous and unruffled tenour of his after-life. On quitting Elrich he was invited by Gleim to reside with him at Halberstadt, which he continued to do until 1792, when he became private secretary to Domherr von Stedern; and though he died in the following year, Tiedge remained in the family upon the same footing during the life of Madame von Stedern, who, at her death, in 1799, secured to him a handsome competency. Being thus placed perfectly at ease in his circumstances, he travelled through the north of Germany, and visited Berlin, where it was his good fortune again to meet with Madame von der Recke, and the intimacy thus resumed continued for life. Though not in accordance with the ordinary usages of society, it was entirely free from the slightest suspicion of impropriety, and no more open to it than was the similar domestication of Cowper with Mrs. Unwin. This union, of a kind so exceedingly rare that no name has been invented for it, was that of two noble and pure minds, congenial in their tastes, and equally inspired with a feeling for poetry and those pursuits which, while they refine, also elevate our nature. The author of 'Urania' was as well shielded from scandal as was the author of the 'Task;' for although very different in form, the first-mentioned poem is, like the other, deeply tinged by religious sentiment; and its merits were more immediately recognised, for it went through several editions within a very short time from its first appearance in 1801.

In 1804 Tiedge and his female friend visited Italy, where they remained about two years; and of this journey we have an account from the pen of Madame von der Recke herself, 'Tagebuch einer Reise,' &c., 4 vols. 8vo., with a preface and notes by Böttiger, which, besides being very superior to the general class of tour-books, affords evidence of her being a zealous though candid Protestant, and a woman of strict piety. On their return to Germany, Madame von der Recke made Berlin, and afterwards (1819) Dresden, her chief place of residence, passing the summer months at Teplitz or Carlsbad. The only change Tiedge henceforth experienced was that occasioned by the loss of his companion and benefactress, for she had taken care that her death (1833) should cause no change whatever in his outward circumstances, not even that of his residence; as she directed that her establishment should be kept up for him precisely as before, and that he should continue to enjoy the luxuries and comforts he had so long been accustomed to. Nor was her anxious solicitude for her friend's welfare useless; for so pre-eminently was Tiedge favoured beyond the ordinary lot, that he not only attained an unusual age, but nearly free from all infirmities of either body or mind. In his eighty-ninth year, says one who appears to have known him personally, he did not seem to be much more than sixty: the only alteration in him was, that for some years he could not take exercise on foot, or stir out except in a carriage or a wheel-chair. Even but a week before his death (March 8th, 1841) he was at the birth-day fête of one of his friends.

Soon after his death, his 'Life and Literary Remains' were given to the world by Dr. K. Falkenstein, in 4 vols.; and an entire edition of all his works, in 10 vols., is now in course of publication. After his 'Urania,' his most original production is perhaps his 'Wanderungen durch den Markt des Lebens,' 1836, which, like the other, may be said to be lyric-didactic, and similar in tendency, though of a less decidedly religious character, the seriousness of its moral precepts being relieved by the tone of playful irony which pervades many parts of the poem. His principal other productions are his 'Poetical Epistles,' his 'Elegies,' and his 'Frauenspiegel,' all which have contributed to his reputation. The esteem in which the poet of 'Urania' is held is proved by the fact that, in honour of his memory, a 'Tiedge Verein,' or Tiedge Institution, has just been established at Dresden, one object of which, it appears, is to give a literary prize every five years, and

another to make some provision in their declining years for meritorious writers who may have fallen into adversity in consequence of age and infirmities.'

TIEL. [THIEL.]

TIE'POLO, GIOVANNI BATTISTA, a celebrated Italian painter of the eighteenth century, was born of a good family at Venice in 1693. Tiepolo, says Lanzi, was the last of the Venetians who acquired a European fame; celebrated in Italy, in Germany, and in Spain. He studied as a boy under Gregorio Lazzarini, painted at first in his manner, then imitated the style of Piazzetta, but attached himself eventually to that of Paul Veronese. Already at the age of sixteen he was known even out of Venice, and when still young he received invitations from various Italian cities to decorate their churches and their public buildings. His works in the north of Italy, both in oil and in fresco, are numerous: one of his first works of note was the Shipwreck of San Satiro, in the church of St. Ambrose, at Milan: he excelled chiefly in fresco, and his colouring and the folds of his draperies bear great resemblance to those of Paul Veronese. In Germany also Tiepolo executed several works: at Würzburg he painted the staircase and the saloon of the bishop's palace and two altar-pieces. He was afterwards invited by Charles III. to Spain, where, in Madrid, he painted the ceiling of the saloon in the new palace of the king, and the hall of the royal guard, by which he is said to have excited the jealousy of Mengs: he executed also the chief altar-piece in oil for the convent church of St. Paschal, at Aranjuez. He died in Madrid in 1769 or 1770.

Tiepolo's style was slight and brilliant, yet his colouring was not glaring: the effect of his paintings was not produced by a recourse to bright colours, but by a judicious contrast of tints: his drawing was however feeble, yet this weakness was nearly concealed by the gracefulness of his attitudes. One of his best pictures in oil is the Martyrdom of St. Agatha, in the church of St. Antonio, at Padua. He etched several plates in a very free and spirited manner. He left two sons, Giovanni Domenico and Lorenzo, who were both painters: the elder etched some of his father's designs.

(Zanetti, *Della Pittura Veneziana*, &c.; Lanzi, *Storia Pittorica*, &c.; Fiorillo, *Geschichte der Mahlerey*, vol. ii.)

TIFLIS, or TEFLIS, the capital of the Russian province of Georgia, is in about 41° 43′ N. lat., according to Capt. Monteith. In 1829 Mr. Federof, who accompanied Professor Parrot on his visit to Mount Ararat, found the latitude of the cathedral church to be 41° 41′. The longitude, according to Birdin, is 62° 34′ E. from Ferro, or 44° 50′ E. of London. Professor Parrot fixes the elevation of the stone bridge over the river Kur at exactly 1100 feet above the level of the Black Sea, and 31 feet above the mean level of the river. The Kur flows through a valley confined between two ranges of lofty mountains. The river enters the valley on the north, and 'at the extremity of the defile,' says Sir R. K. Porter, 'we saw the capital of Georgia, the massy towers of Tiflis rising on the precipitous and sublime banks of the Kur. But the effect produced here is of a deeper tinge. The town itself stands at the foot of a line of dark and barren hills, whose high and caverned sides gloomily overshadow it. Every house, every building within its walls, seems to share the dismal hue of the surrounding heights; for a deep blackness rests on all. The heavy battlements above, and the still majestic towers of the ancient citadel, the spires of Christian churches, and other marks of European residence, could not for some time erase the horrible dungeon impression of Asiatic dirt and barbarism received at first view of the town.' This was written in 1817.

The town is built on both sides of the river; but the larger portion, which is on the right or west bank, contains the houses of the wealthiest inhabitants, the great bazar, the principal squares, the finest churches, the public offices, the residence of the military governor, and of the commander-in-chief. This is the city properly so called, which again is divided into two parts, the old and new town. The limits of the old town are distinctly marked by the ruins of the antient fortifications. The new town extends to the north and west beyond these walls, and is distinguished from the old town by its new buildings in the European style and broader streets. The greater part of it is called by the Georgians Goretuban, that is, the street out of the city. On the left bank is the extensive suburb Awlabar, a large caravansary, the barracks, a long row of houses inhabited by colonists from Southern Germany, and the fortress or citadel, built by the Turks in 1576. Toward the south the town leans against the chain of hills running from the south-west, on the summit of which are extensive ruins of a very antient fortress; its highest point at the western end of the old wall is 392 feet above the bridge; towards the west it rises higher, and from thence a small stream of water is conducted to the city the bed of which however is generally quite dry, except immediately after rain.

There are in Tiflis 15 Greek churches, 20 Armenian, and 2 Roman Catholic, some of which are very handsome. At a point where the river in its course through the town is hemmed in by rocks, a bridge of a single arch connects the town with the suburb of Awlabar. Here also are the ruins of an antient fort, church and houses, and about two miles farther from this side of the city stand the remains of another sacred edifice, on the summit of a lofty hill.

The houses in Tiflis are ill-built, and the streets so narrow that only one carriage can pass through the widest, and in the smaller streets there is scarcely room for a horseman. We must not however derive our ideas from the description of travellers, before or for a few years after the incorporation of Georgia with the Russian empire in 1801. The letters on the Caucasus and Georgia in 1812, written by the wife of a Russian envoy, speak of Tiflis as 'a mass of ruins, melancholy monuments of the ravages of Aga Mahomet and the Persians.' Sir Robert Ker Porter, in 1817, says that the governor was making great improvements, ordering all ruinous houses to be repaired, or entirely pulled down to make way for the erection of new ones. Among these improvements are the alterations in the great bazar, a long narrow winding street with shops on both sides, which he had caused to be entirely roofed in, with circular apertures to admit air and light. Professor Eichwald, who visited Tiflis in 1825 and 1826, and gives some particulars as late as 1829, says, 'Since the year 1801 tranquillity and security have returned, and are now firmly established in Georgia; civilization and commerce increase every year; since that time Tiflis has been improving in its appearance, is continually enlarged by new buildings, and its inhabitants have easily become familiar with all the comforts and even the luxuries of European life.' Professor Parrot, who was there in 1829, speaks in similar terms of the improvements introduced by the Russian government, but does not appear to be so satisfied with the introduction of European fashions.

One of the worst effects of the habitual intercourse with Europeans is the change that has been made in the manners of the women, who have thrown off their former Asiatic restraint, without adopting the reserve and decorum of European manners. This effect is much more decided among the lower orders, because the troops are quartered in the houses of the inhabitants, so that the customary line of separation between the women and the men could no longer be preserved. This circumstance greatly disgusts the Georgians, and they accordingly hailed with delight the judicious ukase of 1829, by which the proprietors of newly-built houses are exempted from receiving soldiers into their houses for six years.

Tiflis has been chiefly indebted for its celebrity to its warm baths, and its Georgian name, Tphilisk Alaki, is equivalent to 'warm town.' Parrot says, its name is derived from the Georgian word *tbili*, warm, which may have been given it either on account of the warm springs, or from the contrast of the great warmth of the climate of Tiflis, with the preceding residence of the Georgian kings at Mzchet, which lies on the declivity of the Caucasus, and has a much cooler temperature. The building of Tiflis and the transferring of the royal residence to this place were effected about the year 455, by king Waktang I., Gork-Aslan. (Klaproth, *Reise*, i. 715; ii. 164.) The mineral springs rise in considerable numbers at the south end of the city, between the strata of limestone, whence they are conducted into the cavern excavated in the solid rock, under one immense roof, divided into different apartments for the men and the women, into which not a ray of day-light is admitted, and which are merely rescued from total darkness by the faint glimmerings of a few

twinkling lamps struggling with the vapour arising from the water. The stench of the place and the disorder and filth which this meagre illumination renders visible, show, says Sir R. K. Porter, sufficient argument for the whole having been left in shade. He observes however that this want of order and cleanliness is not to be wondered at, since the entrance to the baths is free to all, and they crowd indiscriminately into every chamber. Sir Robert went to look at these baths, and was much surprised at being urged by a gentleman who accompanied him, to view the baths of the women, to which they were shown by an old woman. Their entrance did not seem to cause any alarm or astonishment. These waters are reputed to be very beneficial in rheumatic complaints and cutaneous disorders. No chemical analysis that can be depended on has yet been made. Professor Parrot, who examined 17 springs in four different baths, states the hottest at 37°, and the coolest at 19° Réaumur. There are only two springs below 30°; the temperature of the air in the shade, out of the baths, was from 15° to 16° Réaumur.

The situation of Tiflis would certainly make it one of the most delightful spots in the world, if the mountains between which it lies were not totally destitute of trees. They now only reflect the rays of the sun from the southern slope of the Caucasus (which also keeps off the cooling north and north-east winds), and thus produce in the valleys an oppressive heat, which often strikes like the glow of a furnace, and may perhaps be the cause of the bilious diseases prevalent here. The greatest heat during the residence of Professor Parrot was on the 28th of July, between 3 and 5 in the afternoon, 30° 4′ Réaumur.

Though Professor Parrot states that 'notwithstanding the great advantages held out by the Russian government, which entices many persons from Russia and other countries, yet all, from the counsellor of state and general down to the clerk and common Cossack, often long in a few weeks to return to their native country as to a lost paradise;' yet the population is constantly and rapidly increasing. In 1820 it was stated not to exceed 15,000, and is now probably nearly 45,000, it having been 40,000 three years ago. Full one-half are Armenians, the remainder chiefly Georgians, that is, old Greek Christians, some Roman Catholics, and about a hundred Mohammedans. It is the residence of a Georgian patriarch, a Georgian metropolitan, and an Armenian archbishop. There are some manufactories of woollen, cotton, and silk.

Tiflis is most favourably situated to be the medium of an extensive trade between Europe and Asia, but it is only since the arrival of the Russians and the peace of Gulistan that there has been any direct commerce with Georgia. At first, and till the emperor Alexander granted free trade to the trans-Caucasian province, the Armenians merely purchased such goods as they wanted for common use at the fair of Nishnei Novgorod, to which they brought Persian goods, raw silk, Cashmere shawls, and pearls, which they exchanged for woollens, linen, printed calicoes, &c.: they often bought with ready money. In 1821 the ukase granting freedom of trade was published, and commerce greatly increased. In 1823 a rich Armenian went to Odessa, where he purchased goods to the amount of many thousand pounds, which he disposed of to great advantage at Tiflis.

In the following year for the first time, six Armenian merchants came to Leipzig fair, where they purchased European manufactures to the amount of 600,000 rubles banco (25,000*l.*), which they conveyed through Galicia and the south of Russia to Odessa, where they were embarked for Redout Kale. In the year 1825 the value of the goods purchased at Leipzig was 1,200,000 rubles, and in the following year twice as much. Professor Eichwald says it is much to be wished that some European merchants might settle in Tiflis, and endeavour to improve the trade from that city to Persia, Afghanistan, Bokhara, and Tibet. Then the caravans from Cashmere, Cabul, and Tibet would no longer go to Tauris and Ispahan, but cross the Caspian Sea, and so up the Kur to Tiflis, whence the goods would be forwarded over the Black Sea to Europe.

The trade with Persia is very important, and is almost entirely in the hands of the Armenians of Bushire on the Persian Gulf and of Tiflis. The former trade chiefly to the East Indies: the greater part of the ships which navigate between Bushire and Bombay belong to the Imaum of Muscat: only a few English ships come to Bushire. The value of goods brought from India to Persia was two millions of ducats in 1826, and the exports from Persia to India 500,000 ducats. A considerable part of this trade takes the way of Basrah, from which place the manufactures of England and India go up the Euphrates, and are disposed of in Turkey. The transit trade of foreign goods, which chiefly come from Leipzig, is an important branch of the trade between Tiflis and Persia. On the whole the commerce of Tiflis is increasing every year in extent and value.

TIGA, Professor Kaup's name for a genus of birds (*Chrysonotus*, Sw.; *Picus*, Horsf.), placed by Mr. G. R. Gray in the subfamily *Celeinæ* (the 5th), of the *Picidæ*. [Woodpeckers.]

TIGER-BITTERNS. [Tigrisoma.]

TIGER-CATS. [Tigers.]

TIGERS. Although there is but one species of *Tiger*, properly so called, the *Tiger-Cats*, or those species of the genus *Felis* in which the tigerine character predominates, may be also treated of under the title before us.

The *Royal Tiger*, *Felis Tigris*, claims our first notice; and, although poets and poetical zoologists have joined to elevate the lion with his majestic mane to the sovereignty, it may be doubted whether the *Tiger* is not the type of the ferocious and blood-thirsty genus *Felis*.

Some have thought that this species was but little known to the antients; but, we think, with no sufficient grounds. The numerous passages in which the word *Tigris* (τίγρις) occurs in Greek and Latin authors, leave little room for doubting this knowledge; and Hyrcania, with which it is so frequently associated by the latter, is a locality well suited to what we now know of its geographical distribution.

When Aristotle (*Hist. Anim.*, viii. 28), treating of hybrid animals which spring from an intermixture of different races, says that people pretend that the dogs of India are bred from the tiger (τοῦ τίγριος) and a bitch, not indeed at the first union, but at the third, we see no reason, considering the locality which he assigns to the *tigris*, and the opportunities which the conquests of Alexander gave him of knowing the animals of India, why the word should be rendered otherwise than by *Tiger* in our present acceptation of the term. 'The tiger,' writes Pliny (*Nat. Hist.*, viii. 18), 'is produced in Hyrcania and India;' following this up with an allusion to the 'tremendous swiftness' of the animal, and the strong attachment which the Tigress, notwithstanding accidental exception, is known to manifest for her cubs. Again (*Ibid.*, vi. 20), he notices the Indian nations as abounding in wild tigers. Of course he does not omit the story of the origin of the Indian dogs from the Tiger, and the rejection of the two first litters as too ferocious, while the third is taken and brought up. (*Ibid.*, viii. 40.) But, further, it is quite clear from the same authority, that the *Tigris* had been exhibited at Rome, and that Pliny and others well knew the distinction between that species and leopards and panthers. After mentioning the two last, and referring to an ancient decree of the senate that African beasts should not be imported, but stating that the tribune Cneius Aufidius caused a plebiscitum to be passed which permitted their importation for the Circensian games, he states the numbers brought, first by Scaurus, and then by Pompey the Great and Augustus; adding that Augustus was the first who showed a tame tigress (*tigrin*) in a den at Rome, upon the dedication of the Theatre of Marcellus, during the consulship of Q. Tubero and Fabius Maximus; and that the emperor Claudius showed four together. (*Ibid.*, viii. 17.) Suetonius (*Aug.*, xliii.) states that it was the habit of Augustus, besides the exhibitions at the great spectacles, to show to the public any rarity that was brought over, 'ut rhinocerotem apud septa; *tigrim in scena;* anguem quinquaginta cubitorum pro comitio:' and Dion remarks that the tigers (τίγρεις) first seen by the Romans, and, as he thinks, by the Greeks also, were those sent by the Indians as gifts when they were suing for peace from Augustus. The emperor Philip on one occasion exhibited ten tigers, together with thirty-two elephants, ten elks, sixty lions, thirty

leopards, ten hyænas, one hippopotamus, one rhinoceros, forty wild horses, twenty wild asses, and numbers of deer, goats, antelopes, and other beasts; the brutal exhibition being crowned by the mortal combat of two thousand gladiators.

Gordian III. also exhibited ten tigers, and they were present in the shows of Antoninus and Elagabalus. Aurelian, in his triumph over Zenobia, showed four, together with a giraffe, an elk, and other rare animals.

Oppian cannot be mistaken when he writes (*Cyneg.*, iii. 130),

Παρδάλιες τε θοαὶ, καὶ τίγριες ἀιολόνωτοι ;

for here we have leopards and tigers in the same line, and the epithet ἀιολόνωτος (having a variegated back) is quite applicable to the latter.

The Latin poets abound with allusions to the *Tigris*, that, in most instances, can hardly be allotted to any animal but the Royal Tiger; for, though Virgil, in his fourth 'Georgic' (l. 407), applies the epithet 'atra' (black) to 'tigris' in the passage where Cyrene is warning Aristæus as to the forms into which Proteus will transform himself, the word, evidently, does not there allude to colour, but to ferocity. In the fourth 'Æneid,' Dido, in her exclamation against Æneas, says,

——'Duris genuit te cautibus horrens
Caucasus, *Hyrcanæque* admorunt ubera *tigres*.'

The tigers of Bacchus may be considered more doubtful. In the 'Gemmæ et Sculpturæ Antiquæ' there is a representation of a large female *Felis* with the thyrsus from a carnelian (corgnola), with the superscription, 'Tigre di Bacho;' but though the figure, generally, might pass for a Tiger, the tail of the animal is terminated by a shaggy tuft, and no tiger's tail is. Claudian comes much nearer to the mark where he describes Iacchus as marching crowned with ivy, and clad (in the skin) of the Parthian Tiger. When Virgil describes Orpheus, as 'mulcentem tigres' as 'soothing tigers' (*Georg.* iv., l. 510), and Horace, with nearly the same thought, addresses Mercury,

'Tu potes tigres comitesque sylvas
Ducere'

(*Carm.* iii., *Ode* ii.); and again, in his epistle to the Pisos ('De Arte Poeticâ,' l. 393), says of Orpheus,

'Dictus ab hoc lenire tigres, rabidosque leones;'

they make the Tiger personify the greatest ferocity, and they certainly could not have chosen a more apt representative.

Martial speaks of the Tiger in the time of Titus and Domitian. (*Spect.*, Epig. 18, and lib. i., Epig. 105.)

To conclude this branch of the subject, we shall advert to one more literary proof, and one piece of pictorial evidence: and we think that no doubt can exist that, although the Royal Tiger was not so abundant in the Roman shows, particularly the earlier ones, as the leopard and the panther, its form and colouring, as distinguished from the other great cats, were as well and familiarly known to that people.

Pliny, in his chapter 'De Atlantis Arboribus et Cedrinis Mensis,' &c. (*Nat. Hist.*, xiii. 15), speaking of the grain or pattern of these tables, says that where it was oblong or lengthened, they were called tigrine, but where it was wreathed or curled (*intorto*), they were termed pantherine.

The pictorial evidence (so to speak) was furnished by the mosaic found at Rome near the arch of Gallienus. In this work of art, executed not improbably in commemoration of the exhibition of Claudius above noticed, four Royal Tigers, each devouring his prey, are well represented.

Our Zoological Societies and menageries have so increased in number during a long period of peace, that it becomes almost superfluous to describe a form so well known. But as a description of an animal holding so important a rank in the animal kingdom may be expected, we select that of Mr. Bennett, who, in the *Tower Menagerie*, remarks that the Tiger, closely allied to the Lion in size, in power, in external form, in internal structure, in zoological characters, in prowling habits, and in sanguinary propensities, is at once distinguished from it, and from every other of their common genus, by the peculiar markings of its coat. 'On a ground which exhibits in different individuals various shades of yellow,' says Mr. Bennett, 'he is elegantly striped by a series of transverse black bands or bars, which occupy the sides of his head, neck, and body, and are continued upon his tail in the form of rings, the last of the series uniformly occupying the extremity of that organ, and giving it a black tip of greater or less extent. The under parts of his body and the inner sides of his legs are almost entirely white; he has no mane; and his whole frame, though less elevated than that of the Lion, is of a slenderer and more graceful make. His head is also shorter and more rounded.'

There is a paler variety, almost approaching to whitish, and with the stripes visible only in particular lights: this has been exhibited in this country. According to Du Halde, the Chinese Tiger (*Lou-chu*, or *Lau-hu*) varies in colour, some being white, striped with black and grey.

The size of the Tiger varies also; but the dimensions of the form, when fully developed, are, if we are to give credit to some accounts, the veracity of which has not been impugned, most formidable. Buffon notices an individual which was (tail included) 15 feet long; and it is on record that Hyder Ali presented to the Nabob of Arcot one which measured 18 feet in length. The average height varies from about four feet to about three feet, and the length from about eight or nine feet to six.

Geographical Distribution.—Asia only, and not the south of Africa, as Buffon erroneously states; but authors generally agree that the Tiger is now rarely, if ever, met with on this side of the Indus. It is said to be found in the deserts which separate China from Siberia, and as far as the banks of the Oby; and in the south of China, and the larger East Indian Islands (Sumatra, for instance), it is common. Pennant states that it is found as far north as China and Chinese Tartary, and about Lake Aral and the Altaic Mountains. 'It inhabits Mount Ararat,' says the same author in continuation, 'and Hyrcania, of old famous for its wild beasts; but the greatest numbers, the largest, and the most cruel, are met with in India and its islands. In Sumatra the natives are so infatuated that they seldom kill them, having a notion that they are animated by the souls of their ancestors. They are the scourge of the country; they lurk among the bushes on the sides of rivers, and almost depopulate many places. They are insidious, blood-thirsty, and malevolent, and seem to prefer preying on the human race.' Hindustan may be considered the head-quarters of this destructive animal; there it is that he reigns unawed even by the lion, with which he disputes the mastery, and which is comparatively rare in that peninsula.

Habits, Chase, &c.—The bound with which the ambushed tiger throws himself upon his prey is as wonderful in its extent as it is terrible in its effects. Pennant justly observes that the distance which it clears in this deadly leap is scarcely credible. Man is a mere puppet in his gripe; and the Indian buffalo is not only borne down by the ferocious beast, but carried off by his enormous strength. If he fails, it has been said that he makes off. This may be true in certain instances, but in general he does not slink away, but pursues the affrighted prey with a speedy activity which is seldom exerted in vain. This leads us to the observation of Pliny celebrating its swiftness,* for which the Roman zoologist has been censured, most unjustly, apparently; nor is he the only author among the ancients who notices its speed. Oppian (*Cyneg.*, i. 323) speaks of the swift Tigers as being the offspring (γενέθλη) of the zephyr. 'Pliny,' says Pennant, 'has been frequently taken to task by the moderns for calling the Tiger "animal tremendæ velocitatis;" they allow it great agility in its hounds, but deny it swiftness in pursuit. Two travellers of authority, both eye-witnesses, confirm what Pliny says: the one indeed only mentions in general vast fleetness; the other saw a trial between one and a swift horse, whose rider escaped merely by getting in time amidst a circle of armed men. The chase of this animal was a favourite diversion with the great Cam-Hi, the Chinese monarch, in whose company our countryman Mr. Bell, that faithful traveller, and the Père Gerbillon, saw these proofs of the tiger's speed.' †

In the 'Ἑκατοντάς, seu Centuria Imaginum Hieroglyphicarum' (cIↃ. Ↄc. xxiii.) is a wood-cut (here copied) that may refer to such a scene.

Ferocious as the Tiger is, and much as it may deserve the odium heaped upon it, the general chorus of the herd of authors who eulogize 'the courage, greatness, clemency, and generosity' of the lion, contrasting it with the unpro-

* Ante, p. 436. † Bell's 'Travels,' ii. 91; Du Halde, ii. 243.

Tiger pursuing a man on horseback.

voked ferocity, unnecessary cruelty, and poltroonery of the Tiger, becomes ridiculous, though led by such names as Buffon and Pennant. The lion has owed a good deal to his mane and his noble and dignified aspect; but appearances are not always to be trusted. Mr. Barrow, with much more truth, characterizes the king of beasts as powerful but treacherous. 'Happy,' says that traveller, 'for the peasantry, the Hottentots, and those animals that are the objects of its destruction, were its noble and generous nature, that so oft has fired the imagination of poets, realized, and that his royal paw disdained to stain itself in the blood of any sleeping creature! The lion, in fact, is one of the most indolent of all the beasts of prey, and never gives himself the trouble of a pursuit unless hard pressed by hunger.'

Pennant gives the following as an instance, after stating that there is a sort of cruelty in the devastations of the tiger unknown to the generous lion, as well as poltroonery in its sudden retreat on any disappointment: 'I was informed by very good authority, that in the beginning of this century some gentlemen and ladies, being on a party of pleasure under the shade of trees, on the banks of a river in Bengal, observed a tiger preparing for its fatal spring; one of the ladies, with amazing presence of mind, laid hold of an umbrella and furled it full in the animal's face, which instantly retired, and gave the company an opportunity of removing from so terrible a neighbour.'

This is a very pretty story, and the heroine deserves all praise, though it is not very clear what is meant by *furling* an umbrella, so as to make the alleged act square with the context, and the tiger was undoubtedly very polite. But tigers spring from a considerable distance, 15 or 20 feet, and from ambush; and we suspect that a cross-examination of the parties concerned might have slightly damaged the anecdote. Granting, however, that this bold lady walked up to a crouched tiger, and suddenly opened an umbrella in its face (for that, we presume, is the action meant), we may easily conceive that the surprise may have utterly confounded him; but this is not poltroonery. Indeed the same author immediately afterwards gives a tolerable proof of the animal's daring: 'Another party had not the same good fortune; a tiger darted among them while they were at dinner, seized on one gentleman, carried him off, and he never was more heard of.'

But there is another story, a very sad one, which is pregnant with proof of the tiger's hardihood; we allude to the distressing death of Sir Hector Monro's son. Mr. Wood (*Zoography*) relates the horrible occurrence in a few words:—

'This unfortunate gentleman,' says Mr. Wood, 'accompanied by three of his friends, went on shore, December 22, 1792, on Sawgar Island to shoot deer. They continued their sport till the afternoon, when they retired to the edge of a jungle to refresh themselves; where they had not remained long before one of the party, who was leaving the rest to shoot a deer, heard a dreadful roar, and saw a large tiger spring on poor Monro, and rush with him into the jungle with the greatest ease, dragging him through everything that obstructed his course, as if all were made to yield to his amazing strength. All that his companions could do to rescue their friend from this shocking situation was to fire at the tiger; and it is evident that their shots took place, since, in a few minutes after, Mr. Monro staggered up to them covered with blood, and fell. Every medical assistance that the ship afforded was procured for him immediately, but in vain; he expired in the course of twenty-four hours in the greatest agonies. His head was torn, his skull fractured, and his neck and shoulders covered with wounds made by the claws of the savage beast. It is worthy of observation, that neither the large fire that was blazing close to them, nor the noise and laughter which it seems they were making at the time, could divert this determined animal from his purpose.' Contrast this with the story told by Sparrman, of the adventure of Jacob Kok, of Zee-koe-rivier [Lion, vol. xiv., p. 32], in which the Lion, though warmed with the ardour of chasing the terrified Jacob, was daunted when, in his extremity, he faced the infuriated beast from a small heap of stones, presenting the butt-end of his shotless gun to his brutal enemy. This *was* poltroonery, if such a term be applicable to beasts.

But if any doubt as to the courage of the tiger be entertained, Father Tachard's account of a combat between that beast and two elephants at Siam will be sufficient proof. He relates that a lofty bamboo palisade was erected, occupying an area of about 100 feet square. Into this enclosure two elephants were introduced with their heads and trunks shielded by a kind of mask. A large tiger was now brought from its den, and held with cords till one of the elephants approached and inflicted two or three blows on its back with his trunk, so heavily laid on that it fell stunned, as if dead. Then they loosed the tiger. No sooner did he recover than he sprang with a dreadful roar at the elephant's trunk stretched out in act to strike him; but the wary elephant drew up his trunk, and receiving the tiger on his tusks, hurled him into the air. This checked the fury of the tiger, as it well might, and he gave up the contest with the elephant; but he ran several times round the palisade, frequently springing at the spectators. Afterwards three elephants were set upon him, and they in turn dealt him such heavy blows that he again lay senseless, and would have been killed, if the combat, as it is most incorrectly called, had not been stopped. Nothing could be more unfair towards the tiger than the whole of this proceeding; and we will venture to say that no quadruped except a British bull-dog could have shown more 'pluck,' to use a vulgar but expressive term, than this shamefully treated beast.

The older authors generally state that after the tiger has secured its prey it plunges its head into the body of the animal up to its very eyes, as if to satiate itself with blood till the corpse is exhausted, before it tears it to pieces. The best modern accounts tend to prove that the tiger is not more bloodthirsty and has no more blood-sucking propensities than the other great cats; and that this blood-drinking habit is grossly exaggerated.

The tigress brings forth three or four, or four or five cubs at a time; and she is a very fond mother, braving every danger for them, and furiously attacking man and beast in their defence. The antients knew this well. See Martial (lib. iii., Epig. 44):—

'Non tigris catulis citata raptis,' &c.;

and Juvenal (*Sat.*, vi.):—

'Tunc gravis illa viro, tunc orba tigride pejor:'

and though it is on record that a tigress in modern times devoured her cub, one should remember that this unnatural act was done in captivity, and that rabbits, sows, and cats have done the same. But that in a state of nature the maternal feeling is very strong in the tigress, there can be no doubt. Captain Williamson, for example, relates that two tiger-cubs were brought to him when he was stationed in an Indian district. The country-people had found four in the absence of the tigress. The two brought to the captain were put in a stable, where they made a loud noise for several nights. The bereaved mother arrived at last, replying to their cries with fearful howlings, and the cubs were let loose under the apprehension that the infuriated tigress might break in. In the morning it was found that she had carried them away.

For an account of the *hybrids* between the Lion and Tiger, see the article Lion, vol. xiv., p. 35.

Various devices have been put in requisition to take or annihilate this destructive quadruped, and we shall mention one or two of them before we advert to the chace of the animal upon a grander scale. Ten rupees were formerly offered by the East India Company for every tiger destroyed within the provinces where their power and influence extended: a small reward, but sufficient, conjointly with the depredations of the animal, to stimulate the poorer classes to destroy it.

A kind of spring-bow was formerly laid in its way and

discharged a poisoned arrow, generally with fatal effect, when the animal came in contact with a cord stretched across its path, and this method is said still to be in use in some places. Again, a heavy beam was suspended over the way traversed by the tiger, which fell and crushed him on his disengaging a cord which let the beam fall. A Persian device is said to consist of a large spherical strong interwoven bamboo cage, or one made of other suitable materials, with intervals throughout, three or four inches broad. Under this shelter, which is picketed to the ground in the tiger's haunt, a man provided with two or three short strong spears takes post by night, with a dog or a goat as his companion, wraps himself in his quilt and goes to sleep. A tiger arrives, of whose presence the man is warned by the dog or the goat, and generally, after smelling about, rears himself up against the cage, upon which the man stabs him resolutely with his short spear through the interstice of the wicker-work. It seems ludicrous to talk of taking a tiger with birdlime; but it is said to be so captured in Oude. When a tiger's track is ascertained, the peasants, we are told, collect a quantity of leaves resembling those of the sycamore, and common in most Indian underwoods; these they smear with a kind of birdlime which is made from the berries of an indigenous and by no means scarce tree, and strew them with the adhesive substance uppermost in some gloomy spot to which the tiger resorts in the heat of the day. If he treads on one of the limed leaves, he generally begins by trying to shake it from his paw, and not succeeding, proceeds to rub it against his jaw in order to get rid of it. Thus his eyes and ears become agglutinated, and the uneasy animal rolls, perhaps among many more of the smeared leaves, till he becomes enveloped: in this state he has been compared to a man who has been tarred and feathered. The tiger's irritation and uneasiness find vent in dreadful howlings; on which the peasants hasten to the spot, and shoot him without difficulty.

The plan of the box-trap and looking-glass, a device to be found in antient sculpture according to Montfaucon, is said to be practised among the Chinese at the present day.

So much for the trapping of the Tiger. The tiger-hunt is perhaps the grandest and most exciting of wild-sports. Upon such occasions the whole neighbourhood is on the move, and two hundred elephants have been known to take the field; from ten to thirty of these gigantic animals, each carrying sportsmen armed with rifles, have not unfrequently started for the jungle.

Captain Mundy gives a short but spirited description of a tiger-hunt. The party, he tells us, found immense quantities of game, wild-hogs, hog-deer, and the Neilghie;* they, however, strictly abstained from firing, reserving their whole battery for the nobler game of which they were in pursuit. They had to pass through a thick forest, and the author gives a very interesting description of the power and dexterity of the elephants in overthrowing trees to make a road:—'On clearing the wood,' says he, 'we entered an open space of marshy grass, not three feet high; a large herd of cattle were feeding there, and the herdsman was sitting singing under a bush, when, just as the former began to move before us, up sprang the very tiger to whom our visit was intended, and cantered off across a bare plain dotted with small patches of bush-jungle. He took to the open country in a style which would have more become a fox than a tiger, who is expected by his pursuers to fight and not to run, and as he was flushed on the flank of the line, only one bullet was fired at him ere he cleared the thick grass. He was unhurt; and we pursued him at full speed. Twice he threw us out by stopping short in small strips of jungle, and then heading back after we had passed; and he had given us a very fast trot of about two miles, when Colonel Arnold, who led the field, at last reached him by a capital shot, his elephant being in full career. As soon as he felt himself wounded, the tiger crept into a close thicket of trees and bushes, and crouched. The two leading sportsmen overran the spot where he lay, and as I came up I saw him, through an aperture, rising to attempt a charge. My mahout had just before, in the heat of the chase, dropped his ankors, or goad, which I had refused to allow him to recover, and the elephant being notoriously savage, and further irritated by the goading he had undergone, became consequently unmanageable; he appeared to see the tiger as soon as myself, and I had only time to fire one shot, when he suddenly rushed with the greatest fury into the thicket, and falling upon his knees, nailed the tiger with his tusks to the ground. Such was the violence of the shock, that my servant, who sat behind, was thrown out, and one of my guns went overboard. The struggles of my elephant to crush his still resisting foe, who had fixed one paw on his eye, were so energetic, that I was obliged to hold on with all my strength, to keep myself in the houdah. The second barrel too of the gun, which I still retained in my hand, went off in the scuffle, the ball passing close to the mahout's ear, whose situation, poor fellow, was anything but enviable. As soon as my elephant was prevailed upon to leave the killing part of the business to the sportsmen, they gave the roughly used tiger the coup-de-grace. It was a very fine female, with the most beautiful skin I ever saw.'

* Nyl-Ghau. [Antelope, vol. ii. p. 76.]

In the 'Asiatic Annual Register,' for 1804, a gentleman who had been present at the killing of above thirty tigers gives an account of a hunting-party of the Nawab Asuf-ud-Dowlah. After describing the immense cavalcade of the Nawab, he says:—'The first tiger we saw and killed was in the mountains; we went to attack him about noon; he was in a narrow valley, which the Nawab surrounded with above two hundred elephants; we heard him growl horribly in a thick bush in the middle of the valley. Being accustomed to the sport and very eager, I pushed in my elephant; the fierce beast charged me immediately; the elephant, a timid animal, turned tail, and deprived me of the opportunity to fire. I ventured again, attended by two or three other elephants; the tiger made a spring, and nearly reached the back of one of the elephants on which were three or four men; the elephant shook himself so forcibly as to throw these men off his back, and they tumbled into the bush; I gave them up for lost, but was agreeably surprised to see them creep out unhurt. His Excellency was all this time on a rising ground near the thicket, looking on calmly, and beckoning to me to drive the tiger towards him. I made another attempt, and with more success; he darted out towards me on my approach, roaring furiously and lashing his sides with his tail. I luckily got a shot and hit him; he retreated into the bush, and ten or twelve elephants just then pushed into the thicket, alarmed the tiger, and obliged him to run towards the Nawab, who instantly gave him a warm reception, and with the assistance of some of his omras, or lords, laid the tiger sprawling on his side. A loud shout of *wha! wha!* proclaimed the victory.'

There is in Bishop Heber's 'Journal' a most graphic description of a tiger-hunt, but our limits will not permit us to indulge in more of these stirring accounts.

Those who have represented the tiger as untameable have no ground for the assertion. It is as capable of being tamed, and of attachment, even to fondness, for its keeper, as any other animal of its kind. We have seen many instances of this mutual good understanding between the man and the beast, and Mr. Bennett mentions a remarkable example in his 'Tower Menagerie.' A tigress of great beauty, in the Tower when he wrote, and scarcely a year old, had been, during her passage from Calcutta, allowed to range about the vessel unrestricted, and had become perfectly familiar with the sailors, showing not the slightest symptoms of ferocity. On her arrival in the Thames, the irritation produced by the sight of strangers instantly changed her temper, rendering her irascible and dangerous. So sulky and savage was she, that Mr. Cops, who then kept the lions in the Tower, could hardly be prevailed on by her former keeper, who came to see her, to allow him to enter her den; but as soon as the tigress recognised her old friend, she fawned on him, licked him, caressed him, and manifested the most extravagant signs of pleasure; and when, at last, he left her, she cried and whined for the remainder of the day. The tame tigers of the mendicant priests, or Fakirs, of Hindustan, are well known.

But whilst there can be no doubt of the tameable qualities of the tiger, and indeed of all the great cats, they are not to be incautiously trusted. The natural disposition is always ready to break out; and the mildest of them, though

> —'Ne'er so tame, so cherish'd, and lock'd up,
> Will have a wild trick of his ancestors.'

Thus Bontius states that, in 1628, a tiger at Batavia, which had been brought up from a cub, and accustomed

to men all its life, escaped from its cage, fastened on a horse which was feeding near, and killed it; so that the citizens rose upon the tiger with fire-arms and slew it in its turn, to prevent further mischief.

We conclude this part of our sketch with the account given by John Mason, who formerly kept the beasts in Exeter Change, to Mr. Wood, of his fearful encounter with one of these captives.

About the year 1802 a tiger had been purchased by Mr. Alpey to send to the emperor of Germany, and placed in the Tower, there to remain for a few days, till the ship destined to convey the animal abroad was ready. The beast was confined in a large, sufficiently ventilated, wooden case, lined with iron hoops, some of which he ripped off during the first night of his confinement, and gnawed the case partly through. This being perceived, the next day the case was repaired by the addition only of a strong piece of wood nailed on the outside. 'The consequence,' says Mr. Wood, 'might well be expected. The tiger renewed his efforts, and in the course of the following night made his escape, and sprung upon a wall ten feet high, where he remained till Mason came in the morning. The fear of losing such a valuable animal induced this poor fellow, for a reward of ten guineas, to hazard his life in an attempt to secure the tiger. For this purpose he engaged a sergeant and some other persons to assist him, whom he placed in a room, the door of which opened upon the leads, from whence he could reach the animal. He then provided himself with a strong rope, one end of which he gave through the window to his companions, and with the other, having a running noose upon it, he slowly approached the tiger, and threw it over its neck. This was the critical moment: the people within were directed to pull the rope and secure the beast: unfortunately the noose slipped off, and the enraged animal immediately sprung upon the keeper, fixing his teeth into the fleshy part of his arm, and tearing his breast and hand in a dreadful manner with his claws. In this shocking situation the poor man lay under the tiger; while the sergeant cut a bullet into four parts, and, having loaded his musket, he fired through the window at the animal; who, the moment he received the shot, quitted his hold; and, after staggering for a few minutes, expired. The bullet however which destroyed the tiger had nearly been equally fatal to the man, one of the quarters having glanced against his temple, and deprived him of all sense and motion for a considerable time. Nevertheless, after keeping his bed a fortnight, he gradually recovered, and is now (1807) perfectly well, though he will carry the marks of his enemy about with him as long as he lives.' (*Zoography*, vol. i.)

Royal Tiger.

In the East the tiger is associated emblematically with power. Thus the Chinese mandarins covered their seats of justice with its skin. In pl. 17 of the atlas to Sir George Staunton's 'Embassy to China,' representing a military post, two swordsmen are habited and shielded so as to exhibit a tigerine aspect. The tiger soldiers of Hyder Ali and Tippoo Saib were among the choicest of their troops. The tiger's head, gorgeous with jewels, that formed the principal ornament of the throne of Hyder and Tippoo, and was taken by the British among the spoils of the latter at Seringapatam, is well known; as is the automatic representation, clumsy enough it must be admitted, of a royal tiger tearing to pieces a soldier in the pay of the British, and imitating the growling of the beast and the cries of the man, taken also upon the same occasion. (See the Museum at the India House.)

The term 'Tiger' is locally and erroneously applied to the Jaguar. [LEOPARDS, vol. xiii., p. 436.]

Fossil Tigers, &c.

Professor Buckland notices the remains of the Tiger in the cave at Kirkdale, at Plymouth, and in the breccia of Antibes. The great fossil Tiger or Lion (*Felis spelæa*, Goldfuss), and other extinct cats, lived before man was in existence. The following fossil cats are enumerated by Von Meyer, besides the great species above-mentioned:—*Felis antiqua*, Cuv.; *F. Issiodorensis*, Croiz. and Job.; *F. brevirostris*, Croiz. and Job.; *F. Pardinensis*, Croiz. and Job.; *F. Arvernensis*, Croiz. and Job.; *F. Meganterion*, Brav.; *F. cultridens*, Brav.; *F. aphanistes*, Kaup; *F. Oggygia*, Kaup; and *F. prisca*, Kaup. [FELIDÆ, vol. x., p. 224.]

Dr. Lund, in his 'View of the Fauna of Brazil previous to the last Geological Revolution,' remarks that the Hunting Leopard (*Felis jubata*, Linn.; *Cynailurus*, Wagl.), which differs from the rest of the Cats in many essential characters, has been very properly formed into a separate genus; for its claws are not retractile, it is gregarious, and of so mild a disposition that it is frequently tamed and employed in the chace. But, he observes, as a remarkable contrast to this, that its dental system is upon a more murderous plan than that of the true *Feles*, not having the flat projection on the large tearing molar of the upper jaw, which is found in all the other predaceous genera, and the development of which is in inverse proportion to the animal's carnivorous propensities. Dr. Lund recognised this form of dentition in a small animal of the extinct Fauna of the Brazilian region, which was the scene of his valuable labours, not exceeding a domestic cat in size; and he has named it *Cynailurus minutus*. Besides this he discovered the remains of two species of the normal feline form, one as large as the long-tailed tiger-cat (*Felis macroura*, Pr. Max.), the other larger than the Jaguar (*Felis Onça*, Linn.), and comparable to the Tiger and the Lion, the largest species of the Old World.

Tiger-Cats.

Under this title may be classed all those lesser striped and spotted Asiatic, African, and American Cats which do not come under the well-understood denominations of Tigers, Leopards, and Panthers.

Before we proceed to any description or illustration of this beautiful group, it will be advantageous to the student to be put in possession of M. Temminck's well-considered and digested monograph of the genus *Felis* divided into two sections according to their geographical distribution.

Section 1.

This comprises the *Felidæ* of the Old Continent and its archipelago.

Species.

1. *Felis Leo*, including the three varieties of *Barbary*, *Senegal*, and *Persia*. [LION.]
2. *Felis Tigris*, the Royal Tiger (here treated of).
3. *Felis jubata*, the Hunting Leopard. [LEOPARDS, vol. xiii., p. 433.]
4. *Felis Pardus*, the Panther. [LEOPARDS.] Of this M. Temminck gives the following character:—When adult, less than the Leopard: tail as long as the body and the head, its extremity when turned back reaching to the tip of the nose: colour of the fur deep yellowish fulvous, its internal part marked with rose-like spots of the same hue as the ground-colour of the fur; the numerous spots closely approximated; the rose-like spots from 12 to 14 lines at the utmost in diameter: caudal vertebræ 28. N.B. The number of caudal vertebræ assigned to the Leopard by M. Temminck is 22. It would appear that there is no correct figure of the true Panther.

The Black Tiger, *Felis melas*, *Rimau Kumbang* of Sir Stamford Raffles, is considered as only a dark variety of the Leopard.

Felis Uncia is considered as also to be erased from the list of species, as it is only the young of the Leopard or Panther.

6. *Felis macrocelis*, the *Rimau-Dahan*. [LEOPARDS, vol. xiii., p. 432.]

7. *Felis Serval*, comprising *F. Serval* and *F. Capensis*, Linn., the *Chat-pard* of Desmarest, and the *Caracal* of Bruce.

8. *Felis cervaria*. For the characters of this and the seven species of Lynx which follow it in M. Temminck's monograph, see LYNX, vol. xiv., p. 217.

16. *Felis Catus*. [FELIDÆ, vol. x., p. 221.]

17. *Felis manieulata*. [FELIDÆ, p. 222.]

18. *Felis minuta*, identical with the *Felis Javanensis* of Horsfield's 'Zoological Researches in Java,' and therefore not to be adopted.

Section 2.

This comprises the *Felidæ* of the New Western World.

19. *Felis concolor*, the *Puma*. [LION.]

20. *Felis Onça*, the *Jaguar*. [LEOPARDS, vol. xiii., p. 434.]

21. *Felis Jaguarondi*.

22. *Felis eelidogaster*. Bought by M. Temminck at the sale of Mr. Bullock's collection, for the museum of the Netherlands.

23. *Felis rufa*, Guldenst. Bay-Cat of Pennant: with this M. Temminck describes also a specimen brought from Mexico, which may prove distinct. Bought by M. Temminck at Mr. Bullock's sale for the museum of the Netherlands.

24. *Felis pardalis*, the Ocelot.

25. *Felis macroura*.—N.B. These two last confounded together by Linnæus under the name of *F. pardalis*. The Mexican Tiger of Pennant is said to appear to be a representation of *F. macroura*.

26. *Felis mitis*, the *Chati*, F. Cuv.

27. *Felis tigrina*.

This monograph, as far as it goes, has been of great benefit; but the student should examine the menageries and museums, as well as the works of other authors, and he will find several cats noticed both before and since the publication of M. Temminck's catalogue. Among other authorities the publications of d'Azara, of Sir Stamford Raffles, of M. F. Cuvier, of M. Desmarest, of Mr. J. E. Gray, of Dr. Horsfield, and Mr. Vigors in the *Zoological Journal*, of Dr. Horsfield in the *Zoological Researches in Java*, of Prince Maximilian, of M. Lesson, of Sir William Jardine (*Naturalist's Library, Mammalia*, vol. ii., *Felinæ*), and of Mr. Darwin (*Zoology of the Beagle*), may be consulted with advantage.

Dr. Horsfield and Mr. Vigors (*Zool. Jour.*, vol. iv., p. 380) remark that they are not of M. Temminck's opinion, that the determination of species in such groups as these rests upon any examination, however acute, of preserved specimens in cabinets, or in any research, however extensive, into the stores of furriers. Such examination, they think, leads to conjecture; probable and plausible conjecture, it may be true, but still conjecture, and not facts. They add that we are in this way as likely to fall into the error of confounding true species as into that of creating nominal ones, and they express their opinion that the truth can be satisfactorily attained only by diligent researches in the native country of these animals, or by accurate observations on their changes and differences as to sex, age, and season, when in a living state and in confinement.

M. Temminck, in his *Tableau Méthodique* (1827), states that then there were known *thirty* distinct species of cats and seven or eight other doubtful indications.

ASIATIC TIGER-CATS.

Example, *Felis Nepalensis*, Horsf. and Vig.

Description.—Size of *Felis Javanensis*, Horsf., but its habit more slender, the tail and neck proportionally elongate. Ground-colour grey, with a very slight admixture of tawny; bands and spots of the head, back, neck, throat, abdomen, and thighs, deep black; superior longitudinal bands resembling those of *F. Javanensis*. Ground-colour of throat and abdomen nearly white; the lower flanks marked with a faint tawny longitudinal streak. Cheeks streaked with two parallel longitudinal lines, at the termination of which follows a transverse lunar mark which passes with a bold curve to the angle of the mouth, near which a very narrow band crosses the throat. Sides of the neck appearing marked with two broad waving bands, at the termination of which stands an oblong regularly transverse band. Neck underneath nearly immaculate. Shoulder and flanks exhibiting irregular, diversified marks, the anterior oblong, the posterior angular, of a mixed tawny and black, and, individually, above or posteriorly with a broad dash of saturated black: they are scattered over the sides without any regular longitudinal disposition; but they have generally an oblique direction. Abdomen marked throughout with uniform oval spots; anterior thighs within exhibiting one, the posterior thighs two broad black bands. Rump and thighs marked externally with roundish or oblong spots. Tail above, to within about an inch of the tip, with uniform roundish spots, arranged posteriorly in regular transverse bands. Head above and ears agreeing generally with those of *F. Javanensis*. Length from extremity of nose to root of tail, 1 foot 10½ inches. Length of tail 10½ inches. (Vig. and Horsf.)

Dr. Horsfield and Mr. Vigors observe that the distinguishing characters of this species are, its comparatively lengthened habit; the slenderness and proportional length of the tail; the disposition of the marks on the flanks, and the character of these marks as far as regards their diversified form; and the saturated black patch with which they are individually marked at their upper or posterior edge.

'In the *Bengal Cat*,' say those zoologists, 'these marks have a different disposition; they are oblong, and arranged on the flanks in regular succession longitudinally. The materials contained in the museum at the India House have enabled us to make this statement, which is founded on the examination of a specimen brought by General Hardwicke, and on a careful drawing prepared under the eyes of Dr. Hamilton. We have thus two distinct species of small *cats* from India, and the elucidation of this point is of some importance, as it appears, from the following remark in M. Temminck's monographs, "*l'existence de cette espèce dans l'Inde n'est pas constatée*," that he entertained some doubts on the existence of the *Bengal Cat*. It is not our intention, at present, to give a comparative analysis of all the species which resemble our animal. The discrimination of many species of *Felis* is at all times a difficult subject; and on many of them naturalists still disagree. Our immediate object is to indicate a new form of *Felis*, from the upper provinces of India, differing essentially from that which is found in the plains of Bengal; and so direct the attention of naturalists in that country to a more careful investigation of the various Oriental species of this interesting genus.'

The same authors state that the specimen in the collection of the Zoological Society of London was presented by Captain Farrer, of the East India Company's service. It came immediately from Calcutta, where it was said to have been sent from Nepâl. It lived some time in the Society's gardens, but was extremely wild and savage. It generally remained in a sitting posture, like that of the common *Domestic Cat*, and never paced its den in the manner of most other animals of the group. (*Zool. Journ.*, vol. iv.)

Felis Nepalensis.

AFRICAN TIGER-CATS.

Example, *Felis Serval*, the Serval.

Description.—Upper parts clear yellowish, with black spots; lower parts white, with black spots also, but they are less numerous. Upon the head and neck the markings are most conspicuous, and form symmetrical lines on each side directed towards the shoulders. On the other parts of the body they are placed irregularly. On the back they are lengthened, and show a disposition to form four rows; on the body and thighs they are larger and round, and they are smaller but equally round on the extremities. Upon the face and muzzle they are minute,

Back of the ears black at the base, succeeded by a transverse white bar; tips of the ground-colour of the body. On the inside of the fore limbs two conspicuous black transverse bars; the hind limbs with similar markings, but less defined; last joints of the limbs of a paler tint than the rest of the body, the spots on them round and very small. Tail with eight black rings, tip of the same colour. Length, exclusive of tail, 1 foot 11½ inches; tail 9 inches. Height when standing erect, about 12 inches at the shoulder, and 15 inches at the hind quarters. (F. Cuv.)

The animal from which the above description was taken was a very young male. Its temper was mild and gentle, and its disposition sportive. It played like a domestic cat, or rather kitten, chasing its tail, and amusing itself with anything that it could roll with its paw.

Locality.—The Serval is a native of southern Africa. There are generally some living specimens in our menageries. It has been exhibited in that of the Zoological Society of London, and may be seen there now (1842).

The Serval.

American Tiger-Cats.

But it is in America that the tiger-cats are most numerous and beautiful, and there their manners have been best noticed by competent observers: we select three examples of the varieties of form and colouring exhibited by this group in that quarter of the globe.

Felis pardalis, Linn. The Ocelot. This, the most beautiful perhaps of all the *tiger-cats*, almost defies description. Mr. E. Bennett has however given a very faithful account from two living specimens, one existing when he wrote in the Tower of London, and the other in the garden of the Zoological Society in the Regent's Park.

Description.—Body when full grown nearly three feet in length; tail rather more than one; medium height about 18 inches. Ground-colour of fur, grey, mingled with a slight tinge of fawn, elegantly marked with numerous longitudinal bands, the dorsal one continuous and entirely black, the lateral (six or seven on each side) consisting for the most part of a series of elongated spots with black margins, sometimes completely distinct, sometimes running together. The centre of each spot of a deeper fawn than the ground-colour external to them; this deeper tinge is also conspicuous on the head and neck, and on the outside of the limbs, all of which parts are irregularly marked with full black lines and spots of various sizes. From the top of the head, between the ears, there pass backwards, towards the shoulders, two, or more frequently four, uninterrupted diverging bands, which are full black anteriorly, but generally bifurcate posteriorly, and enclose a narrow fawn-coloured space with a black margin; between these there is a single longitudinal, somewhat interrupted, narrow black line, occupying the centre of the neck above. Ears short and rounded, externally margined with black, surrounding a large central whitish spot. Under parts of the body whitish, spotted with black, and the tail, which is of the same ground-colour with the body, also covered with black spots. (Bennett, *Tower Menagerie.*)

Mr. Bennett remarks that he has, in the above description, stated the length of the tail at more than a foot; and that in all the known ocelots, as well as in all the species (of which there are several) that approach it in form and colouring, the proportionate length of the tail is at least equal to that which he has given as its average measurement. The tail however of the Tower specimen did not exceed six or seven inches; its extremity was overgrown with hair, and there was no cicatrix. Still its equality throughout and its abrupt stumpiness induced the belief that this abbreviation was purely accidental; and he felt by no means inclined to regard that specimen as a new species, to be distinguished by the excessive shortness of that appendage, by the unusually pale colour of its markings, and by some slight peculiarity in the mode of their arrangement, which, he observes, varies in every individual that he had seen.

Locality.—Mexico, Paraguay, and probably Peru.

Habits, &c.—The ocelot remains in the deep forests during the day, sallying forth at night in quest of small quadrupeds and birds, the latter of which it successfully chases in the trees, for it is a very expert climber. If it be, as is generally supposed, the *Tlacoozelotl*, *Tlalocelotl*, *Catus Pardus Mexicanus* of Hernandez, it is said to stretch itself out as if dead on the limb of some tree when it spies monkeys in the neighbourhood. They, urged by curiosity, proceed to examine the supposed defunct, and fall victims to their curiosity.

The Ocelot has been so completely tamed as to be left at liberty, and it is said to be capable of strong attachment to its master. Mr. Bennett states that the specimen in the Tower, a male, was perfectly good-tempered, exceedingly fond of play, and had much of the character and manners of the domestic cat. Its food consisted principally of rabbits and birds; the latter it plucked with great dexterity, and always commenced its meal with the head, of which it seemed particularly fond; but it did not eat with the ravenous avidity which characterizes nearly all the animals of this tribe.

The Ocelot.

Felis mitis, F. Cuv.; The Chati. *Chibiguazu* of *D'Azara? Felis Chibiguazu*, Desm.

Description.—About a third larger than the domestic cat: length, exclusive of tail, rather more than two feet; tail eleven inches, height to middle of back, about one foot two inches. Ground-colour of fur on the upper parts, pale yellowish: on the lower, pure white: at the roots, dull grey, and very thick and close. Body covered with irregular dark patches; those upon the back entirely black and disposed longitudinally in four rows; those upon the sides surrounded with black, with the centres of a clear fawn, arranged in nearly five rows. Spots upon the lower part of the body, where the ground-colour of the fur is white, full, and arranged in two lines composed of six or seven patches on each side. Limbs covered with nearly round spots of smaller dimensions: on the fore-legs, near the body, two transverse bands. On the throat a sort of half collar, and on the under-jaw two crescent-shaped spots. Behind each eye two bands about two inches long, terminating opposite the ear. Forehead bordered by two lines, between which are numerous spots, and, at their origin, a blackish mark from which the whiskers spring. Outside of the ear, black, with a white spot upon the small lobe. Base of the tail spotted with small blotches, which towards the end run into half-rings, which are broadest on the upper surface. Pupil round. (F. Cuv.)

This animal (a female) was extremely gentle; and if those with whom it was familiar passed its cage or did not approach it, it would express its discontent by a short cry. It manifested great delight when it was caressed. It lived

Felis mitis.

in the Paris menagerie, and was procured from a dealer in Brest. *Locality.*—South America.

Desmarest and others identify this animal with the Chibiguazu of D'Azara. Temminck, who received a skin from Rio de Janeiro, considers it distinct.

D'Azara's description comes very near to that above given as far as colouring is concerned; but he gives the average length as three feet six inches; the individual which he described, the largest male he had seen, was four feet all but an inch in length; tail thirteen inches; height at shoulders one foot and a half, and behind one foot seven inches and a half. It was so fat that immediately after death it weighed five-and-thirty pounds; the females, he says, are rather less.

The same acute observer, speaking of his *Chibiguazu*, remarks that some of the Guaranese call the domestic cat *Chibi*, and others *Mbracayá*. In the same manner, he says, some give the wild animal of which he is treating the name of *Chibi-guazu*, and others that of *Mbaracayá-guazu;* both appellations signifying *Great Cat*. Many Spaniards, he adds, call it *Onza* (Ounce).

He states that the species is so common, that his friend Noseda captured eighteen individuals in two years, within two leagues of his *pueblo;* but he adds that, notwithstanding this abundance, few are acquainted with it, the huntsman and dogs never falling in with it, and being unable to penetrate to its haunts: he very much doubts whether any quadruped hides itself more effectually. He describes it as remaining by day in the most impenetrable places, and as coming forth after dusk, especially on dark stormy nights, when the chibiguazus daringly enter the corrals and court-yards, though no instance is known of their detection by the dogs. When the moon shines they abstain from visiting inhabited spots, and never are trapped: to lie in wait for them with a gun is hopeless, so sharp a look-out do they keep. They carry off domestic fowls from trees which they climb, sometimes six in one night, and often leave several dead. Men and dogs are avoided by them with extreme caution, and each pair is supposed to live in a separate district, for a male and female, and no more, are always caught in the same place. Noseda formed a trap of strong stakes, with three divisions: in the middle division he placed a white fowl, so that it might not only be heard but seen at a distance: the other divisions were so framed as to shut by the falling of the planks as soon as the chibiguazus entered. This trap was set in the places to which they resorted for prey, and those caught were turned into a great den in Noseda's court-yard. Some of these got away, and were taken again two or three times in the same trap; they were recognised by ear-marks and other proofs: D'Azara infers from this that the idea of danger was obliterated from their recollection by their desire to possess the fowl. He remarked that all which were kept in the den deposited their excrements in their drinking-place, and when he substituted a narrow-necked jug to prevent this, they mounted to its edge for that purpose, and never missed the vessel or its immediate neighbourhood. Nearly the whole day was spent by them rolled up in a ball, and, when a chibiguazu wished to stretch himself, he first licked the one at his side. When straw was put into their den, or so that they could reach it by thrusting their paws through the bars, it was always found that on the day following they had placed it in a heap, after having divided it into bits some quarter of an inch long, and on this they reposed. The small sticks and twigs with which the inside of their den was furnished were broken and torn to pieces in like manner. Twilight and night were passed in pacing to and fro close to the sides of their den; and if crossed or interrupted by another, they puffed and gesticulated like an angry cat, but without using their paws. They never quarrelled, unless they were very much irritated, and then they struck at each other with their fore-paws. They devoured five pounds of flesh per day when first caught, but afterwards three sufficed. A portion was prepared for each of the twelve or fourteen individuals confined, and they took it with their paws according to the length of time they had been there, without any interference on the part of the others. If however the animal whose turn it was did not take his portion, or disregarded it, another immediately snatched at it without any defence on the part of the right owner except by sneezing, and sometimes by blows with its fore-paws. A walk was made for them, enclosed by a sort of hurdle, so that rats, fowls, ducks, or young dogs could be introduced into it: upon opening the cage it was observed that usually one only went out for each victim, and almost always according to the order of their confinement. Cats and dogs they seized with their mouth by the nape of the neck, overlaid them, and then kept them so that they could not stir, till they were dead. Cats' flesh appeared to produce the mange, fretting the chibiguazus, making them mew like cats, and at last destroying them. Snakes, vipers, and toads were also eaten by them, but this diet occasioned violent and continual vomiting; they wasted to skeletons, and died in a few days. If the dog introduced equalled them in size, they touched him not, for it appears that they do not assist each other. If a chibiguazu cannot master any prey alone, he leaves it. Birds were caught by the head and neck, and thoroughly stripped of their feathers before they were eaten. No unnecessary cruelty was manifested. Noseda observed that one did not kill a fowl put into his den till the third day. D'Azara and his friend frequently closed the doors of the yard, and opened the den that the chibiguazus might leave it: those most lately caught went first; and sometimes the old ones would not go out even when their den was entered that it might be swept. They were left at liberty for several hours, during which they examined every crevice, and then lay down to sleep. When boys persecuted them with sticks, they retreated to their den without turning on their persecutors, even when severely beaten. A male on one occasion becoming very lazy, on entering his den he was abused and bitten by his female, as if to punish him. Some individuals were incarcerated for more than a year without exhibiting any sign of love. In the night their eyes shone like those of a domestic cat, and they resembled that animal in their form and habits, in lying down, licking and cleaning themselves, washing their faces with their paws, puffing, sneezing,—in fact in every way. D'Azara concludes by stating that his friend caught a young one, and it became so thoroughly tame that it slept in the skirts of his clerical gown, and went about loose. He affirmed that no animal could be more tractable: but it devoured the poultry of his neighbours, and they killed it.

Felis Pajeros.—The Pampas Cat, Pajero, or Jungle-Cat.

Description.—Fur of great length: longer hairs of the back upwards of 3 inches, and those of the hinder part of the back from 4½ to 4¾ inches in length. General colour pale yellow-grey. Numerous irregular yellow or sometimes brown stripes running obliquely from the back along the sides of the body. On each side of the face two stripes of yellowish or cinnamon commencing near the eye, and extending backwards and downwards over the cheeks, on the hinder part of which they join, and form a single line, which encircles the lower part of the throat. Tip of the muzzle and chin white; a spot in front of the eye, and a line beneath the eye, of the same colour; belly, inner side and hinder part of fore-legs, white also. An irregular black line running across the lower part of the chest, and extending over the base of the fore-legs externally: above this line two other transverse dark markings more or less defined on the chest. On the fore-legs three broad black bands, two of which encircle the leg: on the posterior legs about five black bands externally, and some irregular dark

spots internally. Feet yellowish, and under side of tarsus of a slightly deeper hue. On the belly numerous large irregular black spots. Ears moderate, with long white hairs internally; externally of the same colour as the head, except at the apex, where the hairs are black, and form a slight tuft. Tail short, somewhat bushy, and devoid of dark rings or spots—the hairs are in fact coloured as those on the back. On the upper part of the body each hair brown at the base, then yellow, and at the apex black. On the hinder part of the back the hairs almost black at the base, and, on the sides of the body, each hair grey at the base; there is then a considerable space of yellowish-white colour: towards the apex they are white, and at the apex black. The greater number of the hairs of the moustaches white. Length from nose to root of tail, 26 inches; of tail (fur included), 11 inches. Height of body at shoulders, 13 inches. Size about equal to that of the common wild-cat of Europe; but the Pampas cat is stouter, its head smaller, and its tail shorter. (Waterhouse.)

Mr. Waterhouse (*Zoology of the Beagle*) observes that the markings of this animal vary slightly in intensity: those on the body, he remarks, are generally indistinct; but the black rings on the legs are always very conspicuous.

Locality.—D'Azara says that he knows not, nor has he heard, that this species exists in Paraguay, although it formerly may have been seen there; but as the country became tolerably well peopled, and there were fewer plains, the inhabitants probably extirpated it. He caught four in the Pampas of Buenos Ayres, between 35° and 36° S. lat., and three others on the river Negro. He says they are found on both sides of the La Plata.

Darwin (*loc. cit.*) gives as its habitat Santa Cruz, Patagonia (April), and Bahia Blanca (August). He states that it is common over the whole of the great plains which compose the eastern side of the southern part of America; and he says he has reason to believe, from the accounts he received, that it is found near the Strait of Magellan, which would give it a range of nearly 1400 miles in a north and south direction, D'Azara having stated that it extends northward as far as 30° S. lat. One of Mr. Darwin's specimens was obtained in 50° S. lat., at Santa Cruz.

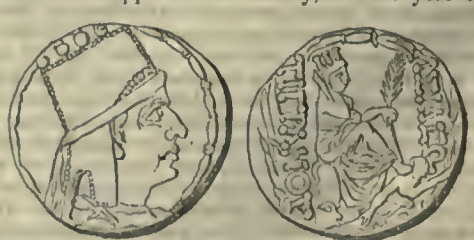
Habits, Food, &c.—D'Azara says that the natives call this animal *gato pajero*, because it lives on the plains, concealing itself in jungles, without entering into the woods and thickets. *Apereas*, or guinea-pigs, according to him, form its principal food. Mr. Darwin states that it takes its name from 'paja,' the Spanish word for straw, from its habit of frequenting reeds. The specimen taken by him at Santa Cruz was met with in a valley where thickets were growing. When disturbed it did not run away, but drew itself up and hissed.

Pampas Cat. (*Zool. of Beagle.*)

We here conclude our notice of the tiger-cats, a race evidently appointed as the principal agents for keeping down the birds and smaller mammalia, which abound in warm climates.

TI'GLIUM. [CROTON.]

TIGRA'NES, king of Armenia, the ally of Mithridates the Great, who gave him his daughter Cleopatra in marriage. He was master of the large tract between Egypt in the south-west and the Caspian Sea in the north-east, which was bounded by Assyria and Media on the east, and by the kingdoms of Pontus and of Cappadocia on the west and north-west. The earlier history of Tigranes is little known; Strabo (p. 532, Cas.) and Justin (xxviii. 3) state that he was sent in his youth as a hostage to the king of the Parthians, who afterwards restored him to liberty. He conquered Gordyene and Mesopotamia, and the Syrians chose him for their king in B.C. 84, or, according to Appian (*De Reb. Syr.*, 70), in B.C. 80. Before B.C. 74 he concluded an alliance with Mithridates, who was then about to begin his third war with the Romans. The conditions of this alliance were, that Mithridates should be master of the countries which they hoped to conquer, and that Tigranes should have the inhabitants and all the moveable property that he could carry off. Plutarch states (*Lucullus*, p. 509, Xyland.) that the army of Tigranes was composed of 260,000 men,—20,000 archers, 55,000 horse, 150,000 foot, and 35,000 pioneers and train,—and that Arabs and warlike Albani from the Caucasus abounded in the Armenian camp. The campaign was opened in B.C. 74. Cappadocia and Bithynia were conquered, and Mithridates laid siege to Cyzicus in Bithynia, but Lucullus came to relieve it, and after various reverses Mithridates was compelled to fly to Tigranes (69). The conduct of the Armenian king had been insencere during these events, and, the Romans being now victorious, he not only refused to receive his father-in-law, but set a prize of a hundred talents on his head, on the pretext that the king had persuaded his son, who was likewise called Tigranes, to rebel against his father and to join the Romans. Mithridates nevertheless succeeded in pacifying his son-in-law, and they joined their armies to meet Lucullus, who had crossed the Euphrates and the Tigris, and had laid siege to Tigranocerta, the new capital of the Armenian kingdom. [TIGRANOCERTA.] A battle ensued near this town, in which Tigranes was completely defeated (6th October, 69), and his capital fell into the hands of the Romans. Tigranes and Mithridates having entered into negotiations with Phraates III., king of the Parthians, for the purpose of drawing him into their alliance, Lucullus, who had now carried his conquest in Armenia as far as Artaxata on the upper part of the Araxes, marched to Mesopotamia to attack the Parthians. But a mutiny of his soldiers compelled him to retreat to Cappadocia, where they dispersed, as it seems, by the instigation of Pompey, who aimed at the supreme command in the war (67). The Romans lost Cappadocia, and Tigranes carried off a great number of the inhabitants of this province, as well as of Cilicia and Galatia. Pompey entered Asia Minor in B.C. 66, and in the same year he defeated Mithridates in a great battle on the Euphrates. Mithridates, having experienced the faithless character of his son-in-law, fled to Phanagoria in the island of Taman, while Tigranes humiliated himself before the Romans, then encamped in the neighbourhood of Artaxata. He went to the tent of Pompey, and, kneeling before his victorious enemy, took off his royal diadem, which Pompey however would not accept. The policy of the Romans required an independent kingdom between their dominions and the dangerous power of the Parthians. Tigranes therefore was reinstated in Armenia, except the districts of Gordyene and that of Sophene, or the westernmost part of Armenia Magna, which he was obliged to cede to his rebellious son Tigranes, then an ally of the Romans. Besides these districts, he ceded to the Romans his kingdom of Syria, including Phœnicia and all his conquests in Cilicia, Galatia, and Cappadocia; he paid six thousand talents, and he gave half a mina to each Roman soldier, ten minæ to each centurion, and sixty minæ, or one talent, to each tribune. (Plutarch, *Lucullus*, p. 637, Xyland.; comp. Appian, *De Bello Mithrid.*, c. 104.) It seems that after this humiliation Tigranes led an obscure and tranquil life, for his name disappears from history, and the year of his



Coin of Tigranes.

British Museum. Actual size. Silver. Weight, 245½ grains.

death is unknown. His successor was Artavasdes. [Mithridates; Pompeius; Lucullus.]

(Valerius Maximus, v. 1, 9; Velleius Patereulus, ii. 33, 1, and c. 37; Cicero, *Pro Lege Manilia;* Woltersdorf, *Commentatio Vitam Mithridatis M. per annos digestam sistens*, Goettingae, 1812.)

TIGRA'NES, prince of Armenia and lord of Sophene, was the son of Tigranes, king of Armenia. During the last war between the Romans and Mithridates aided by his ally king Tigranes, prince Tigranes forsook his father and went over to the Romans. When his father humiliated himself before Pompey, he sat by the side of the Roman general, but he did not rise before his father, nor did he show him the slightest degree of filial respect. Having been created lord of Sophene and Gordyene, he refused to surrender the treasures of Sophene to Pompey, who suspected him of being in secret communication with Phraates, the king of the Parthians, whose daughter he had married. Tigranes also became suspected of having formed a plan for seizing or putting to death his father, and accordingly he was arrested by order of Pompey, who sent him to Rome. He figured in the triumph of Pompey.

Appian (*De Bello Mithrid.*, c. 105 and 117) states that Tigranes was afterwards put to death in his prison. [Tigranes.]

TIGRANO'CERTA (Τιγρανόκερτα), for some time the capital of Armenia, was built by king Tigranes after he had extended his dominion over Mesopotamia, Syria, and Phœnicia. Artaxata, the old capital on the Araxes, being situated in the north and the neighbourhood of the Caucasian nations, then the allies of Armenia, Tigranes seems to have thought it convenient to have his capital near those countries, which often required his presence on account of their possession being still insecure. This danger arose principally from the neighbourhood of the Romans, who, from the time when Attalus left them his kingdom of Pergamus by testament (B.C. 133), formed designs on all Asia Minor, and at the time of the foundation of Tigranocerta (between 84 and 74 B.C., but nearer to 84) were at war with Mithridates, the neighbour and ally of Tigranes. Tigranocerta was situated a short distance from the Upper Tigris, on the Nicephorius, a river of considerable breadth, as Tacitus states. Seert or Sered, a small town, surrounded by antient ruins, is generally supposed to be on the site of Tigranocerta. Sered is situated on the banks of a small river, the modern name of which is unknown, and which flows into another river of considerable length, the Bedlis of Hâjî Khalfah, which has its sources south-east of lake Van, and flows into the Tigris. This latter river is called Khabur by D'Anville, but this is a mistake, the Khabur, according to Hâjî Khalfah, cited by Rennell, being another tributary river of the Tigris nearer its middle course. It has been supposed that the river Centrites was also called Nicephorius, and this opinion is principally founded on the circumstance of the river which passes Sered being a very small stream, while the Nicephorius at Tigranocerta was of a considerable breadth. This opinion however is rejected by Rennell, and indeed no ruins have been found on the banks of the Centrites, though it has not yet been shown that there are none. We are likewise ignorant as to the changes which may have taken place in the direction of the Centrites, which, after having left the mountains at the village of Kala Zerke, flows through an open and level country at some leagues distance east from Sered. According to Tacitus, Plutarch, and Appian, Tigranocerta had very strong fortifications; its suburbs contained gardens and fish-ponds. The town was inhabited partly by barbarians, and partly by Greeks, the inhabitants of twelve Greek towns who were transplanted thither by Tigranes after he had ravaged Cappadocia. The military position of Tigranocerta was admirably chosen. By its situation opposite the passage formed by the narrow valley of the Centrites in the Carduchian Mountains, it commanded one of the principal roads which led and still leads from the valley of the Tigris into Armenia across the mountains. It was also opposite the gorge in the Carduchian Mountains, which, a short distance south of the junction of the Centrites with the Tigris, came so close to the Tigris as to render it impossible for an army to move along the left bank of the river. Xenophon, in conducting the retreat of the ten thousand, apparently intended to enter Armenia by the valley of the Centrites, but he found this passage between the Tigris and the Carduchian Mountains impracticable; and taking suddenly a north-east direction, he ascended the steep Carduchian Mountains, and crossed the Centrites in its upper part.

Master of Tigranocerta, the king of Armenia could suddenly invade Cappadocia, Mesopotamia, and Syria; and in case of defeat he could retreat under the walls of Tigranocerta and defend the defiles in the mountains against a superior army. Lucullus, in his campaign against Mithridates and Tigranes, laid siege to this key of Armenia before he ventured to enter the defiles. The united kings hastened to relieve the town, but they were beaten, and Tigranocerta with immense treasures fell into the hands of the victor (6th October, 69 B.C.), who sent the greater part of the Greek inhabitants back to their homes in Cappadocia. After the fall of Tigranocerta, all Armenia was open to the Romans, who overran the country as far as Artaxata. But no sooner was Lucullus informed that Phraates, the king of the Parthians, was about to attack him, than, instead of descending the Araxes and making an attack on the northern part of Media, he hastened back to Tigranocerta. If he had remained a little longer on the Araxes, the Parthians would have forced the position of Tigranocerta, and the Roman army would have been shut up within Armenia. Strabo (p. 532, Cas.) says that, when Lucullus took Tigranocerta, it was only half finished, and that after its destruction there was nothing but a little village on the spot. However it soon became again a town, and in the wars of Corbulo, 63 A.D., it was a considerable and well-fortified place. (Tacitus, *Annal.*, xv. 4.) Hesychius, *s. v.* Κέρτα, says that κέρτα signifies a town, in Armenian, and this opinion is corroborated by Stephanus Byzantinus *s. v.* Τιγρανόκερτα, who says that, in the language of the Parthians, Τιγρανόκερτα is the same as Τιγρανούπολις in Greek. The word 'certa' also occurs in Carcathiocerta, a town which is also called Amida, and is now known by the name of Kârâ-Amid and Diyârbekir. Soping, in his notes to Hesychius, says that κέρτα or κάρτα is the root of Carthago. [Tigranes; Lucullus; Pompey.]

(Strabo, p. 532, 539, 747, Cas.; Appian, *De Bello Mithrid.;* Plutarch, *Lucullus; Pompeius;* Tacitus, *Annal.*, xii. 50; xiv. 24; xv. 4, &c.; Rennell, *Illustrations of the History of the Expedition of Cyrus, and the Retreat of the Ten Thousand Greeks;* Rennell, *Geography of Asia Minor.*)

TIGRIS, River. [See End of Letter T.]

TIGRISO'MA, Mr. Swainson's name for the *Tiger-Bitterns.*

Subgeneric Character.—Bill as in *Ardea.* Face, and sometimes the chin, naked. Legs almost feathered to the knees. Inner toe rather shorter than the outer. Claws short, stout, regularly curved. Anterior scales reticulate or hexagonal. Mr. Swainson considers this to be the rasorial type, and he arranges it as a subgenus of the family *Ardeadæ* [Herons], between *Butor*, Antiq., and *Nyctiurdea.* Example *Tigrisoma lineatum*, 'Pl. Col.' 860.

(N.B. According to the principle generally received among zoologists, neither *Butor* nor *Nyctiardea* can be retained as generic names. The first is identical with the *Botaurus* of Brisson and Stephens: for the reasons against admitting the second, see Nycticorax.)

TIJU'CA, M. Lesson's name for a genus of birds (*Chrysopteryx*, Sw.; *Attila*, Less.; *Ampelis*, Nordm). Mr. G. R. Gray arranges it between *Calyptomena*, Raffl., and *Procnias*, Hoffm., under the *Ampelinæ*, Mr. Gray's third subfamily of the *Ampelidæ.*

TILBURG is an inland town in the kingdom of the Netherlands, in the province of North Brabant and district of Bois-le-Duc: it is situated in a heath on the banks of the river Ley, 13 miles east of Breda, 14 south-west of Bois-le-Duc, and 38 north-east of Antwerp. It has three churches, a large castle, and 12,000 inhabitants, of whom between 5000 and 6000 are employed in the manufacture of fine woollen cloth and kerseymeres. They likewise manufacture calmucs, beaver coating, baize, and cloth for the army. Extensive barracks have been built by the present king of Holland. Lying out of the great road from Flanders to Holland, it is little visited by travellers.

TILBURY FORT, a fortification erected on the north bank of the river Thames, opposite to Gravesend, for the purpose of commanding the navigation of the river. It was originally formed as a mere block-house in the time of Henry VIII.; but after the Dutch fleet, under De Ruy-

ter, had advanced into the Thames and Medway in 1667, Charles II. converted it into a regular fortification, to which considerable additions have since been made. The fort stands principally in the parish of West Tilbury, but partially in the adjoining parish of Chadwell. It is surrounded by a deep and wide fosse, which may be filled with water when necessary; and its ramparts present formidable batteries of heavy cannon toward the river. The fort is chiefly of brick; but it has a massive stone portal, the elevation of which renders it a prominent object from the opposite side of the river, which is here about a mile wide. Within the fort are commodious barracks and other accommodations for the garrison, which ordinarily consists of a fort-major and a detachment of invalids; and piers toward the river afford facilities for the landing of troops, stores, &c. Owing to the flatness of the shore, the fort is liable to overflowing during floods and spring-tides, and its situation is by no means salubrious. A view of Tilbury Fort, from the river, is given in No. 120 of the 'Penny Magazine.'

TILE, a kind of thin brick, or plate of baked clay, used chiefly for covering roofs, but occasionally for paving floors, constructing drains, &c. The English name, and those by which tiles are known in other European languages, are derived from the Latin *tegula*, which contains the same element as *teg*o, to cover. This becomes, in Saxon, *tigle* or *tigel*; in Dutch, *tegel*, *teghel*; *tichel*, or *tichgel*; in German, *ziegel* or *dachziegel*; in Italian, *tegola*; in Spanish, *teja*, *tega*, or *tegilla*; and in French, *tuile*.

An account of the use of tiles among the antients, illustrated by engravings of roofing-tiles found at Pompeii, is given in the 'Dictionary of Greek and Roman Antiquities,' art. 'Tegula,' in which it is stated that roofing-tiles were originally made, like bricks, of baked clay (γῆς ὀπτῆς), and that Byzes of Naxos introduced tiles of marble about the year 620 B.C. In addition to the superior beauty and durability of such tiles, they were made of much larger dimensions than was practicable in clay, and consequently the effect produced by their parallel joints might be brought into harmony with the rest of the building. A still more expensive and magnificent method of roofing occasionally adopted consisted in the use of tiles made of bronze and gilt. Tiles were originally made perfectly flat, or with nothing more than the hook or nozle underneath the upper border, which fulfilled the purpose of fixing them upon the rafters. They were subsequently formed with a raised border along each side, on the upper surface, and the sides of the tile were made to converge towards the lower end, in order that the raised sides or ledges might not prevent the successive rows of tiles from overlapping each other neatly. The lines of junction between the flat tiles were covered by small semi-cylindrical tiles, called *imbrices*, the rows of which, extending from the ridge to the gutter, divided the surface of the roof into a series of channels, along which water descended to the gutter. Both the *tegulæ* and the *imbrices* terminated at the edge of the roof in ornamental pieces; and the whole appearance of the roof was handsome. Another kind of antient tiling, mentioned by Pliny under the name of *pavonaceum*, consisted of tiles of a semicircular form at their lower edges, which, when laid in overlapping rows, somewhat resembled the feathers in the train of a peacock.

The process of making tiles is so similar to that of brick-making [Brick, vol. v., p. 407], that it will be sufficient to observe that only the best qualities of brick-earth are fit for the purpose. Since the year 1833 no excise-duty has been levied upon the manufacture of tiles, the duty having been found very prejudicial, especially after the repeal of the duty on slates, although it produced a very trifling revenue. The roofing-tiles used in this country are chiefly of two sorts, *plane-tiles*, which are flat, of a rectangular form, and usually about ten inches and a half long, six inches wide, and five-eighths of an inch thick; and *pan-tiles*, which also have a rectangular outline, but are bent in such a manner that, when laid on the roof, the greater part of their surface forms a concave channel for the descent of water, while one side forms a narrow convex ridge, which overlaps the edge of the adjoining tile. These are usually thirteen and a half or fourteen and a half inches long, and about nine inches wide, measured in a straight line from side to side. Plane-tiles are made with a hole near their upper extremity to receive a wooden peg, by which they are hung upon the laths of the roof, and they are laid either with or without mortar in such a manner that the successive rows overlap each other about six inches. Pan-tiles have no holes, but are hung upon the laths by ledges formed at their upper edges; they do not require so great an overlap as plane-tiles, and consequently form a lighter covering. The comparative weight of the two kinds of tiling, and of other kinds of roofing, and the suitable angles of inclination for each, are given under Roof, vol. xx., p. 143. Tiles of a semi-cylindrical form, laid in mortar with their convex or concave sides uppermost, respectively, are used for covering ridges and gutters.

Drain-tiles are most commonly made in the form of an arch, and laid or bedded upon flat tiles called *soles*. Some useful information will be found in a paper 'On the Economical Manufacture of Draining-Tiles and Soles,' by Mr. Robert Beart, in the second volume of the 'Journal of the Royal Agricultural Society;' and in the same volume is a notice of the admirable tile-making machinery invented by the marquis of Tweeddale, which has been recently brought into extensive operation. Paving-tiles are usually square, and of greater thickness than those used for roofing. In antient as well as in more recent times paving-tiles were frequently decorated with ornamental devices in various colours, so as to produce an effect resembling that of mosaic pavement.

TILESIA, a genus of Polypiaria mentioned by Lamouroux.

TILGATE BEDS. A portion of the great series of strata in the Weald of Kent and Sussex, interposed between the green-sands and the Portland oolite, is thus named by Dr. Mantell, who has described the numerous and interesting organic remains which it contains. The reptilian species are described in Professor Owen's 'Report to the British Association,' 1841.

TILIA, the name of a genus of plants belonging to the natural order Tiliaceæ. The trees in England are called *Lime-trees*, in Swedish *Linn*, and in German and Dutch *Linden*. They are characterised by possessing a 5-parted deciduous calyx; 5 petals; numerous free or somewhat polyadelphous stamens; a globose, villous, 1-styled, 5-celled ovary. All the species are handsome trees, with alternate, heart-shaped, acute, serrated, deciduous leaves, and fragrant yellowish panicled flowers. The wood is light, smooth, and white, and their sap possesses a considerable quantity of sugar. They are principally natives of Europe and America.

T. Europæa, the European or Common Lime-tree, has petals without scales, and cordate, acuminate, serrated leaves, which are smooth, with the exception of a tuft of hair at the origin of the veins beneath, and are twice the length of the petioles; the cymes are many-flowered, and the fruit is coriaceous and downy. This tree is abundant in the middle and north of Europe. It is very common in Great Britain, although some doubts have been expressed as to its being truly indigenous. It is however admitted into all British Floras; and there can be no doubt, from its wide diffusion, that it is truly naturalised in this country. It was well known to the antients, and is spoken of by both Theophrastus and Pliny. It is a very general favourite in Europe, and is planted in public places, parks, and approaches to residences, in France, Germany, Holland, and Great Britain. For this purpose its large size, handsome appearance, and profusion of sweet flowers well adapt it. The wood is also in considerable request: it is white, close-grained, soft, light, and smooth, and is used by the cabinet-makers for a variety of purposes. It is easily worked, as well as durable, and on this account has been employed for carving. Most of the fine carvings in this country, as those at Windsor Castle, the library of Trinity College, Cambridge, and at Chatsworth, are of this wood. It is also used for wood-cutting. The fibres of the bark are very tough, and ropes and mats are manufactured from them. They are employed for this purpose in many parts of England, but in Russia and Sweden this manufacture forms a considerable branch of commerce. When used for this purpose the trees are peeled in the beginning of the year, and the bark is steeped in water, after which it is hung up to dry; and the layers of bark, being separated, are cut into ribands for making mats, or the fibres are twisted into ropes. The Russian mats used by gardeners and upholsterers are thus made. The flowers secrete

a large quantity of nectar, and exhale a delicious scent. On this account they are great favourites with bees, and when expanded they are constantly beset with these insects. The honey thus procured is in great repute, and has given celebrity to the honey of Kowno, on the Niemen, in Lithuania, a small town which is surrounded by a forest of limes. It is chiefly used for making liqueurs. The seed of the lime possesses a large quantity of albumen, which is nutritious and perfectly innocuous. It was proposed by Missa, a French physician, to use it in the same way as that of the cocoa-tree. It was found to answer this purpose, but when prepared it will not keep; hence any extensive manufacture of it, although it was attempted in Germany, has been abandoned. Cattle will eat the leaves of the lime, but it is said to communicate a bad flavour to the milk of cows. The flowers were considered anodyne and antispasmodic by older physicians, and were administered in fevers when the Cullenian doctrine of spasm prevailed. Hoffman strongly recommended them, and relates cures effected by them, and they entered as an ingredient into most of his prescriptions. They are not much used in modern medicine.

The linden attains a great age; and many specimens, celebrated for their age and size, exist. 'At Neustadt, in Wirtemberg, there is a prodigious lime-tree, which gives its name to the town, which is called Neustadt an der Linden. This tree is said by Evelyn to have had in his time a trunk above 27 feet in circumference, and the diameter of the space covered by its branches to have been 403 feet. It was 'set about with divers columns and monuments of stone (82 in number, and formerly above 100 more), which several princes and noble persons have adorned, and which as so many pillars serve likewise to support the umbrageous and venerable boughs; and that even the tree had been much ampler, the ruins and distances of the columns declare, which the rude soldiers have greatly impaired.' Evelyn adds copies of many of the inscriptions on the columns, the oldest of which is dated 1550, and the column on which it is inscribed now supports one of the largest limbs, but was at a considerable distance from the tree 300 years ago. (Loudon.) This tree is still in existence. There are many other very aged individuals in this country and on the Continent. The family name of Linnæus is said to have been derived from an antient linden that grew near their residence. The principal street of Berlin is called *Unter den Linden*, from the lime-trees which are planted on each side.

Many varieties of this tree are described; and, as is usual in these cases, some authors have elevated them to the rank and importance of species. The following are found in collections: *T. E. laciniata*, in which the leaves are smaller than those of the common species, and are deeply and regularly cut and twisted. It seldom attains a large size. *T. E. aurea*, which differs only in its twigs having a bright yellow colour. *T. E. dasystyla*, possesses a tomontose style, and differs from the species in the form of its fruit. Some botanists admit only one European species, the *Tilia Europæa*. Koch, in his 'Flora Germanica,' has two, the *T. grandifolia* and *T. parvifolia*, and gives *T. Europæa* as a synonyme of the latter. Hooker, in the 'British Flora,' admits all three; and De Candolle, in his 'Prodromus,' has three species, besides the European, which are as follows:—

T. microphylla, Small-leaved Lime, has its petals without nectaries or scales, cordate, roundish, acuminated, serrated leaves, smooth above and glaucous beneath, with scattered as well as axillary hairy blotches, and compound many-flowered umbels. This is identical with the *T. parvifolia* of Ehrhart and other writers. It is a native of subalpine districts in the north of Europe. In Great Britain it is common in the woods of Essex and Lincolnshire; and Mr. E. Forster thinks it probable that this is the only true British species.

T. rubra, Red Lime, has cordate leaves, unequal at the base, hairy beneath as well as the petioles, with a tuft of hair at the base of the veins; the fruit globose and smooth. It is a native of Taurida, and some few specimens are growing in England. The young branches are of a beautiful coral-red colour, thence it has been called *T. corallina*. This species is by most other writers considered a variety of *T. Europæa* or *T. grandifolia*.

T. platyphylla, Broad-leaved Lime-tree, has petals without nectaries; cordate, serrated leaves, downy beneath; origin of the veins, woolly; branches, hairy; umbels, three-flowered; fruit woody, downy, turbinate, with prominent angles. This is the *T. grandifolia* of Ehrhart and other botanists. It is more common than the other species in Switzerland and the south of Europe. There are several specimens of this tree in England and Scotland, but they can scarcely be said to be wild. Specimens of this tree exist in the churchyard of Seidlitz in Bohemia, with leaves contracted to the form of a hood. They are said to have miraculously assumed this character from the time that the monks of a neighbouring convent were all hanged upon them.

All the foregoing species are distinguished by not having nectaries or scales at the base of their petals; there are six other species characterised by possessing nectaries. Four of these are inhabitants of North America.

T. alba, the White or Silvery Lime, has cordate, serrated leaves, unequal at the base, clothed with white down beneath, but smooth above, and four times longer than the petioles; fruit ovate, with five obscure ribs. This is the *T. argentea* of Desfontaines; *T. panonica* of Jacquin; and *T. tomentosa* of Moench. It is a native of the woods of Hungary, and is very readily distinguished from the other species by the whiteness of its leaves, which becomes especially evident when ruffled by the slightest breeze. It was introduced into this country in 1767, and there are now existing several very fine specimens, one at Walton-on-Thames, 60 feet high, and a number at Highclere in Berkshire. *T. petiolaris* was described by De Candolle from dried specimens sent to him from Odessa, where the tree is cultivated in gardens. The leaves are twice the length of the petioles, and their under surface downy like the last.

T. glabra, the Black or Black American Lime-tree, has leaves deeply cordate, serrated, and somewhat coriaceous and smooth; the petals are truncate and crenate at the apex, and equal in length to the style; the fruit ovate and somewhat ribbed. This tree is a native of North America in Canada and the northern parts of the United States; in the Southern states it is only found at a considerable elevation on the Alleghany mountains. In external character it very much resembles the European species; its flowers and leaves are however larger. Although it was introduced into this country by Miller as early as 1752, it is not much grown, and very few specimens exist. In America the wood and bark are used for much the same purposes as that of its representative in Europe.

T. laxiflora, Loose-flowered American Lime, has cordate, serrated, smooth leaves, loose panicles of flowers, emarginate petals, and globose fruit. It is a native of America, from Maryland to Georgia. It has been known in this country only since 1820, and but few specimens are at present planted. Loudon, in his 'Arboretum' (vol. i., p. 374), states his conviction that this and the other species of American limes are only varieties of *T. glabra*, and he has arranged them accordingly. He has however assigned no other reason for this opinion than their general resemblance.

T. pubescens, the pubescent American Lime, has somewhat cordate and oblique leaves, truncate at the base, and pubescent beneath; the petals emarginate, shorter than the style, and the fruit globose. It is a native of the southern parts of the United States, from Virginia to Georgia, where it is found principally on the banks of rivers. It is a much less vigorous tree than the two last, and has much smaller leaves and more slender branches. There is a variety called by Ventenat *T. p. leptophylla*, which has very thin leaves and delicate serratures.

T. heterophylla, the White American Lime, has ovate leaves, downy beneath, sometimes cordate at the base, sometimes obliquely or equally truncate; globose fruit with 5 ribs. This tree is abundant in Maryland, Delaware, and the Western states of America, and is found on the banks of the Susquehanna, Ohio, and Mississippi. The leaves and flowers of this species are larger than any other. It seldom attains a height of more than forty feet in its native districts, and specimens in Europe do not exceed more than twenty feet. It is a handsome ornamental tree, and deserving of cultivation. It has been known in France nearly a century, but was not introduced into England till 1811.

In the cultivation of the lime it should be placed in moist situations, in an argillaceous, loamy soil. It grows

better on plains than hills, and in moist than dry places. The trees may be propagated by seeds, which should be sown as soon as they are gathered; but this is a very slow process, and the more frequent mode of propagating them is by layers. In France a tree is cut down to the roots, and the shoots are encouraged to grow, and in the course of two or three years they may be planted in the positions in which they are to stand. Lime-trees will bear transplanting at a greater age than most trees; when large trees are transplanted, they should have their roots cut round three or four feet from the stem the year before they are taken up. This stunts their growth, and makes them bear removal better.

(Loudon, *Arbor. et Frut. Brit.*, vol. i. and iv.; Bischoff, *Lehrbuch der Botanik*; Koch, *Flora Germanica*; Hooker, *British Flora*; Don's Miller's *Dict.*, &c.)

TILIACEÆ, a natural order of plants belonging to the synearpous group of polypetalous Dicotyledons. This order consists of trees or shrubs, seldom of herbaceous plants, with simple, toothed, alternate leaves, furnished with stipules. The flowers are axillary. The calyx consists of four or five sepals, which are valvular in æstivation; the petals four or five, with mostly a little pit at their base; the stamens are hypogynous, mostly indefinite, with oval or roundish two-celled anthers bursting lengthwise; the disk is formed of glands, which are equal in number to the petals and opposite to them; the ovary is single, composed of from four to ten carpels, with a single style and stigma divided into lobes according to the number of the carpels; seeds numerous, with erect embryo, and abundant albumen. This order is nearly allied to Sterculiaceæ and Malvaceæ, from which it differs in its glandular disk, distinct stamens, and two-celled anthers. The species, of which there are about two hundred and fifty, are arranged in thirty-two genera, and are generally diffused throughout the tropical and temperate parts of the globe.

Tiliaceæ possess no active properties; they abound in a mucilaginous wholesome juice. The fibres of the inner bark are very tough, and are used for a variety of economical purposes. [TILIA.] The wood is generally white, light, and tough; that of *Grewia elastica* is used for making bows in India. The Trincomalee-wood used at Madras for making the Massoola boats is the produce of Berrya Ammonilla. The Corchorus olitorius is cultivated in Egypt for use as a pot-herb.

Tilia alba.

1, cutting, with flowers and leaf; 2, section of ovary, showing the cells; 3, single flower; 4, stamens.

TI'LIQUA, Mr. J. E. Gray's name for a genus of *Sauvians*. [SCINCOIDIANS.]

TILLAGE, applied to arable land, is the stirring and preparing of the surface of the soil, so as to render it fit for the vegetation of the seeds committed to it: its object also is the destruction of noxious weeds.

The whole art of cultivation consists in tillage and manuring, and the profit of the husbandman depends on the perfection of the tillage and the economy of labour in producing the effect. A defect in tillage will cause a great deficiency in the crops in ordinary years. To ensure good crops, the soil should be in such a state that the rains and dews may readily be diffused through it, without giving it a wet appearance, or evaporating too rapidly. It requires great knowledge and experience to give any particular soil the exact portion of tillage which is suited to it. A fine garden-tilth, as it is called, is the most perfect for light soils which have been long cultivated and manured; when they can be brought to such a state that after continued rains the surface dries without forming a crust, and crumbles of its own accord, the tillage has been good; and the deeper this soil is stirred, the more it will produce: but where clay abounds in the soil, which in dry weather can be readily pulverised by crushing the dry clods, and be reduced to the finest powder, too much tillage may do more harm than good. The fine clay is soon converted into mud at the surface by the least rain, because it is not sufficiently porous to let the water through it; it dries into a hard crust, which effectually precludes the access of air, and consequently stops the vegetation of the seed. It is only by abundant manuring with organic matter, especially of animal origin, that this natural tendency in clays to cohere can be overcome; and until this is effected it is best to stir clay soils as deep as possible by means of subsoil-ploughs, but they should not be pulverised so that the water cannot run down between the lumps and clods, and especially the surface should be left in such a state of roughness that heavy rains cannot cover it with a coat of mud. The clods which are left on the surface imbibe the moisture more gradually, and in drying fall to pieces, by which the young plants are invigorated, and, as it were, moulded up. This is particularly the case in winter after a frost, as all clay-land farmers are well aware. It is very easily ascertained whether a soil will bear much tillage or not. It is only necessary to try some of it in a large pot or box; make the surface very fine by breaking the clods, then water it abundantly, and let it dry in the sun; if a crust is formed in drying, that soil will not bear too much harrowing and pulverising, and should be left in a moderately rough state after sowing or drilling the seed; but if, after it dries, the surface is loose and porous, then the finer the tillage the better the seed will vegetate. The whole depends on the ready admission of air or its exclusion. When grass-seeds are sown, the surface should be well pulverised; but this cannot be safely done if the soil is apt to run together when much rain falls soon after the seed is sown. Some plants, like beans, will force their way through a very hard surface; but small seeds are too weak to do so, and their growth is entirely stopped by the least crust on the surface. Besides the preparatory tillage of the soil before sowing the seed, there is a great advantage in the stirring of it as the plants are growing. On this depends all the merit of the row-culture for every kind of plant, especially those which have esculent roots or extensive foliage, and which are chiefly cultivated for the sustenance of cattle. The effect of deep tillage is here most remarkable. If rows of turnips or cabbages be sown at such a distance that a small plough or other stirring implement can be used between them, and the intervals be stirred more or less, and at different depths, it will be found that the deeper and more frequent the tillage, until the foliage covers the whole interval or the bulbs swell to a great size, the heavier and more abundant the produce will be. It is worth while to try the experiment:—Sow Swedish turnips or mangold-wurzel in rows three feet apart: let some of the rows be merely kept clear of weeds by surface-hoeing, and the plants be thinned out to the distance of a foot apart: let other intervals be stirred to different depths; some three inches, some six inches, and some nine inches or more. The result will be, that the first rows will appear to have been sown much too far from each other, not half the ground being covered with the foliage of the plants; the others will be covered more and more as the tillage has been deeper, and the last will completely cover the whole intervals. The roots or bulbs will be in exact proportion to the richness of the foliage, and the weight of the deeply

tilled rows will far exceed that of any of the others, while the first will, by comparison, appear a poor and scanty crop, however clear of weeds the surface may have been kept. The soil best suited for this experiment is a good light loam on a dry or well-drained subsoil; for stagnant moisture under any soil will chill the fibres and check the growth of the plants, however dry the surface may be. It was this which led Tull, the father of drill husbandry, to the conclusion that tillage was all that the soil required to maintain perpetual fertility. He carried his conclusion too far; but we shall not be wide of the truth if we assert that with proper tillage the soil will be gradually improved, and a much smaller quantity of manure occasionally added to recruit the waste produced by vegetation will render the soil much more fertile than it would be with more manure and less tillage: and as tillage can be increased by mechanical contrivances where labourers are scarce, whereas the supply of manure must generally be limited, it follows that, as a general rule, the land should be well and deeply tilled, due attention being paid to the nature of the soil and its property of retaining or transmitting moisture. Very loose sands should not be much stirred until they are consolidated by the admixture of marl, clay, chalk, or well-rotten dung; but in all cases the manure should be mixed as intimately as possible with the soil, and as deep as the tillage has gone, not including the stirring of the subsoil; for the roots will always penetrate thus far, and find the nourishment which they require. Those plants which throw out roots from the bottom of the stem, as wheat, barley, and oats, require the surface to be most pulverised and enriched to allow these roots to spread; a spring tillage is therefore highly advantageous, which can only be given when the seed has been deposited in rows by drilling or in patches by dibbling. This last method is found to give much finer crops, from the circumstance that the hoe not only loosens the earth between the rows, but also between the different patches of the growing corn, by which the coronal roots are strengthened and the tillering of the stems so much encouraged, that it is not uncommon to see twenty, thirty, or more strong stems all bearing fine ears arising from one tuft of plants, the produce of one or more seeds, whose roots are matted together and send out fibres in every direction. The crowding of several plants does not prevent their growth, provided the fibres can spread around in a rich mellow soil, well pulverised, and admitting the air and moisture readily.

As a perfect tillage requires much labour and minute attention, and in many situations where the farms are large labourers cannot be procured at moderate wages, nor can they always be depended upon to perform the work with sufficient care, mechanical ingenuity has been taxed to invent implements of tillage by which it may be more perfectly accomplished, and at a smaller expense, by using the power of horses instead of that of men, and making implements which will till a considerable breadth at once, and thus save time.

The old plough, and which, however it may be improved, still acts on the same principle of turning up a fresh portion of the soil, burying that which has for some time been at the surface, will probably always continue to be the chief implement of tillage; but the minuter operations, which are taken from garden culture, require particular contrivances to effect them by instruments. The harrows are but an imperfect substitute for the garden rake, and do not stir the soil to a sufficient depth. Other implements have therefore been invented, which by means of wheels can be regulated so as to act at a greater or less depth. These have received the different names of scarifiers, grubbers, cats'-claws, or cultivators, according to the fancy of the inventors. Many of these answer the purpose well, and save labour. They can be used in all directions so as to pulverize the soil to any degree. Heavy rollers with and without spikes around them are used when many clods require breaking; and, although not yet adopted in this country, the Belgian *traineau*, a strong frame of wood boarded over, and loaded with weights if required, is a most effectual instrument in levelling the surface and crushing clods, without pressing them into the soil as the roller frequently does.

It would be endless to enumerate all the implements of tillage which are daily invented: some of the most useful have been already described. [Arable Land; Plough.]

P. C., No. 1544.

As the cultivation of the soil approaches more to that of the garden, more perfect instruments will be used; such as can be directed with great accuracy between parallel rows of growing plants without danger of injuring them. When the width of the stetches or beds accurately corresponds with the width of the instrument, so that the wheels will run in the intervals and the horses step in the same, the soil may be tilled perfectly, although the rows of plants have but a small interval between them: and the largest field will thus present to the eye extended seed-beds or equal rows of growing plants, as we are accustomed to see in a kitchen-garden. The result will be the same as when for the sake of experiment we sow the common grains and leguminous plants of the fields in a plot of garden-ground: in such case the produce is so far greater, that it quite baffles our calculation when extended to a large surface, and hence the incredible results which we continually meet with in the reports of experiments on some new produce lately introduced: everything is on a magnified scale, owing to superior tillage. No doubt many fields possessed of fertile soils might, by attentive tillage, be made as productive as the best garden-ground. The Chinese have, as we are told, already accomplished this by their incredible numbers and indefatigable labour; but science and mechanical contrivance are a substitute for millions of labourers when judiciously applied—as our manufactures fully prove. The same ingenuity applied to tillage might increase the produce of the earth, if not indefinitely, at least far beyond what we may now suspect.

In the early ages of agriculture tillage was almost confined to the ploughing of fallows to clean the land, which was very imperfectly executed, and in ploughing the stubble of one crop to prepare for the seed of another, as long as the land would give a return for the labour. The idea of tillage for the sake of a permanent improvement of the soil was only entertained by a few men who reflected, and that of encouraging the vegetation while the crop was growing was not even thought of. The plough to stir and the harrows to cover the seed were the only instruments in use, and they were very rude of their kind. A return of three or four times the seed sown satisfied the farmer and the landlord; and yet the first was hardly repaid for his toil, and the landlord received for rent what now would scarcely satisfy the tithe-owner. The present state of agriculture may be contrasted with this, and perhaps hereafter the comparison may be as disadvantageous to us as it now appears in our favour when we look back a few centuries.

TILLA'NDSIA, the name of a genus of plants belonging to the natural order Bromeliaceæ. Linnæus says of the plants belonging to this genus, 'Tillandsiæ cannot bear water, and therefore I have given this name to the genus from a professor at Abo, who in his youth having an unpropitious passage from Stockholm to that place, no sooner set his foot on shore than he vowed never again to venture himself upon the sea. He changed his original name to Tillands, which means *on* or *by land;* and when he had subsequently occasion to return to Sweden, he preferred a circuitous journey of 200 Swedish miles through Lapland to avoid going eight miles by sea.' Dr. Elias Tillands, whose name and idiosyncracy have thus been perpetuated, was professor of physic at Abo, and died in 1692, at the age of fifty-two. He published in 1683 an alphabetical catalogue of plants in the neighbourhood of his residence, which was afterwards followed by wood-cuts of 158 of the plants in the catalogue.

The genus Tillandsia of Linnæus comprehends the plants described by Sloane as *viscum caryophylloides*, and by Plumier as *Caragata*, and is characterised by possessing a persistent calyx divided into three oblong, lanceolate, pointed segments; a corolla tubular, longer than the calyx, with the limb divided into three segments; six stamens not so long as the corolla, and inserted into it, and the anthers sagittate; the ovary superior, surmounted by a style with a trifid obtuse stigma; the fruit, a trilocular capsule containing several seeds, each of which is supported on a long stalk of aggregate fibres, which in the end constitutes a feathery wing. The species are most of them parasitical, and are natives of South America.

T. utriculata, the Wild Pine of the colonists of Jamaica, has linear, channelled, recurved, dilated leaves, inflated at the base; stem closely panicled. It is found growing on old and decaying trees in the forests of Jamaica. The stem is three or four feet high, and the leaves are a yard long,

and placed within one another in such a way that the water which runs down them is retained in their expanded bases. The bases then swell out and form a reservoir or bottle, which, being contracted at the neck, prevents the heat of the sun from evaporating the water. These reservoirs will each hold about a quart of water, and during the dry season they are the resort of all kinds of animals for the sake of the water, and travellers are often able to obtain a supply of water from this source when all others fail. Dampier, in his Travels, gives the following account of this plant:—'The wild pine is a plant so called because it somewhat resembles the bush of leaves which surround the true pine-apple. The wild pines commonly grow from some bunch, knot, or excrescence of a tree, where they take root and spring upright. The root is short and thick, from whence the leaves rise up in folds one within the other, spreading often to the top of the tree. They are of a good thick substance, and so compact as to catch and hold the rain-water when it falls. They will contain a pint, or a pint and a half, or a quart; and this water refreshes the leaves and nourishes the root. When we find these pines, we stick our knives into the leaves just above the roots, and let out the water, which we catch in our hats, as I have done many times myself to my great relief.' The seeds of these plants are furnished with wings, by which they are blown from tree to tree, on which they grow. Unless they possessed such means of transportation, they would fall to the ground, where, being parasitical, the young plants would perish.

T. usneoides, the Long-Moss Tillandsia, or *Barbe de vieillard* of the French, the *Viscum caryophylloides* of Sloane, has a twisted, thread-shaped, scaly stem, much branched, with channelled leaves. This plant is a native of the forests of North America, from Virginia to Florida, also of the West India Islands and the Brazils. It has very minute roots, and its long wiry contorted stems creep over the stems and branches of old trees, sometimes hanging down in a bunch like the hairs of a horse's tail. The flowers are small and of a blue colour, and are developed at the ends of the branches. This plant grows on other trees in dry and arid plains, as well as in alpine districts. It attains a larger size in the more temperate localities. Its filamentous stems, when deprived of their bark, may be used for the same purposes as horsehair, and are used in this manner in America. They are also in some places made into cordage. The only preparation they require previous to being used is being put into water for a fortnight or more, according to the temperature, when, on being taken out and dried, the bark easily separates from the fibres, and they are fit for use. In medicine this plant has been recommended as a remedy in hæmorrhoids, also as an effectual diaphoretic.

T. monostachya, Single-spiked Tillandsia, has the radicle leaves linear, channelled, recurved, bruad, and sheathing at the base; the stem simple, clothed with imbricated scales; the spikes simple; the bracteas ovato-concave. This plant is a native of the West Indies. The flowers are of a snow-white colour, appearing in the axils of the bracts, which surround a rachis two or three inches long, and this arises from a mass of leaves arranged in the form of a rosette. As the leaves and bracts are coloured variously, green and red and white, the whole plant looks at a distance like a large flower; and when numerous upon the trees on which they grow, they produce a very handsome and remarkable appearance. The leaves of this as well as most of the other species serve as reservoirs for water. About thirty species have been enumerated by botanists: most of them are inhabitants of South America, especially of Peru, and of the great forests of the Andes; two or three of the species have been found in the southern states of North America.

TILLEMONT, SEBASTIEN LENAIN DE, an historical writer of considerable note, was born at Paris 30th November, 1637. He was the son of Jean Lenain, master of the requests, and his wife Marie le Ragois. His excellence of character was manifested very early; and even as a child he always abstained from those mischievous pranks in which children commonly indulge. When between nine and ten years of age he was placed under the charge of the members of the religious Society then established in the vacant abbey of Port Royal, and under these instructors he devoted himself to the exercises of learning and piety. His favourite author, while at school, was Livy; a preference indicative of the bias of his mind to historical studies. He studied logic and ecclesiastical history under Nicole; and his questions on the latter subject at once evinced the earnestness with which he pursued it, and put the knowledge of his instructor to a severe test. He studied the theology of Estius, from which, when about eighteen years of age, he turned with much satisfaction to the study of the Scriptures themselves, and of the Fathers; and while thus engaged he began to collect the historical notices of the Apostles and Apostolical Fathers, and to arrange them after the plan of Usher's 'Annales.'

The tenderness of his conscience, and the strictness of his notions of duty, kept him for some time undetermined as to the choice of a profession. At the age of 23 he entered the Episcopal seminary of Beauvais, where he was received with such respect from his reputation for historical knowledge, that, fearing it might be a snare to his humility, he contemplated leaving it, but was persuaded to remain by Isaac de Sacy, one of the members of the Society of Port Royal, whom he had chosen for his spiritual guide. He remained three or four years in the seminary of Beauvais, and then spent five or six with Godefroi Hermant, canon of that city. He was much respected and beloved by the bishop of Beauvais, Choart de Buzanval, and fearing still that this estimation would make him vain, he suddenly left the place and returned to Paris, where he remained two years with his intimate friend and school-fellow at Port Royal, Thomas du Fossé; but not finding in Paris that retirement which he desired, he withdrew to St. Lambert, a country parish in the neighbourhood of that city.

In September, 1672, at the mature age of thirty-five, he became subdeacon, and fifteen months afterwards deacon. The following extract from a letter addressed to his brother (Pierre Lenain, then or afterwards subprior of La Trappe) evinces at once his piety and his humility. After stating that it was at the desire of Isaac de Sacy, his friend and guide, that he had become subdeacon and was about to take on him the deaconship, he goes on, 'I assure you, my dearest brother, that it is with great agitation and fear that I have resolved to comply with his wish, for I feel that I am far from those dispositions which I myself see to be necessary for entering upon this office; and above all, I am obliged to confess that I have profited little from the grace which I might have received from the order and duties of the subdeaconship. But on the other hand I could not resist one whom I believe I ought to obey in everything, and who, I am well aware, has the greatest love for me. I beg of you then, my dearest brother, to pray to God for me, and to ask him either to cause M. de Sacy to see things in a different light, or to give to me such dispositions that the advice of my friend may be for my salvation and not for my condemnation.'

In A.D. 1676 he received priest's orders, at the further persuasion of De Sacy, who contemplated making him his successor in the office of spiritual director of the Bernardine nuns, now re-established in their original seat, the abbey of Port Royal, to the immediate neighbourhood of which establishment Tillemont removed. He was however, in 1679, obliged to remove, and he took up his residence at the estate of Tillemont, a short distance from Paris, near Vincennes, which belonged to his family, and from which he took his name. In A.D. 1681 he visited Flanders and Holland; and in A.D. 1682 undertook the charge of the parish of St. Lambert, where he had formerly resided, but soon gave it up at the desire of his father, to whom he ever paid the greatest respect and obedience.

Having prepared the first volume of his great work on ecclesiastical history, he was about to publish it when it was stopped by the censor, under whose notice, as a work connected with theology, it had to pass, and who raised some objections of the most frivolous character. Tillemont refused to alter the parts specified, deeming them not justly within the censor's province; and chose rather to suppress the work, upon which however he continued to labour diligently, though without any immediate intention of publishing it.

This exercise of the censorship led to an alteration of his plan: he determined to separate from the rest of his work the history of the Roman emperors and other princes whose actions were interwoven with the affairs of the Christian church, and to publish it separately: the first volume of this work, which, as not being theological, was exempt from the censorship, appeared in 1690, and was

received with general approbation. It excited a desire for the appearance of his Church history, and the chancellor Boucherat, in order to remove the obstacle to its publication, appointed a new censor. Thus encouraged, he brought out the first volume in 1693, under the title of 'Mémoires pour servir à l'Histoire Ecclésiastique des Six Premiers Siècles.' A note to this volume, on the question whether Jesus Christ celebrated the Passover the evening before his death, in which he examined the views of Bernard Lami, a learned priest of the Oratory, on that question, involved him in a controversy with that writer, who read Tillemont's note before publication, and examined the arguments contained in it in a subsequent work of his own. Tillemont in consequence addressed to Lami a letter, which is printed at the close of the second volume of his 'Mémoires,' and is remarkable for its spirit of modesty and meekness. Lami replied, but Tillemont declined to continue the discussion, thinking that he had said enough to enable those interested in the question to form a judgment. Faydit de Riom, an ecclesiastic whom the Congregation of the Oratory had expelled from their body, a man of considerable talent, but of jealous disposition, published at Bâle, A.D. 1695, the first number (28 pp. 4to.) of a work, to be continued every fortnight, entitled 'Mémoires contre les Mémoires de M. Tillemont.' It contained several violent and unjust strictures on the work, to which Tillemont did not reply, though some of his friends with needless apprehension procured the stopping of Faydit's work, which never proceeded beyond the first number. Faydit repeated his attack in a subsequent work, but it produced little effect.

The remainder of Tillemont's life was passed in the quiet pursuit of his studies. He was attacked by a slight cough at the end of Lent, 1697, and in the course of the summer was seized with fainting, owing to a sudden chill while hearing mass in the chapel of Notre Dame des Anges: toward the end of September his illness increased so as to excite the anxiety of his friends. He consequently removed to Paris for the sake of medical advice; and there, after an illness which rendered his piety and submissiveness to the divine will more conspicuous, he breathed his last, on Wednesday, 10th January, 1698, aged sixty years. He was buried in the abbey of Port Royal, in which the Bernardine or Cistertian nuns, to whom the abbey had originally belonged, were now again established.

The works by which Tillemont is known are, his 'Histoire des Empereurs,' and his 'Mémoires pour servir à l'Histoire Ecclésiastique.' The first was published in 6 vols. 4to.; the first four during the author's life, at intervals from 1690 to 1697: the remaining two after his death, in 1701 and 1738. The earlier volumes were reprinted at Brussels in 12mo., in 1707, et seq., and a new edition appeared at Paris, in 4to., in 1720-23, with the author's latest corrections. He explains his plan in the 'Avertissement' to the first volume: his intention was to illustrate the history of the Church for the first six centuries; but instead of commencing with the first persecutor, Nero, he goes back to Augustus, whose edict occasioned the journey of Joseph and Mary to Bethlehem, and thus determined the place of our Lord's nativity. The history ends with the Byzantine emperor Anastasius (A.D. 518). The style is unpretending, and consists for the most part of a translation of the original writers with slight modifications, and with such additions (marked by brackets) as were needed to form the whole into one continuous narrative, or such reflections as the author deemed requisite to correct the false morality of heathen writers. To each volume are appended notes relating to difficulties of history or chronology which require discusssion of a kind or extent unsuited for insertion in the body of the work. 'There is nothing,' says Dupin, 'which has escaped the exactness of M. Tillemont; and there is nothing obscure or intricate which his criticism has not cleared up or disentangled.'

The 'Mémoires,' &c. extend to 16 vols. 4to., of which the first appeared in 1693; three volumes more during the author's lifetime, in 1694-5-6; and the fifth was in the press at the time of his death. These five volumes came to a second edition in 1701-2, and were followed in 1702-1711 by the remaining eleven, which the author had left in manuscript. This great work is on the same plan as the former, being composed of translations from the original writers, connected by paragraphs or sentences in brackets. Dupin characterizes it as being not a continuous and general history of the Church, but an assemblage of particular histories of saints, persecutions, and heresies, a description accordant with the modest title of the work, 'Mémoires pour servir à l'Histoire,' &c. The author confines himself chiefly with facts, without entering into questions of doctrine and discipline; and notices not all the saints in the calendar, but only those of whom there are some antient and authentic records. Each volume has notes of similar character to those given in 'L'Histoire des Empereurs.'

Tillemont supplied materials for several works published by others, as for the Life of St. Louis, begun by De Sacy and finished and published by La Chaise; for the lives of St. Athanasius and St. Basil, by Godefroi Hermant; of Tertullian and Origen, by Du Fossé, under the name of La Mothe,' &c.

(*Vie de M. Lenain de Tillemont*, by his friend Trouchay, afterwards canon of Laval, Cologne, A.D. 1711; Dupin, *Bibliothèque des Auteurs Ecclésiastiques du Dixseptième Siècle; Biographie Universelle.*)

TILLOCH, ALEXANDER, LL.D., was born at Glasgow on the 28th of February, 1759, and was educated with a view to following the business of his father, who was a tobacconist, and for many years filled the office of magistrate in that city. He was, however, more inclined to the pursuit of scientific knowledge than to the routine of business. His biographer states that in early life his attention was greatly attracted by the occult sciences, and that although he was not long subject to their delusions, he never was inclined to treat judicial astrology with contempt. One of the earliest subjects to which Tilloch applied himself was the improvement of the art of printing; his experiments have been alluded to in a previous volume. [STEREOTYPE, vol. xxiii., pp. 42 and 43.] After carrying on the tobacco business for a time in his native city in connection with his brother and brother-in-law, Tilloch abandoned it, and for several years exercised that of printing, either singly or in partnership with others. In 1787 he removed to London, where he subsequently resided; and in 1789 he, in connection with other parties, purchased the 'Star,' a daily evening newspaper, of which he became editor. This office he continued to hold until within a few years of his death, when bodily infirmities and the pressure of other engagements compelled him to relinquish it. The political opinions of Tilloch were temperate. For many years he devoted attention to means for the prevention of the forgery of bank-notes, and in 1790 he made a proposal to the British ministry on the subject, which met with an unfavourable reception. He then offered his invention to the French government, who were anxious to apply it to the printing of assignats; but, after some experiments had been made, and negotiations had been urgently sought by the French authorities, all communication on the subject was cut short by the passing of the Treasonable Correspondence Bill. In 1797 he presented to the Bank of England a specimen note, produced by block or relief printing, which was certified by the most eminent engravers to be impossible of imitation; yet nothing was done towards the adoption of his or of any similar plan.

Considering that there was room for a new scientific journal, in addition to that published by Nicholson, Tilloch published, in June, 1797, the first number of the 'Philosophical Magazine,' a periodical which has ever since maintained a high reputation as a record of the progress of science, and a digest of the proceedings of learned societies at home and abroad. Of this work he was sole proprietor and editor until a few years before his death, when Mr. Richard Taylor, who succeeded him in its management, became associated with him. In the earlier numbers of the 'Star' Tilloch published several essays on theological subjects, some of which, relating to the prophecies, were subsequently collected into a volume by another person, and published with the name 'Biblicus;' and in 1823 he issued an octavo volume entitled 'Dissertations introductory to the study and right understanding of the language, structure, and contents of the Apocalypse, in which he endeavours to prove that that portion of Scripture was written much earlier than is usually supposed, and before most of the apostolical epistles. His views on this and other points are discussed at length in a notice of this work, published soon after his death, in the 'Eclectic Review.' The last work undertaken by Tilloch was a weekly periodical entitled the 'Mechanic's Oracle,' devoted

principally to the instruction and improvement of the working classes. The first number appeared in July, 1824, and it was discontinued soon after his death, which took place at his residence at Islington, on the 26th of January, 1825.

Tilloch married early in life. His wife died in 1783, leaving a daughter, who became wife of Mr. John Galt. His religious opinions were peculiar, and he was one of the elders who acted as ministers of a small body who took the name of Christian Dissenters, and met for worship in a private house in Goswell Street Road. He was a member of many learned societies in Great Britain and elsewhere, and was proposed, about twenty years before his death, as a fellow of the Royal Society of London; but his name was withdrawn before coming to the ballot, in consequence of an intimation that he would be objected to, not on account of any deficiency in talent or character, but solely because he was proprietor of a newspaper. A memoir of Dr. Tilloch appeared in the 'Imperial Magazine' for March, 1825, from which, with the assistance of other obituary notices, the above account is condensed. This was reprinted in the last number of the 'Mechanic's Oracle,' with a portrait.

TILLOTSON, JOHN, D.D. (born 1630, died 1694), a prelate and one of the most celebrated divines of the Church of England. He was born at Sowerby in Yorkshire, a member of the great parish of Halifax, of a Puritan family. His father, who was engaged in the clothing trade, belonged to that extreme section of the Puritans who were for establishing a general system of Independency, and he belonged himself to an Independent church, of which Mr. Root was the pastor. After having been a pupil in the grammar-schools in the country, the writers of his Life not having told us what schools they mean, but doubtless the grammar-school at Halifax was one, he became a pensioner of Clare Hall, Cambridge, in 1647, and a fellow of the college in 1651. It appears that he remained in the University till 1657. Puritanism was at that period in the ascendency at Cambridge; but Tillotson very early freed himself from his educational prejudices, became a great admirer of the writings of Chillingworth, and soon showed himself one of a class of persons who were then beginning to be considerable in England, who, taking their stand on the Scriptures, opposed themselves at once to Romanism on the one hand and to Calvinism on the other. This position he ever after maintained, and his celebrity arises principally from the ability with which he illustrated and defended, both from the pulpit and the press, the principles of Protestantism, and of a rational and moderate orthodoxy. It may be added also, that so much of the effects of his original Puritan education remained with him, that he was in politics a Whig, although it must be owned that he entertained and occasionally expressed notions of the duty of submission, which, if acted upon, would have maintained the House of Stuart on the throne.

Before he entered holy orders, he was tutor in the family of Prideaux, the attorney-general to Cromwell. This led to his residence in London, and brought him into acquaintance with several eminent persons. He was thirty years of age before he received ordination, and the service appears to have been performed with some degree of privacy, as it is, we believe, not known when or where it was performed, and only that the bishop from whose hands he received it was not a bishop of the English church, but the bishop of Galway in Scotland, Dr. Thomas Sydserf. All the supposed irregularities and imperfections of his early religious history, for amongst other things it was even asserted that he had never been baptized, were brought before the public by the non-juring party, when they saw him elevated to the primacy, from which Sancroft had retired.

It is said by his biographer, Dr. Thomas Birch, that he was not perfectly satisfied with the terms of ministerial conformity required by the act of 1662, which restored the Episcopal church of England; yet on the whole he judged it proper to accept of the terms, and to become a regular and conformable minister of that church.

He was for a short time curate at Cheshunt, and also for a short time rector of Ketton in Suffolk, a living to which he was presented by Sir Thomas Barnardiston, one of his Puritan friends. But he was soon called to a wider sphere of duty, being appointed, in 1664, the preacher at Lincoln's Inn, and lecturer at St. Lawrence's Church in the Jewry. Here it was that those sermons were preached which attracted crowds of the most accomplished and the learned of the time, and which have been since read and studied by many succeeding divines of eminence, and are at this day the basis of his fame.

The course of his preferment in the church during the reign of Charles II. was—1669, a prebendary in the church of Canterbury; 1672, dean of Canterbury; 1675, a prebendary in the church of St. Paul; and 1677, a canon residentiary in the same cathedral. But as soon as King William was established on the throne he was made dean of St. Paul's and clerk of the closet; and in April, 1691, he was nominated by the king to the archbishopric of Canterbury, an appointment which appears to have been really received by him with reluctance, and which exposed him to no small share of envy from very different parties. The truth is, that besides his eminent merits as having been the ablest opposer both of popery and irreligion, in a reign when the tendencies of too many persons in exalted stations were in one of these directions, he had a strong personal interest in the new king's affections, who is said, on credible authority, to have declared that there was no honester man than Dr. Tilloston, nor had he ever a better friend. He was archbishop only three years and a half, dying at the age of sixty-four. He was interred in the church of St. Lawrence Jewry, which had been the chief scene of his high popularity.

He died poor. He had survived both his children; but he left a widow, who was a niece of Cromwell and the stepdaughter of Bishop Wilkins, without any provision except the copyright of his works, which it is said produced 2500*l*. The king granted her a pension, first of 400*l*., and afterwards of 200*l*. more, which she enjoyed till her death in 1702.

An account of the Life of Dr. Tillotson was published in 8vo., 1717. There is a much larger Life of him by Dr. Birch, prefixed to an edition of the works of Tillotson, and published also in an 8vo. volume, the second edition of which was printed in 1753, containing additional matter. There is also an account of him in Le Neve's 'Lives of the Protestant Archbishops of England.' Birch's edition of the Works is in 3 vols. folio, 1752.

TILLY, or TILLI, JOHN TSERCLAS, Count of, was the son of Martin Tserclas, of Tilly. The Tserclas, whose name is also written T'Serclaes, were an old patrician family of Brussels; John, a member of this family, acquired, in 1448, the lordship of Tilly, in South Brabant. John Tilly was born in 1559, at the castle of Tilly, and he early entered the order of Jesuits, from whom he acquired that spirit of fanaticism, of blind obedience, and of absolute command, which distinguished him during his whole life. He soon abandoned his ecclesiastical profession, and entered the army of Philip II., king of Spain and lord of the Netherlands, and he learned the principles of war under Alba, Requesens, the governor of the Netherlands, Don Juan of Austria, and Alexander Farnese. In the war of the Spaniards against the Protestant inhabitants of the northern Netherlands he acquired that hatred of heretics and that warlike enthusiasm for the Roman Catholic religion, which became one of the most prominent features of his character. Towards the end of the sixteenth century he entered the service of the emperor Rudolph II., and distinguished himself, first as lieutenant-colonel, and afterwards as colonel and commander of a regiment of Walloons, in the wars against the Hungarian insurgents and the sultans Murad III. and Ahmed I. After the peace of Sitvatorok in 1606, between Rudolph II. and Ahmed I., he was appointed commander-in-chief of the army of Maximilian, duke of Bavaria, which was in a very disorganized state. In 1609 Tilly commanded the expedition against Donauwerth, an imperial town which had been put under the ban for having persecuted the Roman Catholics, and which surrendered to Tilly without defence. The Liga, or the union of the Roman Catholic states in Germany, appointed him commander-in-chief of their troops, and he held this high office until his death. Tilly gained the first great victory in the Thirty Years' War, which broke out in 1618. [Thirty Years' War.] After having conquered the Upper Palatinate with the troops of the Liga and those of the duke of Bavaria, he proposed to the Imperial generals to pursue the army of Frederick, king of Bohemia, instead of taking winter-quarters and thus losing all the fruits of their conquests. Warfare in

winter was, in the seventeenth century, a very uncommon thing, and Tilly met with much opposition to his plan; but at last the Imperial generals consented to continue the war. Tilly attacked the Bohemians, who had taken up a fortified position on the Weisse Berg, near Prague, and in a few hours the Bohemian army was nearly destroyed (8th of November, 1620), while only some hundreds of the Bavarians were killed. Several of the Bohemian nobles, who lived at Prague or resided in their castles, were warned by Tilly to fly if they would avoid the vengeance of the emperor; but they paid no attention to this generous advice, and were surprised: twenty-seven of them were beheaded.

After the brilliant victory on the Weisse Berg, Tilly hastened to the Rhine for the purpose of preventing the count of Mansfield from joining the margrave of Baden. He succeeded in this object by his skilful manœuvres. The margrave of Baden-Durlach was attacked in the defiles of Wimpfen, and defeated, after an heroic resistance (1622). On the 2nd of June, 1622, he defeated Christian of Halberstadt at Höchst; he pursued Christian and Mansfield to Westphalia; defeated them at Stadt-Loo, near Münster, in a battle which lasted three days (4th to the 6th of August, 1623), and forced them both to disband their troops and to take refuge in England. For his victory at Stadt-Loo, Tilly was created a count of the empire. It has been related, in the article THIRTY YEARS' WAR, how skilfully Tilly first weakened and then destroyed the army of king Christian IV. of Denmark; but the principal glory of this campaign was earned by Waldstein, who, after having joined Tilly on the banks of the Lower Elbe, persuaded Tilly to turn his arms against Holland, and to leave him the conquest of Denmark. After Waldstein had been deprived of his command in 1630, and Gustavus Adolphus, king of Sweden, had landed in Germany, Tilly was appointed field-marshal and commander-in-chief of the imperial army. He appreciated so justly the military talents of his new opponent, that in the assembly of the electors at Ratisbon he declared Gustavus Adolphus to be so great a commander, that not to be beaten by him was as honourable as to gain victories over other generals.

The first great event of the new campaign was the capture of Magdeburg, on the 10th of May, 1631. The Croats and the Walloons in the imperial army committed unheard-of cruelties against the unhappy inhabitants; 30,000 of them were killed, and the town was entirely destroyed after three days' plunder. It has generally been believed that some Imperial officers besought Tilly to stop the atrocities of the soldiers, and that he coolly answered, 'Let them alone, and come back in an hour.' But this is a mere invention, and however severe Tilly was, he cannot be charged with having urged the commission of cruelty, although he considered the plunder of a conquered town as the fair reward of the soldier. On the 14th of May Tilly made his entrance into the smoking ruins of Magdeburg. In a letter to the emperor he said that since the destruction of Troy and Jerusalem there had been no such spectacle as that which Magdeburg presented. Six months later Tilly, who was in a fortified camp at Breitenfeld near Leipzig, was forced, by the impetuosity of his lieutenant, Pappenheim, to engage in battle with Gustavus Adolphus before his reinforcements had arrived. Tilly himself was successful in his attack on the left wing of the Swedes, which was broken, and the elector of Saxony, who commanded it, fled as far as Eilenburg. But Gustavus Adolphus, who had beaten the left wing of the Imperialists, under the command of Pappenheim, stopped the progress of Tilly, and after a long and bloody struggle the imperial army was routed. When Tilly saw the flight of his soldiers, he swore that he would not survive the day on which he, the victor in thirty-six battles, was to fly for the first time in his life. Alone on the field the old field-marshal, bleeding from three wounds, shed tears of despair, and looked for death as his only consolation. However Duke Rudolph of Saxe-Lauenburg persuaded him to withdraw; and Tilly, putting himself at the head of four regiments of veterans, fought his way through the main body of the Swedish army. He narrowly escaped from the bold attack of a Swedish captain, called 'Long Fritz,' who was killed by a pistol-shot at the moment when he was seizing the field-marshal (17th of September, 1631). After the loss of the battle of Leipzig, fortune abandoned Tilly for ever. Although he afterwards succeeded in driving the Swedes from Franconia, Gustavus Adolphus compelled him to retire beyond the Lech. In order to prevent the Swedes from penetrating into Bavaria, Tilly took up a very strong position near Rain, on the right bank of that river. Gustavus Adolphus, having arrived on the left bank opposite Rain, opened a fire from all his batteries on the Bavarian camp, while his pontooniers endeavoured to construct a bridge over the river (5th of April, 1632). Tilly made the most active resistance, but a ball broke his thigh, and he was removed from the field and carried to Ingolstadt. After the fall of Tilly, the elector of Bavaria abandoned his invincible position, and the Swedes crossed the river. Tilly died on the day after the battle, in his seventy-third year, without leaving any issue.

Tilly was a little ugly man, with red hair, large whiskers, a pale face, and piercing eyes. He continued to lead a monastic life in the midst of the noise and the licence of his camp; he boasted that he had never touched wine nor women; he spoke little, but thought much; he despised honours and money; the emperor wished to confer the duchy of Brunswick-Calenberg upon him, but Tilly refused it, and he died poor.

(Julius Bellus, *Laurea Austriaca;* Breyer, *Geschichte des Dreissigjährigen Krieges;* Schiller, *Geschichte des Dreissigjährigen Krieges;* Leo, *Universal-Geschichte.*)

TILSIT (more correctly TILSE), the chief town of Prussian Lithuania, is situated in 55° 4′ N. lat. and 21° 56′ E. long., in a fertile country on the south bank of the river Memel (called in Russia the Niemen). The little river Tilzele (pronounced Tilshelé) forms on the south side of the town a large basin, and discharges itself, between the town and the suburbs, into the Memel, over which there is a bridge of boats, which is 1150 feet long without the approaches. The thirty-six boats or pontoons are removed at the approach of winter into the Tilzele, and replaced in spring. The master of the Teutonic Order built the old castle in 1289, which was repaired and enlarged in 1356; but the present castle, to the east of the town, was not built till 1537. In process of time a considerable town grew up round the castle; favoured by its excellent situation it became the channel for the great trade between the interior of Russian Poland and the port of Memel, so that it was one of the most flourishing towns in the province. The principal buildings and public institutions are, the castle, the town-hall (built in 1752-55), the German Lutheran church, with a very lofty and curious steeple, the very pretty Lithuanian church, the Calvinist church, and the Roman Catholic chapel on an eminence at a short distance from the town; the gymnasium, founded in 1586; a Lutheran and a Roman Catholic hospital, a poor-house and infirmary, and other charitable institutions. The barracks, 600 feet in length, 36 in breadth, and two stories high, were erected in 1794-1800, by a society of the citizens, that the troops might not be quartered in the houses. The inhabitants, about 12,000 (exclusive of the garrison), chiefly draw their subsistence from the trade in corn, linseed, and timber; many are engaged in agriculture (the town possesses lands of its own, and many of the citizens have considerable estates); and there are likewise breweries, distilleries, tanneries, and all the trades usually carried on in large towns. The shoes of Tilsit are celebrated for durability and neatness, and great quantities of them are exported. There are many good gardens in the town and environs, particularly those of the Horticultural Society.

Tilsit has acquired historical celebrity by the treaties of peace concluded on the 7th and 9th of July, 1807, between France, Russia, and Prussia, the terms of which are too well known to be stated in this place: yet in five years after this peace, which seemed to have laid continental Europe prostrate at the feet of Napoleon, a part of that immense army which was to have subdued Russia (Macdonald's division) was seen to return desponding, silent, and miserable over that same river which had so lately witnessed the triumph and splendour of the conqueror.

(Müller, *Handbuch*; Preuss, *Beschreibung von Preussen;* Hassel, *Geogr.-Handbuch.*)

TILT-HAMMER, a large hammer worked by machinery, impelled either by a water-wheel or a steam-engine. Such hammers are extensively used in the manufacture of iron and steel, and the name *tilt-mill* is sometimes applied to the mechanism of which they form the principal feature.

In the process of *shingling* or *blooming* [IRON, vol.

xiii., p. 34], the heated iron is subjected to a very heavy hammer, the strokes of which not only bring it into a new form, but also force out from its substance considerable quantities of dross. The kind of tilt-hammer formerly used for this purpose is represented by Holland, in his treatise on 'Manufactures in Metal,' in Lardner's 'Cabinet Cyclopædia.' He describes the shaft or helve of the hammer as nine feet in length, and thirty or forty inches in circumference, made of ash, and clamped at intervals with stout iron hoops. This shaft passed through the head of the hammer, which was a mass of cast-iron, weighing seven or eight cwt., and was secured at the opposite end to a massy collar of cast-iron called the *hurst*, the projections or pivots of which formed the axis or centre of motion, and were sustained by a strong frame-work of timber. Above the hammer was placed a very strong but elastic beam, formed of tough ash bound with iron hoops, and against this, which acted as a spring to increase the force of the descending stroke, the head of the hammer was thrown up by the revolution of a ponderous circular frame of iron, with four projecting arms or teeth, which came in contact with the shaft very near to the head of the hammer. This circular frame, or *arm-case*, was fixed immediately upon the axis of the water-wheel which supplied the moving-power. In modern iron-works the shingling-hammers are usually formed entirely of iron, the piece forming the actual head of the hammer being inserted into a ponderous cast-iron helve in such a manner that it may be removed when worn out. The spring-beam is frequently dispensed with, and the hammer is lifted either by cogs or arms acting upon the extremity of the helve, beyond the hammer-head, or by an eccentric, or cam, revolving in contact with a projection from the under side of the helve, between the hammer-head and the axis or centre of motion. Holland represents a tilt-hammer of the latter construction, which is about six tons in weight, and nine feet five inches long from the axis to the centre of the head. The hammer-head itself is circular, and weighs about eight cwt. Such a hammer makes about one hundred and fifty strokes per minute.

The tilt-hammers used in the manufacture of steel are smaller and much more rapid in their action. Instead of receiving the impulse of the cams near their head, such hammers are set in motion by tappets or cogs striking downwards upon the tail of the helve or shaft, which is prolonged beyond the axis. The tail of the helve is thus thrown down forcibly upon an anvil, from which it rebounds with great velocity, causing the hammer to make from three to seven hundred strokes in a minute. Tilt-hammers are applied with great advantage to the forging of anchors, axles, &c.

When tilt-hammers are impelled by water-wheels, it is advisable to fix the cams or arms upon a separate shaft, which may revolve at any required velocity without increasing the velocity of the water-wheel itself, by the intervention of suitable cogged-wheels. Without such an arrangement much of the useful effect of the water may be lost, owing to the necessity of urging the wheel to a high speed.

TIMAEUS (Τίμαιος), the son of Andromachus, was born at Tauromenium in Sicily, whence he is sometimes called a Tauromenian, and sometimes a Sicilian, to distinguish him from other persons of the same name. The year of his birth was B.C. 352. He was a disciple of Philiscus of Miletus, who had himself been instructed by Isocrates. He was driven from his native country by Agathocles, the tyrant of Syracuse, whereupon he went to Athens. This seems to have happened in the year B.C. 310, when Agathocles, after the battle of Himera, and before taking his army over to Africa, confiscated under various pretexts the property of his wealthy subjects, and endeavoured to secure his possessions in Sicily by putting to death or sending into exile such as he thought ill disposed towards him. (Diodorus Sic., xx. 4.) Timaeus spent fifty years at Athens in reading and studying. (Polybius, xii. 25.) About the year B.C. 260, when Athens was taken by Antigonus, Timaeus returned to his native country, either to Tauromenium or to Syracuse, where he spent the remainder of his life, and died, B.C. 256, at the advanced age of ninety-six.

Timaeus wrote a great historical work, the main subject of which was a history of Sicily. It began at the earliest times, and brought the events down to Olympiad 129 (B.C. 264), where the work of Polybius begins. (Polybius, i. 5.) How many books the history contained is uncertain, though we know that there were more than forty. It appears to have been divided into large sections, each of which formed in itself a separate work, whence they are spoken of by several writers as so many independent works. Thus one section bore the title of Σικελικὰ καὶ Ἰταλικά, and contained the early history of Sicily in connection with that of Italy; another was called Σικελικὰ καὶ Ἑλληνικά, and contained the history of Sicily and Greece during the time of the Athenian expeditions to Sicily. Another part again contained the history of Agathocles; and the last the history of Pyrrhus, especially his campaigns in Italy and Sicily. This last section was, according to the testimony of Cicero (*Ad Famil.*, v. 12), a separate work, though, as regards the period which it comprehended, it may be viewed as a continuation of the great historical work.

This history of Timaeus, which, with the exception of a considerable number of fragments, is now lost, was commenced by him during his exile at Athens, and at a very advanced age; but he did not complete it till after his return to his own country; and it was here that he added the history of the last years of the reign of Agathocles and wrote the history of Pyrrhus. As regards the character and value of the work the antients do not agree. Polybius is a vehement opponent of Timaeus, and complains of his ignorance of political as well as military affairs; he further states that Timaeus made blunders in the geography even of places and countries which he himself had visited. His knowledge, he says, was altogether derived from books; his judgment was puerile; and the whole work bore strong marks of credulity and superstition. But this is not all that Polybius blames: he even charges him with wilfully perverting the truth. The fondness which Timaeus himself had for censuring others is said to have drawn upon him the nickname of Epitimæus (fault-finder). (Athenæus, vi., p. 272.) Most parts of this severe criticism of Polybius may be perfectly just; but in regard to others we should remember that these two historians wrote their works with such totally different views, that the work of Timaeus, who knew the world only from his books, must in many respects have appeared absurd to the author of a 'pragmatical' history, and to a statesman and general like Polybius. But the loss of the work of Timaeus, even if he did no more than make an uncritical compilation of what others had told before him, is one of the greatest in antient history. Other ancient writers, such as Diodorus, Agatharchidès, Cicero, and others, judge far more favourably of Timaeus. The style of the work, as far as we can judge from the fragments, is justly censured by some antient critics for its rhetorical and declamatory character; although others, like Cicero (*De Orat.*, ii. 14; *Brutus*, 95), speak of it with praise. Timaeus is the first Greek historian who introduced a regular system of chronology, that is, he regularly recorded events according to Olympiads and the archons of Athens; and although, in the early period of his history, his want of criticism led him into gross chronological errors, he set the example which others found very useful and convenient. It must have been with a view to an accurate study of chronology that he wrote a work on the victors in the Olympian Games, of which we still possess a few fragments.

The fragments of Timaeus are collected in Göller's work, 'De Situ et Origine Syracusarum,' p. 207, &c., which also contains (pp. 179-206) an elaborate dissertation on the life and writings of Timaeus. The fragments are also contained in C. and T. Müller, 'Fragmenta Historicorum Græcorum,' Paris, 1841, pp. 193-233. Compare Vossius, *De Historicis Græcis*, p. 117, edit. Westermann; Clinton, *Fast. Hellen.*, iii., p. 489, &c.

TIMAEUS (Τίμαιος), a Greek Sophist, who, according to the supposition of Ruhnken, lived in the third century of the Christian æra. Concerning his life nothing is known; his name has only come down to us in connection with a little vocabulary containing the explanation of words and phrases which occur in the writings of Plato. It bears the title ἐκ τῶν τοῦ Πλάτωνος λέξεων, and is dedicated to one Gentianus, of whom likewise nothing is known. Whether we possess the genuine and complete Vocabulary of Timaeus is doubtful; and from the title, as well as from certain articles in it which have no reference to Plato, and must undoubtedly be regarded as interpolations, one might feel inclined to consider the work as it now stands

as an abridgment of the Glossary of Timaeus, if Photius, who must have had the genuine work before him, did not describe it as a very little work (*βραχὺ πονημάτιον ἐν ἑνὶ λόγῳ*). But notwithstanding its brevity, the work is very valuable; and Ruhnken owns that he has not discovered in it a single instance of a word or a phrase being explained incorrectly. There is only one MS. of this Glossary, which appears to have been made in the tenth century of our æra, and which was unknown until Montfaucon drew attention to it. It was first edited, with an excellent commentary, by Ruhnken, at Leyden, 1754, 8vo.; a second and much improved edition appeared in the same place, 1789, 8vo. Two other editions have since been published in Germany, with additional notes by G. A. Koch (Leipzig, 1828 and 1833, 8vo.).

Suidas (*s. v. Τίμαιος*) ascribes to Timaeus, the Sicilian historian, a rhetorical work, called Συλλογὴ ῥητορικῶν ἀφορμῶν, in sixty-eight books, which Ruhnken, with great probability, attributes to Timaeus the Sophist, who wrote the Glossary to Plato.

(Ruhnken, *Praefatio ad Timaei Glossarium Platonicum.*)

TIMAEUS (*Τίμαιος*), of Locri, a Pythagorean philosopher. He was a contemporary of Plato, who is mentioned among his pupils, and is said to have been connected with him by friendship. (Cicero, *De Finibus*, v. 29; *De Re Publ.*, i. 10.) There exists a work, Περὶ τῆς τοῦ κόσμου ψυχῆς ('De Anima Mundi;' or, on the Soul of the Universe), written in the Doric dialect, which is usually ascribed to Timaeus the Locrian. It contains a brief exposition of the same ideas which are developed in the Dialogue of Plato, which is called after him Timaeus. (Tennemann, *System der Platonischen Philosophie*, i., p. 93, &c.) Separate editions of it have been published by D'Argens, at Berlin, 1762, 8vo., with a French translation; and by J. J. de Gelder, at Leyden, 1836, 8vo.

This Timaeus of Locri is said by Suidas to have also written the Life of Pythagoras; but the usual carelessness of Suidas renders this a doubtful point, as he may possibly have confounded the Locrian with the Sicilian Timaeus, who in his great historical work must have treated of the History of Pythagoras at considerable length.

(Fabricius, *Biblioth. Graec.*, iii., p. 94, &c.; Göller, *De Situ et Origine Syracusarum*, p. 200, &c.)

TIMA'LIA, a genus of birds characterized by Dr. Horsfield.

Generic Character.—Bill strong compressed, deep (altum). *Nostrils* subrounded. *Wings* short, rounded. *Tail* elongated and graduated. *Feet* strong: hind-claw twice as large as the middle anterior claw.

Dr. Horsfield states that a peculiar character is exhibited in both the species of *Timalia* recorded by him, in the structure of the plumes, which cover the back and the upper parts of the neck, as well as the breast, belly, vent, and thighs. He remarks that the separate filaments (*radii* of Illiger), which constitute the vanes or webs of those plumes, are not in close contact, as is generally the case, but, being inserted into the shaft at a small distance from each other, they diverge with perfect regularity. 'The parts which they cover,' says Dr. Horsfield in continuation, 'are accordingly marked with delicate parallel lines, and wherever several plumes lie over each other, they form a beautiful reticulation. On the posterior part of the abdomen, the vent, and the thighs, the plumes have a similar structure; but the filaments are greatly elongated and pendulous, so as to envelop those parts with a lax plumose covering, which on near inspection appears covered with delicate hairs. This appearance is produced by a series of very minute parallel villi, on each of the separate filaments, arranged with great regularity and beauty. Plumes in which this structure can be discerned with the naked eye are named decompound by Illiger, and described as those whose radii are pinnated with smaller lateral radii; and the effect which the arrangement of these decompound plumes has in the appearance of the bird is exhibited with accuracy both in the figure of *Timalia pileata* and *Timalia guluris*.'

Example, *Timalia pileata*.

Description.—Body ovate, rather stout. General colour above, brown with an olivaceous tint; underneath, testaceous inclining to grey. Head capped with saturated chestnut. Throat and cheeks white. Breast white inclining to grey, marked with intensely black stripes by the shafts of the plumes. A narrow white band commences at the forehead, near the base of the bill, passes backward, encircles the eye, and unites with the white plumes of the cheeks. Axillæ white; which colour also shows itself in a narrow border of the wing. Quills and tail-feathers of a more pure brown colour than the other parts; very narrow transverse undulations, of a darker colour, observable on the tail-feathers by close examination. Plumes of the hypochondriæ, thighs, and vent, long, pendulous, decompound, and villose. Lesser wing-coverts, as well as the plumes which cover the nape and back, greyish-blue at the base; which colour shows itself on the separate filaments or radii, if the plumes are accidentally deranged. Tail underneath brown, with a hoary tint. Bill black and shining. Feet brown. (Horsf.)

Locality, Habits, &c.—Dr. Horsfield observes that the species is not unfrequent in the groves and small woods which abound throughout Java. It often, he says, approaches villages and plantations, constructing its nest in the hedges; and he speaks of it as one of the social birds that delight to dwell in the vicinity of cultivation. In large forests he did not notice it. He describes its flight as low and interrupted, and adds that wherever it resides it is a welcome neighbour, in consequence of the peculiarity and pleasantness of its note, which consists of a slow repetition of the five tones of the diatonic scale (C, D, E, F, G), which it chants with perfect regularity, several times in succession, and at small intervals of time. Dr. Horsfield further remarked that the sixth tone was sometimes added; but as this required apparently an extraordinary effort, it was by no means so agreeable to a musical ear as the simple repetition of the five notes, which appeared to be the natural compass of the bird's organs. (*Zoological Researches in Java.*)

Timalia pileata. (Horsf.)

TIMALI'NÆ, Mr. G. R. Gray's name for his third subfamily of *Turdidæ*. [THRUSHES; TIMALIA.]

TIMANEES. [SIERRA LEONE.]

TIMANTHES, a native of Sicyon or of Cythnos, was one of the most celebrated painters of Greece; he was contemporary with Zeuxis and Parrhasius, and lived about 400 B.C. The works of Timanthes were distinguished particularly for their invention and expression, and one of the chief merits of his invention was, that he left much to be supplied by the imagination of the spectator. There is a remark in Pliny (*Hist. Nat.*, xxxv. 36), probably a quotation, which bestows the highest praise upon Timanthes: it says, though in execution always excellent, the execution is invariably surpassed by the conception. As an instance of the ingenuity of Timanthes' invention, the same writer tells us of a picture of a sleeping Cyclops, painted upon a small panel, but in which the painter had conveyed a perfect idea of the giant's huge size, by adding a few satyrs measuring his thumb with a thyrsus.

Though Timanthes was evidently one of the greatest painters of antiquity, antient authors have mentioned only five of his works: Pausanias makes no mention of him at all, and Cicero classes him among the painters who used only four colours.* He painted a celebrated picture of the

* See 'Dictionary of Greek and Roman Antiquities,' art. 'Colores.'

stoning to death of the unfortunate Palamedes, the victim of the ignoble revenge of Ulysses for having proclaimed his apparent insanity to be feigned: a subject worthy of the pencil of a great master. This picture is said to have made Alexander shudder when he saw it at Ephesus. (Tzetzes, *Chil.*, viii. 198; Junius, *Cat. Artif.*, v. 'Timanthes.') Timanthes entered into competition with Parrhasius at Samos, and gained the victory; the subject of the paintings was the contest of Ajax and Ulysses for the arms of Achilles. [PARRHASIUS.] His most celebrated work however was that with which he bore away the palm from Colotes of Teos; the subject was the Sacrifice of Iphigenia; and perhaps no other work of antient art has been the object of so much criticism, for and against, as this painting, on account of the concealment of the face of Agamemnon in his mantle. The antients have all given the incident their unqualified approbation, but its propriety has been questioned by several modern critics, especially by Falconet and Sir Joshua Reynolds; Fuseli however, in an elaborate and excellent criticism in his first lecture, has probably finally settled the matter in favour of the painter. The Sacrifice of Iphigenia was given as the subject of a prize-picture to the students of the Royal Academy in 1778, and all the candidates imitated the 'trick' of Timanthes, as Sir Joshua Reynolds terms it, which was the origin of his criticism upon the subject in his eighth lecture: he says, 'Supposing this method of leaving the expression of grief to the imagination to be, as it was thought to be, the invention of the painter, and that it deserves all the praise that has been given it, still it is a trick that will serve but once; whoever does it a second time will not only want novelty, but be justly suspected of using artifice to evade difficulties.'

The shallow remark of Falconet about Timanthes' exposing his own ignorance by concealing Agamemnon's face, is scarcely worthy of an allusion. It may be questioned whether Agamemnon, under such circumstances as he was placed, could have been well or even naturally represented in any other way: although many things might combine to render his presence at the sacrifice absolutely necessary, still it is not to be supposed that he could calmly stand by and be an eye-witness of his own daughter's immolation; notwithstanding his firm conviction that his attendance was necessary to sanction the deed, he could not look upon it; it would be unnatural. The criticism of Quintilian, Cicero, and others, that the painter, having represented Calchas sorrowful, Ulysses much more so, and having expressed extreme sorrow in the countenance of Menelaus, was in consequence compelled to conceal the face of the father, is not more pertinent than that of the modern critics. 'They were not aware,' says Fuseli, 'that by making Timanthes waste expression on inferior actors at the expense of a principal one, they call him an improvident spendthrift, and not a wise economist.'

Falconet observes that Timanthes had not even the merit of inventing the incident, but that he copied it from Euripides: upon this point Fuseli remarks—'It is observed by an ingenious critic that in the tragedy of Euripides the procession is described; and upon Iphigenia's looking back on her father, he groans and hides his face to conceal his tears: whilst the picture gives the moment that precedes the sacrifice, and the hiding has a different object, and arises from another impression' (v. 1550).

'I am not prepared with chronologic proofs to decide whether Euripides or Timanthes, who were contemporaries about the period of the Peloponnesian war, fell first on this expedient; though the silence of Pliny and Quintilian on that head seems to be in favour of the painter, neither of whom could be ignorant of the celebrated drama of Euripides, and would not willingly have suffered the honour of this master-stroke of an art they were so much better acquainted with than painting, to be transferred to another from its real author, had the poet's claim been prior.' As far as regards priority, the 'expedient' was made use of by Polygnotus long before either Timanthes or Euripides; in the Destruction of Troy, in the Lesche at Delphi, an infant is holding his hands over his eyes, to avoid the horrors of the scene. (Pausanias, *Phoc.*, x. 26.)

The fifth work of Timanthes mentioned by the antients was the picture of a hero, preserved in the time of Pliny in the Temple of Peace at Rome, an admirable performance.

There was another antient painter of the name of Timanthes; he was contemporary with Aratus, and distinguished himself for a painting of the battle of Pellene, in Arcadia, in which Aratus gained a victory over the Ætolians, Olym. 135.1 (240 B.C.). Plutarch praises the picture; he terms it an exact and animate representation (*Aratus*, 32).

TIMBER-TRADE. Several centuries ago the woods and forests of England were sufficient to supply all the timber required for the building of ships and houses, as well as for fuel. In the sixteenth century we begin to hear complaints of their exhaustion. An act having been passed in 1531 requiring coopers to sell their barrels at fixed prices (23 Hen. VIII., c. 4), they were allowed by another act (35 Hen. VIII., c. 8), passed twelve years afterwards, to increase their prices. Various circumstances rendered this change necessary; but at the time, the greater scarcity of timber, though only one cause of the rise of the material, was regarded as the sole cause, as is evident from an act passed during the same session, 'for the preservation of woods' (35 Hen. VIII., c. 17), in the preamble of which 'the decay of timber and woods universally within this realm of England' is said to be so great, 'that unless speedy remedy in that behalf be provided, there is great and manifest likelihood of scarcity and lack as well of timber for building, making, repairing of houses and ships, as also for fuel and fire-wood.' The act relating to the price of barrels required, amongst other things, that the exporters of beer should import clapboards sufficient to replace the barrels sent out of the country; and the other act was designed to enforce certain restrictions respecting the felling of trees, and to prevent the conversion of woodlands into pasture or tillage. The wealds of Kent, Sussex, and Surrey, where iron-works had been carried on from very antient times, were excluded from the provisions of this act. In 1558 however an act was passed (1 Eliz., c. 15), entitled 'An Act that timber shall not be felled to make coles for the making of iron,' which prohibited the use of timber one foot square in iron-works within fourteen miles of the sea, or within the same distance of eight of the principal rivers of England, or any navigable stream having an outlet on the coast; but the three southern counties previously mentioned were exempt from the operations of the act. The design seems to have been to encourage the trade in timber fit for building, and to benefit those parts of the country which did not possess a sufficient supply. Iron-works having been subsequently erected not far from London, and within the prescribed distance of the Thames, as well as within other limits, and which required so much fuel that the woods 'daily decay and become scant,' an act was passed in 1580 (23 Eliz., c. 5) to prevent the erection of new iron-works within the limits mentioned by the act of 1558, and the restrictions respecting felling trees were renewed. In 1592 the subject again attracted notice, and an act was passed (35 Eliz., c. 11), which, amongst other things, prohibited aliens exporting fish, unless they imported clapboards; and altogether prohibited the exportation of wine-casks. In the following century the scale of prices turned in favour of pit-coal. Before the discovery of the process of smelting iron with pit-coal, the transfer of this branch of industry to the colonies in North America was seriously entertained, and was carried into effect to some slight extent. It was also suggested that the waste lands of England should be planted; and the woods of Ireland being less exhausted than those of England, a considerable quantity of iron was for some time smelted there.

During the decline in the internal supply of timber, it gradually became an article of extensive demand from other countries. In 1830, according to a statement of Mr. Huskisson, the fir timber used in England for building purposes was nearly all brought from abroad. The proportion of timber of native production used for similar objects is not known or even guessed at. The north of Europe, especially the countries on the Baltic, and our colonies in British North America, are the great sources of supply. Teak is brought from the west coast of Africa, mahogany from the Bay of Honduras and other places, and fancy and dye woods from a number of other quarters; but none of these come into competition with the building timber of the Baltic or of our North American possessions. The timber of the north of Europe is generally of excellent

quality, and much superior to the colonial timber. Sir Robert Seppings, formerly surveyor of the navy, stated before a parliamentary committee, 'that Canada timber is peculiarly subject to dry-rot; that frigates built of fir, the growth of North America, did not average half the durability of other timber; and that the Royal Navy had suffered so much from the use of Canada or North American timber, that its use was now altogether discontinued, except for deals and masts.' A number of timber-merchants, builders, and carpenters gave evidence before the same committee as to the inferior quality of the colonial timber. One of the witnesses said:—'It is not allowed to be used in government buildings, nor is it ever used in the best buildings in London. It is only speculators who use it, from the price of it being much lower than the Baltic timber.' The inferior colonial timber is forced into use by enormous differential duties, which, before the recent alteration of the tariff, amounted to a bonus of 1000 per cent. in some cases, as the following table shows:—

	Duty on Foreign Timber. £. s. d.	Ditto from British possessions. £. s. d.	Differential duty per cent.
Battens, per 120	10 0 0	1 0 0	1000
Deals, ditto	22 0 0	2 0 0	1000
Lath-wood, per fathom	4 5 0	0 15 0	566⅔
Masts, 12 inches and upwards, each	2 15 0	0 10 0	550
Staves, average duty per 120	3 0 0	0 6 0	1000
Oak planks, per load	4 0 0	0 15 0	533⅓
Fir timber, ditto	2 15 0	0 10 0	550
Oak ditto, ditto	2 15 0	0 10 0	550
Wainscot logs	3 15 0	0 12 0	625
Unenumerated timber	1 8 0	0 5 0	560

In 1787 the duty on foreign timber was only 6*s.* 8*d.* the load of fifty cubic feet, but it was raised at different times, until, in 1804, it amounted to 25*s.* In 1810 the duty was raised to 54*s.* 8*d.*; and from 1814 to 1820 it was 64*s.* 11*d.* and 65*s.* the load. The trade in colonial timber had scarcely any existence before 1803, although until 1798 it had been admitted free of duty; and the duty imposed in that year was only 3 per cent. *ad valorem*, which was changed in 1803 to a specific duty of 2*s.* the load. In consequence of the war there was a great rise in the price of European timber, and Memel fir advanced from 78*s.* to 320*s.* the load. In order therefore further to encourage the supply from our own colonies, North American timber was again, in 1806, admitted duty free. The stimulus was no doubt justifiable, but it was continued after the temporary causes in which it originated had passed away. The following table shows the effect of the differential duties in substituting colonial timber for that of the north of Europe:—

Average Quantities in periods of Five Years.		Baltic. Lds.	N. A. Colonies. Lds.	Total. Lds.	Per Centage proportion. Baltic.	Colonial.
1788 to 1792		219,396	2,660	222,057	99	1
1793	1797	164,000	1,225	165,825	99	1
1798	1802	178,019	2,916	180,935	99	1
1803	1807	232,477	16,533	249,070	94	6
1808	1812	73,718	120,537	194,255	38	62
1814	1818	125,855	147,597	273,453	46	54
1819	1823	116,600	335,556	452,158	26	74
1824	1828	191,890	410,903	602,793	32	68
1829	1833	122,783	412,682	535,466	24	76

The return to a sounder principle of taxation has been very slow. In 1821, in consequence of recommendations from both Houses of Parliament, the duty on European timber was reduced from 65*s.* to 55*s.* the load, and a duty of 10*s.* was imposed on colonial timber, leaving a preference duty of 45*s.* still in operation. In 1831, the government of Earl Grey proposed, by gradual reductions, spread over three years, to lower the duty on European timber 15*s.*, which would still have left it at 40*s.*, or 30*s.* higher than colonial; but the measure was defeated in the House of Commons by a majority of 236 to 190. A committee of the House of Commons which inquired into the timber duties in 1835, recommended a very inadequate reduction (similar to that proposed by Earl Grey's government), but it was not followed by any result; and in 1841 the government of Lord Melbourne proposed a reduction from 55*s.* the load to 45*s.* on foreign timber, and an increase from 10*s.* the load to 15*s.* on colonial; but subsequent party changes prevented this alteration being effected. In the tariff of 1842 (5 & 6 Vict., c. 47), the duty on colonial timber has been reduced to a merely nominal sum, namely, 1*s.* the load, and to 2*s.* on deals, and 6*d.* on lath-wood. The reduction on foreign timber is partly prospective. Until the 10th of October, 1843, the duty will be 30*s.* the load on timber, and after this date 25*s.*; on foreign deals the reduction in the first instance is to 35*s.*, and after October, 1843, it will be 30*s.*, and the duty on lath-wood is at once reduced to 10*s.* the load. In 1841 the duty on timber produced 1,566,291*l.*, and, without allowing for an increase of consumption in the first year, the loss of revenue is estimated at 601,491*l.*; and for the year ending October, 1844, when the reduced duties will be fully in operation, the loss to the revenue will be 589,991*l.* according to the estimate of the minister, who allows for an increase of 12 per cent. on foreign and 20 per cent. on colonial timber, and 20 per cent. on foreign and 24 per cent. on colonial deals. (Speech of Sir R. Peel, 11th March, 1842.) The mode of charging the duty has been improved and rendered less complex under the present arrangement. Planks, deals, and battens were formerly charged by the great hundred (120) in classes, and the duty was disproportionably heavy on the smallest and least valuable kinds. In measuring timber in logs, or unsawn, the cubic contents were, it is alleged, not fairly calculated, but were over-estimated to the extent of from 10 to 20 per cent.; and the sawyers complained that timber partly cut up was charged with a lower proportional duty than in the log, by which their interests were needlessly injured. The public however have still reason to complain that the duties are calculated, as before, to interpose restrictions on the use of superior timber, in order to benefit those who are engaged in supplying the inferior article. The direct loss sustained previous to the recent alteration of duty was estimated at 1,500,000*l.* annually; and a great sacrifice of revenue has now been made without attaining the benefits which might have attended a return to a better policy, though the disproportion will be only 24*s.* instead of 45*s.* the load. Prussia, Norway, Sweden, and other countries are still restricted in the means of exchanging their products for British manufactures; the preference duty on Canadian timber prevents a supply of timber being derived from the forests on the banks of the Danube and on the countries bordering the Black Sea; and the general shipping interests have been sacrificed to the owners of six or seven hundred half worn-out ships. In the colonies the monopoly duty has diverted industry from agriculture. It has been repeatedly shown that neither to any portion of the shipping interest here nor the timber interest of the colonies would a complete equalization of the timber duties be more than temporarily injurious. The fixed capital embarked in saw-mills does not, it is believed, exceed 200,000*l.*, and some descriptions of Canadian timber would command the English market under any circumstances, while there is a growing demand for all kinds in the Northern states of the American union. The floating capital now engaged in the trade of 'lumbering' could of course be transferred with little difficulty to the cultivation of the soil, and the export of flour, tobacco, hemp, flax, and ashes, would fill up the vacuum occasioned by the diminished export of timber, and would require the shipping which had not found full employment in the new channels to which the timber-trade would be directed.

The consumption of timber in the United Kingdom in 1841 was as follows:—

	Great Hunds.	Gross Revenue.
Battens and Batten Ends	18,969	£156,120
Deals and Deal Ends from British America	44,148	90,113
Deals and Deal Ends from other parts	24,242	491,980
Staves	89,699	40,777
	Loads.	
Timber 8 in. sq. and upwards from British America	613,679	337,795
——from other parts	131,479	370,302

Other sorts are technically called 'woods,' meaning fancy woods for furniture, &c., and dye-woods. Of mahogany the consumption was 18,170 tons in 1841, having been 20,451 tons in 1840. (*Report of Committee on Timber Duties*, 1835; *British and Foreign Review*, No. 4; Porter's *Progress of the Nation*, vol. ii.)

TIMBER AND TIMBER-TREES.—Timber-trees are those the wood of which is used for building or repairing houses. Oak, ash, and elm, of the age of twenty years and upwards, are the trees most generally included under that denomination; but there are many other kinds of trees, such as beech, cherry, aspen, willow, thorn, holly, horsechesnut, lime, yew, walnut, &c., which are, by the

custom of certain parts of England, considered as timber-trees, as being those used in building. (Cruise, *Dig.*, t. 3, c. 2, ss. 6, 7.) Most of the cases upon the question as to what trees are to be considered timber, have arisen in reference to the stat. 46 Edw. III., c. 3, whereby it was enacted that great or grosse wood of the age of twenty, thirty, or forty years, or upwards, should not be titheable, but that *sylva cædua*, or underwood, should be titheable. Lord Coke says that two doubts arose on the construction of this statute: first, what should be considered as high or great wood; and secondly, of what age those grosse or timber trees should be. As to the first, the answer was, that in this act the word *grosse* signified such wood as had been or was, either by common law or the custom of the country, timber; for the act did not extend to other woods that had not been or would not serve for timber, though they were of the bigness or greatness of timber. As to the second question, of what age those grosse or timber trees should be, the statute resolved this doubt in these words: 'Great wood of the age of twenty years or upwards;' which words were considered as declaratory of the common law on the subject. (2 *Inst.*, 642, 643; 3 *Rep.*, 12.) It appears now to be settled, though there have been contradictory decisions on the point, that trees of the growth of twenty years and upwards, sprung from old stools or roots, are within the exemption of this statute, and are consequently to be considered as timber. (4 M. & C., c. 600.)

The timber-trees growing upon land belong to the owner of the inheritance. A tenant for life has only a qualified interest in them, in so far as they afford him shade and shelter, and a right to take the mast and fruit. If the tenant for life fells timber-trees on the land to any amount greater than he is entitled to as estovers, that is to say, the allowance of wood necessary for the reparation of houses and fences, he becomes liable to an action of waste [WASTE]; and the trees, which by these or any other means, accidental or otherwise, have become severed from the land, may be seized by the owner of the inheritance, or an action may be brought by him for them. (3 P. W. 267.) If, however, the estate of the tenant for life be without impeachment of waste, he has the full right to fell timber, and also the property in all timber-trees felled and blown down during his life.

The Court of Chancery has sometimes directed the timber growing on an estate, whereof a person was tenant for life, to be cut down, for the purpose of paying debts and legacies charged upon the inheritance. (2 Vern., 152.) The Court of Chancery has also directed timber in a state of decay to be cut down for the benefit of the person entitled to the inheritance, provided no damage were done to the tenant for life. (2 Vern., 218.) The practice in these cases is to order the money arising from the sale of the timber to be invested, and the interest of it paid to the tenant for life.

In leases for lives, when timber is included, if the lessor fells the trees, the lessee may maintain an action of trespass against him, because the lessee, though he may not cut down the trees without being subject to an action of waste, has an interest in them for shade and shelter, and a right to take the mast and fruit, and may also lop them if they be not thereby injured. But where the trees are excepted in a lease, which is usually done, the lessee has no interest whatever in them, and the lessor may bring an action of trespass against him if he fells or damages them. The lessor has also a power, incident to the exception, of entering on the land in order to fell and take away the trees; though this power, for the sake of avoiding questions, is often expressly reserved.

The timber growing on copyhold estates is, by the general custom of most manors, the property of the lord, who may cut it down, provided he leaves a sufficient quantity for the repairs of the copyhold, which the copyholder is entitled to of common right. But the general right of the copyholder to have timber for the reparation of houses and for ploughbote and hedgebote may be restrained by custom, namely, that he shall not take it without assignment from the lord or his bailiff. (13 *Rep.*, 68.) Where the custom of the manor is that the copyholder shall employ the timber cut down in the reparation of his tenements, he may sell the tops and bark towards defraying the expenses of the repairs. (3 Buls., 282.) A copyholder in fee may, by the particular custom of the manor, have a right to cut timber-trees growing on his copyhold, and sell them at his pleasure; and the same right may belong by custom to a copyholder for life, who is entitled to nominate his successor, as being a *quasi* copyholder in fee; but a custom that a copyholder for life may cut down timber is unreasonable and void, as being a destruction of the inheritance, and contrary to the nature of a life estate.

Ecclesiastical persons being considered in most respects as tenants for life of the lands held by them *jure ecclesiæ*, are not permitted to cut down timber except for repairs; but by the 56 Geo. III., c. 52, the incumbent of any benefice, with the consent of the patron and bishop, is enabled to pay the moneys to arise by sale of any timber cut from the glebe-lands of such benefice, either for equality of exchange, or for the price of houses or lands purchased by him under the statutory powers vested in him for such purposes.

Trustees to preserve contingent remainders are bound to preserve not only the limitations of the settlement under which they are trustees, but also the inheritance of which the timber is part; and the Court of Chancery will interfere at their suit to prevent the owner of the particular estate joining with the person entitled to the inheritance for the time being to cut down the timber on the estate. (2 Swanst., 144.)

TIMBREL, a musical instrument of the highest antiquity; the *tympanum leve* of the Roman poets, and, in the opinion of all writers of any authority, the same, in an almost unaltered state, as that now known in every part of Europe under the names of tabor, tambourine, *tambour de Basque*, &c.

TIMBUCTU' (TEMBOCTU, TOMBOOKTOO, &c.) is placed by Mr. Arrowsmith, after careful criticism and collation of a number of routes, in 17° 8′ N. lat. and 2° 58′ W. long. Mr. M'Queen, to whom we are so much indebted for the extension and correction of our geographical knowledge of Africa, had placed it in 17° 40′ N. lat. and 2° 30′ W. long.; but 'readily yields the palm of accuracy to his (Mr. Arrowsmith's) researches in preference to my own.' The position assigned by Mr. Arrowsmith may be assumed to be as exact as can be obtained until the point is fixed by astronomical observations on the spot; or even then, unless they may be made by more competent observers than the discrepancies among the statements of those who have attempted to ascertain the positions of places on the Lower Niger show some or all of these gentlemen to have been.

The position of Timbuctú is one which is most important to have ascertained, not merely on account of its being the centre of so many routes, and therefore a useful starting-point whence to calculate the horizontal bearings and distances of many places; but also as being, what the circumstance of so many routes meeting there might of itself have shown, the index of the comparative elevations, slopes, and depressions of the interior of Western Africa. It is for the same reason an important position relatively to the history of the migrations of African tribes, of the development of the trade of Africa, and of its progress in general civilization.

The rude map of the northern curve of the Kowara by the schoolmaster of Sultan Bello, the sketch of the position of Timbuctú given to Mr. Park by an old Somonii Moor, and the delineation of central Libya according to Ptolemy, all concur in representing the Niger at the most northern point of its course as forming a great curve—flowing first to the north, then to the east, and ultimately to the south. The discoveries of modern English travellers on the Upper and Lower Niger place it beyond a doubt that these representations must be in the main accurate; and the routes between a great number of different places obtained from Arab travellers from the coast-towns of Morocco, Algiers, Tunis, and Tripoli, to the interior, as well as from the natives of the interior themselves, all harmonize with and corroborate these conclusions. It is because the statements of M. Caillié agree with this view that we feel assured he has not intentionally deviated from veracity, and because we place a reliance on his account of the appearance and condition of individual places and persons which we can by no means accord to his bearings and distances.

Timbuctú appears to stand on the declivity of an inconsiderable eminence about eight miles north of the Niger. 'Nothing,' says Caillié, 'is to be seen in all directions

but immense plains of loose shifting sands of a yellowish-white colour.' From the point where Caillié quitted the Niger, to Cabra, the port of Timbuctú, a distance of three miles, he passed along a narrow canal, and as he remarks that 'the negro slaves hauled the canoe along by a rope, as the pole would not have been sufficient to move it,' the natural inference is that he was proceeding up the stream. Between Cabra and Timbuctú he passed two lakes. These appearances coincide with the statements of Arabian geographers that a wady, filled during the rainy season with a stream of water, extends from north-east of Timbuctú, and, passing to the south of that town, disembogues into the Niger to the south-west of it. The same authorities mention a number of similar wadys at a distance of eight or ten days' journey to the north-east of Timbuctú, extending over a tract of country nearly 60 miles in breadth, and all apparently converging as they descend towards it as to a central point. The Gozen Zair, which falls into the Niger a short way to the south-east of Kabra, flows from the west. All these circumstances concur to indicate a strong analogy between the great northern curve of the Niger south of Timbuctú and the great northern bend of the Hoanghó. Both rivers, descending from elevated mountain ridges in a general northerly direction, are encountered by the slope of an extensive elevated plain, run some time in a direction from west to east at its side, and then turning to the south flow off through mountain defiles. It is this peculiarity in the structure of the plain on which Timbuctú is situated that has rendered that site from a remote antiquity the meeting-place of so many converging lines of traffic. It is the nearest point at which the traders from the commercial districts that skirt the coasts of the Mediterranean west of Barca, and of the Atlantic north of Cape Nun, can strike, after crossing the great desert, the fertile lands extending to the south-east and south-west along the Upper and Lower Niger.

Leo Africanus states that Timbuctú was built by Mansa Suleiman, about the year 610 of the Hejira (A.D. 1214), and that it soon became the capital of a powerful state. Seeing however that Ptolemy places towns of the name of Kúpha (Κάφη) and Nigeira Metropolis (Νιγειρα Μητρόπολις), the former nearly in the probable meridian of Timbuctú, and the latter somewhat to the east, at the confluence of a tributary with the Niger, there can be little doubt that the town built by Mansa Suleiman was not the first important commercial station in those regions. Indeed an author quoted by Cooley (*Negroland of the Arabs*, p. 68) would lead us to believe that a town bearing the name Tombuti existed in those regions as early as the year 297 of the Hejira. Rulers with the title Mansa continued to govern Timbuctú from 610 to 792 of the Hejira.

The chiefs of Maroceo and Fez rendered Timbuctú tributary, and from that time the communications of the Arabs with that country became more frequent and regular. Leo Africanus mentions that the grand mosque of the town and the palace of the king were built by an architect from Granada. The Arab conquerors allowed however the native dynasty to remain on the throne. The expulsion of the Arabs from Spain, and the weakening of the Arab power in North Africa by the Turkish conquests in Tunis, Tripoli, and Algiers, in the course of the fifteenth century, increased the impunity of the predatory nomade hordes; and about the same time, or a little later, the formation of settlements on the west coast of Africa, first by the Portuguese and afterwards by the English and French, by creating a new line of traffic with the interior, diminished the importance of Timbuctú as a commercial entrepôt. About the year 1500 a negro general of Soniheli, king of Timbuctú, raised the standard of revolt on the death of his master, overturned the Moorish supremacy, conquered a number of the neighbouring provinces, and recalled to Timbuctú a part of the trade which had left it for Jenné on the Niger. When Leo Africanus visited this part of Africa, the territories of Abu-Bekr-Ishieh, the negro conqueror, extended from Agadez on the north to Kaslinah on the south. Marmol (1573) describes the commerce of Timbuctú as in a flourishing condition in his day. According to the information collected by Mr. Jackson, Timbuctú would appear, about 1668 or 1670, to have fallen under the dominion of the king of Bambarra; for Mullah Arshid, of Tafilet, having driven Sidi Ali of Suz from his territories, the fugitive was protected by the king of Bambarra, and created by him commandant of Timbuctú. Sidi Ali made his peace with Mullah Ismael, successor of Mullah Arshid, and the consequence was that Timbuctú became tributary to the prince of Tafilet. This connection terminated with the death of Mullah Ismael (1727), and since that time Timbuctú appears to have been governed by a negro ruler, that is, by one who is neither an Arab, nor a Tuarik, nor a Fellatah. The security of person and property, and the commerce of Timbuctú, appear to have fallen off since the accession of the negro dynasty.

Caillié estimates the permanent inhabitants of Timbuctú at from 10,000 to 12,000. After the arrival of the caravans the town assumes for a portion of the year a much more populous and probably a much more bustling appearance. During his stay it was dull and listless. The streets are clean, and wide enough to allow three horsemen to pass abreast. The houses are of sun-dried bricks, and consist entirely of a ground-floor; in some a sort of closet is constructed over the entrance; the apartments are built on the four sides of an open court in the centre. Both within the town and round about it there are numerous straw huts of a conical form. The town is not walled. In the centre of the town is a square surrounded by circular huts, and planted with a few trees: in the middle of it a large hole is dug as a receptacle for filth. Two enormous heaps outside of the town appeared to be accumulations of rubbish. Some buildings on the east side of the town are overwhelmed with sand. There are seven mosques; two of them large, and part of the largest apparently of considerable antiquity; each is surmounted by a brick tower. To the west-south-west of the town are large excavations from 35 to 40 feet deep, which collect in the rainy season the supplies of water which serve the inhabitants for drinking and culinary purposes throughout the year. There is no spontaneous vegetation near the town except some stunted mimosa-trees. Near the reservoirs are some small plantations of bad tobacco. The inhabitants of Timbuctú draw from Jenné their supplies of millet, rice, vegetable butter, honey, cotton, Soudan cloth, pepper, onions, dried fish, pistachias, &c. Fire-wood and timber for building, and provender for cattle, are brought from Cabra. They purchase cattle from the nomades of the tribe of Zawai, who possess the country two days' journey distant from Timbuctú to the north-east; from the people of Sala, ten days journey to the east; and from the Tuariks, who are the most powerful race, on all sides. They procure salt for their own consumption and for the trade with Soudan from Tádcini, which lies twenty days' journey north-west of the town.

The negro and Arab inhabitants of Timbuctú are exclusively engaged in trade. Great part of the Moors are from the sea-coast; they start with an adventure to Timbuctú, reside for some years there, and when they have acquired enough, return to their native country. The negro inhabitants dress like the Moors, and are zealous Mohammedans. They have several wives, whom, as well as their slaves, they employ in menial affairs. The Moors, who are only temporary residents, cohabit with their slaves. Caillié represents all classes of the inhabitants as cleanly both in their persons and houses. Several villages on the Niger are subject to Timbuctú. Cabra, the port of Timbuctú, is secured against the inundations by being slightly elevated above the marshes; the sandy desert commences immediately to the north of it. This place appeared to Caillié to contain about 1000 or 1200 inhabitants, all of the poorer class, engaged in the service of the merchants of Timbuctú. The dwellings are either mean houses or small huts; the street is neat, but the landing-place is dirty. The merchandize is conveyed between the port and Timbuctú on asses and camels: these belong in general to the inhabitants of Cabra; but sometimes the poorer Tuariks hire their camels for the purpose. The Tuariks are the terror of the surrounding country: they exact tribute from the inhabitants of Timbuctú, and tolls from all merchants who pass to the town overland or by the Niger. The nomade Arab tribes appear to stand in awe of them: the Fellatah to the south keep their ground against them; but as they surround Timbuctú for some distance on all sides, they hold the entire trade of these regions at their mercy.

TIME. This word may be considered either with reference to our abstract idea of the thing signified by it, or to the measures of it which have been contrived for use in the business of life. Something on the first point of view will be found in the article SPACE AND TIME, to which the following may be added.

When we think of time in the usual manner, it is of a real thing external to ourselves, which we cannot help imagining to have an existence and a measure, both of which would remain though those who now speculate upon the conception were annihilated. A little more consideration shows that we are indebted for the idea to successions of observed events, or at least for the power of applying the idea to external objects. No description can be adequate; if we say that *change* necessarily implies *time*, and that the perception of that which *is* being different from that which *was*, suggests the notion of an interval, we see that we have already fully assumed the idea of time in the words *is* and *was*. But we may say that space and the objects which fill it exist independently of ourselves, and would undergo changes though we were not in existence to perceive them, and that therefore the times which those changes require would also exist; this involves the whole of the most abstruse part of metaphysics, and is much beyond the scope of our article. We shall therefore turn to the mode of measuring time; we have a thorough conviction that time is a magnitude, that is, has its *more* and *less*. We must ask ourselves in the first instance what we mean by a greater or a smaller time.

In the perception of time as a magnitude, that is, of intervals of time as containing more or less of duration, we refer in the first instance to a habit derived from continual acquaintance with those great natural successions on which the usual actions of our lives depend, with which we can constantly, though unconsciously, compare the duration of our thoughts and actions. There is no more an absolutely long or short time than there is an absolutely great or little space; these words are only comparative. If, for example, any one were to affirm that the universe was continually growing less and less, all its parts altering in the same proportion, and the dimensions of the human race with the rest, in such manner that the whole solar system would now go into a nut-shell, such as nut-shells were a thousand years ago, it would be impossible either for him to prove it, if true, or for any one else to prove the contradiction, if false. In like manner if any one were to say that the revolutions of all the heavenly bodies were continually accelerating, but that the properties of matter were also continually altering, and the speed with which ideas are formed and communicated, and muscular efforts made, continually increasing: it would be impossible to prove a contradiction. The oriental story is the best illustration of this:—A prince was ridiculing the legend of Mohammed being taken up by an angel, and holding many long conferences with his Creator, and having many views of heaven and hell to the smallest details, in so short a time, speaking with reference to things upon earth, that on his being brought back, the water had not quite flowed out of a jug which he had dropped from his hand when the angel caught him. A magician at the court of this prince checked his laughter by offering to prove the possibility of the story, if his highness would only dip his head into a basin of water. The prince consented, and the instant his head was immersed, found himself lying by the sea-shore in a strange country. After a reasonable quantity of malediction upon the magician, he found himself obliged by hunger to go to a neighbouring town, and seek the means of support. In time he became independent, married, and brought up a family, but was gradually stripped of all his substance by losses, and buried his wife and children. One day he threw himself into the sea to bathe, and on lifting his head out of the water, found that he had only lifted it out of the basin, the magician and the other courtiers standing round. On his bitterly reproaching the magician, the latter assured him, and was confirmed by all the bystanders, that he had done nothing but just dip his head into the basin, and lift it out again. Of course the prince expressed no more doubts about the story of Mohammed, and however much any reader of the two tales may think that neither *is* true, a little reflection will show that either *might* be so. Perhaps the allegory might have been suggested by what is known to take place in dreams; there is evidence enough that many of the longest of these illusions really occupy no more than, if so much as, a second or two by the pendulum. [DREAM, p. 143.]

In the laws of motion it seems as if, so to speak, matter took cognizance of time; a particle of matter will continue to describe equal spaces in *equal times*, until acted on by force from without. Yet it would be possible to state this law as follows, in such a manner as to avoid the comparison of quantities of duration. If two particles acted on by no external forces, are at A and *a* at the same epoch of duration, and at B and *b* at the same subsequent epoch, then if A C be *m* times A B, and if *a c* be *m* times *a b*, the law of motion is that C and *c* will be respectively attained at the same instant. The mathematician will readily see that the equations of motion do not depend upon the absolute recognition of time as a measurable quantity, but that any moving particle, as A, being acted on by no force, the distance A C, described in the time *t*, might be introduced into all formulæ instead of the time, without any question as to whether, time being physically considered, the space A C varies as the time. It is enough that the uninfluenced motion of any other particle should be connected with that of the standard particle by the law above described. But though we can thus avoid the idea of measurement of time, we cannot get rid of its existence or of the notion of succession of epochs; grant that we can reduce dynamics to a *theory of simultaneous positions* of particles of matter, without reference to the absolute length of time employed in passing from one position to another, there is still the notion of time in the notion of simultaneous. But, nevertheless, the idea of succession thus introduced is hardly, if at all, more physical than that which comes into most of the branches of pure mathematics, a point on which it will be worth while to dwell for a moment.

When Newton, in his doctrine of fluxions, or flowing quantities, imagined length, space, solidity, and even number, to be generated by a continual and gradual flow, as a line by the motion of a point, a surface by that of a line, and so on, it was objected that he introduced the ideas of time and motion, both of which were foreign to pure mathematics, and properly belonged to mechanics. To get rid of these intruders, the theory of limits, which the notion of fluxions immediately requires, was attached, not to flowing quantities, but to variable quantities. Let x be a variable quantity, is one of the most common phrases of the systems which have superseded that of Newton. Now variation means change; it is never pretended that a variable has two values at once. All the difference is, that by Newton the object of consideration is supposed to grow larger or smaller, while the moderns pass in thought from a larger quantity to a smaller, or *vice versâ*, taking one first and the other afterwards. If so slight a difference as this be worth a contest, the distinction of pure and mixed science must be trivial enough: the fact is, that both systems consider successive values, and *succession is time*. If two computers were to quarrel which was the purer arithmetician, the one who stood still and counted the carriages as they passed by him, or the other who walked from one to another and counted them as they stood still, they would, to us, much resemble some of the disputants for and against the principle of fluxions.

The actual measure of time depends upon our being able to secure successions of similar events which shall furnish epochs separated by equal intervals of time. We cannot do this by our thoughts, except approximately, and for short periods. The memory of a musician, aided by the sentiment or feeling of time which is part of a good ear for music, will do remarkably well for a short period: a person who could not well preserve the division of a second into eight parts at least would make a poor figure in an orchestra. As to the judgment of considerable periods of time, it is materially influenced by the manner in which it has been spent: a time which *seems* to have been long through weariness *has* been long, and the contrary, on grounds already alluded to. Thus a year of mature age is really, to the thoughts, of a different length from one of childhood. Again, when we talk of a long period of time having passed quickly or slowly, we speak not of the time, but of our mode of remembering it. A person of rapid

recapitulation always says that time has passed quickly, another of a contrary habit the contrary; and this whether the rapidity is a consequence of quickness of ideas, or of having little to recall.

In all the more correct machines which have been invented to measure time, there is but one principle: a vibration is kept up by the constant application of forces only just sufficient to counteract friction and other resistances, and machinery is applied to register the number of vibrations. The remarkable law noted under Isochronism and Vibration makes it comparatively immaterial whether the vibrations are of precisely the same extent. But the imperfections of such instruments, or rather, our ignorance of the precise action of disturbing causes, and particularly of changes of temperature, renders them comparatively useless for measuring long periods, so that if we could not have recourse to the motion of the heavenly bodies, there would be no permanent measure of time. And even in astronomical phenomena there is no absolute recurrence at equal intervals, though nearly enough for common purposes. The value of such phenomena for the most accurate measures consists in most of their irregularities being truly distributed about a uniform mean, so that the excesses of some periods are compensated by the defects of others, giving, in the long run, power of determining that mean with as much accuracy as our modes of measurement can appreciate. The determination of time for civil reckoning may be divided into two parts: first, the mode of making the different periods derived from the sun and moon agree with each other so as to afford an easy method of reckoning co-ordinately by both [Periods of Revolution]; secondly, the mode of procuring true and convenient subdivisions of the natural unit consisting of a day and night. To the second of these we now turn our attention.

The actual revolution of the earth, as measured by the time elapsed between two transits of the same star over the meridian, is called a *sidereal* day. It is divided, as are all other days, into twenty-four hours of sixty minutes each, &c. The time so given is called sidereal time. If the sun were a fixed star, this sidereal time would be the common mode of reckoning. But the sun having its own slow motion in the ecliptic, in the same direction as the revolution of the earth, the interval between one meridian transit of that body and the next is [Synodic] longer than the simple revolution of the earth, for just the same reason that the time which the minute-hand of a watch moves from coincidence with the hour-hand to coincidence again is longer than the hour, or simple revolution of the minute-hand. If the sun moved uniformly, and in the equator, the real solar day, which means the interval between two meridian transits of the sun, would always be of the same length, and a little longer than the sidereal day. But the sun neither does move uniformly, nor in the equator; and each of these circumstances causes a slight irregularity in the absolute length of the solar day, or, as it is called, the *real* solar day. This is the reason why the time shown by a sundial does not agree with the watch. To remedy this inconvenience, a fictitious sun is supposed to move in the ecliptic, and uniformly, while another fictitious sun moves in the equator, also uniformly. Both the fictitious bodies have the average motion of the real sun, so that the years of the three are the same; and the fictitious sun of the ecliptic is made to coincide with the real sun at the perigee and apogee, or nearest and farthest points from the earth; while the fictitious body in the equator is made to coincide with the fictitious body of the ecliptic at the equinoxes (from which it arises that there is also a coincidence at the solstices). This fictitious sun of the equator is that to which clocks are adjusted; the interval between two of its transits, which is always of the same length, is called a *mean solar day*, which is divided into twenty-four mean solar hours, &c. The difference between time as shown by the real sun and the fictitious sun in the equator, is called the equation of time.

The determination of the equation of time is a mathematical problem of some complexity: what we have here to notice is, that owing to the joint action of the two sources of difference, it presents a very irregular series of phenomena in the course of the year. If the sun moved regularly, but in the ecliptic, there would be no equation of time at the equinoxes and solstices: if the sun moved with its elliptic irregularity, but in the equator instead of the ecliptic, there would be no equation of time at the apogee and perigee. Between the two the equation of time vanishes only when the effect of one cause of irregularity is equal and opposite to that of the other; and this takes place four times a year. In this present year (1842) the state of the equation of time is as follows:—January 1, the clock is before the sundial $3^m\ 51^s$, and continues to gain upon the dial until February 11, when there is $14^m\ 35^s$ of difference. This then begins to diminish, and continues diminishing until April 15, when the two agree, and there is no equation. The dial then is before the clock until May 14, when the equation is $3^m\ 55^s$, which diminishes until June 15, when there is again no equation. The clock is now before the dial, and the equation increases till July 26, when the equation is $6^m\ 10^s$, which diminishes until the 1st of September, when there is no equation, for the third time. The dial is now again before the clock; and by November 2 the equation has become $16^m\ 18^s$, from which time it falls off until December 24, when it is nothing for the fourth and last time. The clock then gets gradually before the dial till the end of the year. The phenomena of the next year present a repetition of the same circumstances, with some trivial variations of magnitude. There are several slight disturbing causes to which we have not thought it worth while to advert in a popular explanation: in particular, the slow motion of the solar perigee [Year; Sun], which will in time wholly alter the phenomena. For instance, when the perigee comes to coincide with the equinox, there will be only two periods at which the equation of time vanishes, namely, when the sun is at either equinox.

The sidereal day is $23^h\ 56^m\ 4^s.09$ of a mean solar day, and the mean solar day is $24^h\ 3^m\ 56^s.55$ of a sidereal day. We have in this article only to do with the mode of obtaining a uniform measure of time, or of intervals of time; this being premised, the subject will be taken up again in the article Year.

TIME BARGAIN. [Stocks.]

TIME OF DESCENT, the technical term for the time employed by a material particle in falling down an arc of a curve under the action of gravity, the mode of obtaining which is explained in Velocity. When any number of curves are drawn from a given point, and another curve is so drawn as to cut off from every one of them an arc which is described by a falling particle in one given time, that curve is called *tautochronous*, or a *tautochron*. But when a curve is such as the cycloid, namely, that a particle, wherever placed, will fall to the lowest point in the same time, such a curve is also called *tautochronous* by various writers, and *isochronous* by others. Our only object in inserting this article has been to note this confusion of language.

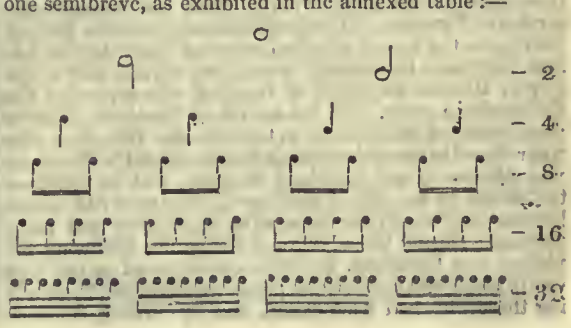
TIME (in Music) is:—

I. The measure of the duration of sound.

II. That which divides a bar into two or three equal parts, and subdivides these.

III. The movement—*i.e.* the quickness or slowness—of a composition.

1. The degree of sound, or pitch, is shown by the place on the staff of any one of the characters called notes; but its duration is known by the particular note; that is, as minim, or crotchet, &c. The longest note, in relation to time, used in modern music, is the semibreve, which is considered the measure-note, and its average length is about four beats of a healthy man's pulse. The five other notes are proportionate parts of this. Thus the minim is in duration $\frac{1}{2}$ of a semibreve; the crotchet is $\frac{1}{4}$, &c.: consequently two minims, or four crotchets, &c., are equal to one semibreve, as exhibited in the annexed table:—



2. Time is either duple or triple. The former divides every bar, or measure, into 2, or 4, &c. equal parts; the latter into 3, or 6, &c. Times are marked by the letter C,—also by this letter barred (¢), and by figures. The C, whether barred or not, indicates *Common Time;* that is, duple time, having one semibreve, or its equivalent in notes, in each bar. Figures represent the fractions of a semibreve, the upper figure the numerator, the lower the denominator. When the numerator is 2 or 4, the time is duple; when 3, it is triple; when 6 or 12, it is compound-common; and when 9, it is compound-triple. But in reality, there are only two times,—binary and ternary; or, duple and triple; a fact which would long ago have been recognised and acted on, had music, as a system, made those advances which have long been witnessed in the other arts and sciences.

3. The term *Time* has hitherto had a third meaning annexed to it in musical language, by its employment in the sense of movement, a practice which has produced some confusion. The Italian word *Tempo*, signifying the same, is now growing into use—a manifest improvement, which, it is to be hoped, will not have to encounter those professional prejudices under which music has so long laboured. [METRONOME.]

On the subject of Time (*Tems*) Rousseau has well remarked, that a succession of sounds, however skilfully arranged as to high and low, produces only vague effects. It is measure, the duration, relative and proportional, of sounds, which fixes the true character of the music, and endows it with all its energy. Time (under which term he, of course, includes rhythm) is the soul of song. Airs whose movement is slow make us pensive; but a gay, spirited, and well cadenced air inspires us with joy, and our feet can hardly be restrained from dancing. Break the measure, confound the relative times of the sounds, and the very same airs which proportion had rendered so agreeable, at once lose all their character, all their charms, and are incapable of exciting the slightest degree of pleasure. Time, on the contrary, possesses a force, a power, in itself, and acts independently of a diversity of sounds. The drum furnishes a proof of this, rough and imperfect as the instrument is, because (the author ought to have said) its beats are in rhythm, though the sound is unvaried.

TIMO'LEON (Τιμολέων), a Greek general and statesman. He was a native of Corinth, and the son of Timodemus and Timariste. Respecting his youth we know nothing, except that he was no less distinguished by his noble character and his love of freedom than by his illustrious descent. When he had grown up to manhood, his elder brother Timophanes, who had been elected general by the Corinthians, assumed the tyrannis in his native city by the help of his friends and his mercenaries. Timoleon at first only remonstrated with his brother, but when this was useless, he formed a plot against him, and Timophanes was killed. Soon after this event, which threw all Corinth into a state of violent agitation, some extolling the conduct of Timoleon as magnanimous and worthy of a real patriot, others cursing and condemning him as a fratricide, there arrived at Corinth ambassadors from Syracuse soliciting the aid of the Corinthians against its oppressors. This was a favourable opportunity for the party hostile to Timoleon to get rid of his followers, while at the same time it opened to Timoleon a field of action in Sicily, where he might act according to his principles and deliver the island from its oppressors. Timoleon was accordingly sent to Syracuse with a small band of mercenaries, which he himself had raised, 344 B.C. Syracuse was then divided into three parties: the popular party, which had engaged the service of Timoleon; a Carthaginian party; and the party of Dionysius, the tyrant, who had returned from Italy in B.C. 346. Dionysius had already been driven out of a part of the city by Hicetas, the tyrant of Leontini, who supported the Carthaginian party. On the arrival of Timoleon, Hicetas was compelled to withdraw to Leontini, and Dionysius, who was reduced to surrender himself and the citadel to Timoleon, was allowed to quit the island in safety, and he withdrew to Corinth, in B.C. 343. [DIONYSIUS.] Syracuse had almost become desolate by the successive revolutions and party warfare. During the winter and the spring following his victory over Dionysius, Timoleon endeavoured as much as was in his power to restore the prosperity of the city by recalling those who had been exiled, and by inviting colonists from other parts of Sicily and assigning lands to them. After this he continued to carry on petty warfare partly against the Carthaginians and partly against Hicetas. The Carthaginians in the meantime collected a new army, which is said to have consisted of 70,000 foot and 10,000 horse, and which was conveyed to Sicily by a large fleet. Timoleon could muster no more than 3000 Syracusans and 9000 mercenaries, but in order to strengthen himself he concluded a peace with Hicetas, some of whose troops now joined his army. He marched out against the enemy, and by his superior generalship he succeeded in gaining a brilliant victory over the Carthaginians on the banks of the river Crimessus, and confined them to the part of Sicily between the river Halycus and the western coast, B.C. 339. After this victory and the conclusion of a peace with Carthage he directed his arms against the tyrants in other towns of Sicily, whom he compelled to surrender or withdraw, partly by the terror of his name and partly by force of arms. Hicetas was made prisoner, and condemned to death by the Syracusans, with his wife and family.

After freedom and the ascendency of Syracuse were thus restored in the greater part of Sicily, Timoleon directed his attention to the restoration of the prosperity of the towns and the country. The former, especially Syracuse, were still thinly peopled, and he invited colonists from Corinth and other parts to settle there, and distributed lands among them. He himself, with the consent of the Syracusans, undertook to revise and amend their constitution and laws, and to adapt them to the altered wants and circumstances of the state. Although it would have been easy for him to establish himself as tyrant and to secure to his descendants the kingly power at Syracuse, he fulfilled the duties of the office entrusted to him with a fidelity which has rarely been equalled. He had no other end in view but the establishment of popular liberty, for which he prepared and trained the people. Some acts of cruelty and apparent injustice with which he is charged, find their excuse in the character of those whom he had to deal with, for the Syracusans at that time were a motley and demoralized people, who could not be managed without Timoleon's assuming at times the very power which it was his wish to destroy. But Syracuse and Sicily felt the benefits of his institutions for many years after his death, and continued to enjoy increasing prosperity.

During the latter part of his life Timoleon was blind and lived in retirement, respected and beloved by the Sicilians as their liberator and benefactor. He died in the year B.C. 337, and was buried in the Agora of Syracuse, where subsequently his grave was surrounded by porticoes and adorned with a gymnasium called the Timoleonteum.

(Plutarch, and C. Nepos, *Life of Timoleon;* and Diodorus Siculus, lib. xvi.)

Decadrachm of Syracuse, inserted as a sample of the Coins of Syracuse. British Museum. Actual size. Silver. Weight, 625 grains.

TIMO'MACHUS, a celebrated antient painter, a native of Byzantium, and said to have been the contemporary of Julius Cæsar. Pliny (*Nat. Hist.*, xxxv. 40) informs us that Cæsar purchased two pictures in encaustic by Timomachus, for 80 Attic talents, about 17,280*l.*; one representing Ajax the son of Telamon brooding over his misfortunes; the other, Medea about to destroy her children: he dedicated them in the temple of Venus Genetrix. These pictures have been much celebrated by the poets; there are several epigrams upon them in the Greek anthology, and they are alluded to by Ovid in the two following lines:—

'Utque sedet vultu fassus Telamonius iram,
Inque oculis facinus barbara mater habet.' (*Trist.*, ii. 525.)

('Ajax the son of Telamon is seated, showing his anger by his countenance; and the barbarous mother betrays by her eyes her intended crime.')

We learn from Pliny also that the picture of Medea was not finished; its completion was interrupted apparently by the death of the painter, yet it was admired, he says, more than any of the finished works of Timomachus, as was the case likewise with the Iris of Aristides, the Tyndaridæ of Nicomachus, and a Venus by Apelles, which were more admired than any of the finished works of their respective masters. This picture is noticed also by Plutarch (*De Aud. Poet.*, 3) in a passage where he speaks of the representation of improper subjects, but which we admire on account of the excellence of the execution.

In the common text of Pliny, Timomachus is said to be the contemporary of Cæsar ('Julii Cæsaris aetate'), but Durand, in his 'Histoire de la Peinture Ancienne,' &c., expresses an opinion that the word *aetate* is an addition of the copyist, for which he assigns several reasons. The conjecture has much in its favour; the price of these pictures (17,280*l.*) is enormous, if we suppose it to have been paid to a living painter; but on the contrary it is a case with many parallels if we suppose the money to have been paid for two of the reputed masterpieces of antient painting. The fact of the Medea being unfinished puts it beyond a doubt that the picture was not purchased of the painter himself; and from a passage in Cicero (*In Verr.*, l. iv., c. 60) it seems equally clear that both pictures were purchased of the city of Cyzicus; and from the manner in which they are mentioned with many of the most celebrated productions of the antient Greek artists, it would appear that they were works of similar renown, and were likewise the productions of an artist long since deceased. Timomachus was therefore most probably a contemporary of Pausias, Nicias, and other encaustic painters, about 300 B.C. Pliny himself, elsewhere speaking of Timomachus, mentions him together with the more antient and most celebrated painters of Greece, with Nicomachus, Apelles, and Aristides, as in the passage above quoted.

Pliny mentions also the following works of Timomachus: an Orestes; an Iphigenia in Tauris; Lecythion, a gymnasiast; a 'cognatio nobilium;' two philosophers or others, with the pallium, about to speak, one standing, the other sitting; and a very celebrated picture of a Gorgon.

TIMON (Τίμων), a Greek poet and philosopher who lived in the reign of Ptolemaeus Philadelphus, about 270 B.C. He was the son of Timarchus, and a native of Phlius in the territory of Sicyon. He studied philosophy under Stilpo, at Megara, and under Pyrrho, in Elis. He subsequently spent some time in the countries north of the Ægean, and thence went to Athens, where he passed the remainder of his life, and died in the ninetieth year of his age.

Diogenes Laërtius, who has written an account of Timon (ix., c. 12), ascribes to him epic poems, 60 tragedies, satyric dramas, 30 comedies, silli (σίλλοι), and cinaedi (κίναιδοι) or licentious songs. The silli however appear to have been the kind of poetry in which he excelled. They were satires directed against the arrogance and pedantry of the learned. Timon wrote three books of silli (Athenaeus, vi., p. 251; vii., p. 279), in which he parodied all the dogmatic philosophers of Greece: he himself was a Sceptic. The metre of these poems was the hexameter, and it appears that sometimes he took whole passages from Homer which he applied as parodies. In the first book Timon spoke in his own person; in the second and third the form of the poems was that of a dialogue, in which he conversed with Xenophanes of Colophon, who was supposed to have been the inventor of the silli. (Diogenes Laert., ix. 111.) We now only possess a few fragments of these poems, which show that in their way they must have been admirable productions. They are collected in H. Stephanus, 'Poesis Philosophica;' in F. Paul, 'De Sillis Graecorum,' Berlin, 1821, p. 41, &c.; in Brunck's 'Analecta,' ii. 67; and iv. 139. Respecting the other works ascribed to him we possess no information.

(J. F. Langheinrich, *De Timone Sillographo*, in 3 parts, Lipsiae, 1720-23.)

TIMON (Τίμων), surnamed the Misanthrope, was a son of Echecratides, and a native of Colyttus, a demos in Attica. (Lucian, *Timon*, c. 7; Tzetzes, *Chil.*, vii. 273.) He lived during the Peloponnesian war, and is said to have been disappointed in the friendships he had formed, in consequence of which he conceived a bitter hatred of all mankind. His conduct during the period that his mind was in this state was very extraordinary. He lived almost entirely secluded from society, and his eccentricities gave rise to numerous anecdotes, which were current in antiquity. The sea is said to have separated even his grave, which was on the sea-coast, from the mainland, by forming it into an island and thus rendering it inaccessible. (Plutarch, *Anton.*, 70; Suidas, *s. v.* ἀποβρῶγας.) The comic poets, such as Phrynichus (Bekker, *Anecdota*, p. 344), Aristophanes (*Lysistr.*, 809, &c.; *Aves*, 1548), Plato, and Antiphanes, ridiculed him in their comedies. Antiphanes wrote a comedy called 'Timon,' which perhaps furnished Lucian with the groundwork for his dialogue in which this misanthrope acts the most prominent part. His name has remained proverbial to designate a misanthrope down to the present day, and is immortalized by the genius of Shakspere.

(Heinsterhuis, *On Lucian*, vol. i., p. 99, of the smaller edition.)

TIMOR. [SUNDA ISLANDS, LESSER.]

TIMORLAUT. [SUNDA ISLANDS, LESSER.]

TIMOTE'O DA URBI'NO, or DELLA VITE, a celebrated Italian painter of the Roman school, was born at Urbino in 1470, or rather 1480. In about his 20th year, by the advice of a brother living in Bologna, he repaired to that city to learn the business of a jeweller, &c.; but displaying a power of design worthy of a greater purpose, he devoted himself to painting, and according to Malvasia attended the school of Francia in Bologna for about five years: Vasari however says that Timoteo was his own master. At the age of 26 he returned to Urbino, where in a short time he so far distinguished himself, says Vasari, as to receive an invitation from his cousin Raphael in Rome to repair thither and assist him in some of his extensive works. This statement creates a difficulty not easy to be cleared up: Vasari says that Timoteo died in 1524, aged 54; yet we find him in his 27th or 28th year, consequently in 1497 or 1498, going to Rome to assist Raphael, who however did not go to Rome himself until 1508: 1524 was very probably therefore a misprint for 1534 in the original edition of Vasari, and the error has found its way into all the later works. By this supposition and by allowing a year or two to have elapsed between his return to Urbino and his visit to Rome, the various dates may be easily reconciled, and what Vasari says about Timoteo's assisting Raphael to paint the Sibyls in the Chiesa della Pace, which were painted in 1511, becomes quite consistent. He did not remain long in Rome, but returned to his native place at the solicitation of his mother, much to the displeasure of Raphael. He remained however quite long enough to learn to appreciate and to imitate the beauties of Raphael's style, and to become one of the most distinguished painters of the Roman school; yet there are in all his works traces of the style of Francia, a certain timidity of design, a delicacy of execution, and a richness of colouring. His chief works are at Urbino, at Forlì, and in the neighbourhood; he executed many of them in company with Girolamo Genga, as a chapel at Forlì and part of the paintings in the chapel of San Martino in the Cathedral of Urbino; the altar-piece was painted entirely by Timoteo: he executed also some excellent works in fresco at Castel Durante. Further, in Urbino there are—in the Cathedral, a Magdalen; in San Bernardino, outside the city, a celebrated picture of the Annunciation of the Virgin; and another fine picture with several figures in Santa Agata; also in the residence of the Dukes of Urbino, an Apollo and two of the Muses, extremely beautiful; besides many other works. Vasari remarks that he left some works unfinished at his death, which were afterwards completed by others, and he adds that there could not be a more satisfactory evidence of the general superiority of Timoteo. He was of a cheerful disposition, and used to play every kind of instrument, but especially the lyre, which he accompanied with his voice, with extraordinary grace and feeling. Lanzi says that the Conception at the Observantines at Urbino, and a *Noli me tangere* in the church of Sant' Angelo at Cagli, are perhaps the best of his works that remain. The same writer observes that Pietro della Vite, the brother of Timoteo, also a painter, was probably the priest of Urbino mentioned by Baldinucci (vol. v.) as Raphael's cousin and heir.

(Vasari, *Vite de' Pittori*, &c.; Lanzi, *Storia Pittorica della Italia.*)

TIMO'THEUS (Τιμόθεος), son of Conon of Athens. He inherited from his father a considerable fortune, and if we

may judge from his intimacy with Isocrates, Plato, and other men of talent, and from the manner in which others speak of him, he received a most excellent education; but no important particulars are known respecting his earlier life. The first time that he comes prominently forward in the history of his country, was during the war between Thebes and Sparta. In the year B.C. 375, after the battle of Naxos, the Thebans, who were threatened with an invasion by the Lacedæmonians, requested the Athenians to avert this danger by sending a fleet round Peloponnesus, as they had done at the beginning of the Peloponnesian war. The request was readily complied with, and Timotheus was appointed commander of a fleet of sixty ships, with which he was to sail round Peloponnesus and along the western coasts of Greece. In this expedition he first took Coreyra, which he treated with the utmost mildness and without making any use of his right as conqueror. The consequence was, that he had very easy work with Cephalenia and Acarnania, and that even Alcetas, king of the Molossians, was induced to join the Athenian alliance. But while Timotheus was thus reviving the power of Athens in that part of Greece, the Lacedæmonians sent out a fleet against him, under the command of Nicolochus. A battle was fought near the bay of Alyzia, in which the Spartans were defeated. Soon after Nicolochus offered another battle, but as the fleet of Timotheus had suffered too much to allow him to accept it, Nicolochus raised a trophy. But Timotheus soon restored his fleet, which was increased by reinforcements of the allies to seventy ships, against which Nicolochus could not venture anything. The original object of the expedition however was now accomplished, as the Spartans had not been able to make their projected invasion of Bœotia, and Thebes was thus enabled to direct her forces against the Bœotian towns which asserted their independence. Timotheus at the head of his large fleet had no means of maintaining it, for Thebes herself had contributed nothing towards it, and Athens, which was not in a very prosperous condition, had been obliged to bear all the expenses of the fleet, with the exception of what Timotheus himself had furnished from his private purse. Athens therefore concluded a separate peace with Sparta, and sent orders to Timotheus to return home. On his way thither he landed at Zacynthus a body of exiles who probably belonged to the democratical party of the place, and who had sought his protection. He provided them with the means of opposing and annoying their enemies, the oligarchical party of Zacynthus, which was in alliance with Sparta. The oligarchs sent envoys to Sparta to complain, and Sparta sent envoys to Athens to remonstrate against the conduct of her admiral. But no satisfaction was given, as the Athenians would not sacrifice the Zacynthian exiles for the purpose of maintaining the peace. The Spartans therefore looked upon the peace as broken, and prepared for new hostilities.

Soon after these occurrences Coreyra was hard pressed by the Peloponnesian fleet, and implored the Athenians for protection. Timotheus, who, on his former expedition, had given such great proofs of skill and talent, was again entrusted with the command of sixty ships. But Athens, which was itself in great financial difficulties, had not the means to equip them, and Timotheus in the spring of 373 B.C. sailed to the coasts and islands of the Ægean to request the Athenian allies to provide him with the means of assisting the Coreyraeans. He appears to have received some support from Bœotia (Demosth. *in Timoth.*, p. 1188), and in Macedonia he formed friendly relations with king Amyntas. His proceedings however went on very slowly, and apparently without much success, for he was of too gentle a disposition to force the allies to furnish what they could not give conveniently. At last however he had sailed as far as the island of Calaurea, where his men began to murmur because they were not paid. The state of affairs in Coreyra had grown worse every day. His enemies at Athens seized upon the slowness of his progress as a favourable opportunity for aiming a blow at him. Iphicrates and Callistratus came forward to accuse him, whereupon he was recalled, and the command of his fleet given to his accusers and Chabrias. His trial was deferred till late in the autumn; but he was acquitted, not indeed on account of his innocence, though it was well attested, but on account of the interference of Alcetas, the Molossian, and Jason of Pheræ, who had come to Athens to protect him.

In B.C. 361, after the removal of his rival Iphicrates, Timotheus received the command of the fleet on the coast of Macedonia. He took Potidæa and Torone from Olynthus, and these conquests were followed by the reduction of all the Chalcidian towns. From thence he proceeded to the Hellespont, where, with the assistance of Ariobarzanes, he again gained possession of several towns. In the year following he commenced his operations against Amphipolis, in which however he had no success at all, probably on account of the interference of the Macedonians, who supported the town, and Timotheus was nearly compelled to take to flight.

In the year 357 B.C. Timotheus and Iphicrates, who had for some time been reconciled to each other through the marriage between a daughter of the former and a son of the latter, obtained the command of a fleet of 60 sail against the rebellious allies of Athens, especially against Samos. But the Athenian arms were unsuccessful, and a treaty was concluded between the belligerents, which put an end to the Social War. The Athenian generals however, Timotheus, Iphicrates, and Menestheus, were charged with having caused the ill-luck of the Athenians, and brought to trial. Timotheus in particular was accused of having received bribes from the Chians and Rhodians. His colleagues, who were themselves in the greatest danger, were so convinced of his innocence, that they declared they were willing to take all the responsibility upon themselves. But he was nevertheless condemned to pay a fine of 100 talents. As he was unable to pay the sum, he withdrew to Chalcis in Eubœa, where he died soon after, in B.C. 354. The injustice of this sentence was tacitly acknowledged by the Athenians after the death of Timotheus, by the manner in which his son Conon was allowed to settle the debt of his father.

Timotheus was no less distinguished as a man than as a general. He was of a very humane and disinterested character. He sacrificed all his property in the service of his country, while other men of his age used public offices only as a means of enriching themselves. When Alcetas and Jason came to Athens to protect him, they lodged in his house, at which time he was so poor, that he was obliged to borrow furniture to receive his illustrious friends in a manner worthy of their station. Even his enemies, when they came to know him, could not help feeling attachment and esteem for him.

(Xenophon, *Hellen.*, v. 4, 63, &c.; vi. 2, 11, &c.; Isocrates, *De Permutatione;* C. Nepos, *Timotheus;* Diodorus Sic., xv. and xvi.; compare Thirlwall, *History of Greece*, vol. v.)

TIMO'THEUS (Τιμόθεος) of Miletus, a Greek musician and lyric poet. The time when his reputation had reached its height was about the year B.C. 398. (Diodorus Sic., xiv. 46.) He was a contemporary of Euripides, and spent the last years of his life at the court of Macedonia, where he died in B.C. 357, at the advanced age of 97. He increased the number of the strings of the lyre to eleven, an innovation which was considered by the Spartans, who would not go beyond the number of seven strings, to be a corruption of music, and a decree was passed at Sparta, which is still extant in Boëthius, condemnatory of his innovation. (Plutarch, *De Mus.*, p. 1141, ed. Frankf.; Athenaeus, xiv., p. 636.) Suidas mentions a great number of poetical compositions of Timotheus, which were in their time very popular in Greece; among them are nineteen nomes, thirty-six prooemia, eighteen dithyrambs, and twenty-one hymns. All these works are now lost, with the exception of a few fragments which are preserved in Athenaeus and the grammarians.

(Vossius, *De Poetis Graecis*, p. 46; Bode, *Geschichte der Lyrischen Dichtkunst der Hellenen*, vol. ii., p. 305, &c.)

TIMO'THEUS (Τιμόθεος), an Athenian poet of the so-called middle comedy. Suidas mentions the titles of several of his plays, and Athenaeus (vi., p. 243) has preserved a fragment of one which bore the title 'The Little Dog.' (Compare A. Meineke, *Historia Critica Comicorum Graecorum*, p. 428.)

TIMOTHY, EPISTLES OF ST. PAUL TO. Timothy, to whom these Epistles are addressed, was a native of Lystra, a city of Lycaonia, in Asia Minor. His father was a Greek, or Gentile, but his mother, Eunice, was a Jewess. Both his mother and grandmother Lois were Christian believers (2 *Timoth.*, i. 5), who were probably converted

to the faith by the preaching of Paul and Barnabas on the occasion of their first apostolical journey among the Gentiles. Whether Timothy was himself converted by St. Paul or by the teaching of his mother does not appear; but it is certain that she had taken great pains with her son's education, for from a child, as St. Paul says, 'he had known the Holy Scriptures.' (2 *Timoth.*, iii. 15.) His devotion to his new faith was so ardent, and the progress he made in the knowledge of the gospel so great, that he gained the esteem and good word of all his Christian acquaintance. Accordingly when St. Paul paid his second visit to Lystra, the believers both of that city and Iconium commended him so highly to Paul, that he 'would have Timothy go forth with him' as the companion of his travels. Previously to commencing them however St. Paul circumcised Timothy, 'because of the Jews,' who were numerous and powerful in those parts, and likely to take offence at the preaching and ministration of an uncircumcised teacher. (*Acts*, xvi. 1-3.) He was then solemnly admitted and set apart to the office of an evangelist, or preacher of the gospel, by the elders of Lystra and St. Paul himself laying their hands upon him (1 *Tim.*, iv. 14; 2 *Tim.*, i. 6), though he was probably not more than twenty years of age at the time. From this period (A.D. 46) mention is frequently made of Timothy as the companion of St. Paul in his journeys, as assisting him in preaching the gospel, and in conveying his instructions to the different Christian churches. His first mission was in company with St. Paul and Silas, when they visited the churches of Phrygia and delivered to them the decrees of the council of elders at Jerusalem, by which the Gentiles were released from the obedience to the law of Moses as a requisite for salvation. From Phrygia he proceeded in the same company to Troas, and thence to Macedonia, where he assisted in founding the churches of Philippi, Thessalonica, and Berœa, at the last of which cities he and Silas were left when St. Paul was driven from Macedonia by the persecution of the Jews in that country and retired to Athens. In this city St. Paul was subsequently joined by Timothy (1 *Thess.*, iii. 1), who gave him such an account of the afflicted state of the Thessalonian Christians as induced him to send Timothy back to 'establish and comfort them, concerning their faith': a charge both of difficulty and danger. From Athens St. Paul went to Corinth, where he was joined by Timothy and Silvanus, who both assisted him in converting the Corinthians and establishing the Corinthian church, for a period of a year and a half. (2 *Cor.*, i.) When St. Paul left Corinth, Timothy appears to have accompanied him on his return to Asia, where they resided nearly three years, without interruption, except during the visit of St. Paul to Jerusalem, to keep the feast there, in which however it does not appear that he was accompanied by Timothy. Towards the expiration of their residence at Ephesus, St. Paul despatched Timothy and Erastus together to precede himself on a journey to Macedonia. (*Acts*, xix. 22.) It would also seem (1 *Cor.*, iv. 17) that St. Paul at the same time charged Timothy to visit the church of Corinth. On returning from Corinth to Macedonia, Timothy was joined by St. Paul from Ephesus, and henceforward they were frequently together, till Timothy was appointed by St. Paul to govern the church of Ephesus. In the interval between St. Paul's joining Timothy in Macedonia and the appointment of the latter to the superintendence of the church at Ephesus, Timothy appears either to have accompanied St. Paul on his first journey to Rome, or to have visited him there. St. Paul, as is well known, was a prisoner at Rome, though under but little restraint, and from *Hebrews* (xiii. 23) we may conclude that Timothy also suffered imprisonment either at Rome or elsewhere in Italy; and that he was released before St. Paul left that city. The subsequent history of St. Paul and Timothy is not clearly given either in the *Acts of the Apostles* or the Epistles of the New Testament; but it is reasonable to suppose that when they were both set at liberty, they renewed the journeys made for founding new churches and revisiting old. (See *Hebrews*, xiii. 23; *Philipp.*, i. 1; ii. 19; 1 *Tim.*, i. 3.)

Timothy was eventually left with the charge of the church at Ephesus, where St. Paul had made his headquarters in Asia. How long Timothy exercised this office is not known, nor can we determine the time of his death. An ecclesiastical tradition relates that he suffered martyrdom, being killed with stones and clubs (A.D. 97) while he was preaching against idolatry in the neighbourhood of the temple of Diana at Ephesus. His supposed relics were removed to Constantinople, with great pomp, A.D. 356, in the reign of the emperor Constantine. Shortly after Timothy's appointment to the superintendence of the church at Ephesus, St. Paul wrote to him his first Epistle; the date of which was probably about A.D. 64, *after* St. Paul's first imprisonment at Rome. Some critics indeed assign to it as early a date as A.D. 56, supporting their opinion by 1 *Tim.*, i. 3, from which it appears (1.) that Timothy was in Ephesus when the Apostle wrote his first letter to him; (2.), that he had been left there when Paul was going from Ephesus into Macedonia. A careful examination however of the narrative in the *Acts* will convince the reader that the contemplated journey into Macedonia, of which the Apostle speaks (1 *Tim.*, i. 3), is some journey not mentioned in the *Acts*, and therefore subsequent to St. Paul's release from his first confinement at Rome. But whatever doubt there may be as to the *date* of the first, there is none about the genuineness of either of the two Epistles to Timothy. They have always been acknowledged to be the undisputed production of the Apostle Paul. The object and design of the First Epistle to Timothy were such as we might have expected from the relation between St. Paul the writer, and Timothy, to whom it was addressed. It was written with the view of guiding and directing the latter in his responsible and difficult ministry as the head of the church at Ephesus, to instruct him in the choice and ordination of proper officers, and to warn him against the false teachers (Michaelis thinks they were Essenes) who had 'turned aside' from the simplicity of the gospel, to idle controversies and 'endless genealogies,' and who, setting themselves up as teachers of the Law of Moses, had insisted upon the necessity of obedience to it as a requisite for salvation.

In chap. i., accordingly, St. Paul alludes to the commission given by him to Timothy at parting, and specifies the particular errors which he was to condemn, together with the truths which he was to inculcate.

In chap. ii. the apostle describes the manner in which the public worship of the church at Ephesus was to be conducted.

In chap. iii. St. Paul explains the qualification of the persons whom Timothy was to ordain as bishops and deacons, and tells him that he had written the letter with a view of teaching him 'how he ought to behave himself in the house of God, which is the church of the living God, the pillar and the ground of truth.'

The last verse of this chapter has occasioned much controversy respecting the reading of the word Θεός, or 'God,' for which one MS. has ὅς, 'who,' and another ὅ, 'which.' The majority of the MSS. read Θεός, or 'God,' and several of the antient versions express the ὅ or 'which,' instead of Θεός.

In chap. iv. St. Paul foretells the heresies which were to arise in the church in after-times, and strongly condemns them. He also exhorts Timothy to a faithful and exemplary discharge of his duties, and to a steadfast continuance in the doctrines of the Gospel.

In chap. v. St. Paul instructs Timothy in the right method of admonishing the old and the young of both sexes. He also describes the age and character of such widows as were to be employed by the church in teaching the younger women the principles of religion, for which it would seem that the former received some recompense from the funds of the church.

In chap. vi. St. Paul describes the duties which he wished Timothy to inculcate on Christian slaves, as owing from them to their masters, whether infidels or believers. He also reprobates strifes about words, and perverse disputings, which seem to have been rife in the Ephesian church; condemns an inordinate love of money, exhorts Timothy to charge the rich to be 'rich in good works,' and concludes with a most solemn charge before God and Jesus Christ, that he should keep 'the commandment,' without spot and unblameable.

The Epistle was written from Nicopolis in Macedonia (*Titus*, iii. 12), and not from Laodicea, as the subscription informs us. The undesigned coincidences between it and the *Acts of the Apostles* are given in Paley's 'Horæ Paulinæ,' p. 323-338.

The Second Epistle of Paul to Timothy.—From chap. i.,

vers. 8, 12, 17, it appears that this Epistle was written by St. Paul while he was a prisoner at Rome; but whether he wrote it during his first imprisonment, recorded in *Acts*, xxviii., or during a *second* imprisonment, has been much questioned. According to the uniform tradition of the antient church, it was written during the second confinement. The modern critics, who refer it to the time of the *first*, are for the most part anti-episcopalians or Romanists: the former being concerned to deny the permanency of Timothy's charge at Ephesus; the latter not knowing how to account for the omission of Peter's name in the salutations from Rome. The arguments adduced by Macknight (Preface to 2 *Timothy*) in support of the opinion of the antient church are, we think, conclusive. St. Paul, it is generally agreed, returned to Rome after his first imprisonment, early in A.D. 65; where, after being kept in bonds as an 'evil doer' for more than a year, he is believed to have suffered martyrdom, A.D. 66. As therefore the Apostle requests Timothy (iv. 21) to come to him at Rome before winter, it was probably written in July or August, A.D. 65; and it is generally supposed that Timothy was at Ephesus when St. Paul addressed it to him.

The immediate design of St. Paul in writing this Epistle was, it would seem, to apprise Timothy of the circumstances that had recently happened to himself at Rome, and to request his immediate presence there. Accordingly we gather from the last chapter of this Epistle, that St. Paul was closely confined as a malefactor for some crime laid to his charge; that when he was brought before the Roman magistrates to make his first answer, 'no man stood by him, but all men forsook him;' that only Luke was with him: that being thus deserted by almost all, he was greatly desirous of seeing Timothy, 'his dearly beloved son in the gospel,' before the 'time of his departure,' which he knew 'was at hand.' He therefore requested him to come to Rome immediately, but being uncertain whether he should live to see Timothy again, he gave him in this Epistle a variety of admonitions, charges, and encouragements. This Epistle in fact is an appropriate and affecting sequel to the first, the principal injunctions and warnings of which it repeats, but with additional earnestness and fervour. St. Paul, as if for the last time (chap. i.), conjures Timothy to apply himself with all his gifts of grace to his holy work, to hold fast the doctrine which he had received from him, and not to be ashamed either of the testimony of the Lord or of St. Paul's own sufferings.

In chap. ii. St. Paul again cautions Timothy against heretics and 'foolish questions,' and exhorts him to personal holiness. In chap. iii. he gives a description of the 'perilous times which should come,' and which were to be anticipated by every possible exertion in performing the duties of a Christian minister. To this work, in chap. iv., he exhorted him by a solemn charge before 'God and the Lord Jesus Christ, the judge of the quick and the dead.' He then depicted his own present state, and his presentiment of an approaching martyrdom; and after requesting the immediate presence of Timothy, concluded by sending to him the greetings of some of the brethren of the Church at Rome. Whether Timothy arrived at Rome in time to find St. Paul alive, does not any where appear: the latest authentic information we have concerning him being given in this letter.

The Epistles to Timothy, in conjunction with those to the Thessalonians and Titus, are extremely valuable, as furnishing very strong evidence to the truth of many of the facts related in the *Acts of the Apostles*. The undesigned coincidences between the *Second Epistle to Timothy* and the *Acts* are given by Paley, in his 'Horæ Paulinæ,' pp. 339-356. Their value in another respect is thus described by Macknight, Preface to 1 *Timothy*—'These Epistles are likewise of great use in the church, as they exhibit to Christian bishops and deacons in every age the most perfect idea of the duties of their functions: teach the manner in which these duties should be performed: describe the qualifications necessary in those who aspire to such offices, and explain the ends for which they were instituted, and are still continued in the church.'

To the *Epistle to Timothy*, that addressed by St. Paul to Titus, nearly at the same time, is both a companion and an illustration. The subject matter is nearly the same in both, and it is important to observe, that in none of these Epistles, addressed to intimate and tried friends, do we perceive any doctrine or precept at all different from what is enforced in the Epistles addressed to and designed for whole churches. The views and hopes and motives of action are the same in both: a proof of the Apostle's sincerity, and an evidence that he did not teach a double doctrine, one for the learned and the other for the vulgar.

(Horne's *Introduction to the Critical Study of the Scriptures*, vol. iv., p. 378; Macknight, vol. iii.; Benson, Preface to 1 and 2 *Timothy*; Evans's *Scripture Biography*.)

TIMOTHY-GRASS, so called from a person of that name who successfully cultivated it in North America, where it seems to grow more luxuriantly than any other kind of grass. Its botanical name is *Phleum pratense*, and its common English name is *Meadow Cat's-tail Grass*. It has been highly extolled by many agriculturists for the profusion of hay which it makes, and also for its rapid growth when depastured. It is but a coarse grass when allowed to stand till it is fit for hay; and in rainy weather it so readily imbibes moisture, that the harvest is very precarious. This is a principal reason why its cultivation has not been much extended in England. It is said to give a very sweet and early herbage for sheep in spring, and, mixed with other grasses, may be very useful in laying down land to pasture for a few years.

The soil which suits timothy-grass best is a good moist and rather stiff loam. On gravel or chalk it soon dies off. It is scarcely to be recommended without a mixture of other grasses, although very heavy crops of it have been grown; and from its strong stem, when full grown, it should always be fed off when young, or cut for soiling horses and cattle before the stem has acquired its full growth. That it is not a grass naturally suited to the climate of Great Britain appears from its not being generally found in the best natural pastures. In rich land which is tired of clover it may form a very good substitute, to cut up green and depasture afterwards. The experiments which have been made with timothy-grass are not sufficiently satisfactory to form a decided opinion of its real merits, and it well deserves the attention of experimental agriculturists.

TI'MUR, SULTAN, KIAMRAM KOTB-ED-DI'N GURGAN SA'HEB-KIRA'N JIHA'NGIR, that is, 'Sultan Timur, the fortunate, the axis of the faith, the great wolf, the master of time, the conqueror of the world.' Timur, a name which frequently occurs among the princes of the Eastern Turks, signifies 'iron' in the Jagataï dialect, and corresponds to the Osmanli 'demur.' Timur was born on the 5th or 25th of Sha'bán, 736 A.H. (A.D. 1335), at Sebz, a suburb of Kesh, a town south-east of Samarkand. He was the son of Tárághaï-Nowian, who was chief of the Turkish tribe of the Berlas, which inhabited the district of Kesh. Timur was descended from a younger son of Bardani-Khan Behadir, or Baghatur, whose eldest son, Yessugaï, was the father of Genghis-Khan, and he was a direct descendant of Genghis-Khan on the female side. He was consequently of Mongol origin, and, being of royal blood, he held a high rank among that Mongol nobility which was founded by Genghis-Khan among the Eastern Turks. [TARTARS.] This rank is expressed by the title Nowian, which was added to the name of his father. Yet the power of his family was not great. Timur was a soldier at the age of twelve years, and he spent his youth in the continual feuds between the nobles of those different kingdoms and principalities into which the empire of Genghis-Khan was divided by his successors. After the death of his father, his uncle Seïf-ed-dín became chief of the Berlas, being the eldest of the family; but a war having broken out between Husein, khan of Northern Khorásán, and Mawerainnehr (Mawar-el-nahr), or Jagataï, and Timur-Togluk, khan of the Getes (Getae), in Northern Turkistan, young Timur actively supported Husein, and was appointed chief of the tribe of the Berlas in A.H. 763 (A.D. 1361). In this war Timur received a wound in his thigh, in consequence of which he became lame. From this he was called Timur-lenk, or the lame Timur, which has been corrupted by Europeans into Tamerlane, by which name Timur is as well known in Europe as by his real name. Husein rewarded him also with the hand of his sister Turkan, A.H. 765 (A.D. 1363). Notwithstanding these favours, Timur intrigued against his protector; and after the death of his wife he openly rebelled against him, A.H. 767 (A.D. 1365). With a body of only 250 horsemen

he surprised and took Nakhshab, a town which was defended by a garrison of 12,000 men, among whom there were most probably a great number of traitors. In A.H. 768 (A.D. 1366) he defeated Husein near his capital, Balkh, and this prince was murdered by some emirs, who, seeing their former master forsaken by fortune, endeavoured to obtain the favour of Timur by putting his rival to death. Balkh, which was defended by the adherents of Husein, was taken by storm and destroyed by fire after a siege of three years, A.H. 771 (A.D. 1369), and Timur was proclaimed khan of Jagataï in the same year by the Kurultaï, or the general assembly of the people. He chose Samarkand for his capital. Husein-Sofi, khan of Khowaresm (Khiwa), having imprisoned Timur's ambassadors, was attacked by Timur, who, after five campaigns, at last succeeded in taking the town of Khowaresm, in A.H. 781 (A.D. 1379). The town was destroyed, and the principal inhabitants, especially artists and scholars, were transplanted to Kesh, which became the second capital of Timur's empire. Previously to this the khan of the Getes, who was master of the country between the Sihun, or Jaxartes, and the Irtish, had likewise been compelled to pay homage to Timur, who thus became master of a part of Siberia and of the whole country which we now call Turkistan, and which was formerly known by the name of Great Tartary. After these conquests Timur thought himself strong enough to carry into effect the plan of making himself master of all those countries which had once obeyed his ancestor Genghis-Khan. He first attacked Khorásán, or the north-eastern part of Persia, which was then divided between Gaiyáth-ed-dín-Pir-'Ali, who resided at Herat, and Khojah-'Ali-Murjid, whose capital was Sebsewár. Khojah-'Ali-Murjid, whose dominions were on the boundaries of Jagataï, paid homage to Timur as soon as he was summoned; but the master of Herat prepared a vigorous resistance. Timur took Herat by storm, but did not destroy it. He carried off as his only trophy the iron gates of this town, which were noted for their beautiful workmanship, and which he ordered to be transported to his birthplace, Kesh. The larger towns of Khorásán surrendered without resistance, and Timur was only checked by several strong fortresses, such as Shaburkán, Kabushán, and especially Káhkáha, between Balkh and Kelat, in the mountains of the Hindu-Kush. When these fortresses fell, all Khorásán was under his yoke. The inhabitants of Sebsewár having revolted, Timur took the town by storm: two thousand of the inhabitants were placed alive one upon the other, till they formed a mass like a tower, and each layer of human beings was fastened to the rest by mortar, as if they were so many bricks.

Beginning his career at an age when other conquerors are satisfied with their laurels, Timur had employed twenty years in reflecting on the principles of warfare. He led his armies with the prudent boldness of an experienced general, but not with the superiority of genius. The differences between the numerous successors of Genghis-Khan enabled Timur to attack them one after another, and each was pleased with the fall of his rivals. He employed the same policy in his war against Persia. This country was governed by several princes. Shah-Sheja, of the dynasty of Mozaffer, who reigned in Fars and southern Irák, or in that part of Persia which was most exposed to any army from the east, submitted to Timur without resistance. Thus Sultan Ahmed, of the house of the Ilkhans, the master of Northern Irák and Azerbiján, or Western Persia, had alone to sustain the attacks of the Tartars, A.H. 788 (A.D. 1386). Timur entered the dominions of Ahmed by following the coast of the Caspian Sea. In one campaign he conquered the provinces of Mazanderán, Rei, and Rustemdar, and took the towns of Sultania, Tabris, and Nakhshiwán. He crossed the Araxes at Julfa on a magnificent bridge, which was strongly fortified on both sides, but which is now destroyed. Kars, now the key of Eastern Turkey, fell into his hands; Tiflis surrendered, and the prince of Georgia purchased his protection by adopting the Mohammedan faith. The prince of Shirwán sent tribute to the camp of Timur, nine pieces of each thing sent (nine was a holy number among the Mongol princes), but only eight slaves; the ninth was himself. On these terms he was allowed to remain in possession of his dominions. Taherten, king of Armenia, submitted to Timur without any resistance; but Kárá-Yúsuf, prince of Diyarbekir, and master of the country round Lake Wan, prepared to defend himself. A body of Timur's army marched against him, and took the fortresses of Akhlat and Adiljuwáz by storm; and Timur himself conducted the siege of Wan. This famous fortress fell after a siege of twenty days, the garrison was cast from the steep rock on which this town is situated, and the fortifications were razed by ten thousand miners and pioneers. Ready to cross the Carduchian Mountains and to descend into the valley of the Upper Tigris, Timur was obliged, by a revolt of the inhabitants of Ispahan, to march suddenly to southern Persia. He took Ispahan by a general assault: he spared the lives and the houses of artists and scholars, but the remainder of the city was destroyed, and the inhabitants were massacred. More than 70,000 heads were laid at the feet of the conqueror, who ordered his soldiers to pile them up on the public places of the town, A.H. 789 (A.D. 1387).

Satisfied with having conquered the greater part of Persia, Timur turned his arms towards the north, and overran the kingdom of Kiptshak, which was then governed by Toktamish-Khan. This war lasted from A.H. 789 to 799 (A.D. 1387 to 1396). [TARTARS, *Kiptshak*.] We shall here only mention the march of Timur in the campaign of A.H. 793 (A.D. 1391). According to Sheref-ed-dín, Timur started from Tashkend, on the Jaxartes, on the 13th of Safer, A.H. 793 (19th of January, 1391). He marched in a northern direction, and passed by Kárá-suma, Yázi, Kárá-chuk, and Sabrán, until he reached Sárik-Uzen, on the river Arch: thence he proceeded as far as Mount Kuchuk-dagh, and subsequently crossed Mount Ulu-dagh, or the range of the Altai. He then took a north-western direction until he reached the upper part of the river Tobol in Siberia, and thence proceeded westward, crossing the Ural Mountains, and the upper part of the river Ural, or Yaïk, where he drew up his army on the banks of the Bielaya, a southern tributary of the Kama, which flows into the Wolga. Toktamish, who awaited Timur in the environs of Orenburg, was not a little astonished to find him so far advanced towards the north; but being informed of his having taken that direction, he hastened to the country of the Bielaya (Bashkiria), and fought that dreadful battle which took place on the 15th of Rejeb, A.H. 793 (18th of June, 1391), in which his whole army was slaughtered.

In the following year (A.H. 794; A.D. 1392) Timur returned to his residence at Samarkand, and he left the war with Kiptshak to his lieutenants; he only appeared in the field in A.H. 797 (A.D. 1315) in order to stop the progress of Toktamish in the Caucasian countries. Meanwhile troubles broke out in northern Persia, which were put down by Timur's generals, who committed unheard-of cruelties, especially in the town of Amul, where the whole tribe of the Fedayis was massacred. Timur himself attacked southern Persia after his first return from Kiptshak. The country of Fars was governed by several princes of the dynasty of Mozaffer, vassals of Timur, who aimed at independence. After having occupied Loristán, Timur entered Fars by the mountain-passes east of Shiraz, which were defended by the stronghold of Kalaï-zefid; but this fortress and the capital Shiraz were taken, the princes were put to death or fell in battle, and Timur's son Mirán-Shah was invested with the government of Fars and Khuzistán. From Shiraz Timur marched westwards to attack the king of Bagdad, Ahmed Jelair, of the house of Ilkhan. Bagdad surrendered without resistance, and Sultan Ahmed and his family fled towards the Euphrates, accompanied by a small body of cavalry. Timur and forty-five emirs mounted on the swiftest Arabian horses pursued the sultan, and came up with him before he had reached the Euphrates. In the engagement which ensued Ahmed was again defeated and compelled to fly, leaving his harem and one of his sons in the hands of the victor. The scholars and artists of Bagdad were transplanted to Samarkand; Timur remained at Bagdad for two months, allowing so little licence to his soldiers that he ordered all the wine which was found in the town to be thrown into the Tigris.

During this time Kárá-Yúsuf, prince of Diyarbekir, had recovered part of those districts round Lake Wan which Timur had taken from him in a former campaign; and several princes in Armenia and Georgia were still independent. Timur resolved to bring them to submission, and after having succeeded in this, to attack the kingdom of Kiptshak on its boundaries in the Caucasus. Starting from Bagdad in A.H. 797 (A.D. 1394), he marched to the Upper

Tigris by Tekrit, Roha or Edessa, Ho-su, and Keif, all situated in Mesopotamia. He laid siege to Mardin, a strong place in the mountain-passes south-east of Diyarbekir, but not being able to take it, he contented himself with the promise of an annual tribute which Sultan Iza, the master of Mardin, engaged to pay, and he marched to Diyarbekir. This town was taken and plundered. From Diyarbekir Timur marched to Akhlat, north of Lake Wan, crossing the mountains, as it seems, by the passes of the Bedlis, or Centrites. [TIGRANOCERTA.] After having subdued all Armenia and Georgia, Timur reached the river Terek in the Caucasus, and there fought another bloody battle with the khan of Kiptshak. In A.D. 1395 and 1396 Timur conquered all Kiptshak, and penetrated as far as Moscow, whereupon he left the command of these countries to his lieutenants, and returned to Samarkand, in order to prepare for a campaign against India.

After the death of Firus-Shah, the master of India between the Indus and the Ganges, several pretenders made claims to the vacant throne. At last Mahmud succeeded in making himself master of Delhi, and in establishing his authority all over the empire of Firus-Shah. Under the pretext of supporting the rivals of Mahmud, Timur declared war against India; and such was the renown of his name, that ambassadors from all the countries of the East arrived at Samarkand and congratulated him on his new conquests before he had obtained any triumph. Timur left his capital in A.H. 801 (A.D. 1398). He took his way through the passes in the Ghur Mountains, or the western part of the Hindu-Kush; and on the 8th of Moharrem, A.H. 801 (19th of September, 1398), he crossed the Indus at Attock, where Alexander had entered India [ALEXANDER THE GREAT], and where Genghis Khan had been compelled to give up his plan of advancing farther. Timur traversed the Punjab in a direction from north-west to south-east, crossing the rivers Behut, Chunab, Ravee, the Beeah, the Hyphasis of the antients, where Alexander terminated his conquests, and the Sutlej, the easternmost of the five great rivers of the Punjab. Although no great battle had been fought, the Tartars had already made more than 100,000 prisoners; and as their number daily increased, Timur ordered them all to be massacred, to prevent any mutiny, which might have become fatal to him in case of a defeat. At last the Indian army was defeated in a battle near Delhi, and this town, with all its immense treasures, fell into the hands of the conqueror. Delhi was plundered, and a part of it was destroyed, the inhabitants having set fire to their houses, and thrown themselves with their wives and children into the flames. Several thousands of artists and skilful workmen were transplanted to Samarkand. Timur pursued the army of Mahmud as far as the sources of the Ganges, and after having established his authority in the conquered countries, returned to Samarkand in the same year in which he had set out for the conquest of India.

Meanwhile troubles had broken out between the vassal princes in Persia and the countries west of it; and Timur's own sons, who were governors of this part of his empire, had attacked each other, and one of them was accused of having made an attempt to poison his brother. These events became as many occasions of new conquests for Timur, who overran the whole country between Persia and Syria. Siwas (Sebaste), one of the strongest towns of Asia Minor, which belonged to the Osmanlis, was taken after a siege of eighteen days. The Mohammedan inhabitants were spared; the Christians, among whom were more than 4000 Armenian horsemen, were interred alive. (A.H. 803; A.D. 1400.) Among the prisoners was Ertoghrul, the son of Bayazid, sultan of the Osmanlis, who defended the town for his father, and who was put to death after a short captivity. The fall of Siwas and the murder of Ertoghrul were the signals for war between Timur and Bayazid, who had filled Europe with the terror of his name, and who was then besieging Constantinople. The rapidity of his marches and the impetuosity of his charges had procured him the surname of 'Ilderim,' or the 'Lightning;' and accustomed to victories over the knights of Hungary, Poland, France, and Germany, he did not dread the Tatars of Timur. Previously to the siege of Siwas, he had negotiated with Timur about some Turkish emirs in Asia Minor, and especially about Taherten, king of Armenia, a vassal of Timur, who had been deprived by Bayazid of several of their best towns, and whom Timur protected. To humble his pride, Bayazid imprisoned the Tatarian ambassadors, and Timur in revenge carried devastation into the dominions of the Osmanlis.

Before Bayazid had crossed the Bosporus, Timur, offended by Ferruj, Sultan of Egypt, overran Syria, then a dependence of Egypt. The army of Ferruj was routed with dreadful slaughter at Haleb, and this populous town was taken by the Tatars, who entered it with the flying Egyptians. Plunder, bloodshed, and cruelties signalized this new conquest (11th to 14th of Rebuil-ewwal, A.H. 803; 30th of October to 2nd of November, 1400 A.D.), which was followed by the fall of Damascus (9th of Sha'bán, A.H. 803; 25th of March, 1401). Artists and workmen were as usual carried off to Samarkand and other towns of Turkistan. Ferruj became a vassal of the Tatars. Bagdad having revolted, Timur took it by storm on the 27th of Zilkide, 803 A.H. (9th of July, 1401 A.D.), and 90,000 human heads were piled up on the public places of the town.

Hitherto negotiations had still been carried on between Timur and Bayazid, who had advanced into Asia Minor with a well-disciplined although not very numerous army. But Bayazid having discovered that Timur had bribed several regiments of Turkomans that were in the army of the Osmanlis, the negotiations were broken off, and the two greatest conquerors of their time advanced to meet each other in the field.

After the fate of Haleb, Damascus, and Bagdad, Timur had assembled his army near Haleb, and, crossing the range of the Taurus, he had proceeded north-westwards to the northern part of Anatolia. At Angora he met with Bayazid. The battle, one of the most eventful which have ever been fought, took place on the 19th of Zilhije, 804 A.H. (20th of July, 1402 A.D.). After an obstinate resistance the Osmanlis, who were much less numerous than the Tatars, were routed. Old Bayazid, to whom flight was unknown, despised every opportunity of saving himself, and so strong was the habit of victory in him, that he could not conceive his defeat even when he saw the general rout of his warriors. At the head of his janissaries, Bayazid maintained himself on the top of a hill; his soldiers died of thirst or fell by the sword and the arrows of the Tatars; at last he was almost alone. When the night came he tried to escape; his horse fell, and Bayazid was made a prisoner by the hand of Mahmud Khan, a descendant of Genghis Khan, and who was under-khan of Jagataï. One of his sons, Muza, was likewise made prisoner; another, Mustafa, fell most probably in the battle, for he was never more heard of; three others, Soliman, Mohammed, and Iza, escaped with part of their troops. Timur received his royal prisoner with kindness and generosity. Afterwards, when some faithful Osmanlis tried to save their master, he was put into chains, but only at night. Accompanying Timur on his march, he sat in a 'kafes,' that is, in a sedan hanging between two horses, and this was the origin of the fable that Timur had put Bayazid in an iron 'cage' like a wild beast, a fable which has chiefly been propagated by Arabshah and the Byzantine Phranzes (i., c. 26). Bayazid died in his captivity at Akshehr, about a year after the battle of Angora (14th of Sha'bán, 805 A.H.; 8th of March, 1403 A.D.), and Timur allowed Prince Muza to carry the body of his father to Brusa.

The sons of Timur pursued the sons of Bayazid as far as the Bosporus, but having no fleet, they did not cross this channel. They ravaged the country, and afterwards joined their father Timur, who with the main body of his army took Ephesus and laid siege to Smyrna. This town, which belonged to the Knights of St. John at Rhodes, fell after a gallant resistance, in the month of December, 1402. However, the conquest of Asia Minor from the Osmanlis was only a temporary triumph, for a short time afterwards it was recovered by Mohammed I., the son and successor of the unfortunate Bayazid. After having thus carried his arms as far as the shore of the Ionian Sea, Timur withdrew to Persia to quell an insurrection, and then retired to Samarkand. He was preparing for the conquest of China, but he died on his march to that country, at Otrar on the Jaxartes, on the 17th of Sha'bán, 807 A.H. (19th of February, 1405), in his seventy-first year, after a reign of thirty-six years, leaving thirty-six sons and grandsons, and seventeen granddaughters. A considerable part of Timur's western and northern conquests, Asia Minor, Bagdad, Syria, Georgia, Armenia, and the whole kingdom of Kiptshak, were lost by his successors almost immediately after his death. In

Persia and Jagataï his descendants reigned for a century; and for three centuries they ruled over Northern India under the name of the Great Moguls.

Timur has been compared with Alexander, but he is far below him. It is true, that except in India, Alexander found only effeminate nations on his way, while Timur fought with the most warlike nations of the world; but the enemies of Alexander formed great political bodies which were governed by one absolute master, while the warlike nations which were subdued by Timur were divided into a multitude of tribes and governed by numerous princes, each of whom was jealous of his neighbour. Timur overran the territory of two mighty nations, the Turks-Osmanlis, and the Tatars of Kiptshak, but he was not able to subdue them. Both Alexander and Timur protected the arts and sciences, but Timur could only transplant them by force from one place to another, while poets and scholars flocked to Alexander because he could appreciate their talents. Timur's cruelty was the consequence of his savage and barbarous temper; Alexander only forgot the laws of humanity when he was overpowered by wine or by passion. Timur was a man of extraordinary talents, who accomplished great things after long experience and severe struggles: Alexander, a true genius, came, saw, and vanquished. The greatness of Timur inspires awe, and we shrink from it with terror; the greatness of Alexander attracts us because it is adorned with the amiable qualities of his character.

The life of Timur is the subject of many valuable works. Sheref-ed-dín-'Ali wrote the history of Timur in Persian, which has been translated into French by Pétis de la Croix, under the title 'Histoire de Timur-Bec, connu sous le nom du Grand Tamerlan,' &c., Paris, 1722. This is the best work concerning Timur, although the author often flatters. Arabshah, a Syrian, on the contrary, depreciates the character of Timur; his history, or rather his epic, has been translated under the title 'Ahmedis Arabsiadae Vitæ et Rerum Gestarum Timuri qui vulgo Tamerlanes dicitur, Historia,' Lugduni-Batavorum, 1636. Longdit, Argote de Molina, Petrus Perundinus Pratensis, Boekler, Richerius, &c., have also written the life of Timur. Among the Byzantines, Ducas, Chalcondylas, and Phranzes contain many valuable accounts, though Phranzes is less critical than the others. A very interesting book is 'Schildtberger, eine Wunderbarliche und Kurzweilige Historie,' &c., 4to. The same book was translated into modern German by Penzel, München, 1813. Schildtberger, a German soldier, was made prisoner by the Turks in the battle of Nicopolis (1396), when he was only sixteen years old. In the battle of Angora he was taken by the Tatars, and became a kind of secretary to Shahrokh and Miran-Shah, the sons of Timur. He finally returned to Germany in 1427, after a captivity of thirty years, and then wrote the history of his adventures.

Gibbon gives a splendid view of Timur's conquests in the 'Decline and Fall,' chap. lxv. Another most valuable work is Clavijo, 'Historia del gran Tamerlan, c Itinerario,' &c. Clavijo, ambassador of king Henry III. of Castile at the court of Timur, was present at the battle of Angora. (Desguignes, *Histoire des Huns*, vol. ii.) Timur may be considered as the author of the 'Tufukat, or the Code of Laws.' This work was originally written in the East-Turkish language, and was translated into Persian. The Persian version, with an English translation and a most valuable index, was published by Major Davy and Professor White, Oxford, 1783, 4to.; and Langles has translated the Persian version into French, under the title, 'Instituts Politiques et Militaires de Tamerlan,' Paris, 1787. This work is of great importance for the history of Timur; we see that this Tatarian conqueror was provided with maps and works concerning geography, which were composed by his order.

TIN. This metal is one of those which were earliest known, though it occurs in comparatively few countries: the acquaintance of the antients with this metal, though it does not occur in the native state, is accounted for by the circumstances that the ore is found frequently near the surface, and is easily reduced by charcoal and a moderate degree of heat to the state of metal.

According to Berzelius, tin is found in England, Saxony, Bohemia, Hungary, the isle of Banca, the peninsula of Malacca, in Chili, and Mexico: Malacca furnishes the purest tin, and Cornwall the largest quantity.

Tin occurs in two states of combination, the peroxide and double sulphuret of tin and copper: this last is rather a rare substance, and it is from the former that the metal is almost entirely obtained.

The peroxide of tin is found in Cornwall in two forms:—1. In veins in primitive countries, where it is intimately mixed with several other metals, as arsenic, copper, zinc, and tungsten: this is common *tinstone*. 2. In loose rounded masses, grains, or sand in alluvial soil, in which state it is called *stream-tin*. The former, when reduced to the metallic state, yields *block-tin*; while the latter yields *grain-tin*, which is the purer of the two.

Oxide of Tin—Tinstone—Occurs in attached and imbedded crystals, and massive. Primary form a square prism, which is commonly terminated by four-sided pyramids. Cleavage parallel to the lateral planes and both diagonals. Fracture uneven or imperfectly conchoidal. Hardness 6 to 7: gives sparks with steel, and is brittle. Colour white, yellow of various shades, red, brown, and black. Streak paler. Lustre adamantine, vitreous. Transparent, translucent, opaque. Specific gravity 6·96. Insoluble in acids. Before the blow-pipe, in powder on charcoal, it is reduced to the metallic state. Fine crystals of this substance occur, more especially in Cornwall and Saxony.

Analysis of the oxide of tin of Cornwall by Klaproth:—

Tin . . .	77·5
Oxygen . . .	21·5
Iron . . .	0·25
Silica . . .	0·75
	100·0

The *Massive Varieties* of oxide of tin are called stream-tin. What is termed *wood-tin* is found in reniform and botryoidal masses, or in wedge-shaped pieces, which have arisen from their partial destruction: the surfaces are generally water-worn. Wood-tin exhibits various shades of brown, which sometimes appear in concentric bands, giving it a ligneous appearance, whence its name.

Stream-tin has evidently been derived from the destruction of tin veins or lodes, the lighter portions of stony matter having been carried away by the water, which has rounded the fragments of the ore.

At Finbo in Sweden oxide of tin has been met with containing nearly 2·5 per cent. of oxide of columbium.

Tin Pyrites.—Sulphuret of Tin, a double Sulphuret of Tin and Copper, is a rare substance, having been found only in Cornwall at Huel Rock, in the parish of St. Agnes.

Occurs crystallized and massive. Primary form of the crystal a cube. Cleavage parallel to the faces of the primary form. Fracture uneven, with a metallic lustre. Hardness: readily scratched and reduced to powder; brittle. Colour steel-grey, mixed with yellow. Specific gravity 4·35.

Massive Variety.—Fracture granular and uneven, with a metallic lustre. Hardness 4. Brittle. Opaque. Specific gravity 4·35 to 4·76.

Analysis by Klaproth:—

Tin . . .	34
Copper . . .	36
Iron . . .	2
Sulphur . . .	25
	97

Having now described the ores, we proceed to state the *Properties of Tin.*—This metal is of a silver-white colour, very soft, and so malleable that it may be reduced into leaves 1-1000th of an inch thick, called tin-foil: it suffers but little change by exposure to the air, and that which does occur arises rather from impure sulphurous vapours than from oxidation; for it is not oxidized even by the combined action of air and moisture. Its tenacity is but slight, so that a wire 1-15th of an inch in diameter is capable of supporting only about 31 pounds: a bar a quarter of an inch in diameter was broken by 296 pounds weight. Tin is inelastic, but very flexible, and when bent it produces a peculiar crackling noise. When rubbed it imparts to the fingers a peculiar smell, which remains for a considerable time. Its specific gravity is about 7·29; at 442° Fahr. it fuses, and if exposed at the same time to the air, its surface is tarnished by oxidizement, and eventually a grey powder is formed. When

healed to whiteness it takes fire, and burns with a white flame, and is converted into peroxide of tin. If slowly cooled after fusion, it exhibits a crystalline appearance on solidifying.

Oxygen and Tin do not readily combine at common temperatures: they unite in three proportions, forming the protoxide, sometimes called stannous acid, the sesquioxide, and the per- or bin-oxide, frequently termed stannic acid. Protoxide of tin cannot be procured perfectly pure by direct action: the best method of preparing it is to procure a solution of protochloride of tin, evaporate it carefully to dryness, and then triturate it in a mortar with excess of crystallized carbonate of soda, which decomposes the chloride, and leaves the protoxide of tin.

When this has been washed, and dried carefully on the sand-heat, it is of a fine bluish-black colour, is very soluble in hydrochloric acid, and when heated in the air it takes fire, burns, and is converted into peroxide: the density of protoxide of tin is 6·666: it is soluble in solution of potash and soda, but not in ammonia, nor do the alkaline carbonates dissolve it. It is composed of—

One equivalent of oxygen . .	8
One equivalent of tin . . .	58
Equivalent . .	66

The alkaline solutions of this oxide gradually deposit metallic tin, and peroxide remains in solution. Its salts very readily absorb oxygen from the air, and form compounds which readily yield oxygen; and it is on this account that it converts the sesquioxide of iron into protoxide, and precipitates silver, mercury, and platina in their metallic state. With gold a purple compound is formed, known by the name of the purple powder of Cassius. The hydrate of this oxide of tin is white.

Sesquioxide of Tin is formed by mixing fresh precipitated and moist hydrate of peroxide of iron with a solution of protochloride of tin, as free as possible from hydrochloric acid: by the mutual action of these substances a slimy grey matter is thrown down, which is generally slightly yellow, from the presence of a little peroxide of iron. It is composed of—

One equivalent and a half of oxygen	12
One equivalent of tin . . .	58
Equivalent . .	70

It is soluble in hydrochloric acid, and also in ammonia, which last property distinguishes it from the protoxide; and it is distinguished from the peroxide by giving a purple precipitate with the salts of gold.

Peroxide or Binoxide of Tin, or *Stannic Acid*.—This is readily prepared by the action of strong nitric acid slightly diluted upon tin: violent action occurs, and the binoxide formed remains in the state of hydrate: after washing and drying and exposure to a red heat, the binoxide remains pure, and is of a straw-yellow colour: the perchloride of tin, when decomposed by an alkali, also yields binoxide of tin: when it has been rendered red-hot it is quite insoluble in acids, and acts as an acid by forming soluble compounds with the alkalis, which are called *stannates*: the moistened hydrate acts as an acid also in reddening litmus-paper. When melted with glass it forms a white enamel.

It is composed of—

Two equivalents of oxygen . .	16
One equivalent of tin . . .	58
Equivalent . .	74

Chlorine and Tin combine to form the protochloride and the perchloride. The protochloride is prepared by dissolving the metal in hot hydrochloric acid till the evolution of hydrogen gas ceases: the solution is colourless, and deposits crystals, which sometimes are acicular, and at others prisms of considerable size. They consist of—

One equivalent of chlorine . .	36
One equivalent of tin . . .	58
Three equivalents of water . .	27
Equivalent . .	121

When heated to about 212°, the whole of the water is nearly expelled; at a higher temperature hydrochloric acid is evolved, and oxichloride of tin remains. It is soluble in a small quantity of water, but decomposed by a large quantity, oxichloride of tin being precipitated.

The protochloride of tin is used as a mordant in calico-printing, and in chemical investigations as a de-oxidizing agent, acting in the mode already described.

Protochloride of tin may also be obtained by distilling a mixture of equal weights of granulated tin and bichloride of mercury, or of protochloride of mercury, or by transmitting hydrochloric acid gas over tin heated in a glass tube; in all these cases it is procured free from water, and is a grey solid, of a resinous lustre, which fuses below redness and sublimes at a high temperature.

Bichloride of Tin may be prepared in several modes: first, by heating the protochloride in chlorine gas; second, by dissolving the hydrated peroxide in hydrochloric acid; third, by putting tin into the mixture of hydrochloric and nitric acid, called *aqua regia*, which yields nascent chlorine; fourth, when a mixture of 1 part of tin with 4 parts of bichloride of mercury is distilled with a gentle heat, a colourless limpid liquid is obtained, which fumes strongly in moist air; this is the bichloride of tin, formerly known by the name of the fuming liquor of Libavius; it boils at 248°, is rendered solid by the addition of one third of its weight of water, and dissolves in a larger quantity; by the action of alkalis it is decomposed, hydrated peroxide of tin being precipitated.

It consists of—

Two equivalents of chlorine	72
One equivalent of tin . .	58
Equivalent . .	130

A solution of this salt under the name of nitromuriate of tin is extensively used in dyeing and calico-printing.

Sulphur and Tin combine in three proportions: the protosulphuret is prepared by adding to melted tin an equal weight of sulphur, and stirring the mixture till combination is effected; the product is to be powdered when cold, mixed with an equal weight of sulphur, and thrown in small portions into a hot crucible and eventually heated to redness. Its properties are, that it is of a bluish-black colour, has a metallic lustre, fuses at a red heat, and when cooled has a lamellated texture. When hydrosulphuric acid gas is passed into a solution of protochloride of tin, a similar compound is obtained; hydrochloric acid dissolves protosulphuret of tin with the evolution of hydrosulphuric acid gas, a solution of the protochloride of tin being formed.

It is composed of—

One equivalent of sulphur .	16
One equivalent of tin . .	58
Equivalent . .	74

Sesquisulphuret of Tin.—To prepare this, finely powdered protosulphuret of tin is to be mixed with a third of its weight of sulphur, and the mixture is to be heated to moderate redness until sulphur is no longer volatilized. It has a deep greyish-yellow colour, and when strongly heated is reconverted to the state of protosulphuret; when heated in hydrochloric acid, hydrosulphuric gas is given out.

It is constituted of—

One and a half equivalent of sulphur	24
One equivalent of tin . .	58
Equivalent . . .	82

Bisulphuret of Tin may be prepared in different modes: when hydrosulphuric acid or hydrosulphate of ammonia is added to a solution of bichloride of tin, a bulky precipitate of a dirty yellow colour is obtained; this is hydrated bisulphuret of tin: in the dry way it is procured by heating in a retort twelve parts of tin amalgamated with six parts of mercury, rubbed up with seven parts of sulphur and six of hydrochlorate of ammonia; the mercury facilitates the combination of the tin and sulphur, and the ammoniacal salt, by its evaporation, appears to prevent the temperature becoming so high as to decompose the bisulphuret of tin formed. This substance, formerly known to the alchemists by the name of *Aurum musivum*, or *Mosaic gold*, is in crystalline scales, and sometimes in six-side plates, of a golden-yellow colour and metallic lustre. It is not soluble in any acid, but nascent chlorine, in the form of what was formerly called *aqua regia*, dissolves it; it is soluble also in solution of potash and soda, forming what have been called *sulphur salts*.

It consists of—

Two equivalents of sulphur	32
One equivalent of tin .	58
Equivalent . .	90

Phosphuret of Tin is readily formed by adding phosphorus to the melted metal; it is of a silvery-white colour, and soft enough to be cut with the knife. After fusion it crystallizes on cooling; when thrown upon a red-hot coal, the phosphorus burns. This compound does not appear to have been accurately analyzed; but when phosphuretted hydrogen is made to act upon a solution of protochloride of tin, a terphosphuret is formed, which is readily oxidized by the action of the air.

It consists of—

Three equivalents of phosphorus	48
One equivalent of tin . .	58
Equivalent . .	106

Iodides of Tin.—To prepare the protiodide, two parts of granulated tin are to be heated with five parts of iodine; the resulting iodide is a red translucent substance, very fusible, soluble in water, and volatile at a high temperature.

It consists of—

One equivalent of iodine .	126
One equivalent of tin .	58
Equivalent . .	184

The *Periodide of Tin* is formed by dissolving the hydrated peroxide of tin, precipitated by an alkali from the solution of the bichloride, in hydriodic acid; it forms crystals of a silky lustre, which are resolved by boiling water into peroxide of tin and hydriodic acid.

Seleniuret of Tin.—When tin is fused with selenium, they combine with the evolution of light. The compound formed is a spongy mass, of a grey colour and metallic lustre; when heated, selenium is expelled and peroxide of tin remains.

Oxisalts of Tin.

Protonitrate of Tin is formed by dissolving either the metal or the protoxide in dilute nitric acid; a yellow unerystallizable solution is obtained; by exposure to the air it absorbs oxygen, and peroxide of tin is precipitated.

It is probably composed of—

One equivalent of nitric acid .	54
One equivalent of protoxide of tin	66
Equivalent . . .	120

Pernitrate of Tin.—When tin is acted upon by strong nitric acid, the peroxide formed remains entirely insoluble in the acid; to procure the pernitrate it is best to cause the hydrated peroxide to dissolve in dilute nitric acid. The solution is colourless and yields no crystals; when diluted or heated, it is rendered turbid.

Sulphates of Tin.—By boiling excess of tin in sulphuric acid, a solution is obtained from which colourless acicular crystals of sulphate of tin are deposited. When, on the other hand, tin is boiled in excess of sulphuric acid, or hydrated peroxide of tin is dissolved in the acid, persulphate of tin is obtained in solution, but it cannot be made to crystallize.

Carbonate of Tin.—When carbonate of potash is added to protochloride of tin, a white precipitate is formed, which, supposing it to contain carbonic acid while moist, loses it during washing and drying; it appears therefore that a permanent carbonate of this metal is not attainable.

Phosphates of Tin.—When phosphate of soda is added to a solution of protochloride of tin, an insoluble white precipitate of protophosphate is obtained; the perphosphate, also an insoluble colourless precipitate, may be procured by adding the phosphate of soda to a solution of perchloride of tin.

Having described the principal and best known oxisalts of tin, we shall mention the characters of the salts of tin, as given by Dr. Thomson; they are as follows:—The protosalts of tin are white, and the solutions of them are usually colourless; their taste is astringent and metallic, and highly disagreeable; when in solution, they rapidly absorb oxygen, and are converted into the corresponding persalts.

When a plate of lead or zinc is put into a solution of tin, it is thrown down in the metallic state. Ferrocyanide of potassium occasions a white gelatinous precipitate when dropped into these solutions, and sulphuret of potassium occasions a coffee-brown precipitate in the salts of the protoxide of tin; but neither gallic acid nor infusion of galls occasions any precipitate. When chloride of gold is poured into solutions of protoxide of tin, a purple-coloured precipitate falls. A solution of potash throws down a white precipitate, which dissolves in excess of the alkali. If the solution be boiled, a black powder falls, which is metallic tin; while a compound of peroxide of tin and potash remains in solution. Ammonia throws down a white precipitate, not soluble in excess of the alkali.

Alloys of Tin.

Most of the malleable metals are rendered brittle by alloying with tin; it combines readily with potassium and sodium, forming brilliant white alloys, which are less fusible than tin; the potassium alloy burns readily when it contains more than one-fifth of potassium. With arsenic it forms a metallic mass which is whiter, harder, and more sonorous than pure tin. With antimony tin forms a white, hard, and sonorous alloy. Bismuth forms with tin an alloy which is more fusible than either of the metals separately, a mixture of equal weights melting at 212°; this compound is hard and brittle. Copper and tin form alloys which are well known and highly useful; they are bell-metal and bronze. With mercury tin readily amalgamates, and the compound is used for silvering mirrors. With iron tin forms white compounds which are more or less fusible according to the proportion of iron they contain; tinplate is of all the alloys of tin the most useful, and the preparation of this and of pewter are the most extensive applications of this very valuable metal.

TIN, MANUFACTURE OF. Under this head may be noticed, first, the processes required to bring tin into a marketable state, embracing the smelting and refining of the metal; secondly, the manufacture of tin-ware, or of articles of tin-plate; and, thirdly, a few of the manufactures of compound metals in which tin forms the principal ingredient. The process of Tinning, or of covering plates of iron, the inner surfaces of vessels of iron or copper, &c., with a thin coat of tin, forms the subject of a separate article.

Smelting and Refining of Tin; preparation of Block and Grain Tin.—The processes by which tin-ores are mechanically separated from the grosser impurities which are usually found with them, and broken into fragments convenient for the subsequent operations, are briefly noticed in the article Mining, vol. xv., pp. 244 and 245. After being thus reduced to a coarse powder, the ore is roasted or calcined in a reverberatory furnace, until it ceases to exhale arsenical vapours, by which, together with some subsequent processes, it is further cleansed from the admixture of foreign matter and prepared for smelting. A very full account of all the processes connected with the preparation and smelting of tin-ore, as practised about sixty years since, is given in the 'Mineralogia Cornubiensis' of Pryce, of Redruth; but, although most of the processes are still performed with little alteration, we have depended more for the following account of them upon an extensive article on 'Tin,' in Dr. Ure's recently published 'Dictionary of Arts, Manufactures, and Mines,' in which the previous operations of mining are also minutely described.

The ores of tin raised in Cornwall and Devonshire are always reduced, or smelted, within those counties, their exportation being prohibited; but this arrangement is stated not to be injurious to private interests, because the vessels which bring the fuel from Wales for the smelting-furnaces return to Swansea and Neath laden with copper-ores. The smelting-works do not generally belong to the proprietors of the mines, but to other parties who purchase the ore from them, their value being determined by a kind of assay. When several bags of ore, of nearly uniform quality, are taken to the smelting-works, a small sample is taken from each, and these samples, after being blended together, are mixed with about four per cent. of ground coal, placed in an open earthen crucible, and heated in an air-furnace until the ore is reduced. As the furnace is made very hot before the crucible is introduced, the assay is finished in about a quarter of an hour; after which the melted metal is poured into a mould, and the drossy substances which remain in the crucible are pounded

in a mortar, in order to separate, and to add to the ingot, any minute granules of tin remaining among them. Dr. Ure observes that a more exact assay would be obtained by fusing the ore, mixed with five per cent. of ground glass of borax, in a crucible lined with hard-rammed charcoal. A gentle heat should be applied to the crucible during the first hour, a stronger heat during the second hour, and, finally, an intense heat for a quarter of an hour. This process brings out from four to five per cent. more tin than the other; but it is stated that it has the inconvenience of reducing the iron, if any be present, which may be readily ascertained by subsequent solution in nitric acid. This mode of assaying, it is admitted, would be too tedious for ordinary adoption, as the smelter may have occasion to try several samples in one day; and that first described, while imperfect in a chemical point of view, affords a similar result to that realised by the smelter on a large scale.

The smelting of tin-ores is effected by two different methods, which may be briefly described by stating that in the first and most common, the ore, previously mixed with culm, is exposed to heat upon the hearth of a reverberatory furnace, in which pit-coal is used as fuel; while in the second, which is applied merely to *stream tin* (the tin procured from stream-works), and which is followed in order to obtain tin of the finest quality, the ore is fused in a blast-furnace, called a blowing-house, in which wood-charcoal is used for fuel.

In the former process the prepared ore, which is called *schlich*, is mixed with from one-fifth to one-eighth of its weight of powdered anthracite, or culm, to which a little slaked lime or fluor-spar is sometimes added as a flux. These substances are carefully blended together, and a little water is added to the mixture to facilitate the operation of charging the furnace, and to prevent the charge from being blown away by the draft at the commencement of the smelting process. From twelve to sixteen cwt. of the above mixture forms an ordinary charge; but in the smelting-furnaces at St. Austle, or Austell, in Cornwall, of which representations are given by Dr. Ure, each charge amounts to from fifteen to twenty-four cwt. The charge is spread upon the concave hearth of the furnace, and then the apertures by which it is inserted are closed and luted, and the furnace is gradually heated, and kept hot for six or eight hours, by which time the reduction of the ore is complete. The gradual application of the required temperature is necessary to prevent the tin oxide from uniting with the quartz of the gangue, or refuse portion of the ore, and forming a kind of enamel. When the fusion or reduction of the ore is considered to be finished, one of the apertures of the furnace is opened, and the melted mass is stirred up to complete the separation of the tin from the scoriæ, which are then drawn out by means of an iron rake. These scoriæ consist principally of masses of refuse matter from which no more tin can be profitably extracted, and which are therefore immediately thrown away; but among them are pieces which yet retain a considerable quantity of tin, and which are separated and reserved for further processes. So soon as these refuse matters are removed, a channel is opened, by which the melted tin flows from the hearth into a large vessel called the basin of reception, where it is allowed to rest for some time, in order that the impurities yet remaining with the metal may separate, by their different specific gravities. When it has settled, the tin is ladled into moulds, so as to form it into large blocks or ingots.

The ingots produced by the above process frequently contain portions of iron, copper, arsenic, and tungsten, together with small quantities of sulphurets and arseniurets that have escaped decomposition, unreduced oxide of tin, and earthy matters which have not passed off with the scoriæ. To remove these the tin is subsequently exposed to the process of *refining*, which commences by placing the blocks or ingots on the hearth of a second reverberatory furnace, similar to that used for reducing the ore, and applying a moderate heat, which causes the tin to melt, and to flow into a basin provided for it, leaving upon the hearth a residuum which consists of a very ferruginous alloy. Fresh blocks are then placed in the furnace, without removing the unmelted remains of the former, until about five tons of tin have flowed into the basin. This part of the process is termed a *liquation*, and is followed by the actual refining, which is usually effected by plunging billets of green wood into the melted tin in the refining basin, by means of an apparatus erected by it. The heat occasions the disengagement of considerable volumes of gas from the wood, and thus a kind of ebullition is produced in the tin, which causes the lighter impurities to rise to the surface in a frothy form, and the heavier to fall to the bottom. The froth or scum, which consists chiefly of the oxides of tin and foreign metals, is skimmed off and returned into the furnace; and when the tin is sufficiently boiled, the green wood is lifted out, and the whole is allowed to settle, in doing which the purest tin rises to the top, that with a trifling admixture of foreign metals remains in the middle, while the foulest portion sinks to the bottom. When the mass becomes so cool that no further separation can take place, the tin is again ladled into moulds; the quality of the blocks thus produced varying according to the order in which the moulds are filled. The blocks formed from the lowest part of the tin are usually so impure as to need a repetition of the refining process. The operation as above described requires five or six hours; of which the first is occupied in filling the basin, the three following in boiling the tin with the billets of wood, and the remaining time in subsidence. A similar effect is sometimes produced by an operation called *tossing*, in which, instead of the ebullition produced by the green wood, the mass of melted tin is agitated by a workman repeatedly lifting a quantity of tin in a ladle, and letting it fall into the basin from a considerable height. After continuing this agitation for some time, the surface is skimmed carefully; and if the upper part of the tin be yet too impure for the market, the refining is rendered more perfect by keeping the metal in a fused state, without agitation, until the impurities separate spontaneously. After refining, the tin is cast into blocks of about three cwt. each. The moulds used for this purpose are frequently made of granite; and the tin thus prepared is sold as *block tin*. From a very remote period, almost to the present time, a duty was paid upon all tin raised in Cornwall to officers appointed by the duchy, who required all blocks, before being sent to market, to be taken to them for the purpose of being *coined*, or marked with a distinguishing stamp. The mode of collecting the duty on tin was very inconvenient, as it required all tin to be cast into blocks for coining, although it might have to be subsequently re-cast into some other form for sale in foreign markets; besides which the miner or smelter had to bear the expense of sending it to one of the places appointed for coining, and the inconvenience of waiting for one of the periodical coinages, which were usually three months apart. These duties were abolished by 1 & 2 Vict., cap. 120, which settles a perpetual annuity on the duchy of Cornwall equal to the average produce of the tin duties for ten years previous to its coming into operation.

It has been stated that the richer portion of the scoriæ left by the process of smelting is reserved for further operations. Such as contain small grains of tin among the slag or refuse are taken to a stamping-mill, and broken and washed in a similar manner to the ore; while those which contain much tin are re-smelted without any previous preparation. From these scoriæ, which are called *prillion*,* an inferior kind of tin is produced by a second smelting. The inferiority of this product may be readily imagined, observes Dr. Ure, since the metal which forms the granulations among the scoriæ is what, being less fusible than the pure tin, solidified quickly, and could not flow off into the metallic bath, or basin of reception. The dross or residuum of the refining furnace is fused by increasing the fire after the removal of the refined tin, and is then run out into a separate basin, in which it is allowed to settle. The upper portion is then cast into moulds as impure tin, which needs a second refining, and the inferior part of the mixture becomes deposited on the bottom and sides of the vessel in the form of a brittle white alloy, with a crystalline fracture, which contains so large a proportion of foreign metals that no use is made of it.

The average quality of the tin-ore, as prepared for the smelting-furnaces, is such that 20 parts of it yield from 12½ to 13 parts of metallic tin, or from 62½ to 65 per cent., and the quantity of coal required for producing one ton of

* So Dr. Ure; but Pryce, in his 'Mineralogia Cornubiensis,' uses the word *pillion*, or *pillion-tin*, and defines it (p. 385), 'The tin which remains in the scoriæ or slags after it is first smelted, which must be separated and re-melted.' He applies the name *prill* to copper in a similar state.

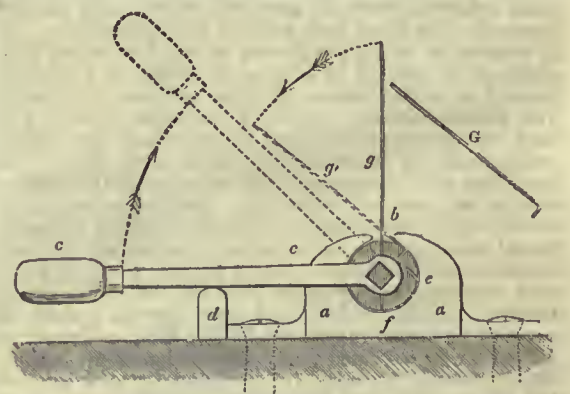
tin is about a ton and three-quarters. Respecting the time when this economical fuel was substituted for wood-charcoal in the smelting of tin-ores, authorities are at variance. Pryce, in his 'Mineralogia Cornubiensis,' p. 282, says that 'Necessity at last suggested the introduction of pit-coal for the smelting of tin-ore, and, among others, to Sir Bevil Granville, of Stow, in this county (Cornwall), temp. Car. I., who made several experiments, though without success;' and he adds that the 'effectual smelting of tin-ore with pit-coal' did not take place till the second year of Queen Anne, 'when a Mr. Liddell, with whom Mr. Moult, a noted chemist, was concerned, obtained her majesty's patent for smelting block tin with fossil coal in iron furnaces.' 'The invention of reverberatory furnaces built with brick, stone, sand, lime, and clay, soon followed this discovery; the form of which,' he states, writing about 1778, 'has admitted little improvement to the present time.' Holland, after observing that the commencement of this important substitution is generally supposed to have been about 1680, states that the question as to the discovery of the fitness of pit-coal for the purpose lies between Pryce's account, as above cited, and that of Becher (whose name he incorrectly gives Beecher), an ingenious German who, in consequence of persecutions in his own country, visited England in the reign of Charles II., and introduced several improvements in the art of mining; and he quotes a passage, but without referring to his authority, in which Becher claims for himself the credit of the introduction of coal for smelting tin. Whatever may have been the precise time or manner of this improvement, its importance is indisputable; and such is the effect of the superior economy of this and other metallurgic operations as performed in England, that experiment has shown the possibility of bringing tin-ore from the Malay countries to this island for the purpose of smelting, and sending the tin back to the East at a lower price than it can be produced for on the spot.

The smelting or reduction of tin by the blast-furnace, with wood-charcoal, is practised on a limited scale for the production of tin of the greatest possible purity. The finest ores supplied by stream-works, and the finer tin sands, are selected for this operation, and as these are free from many of the impurities found in other ores, they do not require calcination. The works in which blast-furnaces are employed are commonly called *blowing-houses*. The furnaces used are about six feet high, from the concave hearth to the throat, or commencement of the long narrow chimney, which, after proceeding for some distance in an oblique direction, contains a chamber in which the metallic dust carried off by the blast is deposited. The furnace is lined with a vertical cylinder of cast-iron, coated internally with loam; and it has an opening called the *tuyère* near the bottom, by which the blast is introduced, either from large bellows or from cylinders. No substance is added to the ore and charcoal, unless it be the residuary matter of a previous smelting; and the proportion of charcoal consumed is about one ton and six-tenths for every ton of tin produced. The melted tin runs from the furnace into an open basin, whence it is run off into a large vessel in which it is allowed to settle. The scoriæ which run with the metal into the basin of reception are skimmed off, and separated into two portions, one consisting of such as retain tin oxide, and the other of such as have no oxide, but contain tin in a granulated state. The subsequent operations of refining by allowing the mass of metal to rest, and then submitting the upper and purer portion to the refining basin, and re-melting the lower part, and of agitating the tin by the green-wood ebullition, are much the same as with block tin prepared in a reverberatory furnace with pit-coal. In order to convert the blocks of tin produced by the blast-furnace process into the form known as *grain tin*, or, according to the more appropriate French term, *étain en larmes*, 'tears of tin,' they are heated until they become brittle, and made to fall from a considerable height in a semi-fluid state, thus producing an agglomerated mass of elongated grains.

From a comparison of the results of the two methods of smelting above described, Dr. Ure shows that the reverberatory furnace with pit-coal occasions less loss of metal than the blast-furnace, and is by far the most economical. To produce a ton of metal by the former process requires, as before stated, a ton and three-quarters of pit-coal, while a ton and six-tenths of wood-charcoal is consumed in producing the like quantity of metal by the blast-furnace; and as one ton of wood-charcoal is about equivalent, in calorific effect, to two tons of pit-coal, the difference in favour of the reverberatory plan is very great. The superior quality of the tin produced by the other process is attributable partly to the greater purity of the fuel, and partly to the finer quality of the ore selected for the purpose.

Manufacture of Tin-ware.—It is unnecessary here to enumerate the various purposes to which tin is applied in the useful arts, either as an ingredient in many useful alloys, for which its ready fusibility, its cleanliness, and its beautiful appearance render it especially valuable, or as the basis of chemical compounds used in dyeing, &c. It is rarely employed alone in our metalline manufactures, but when laid in a thin coat upon the surface of sheet-iron by the process of Tinning, it produces a material of such extensive use in the manufacture of culinary and other articles, that a more detailed notice may be given. Holland observes that in this country the greater portion of the tin used in the manufacture of articles composed exclusively of that metal is that which is expanded by rolling or hammering, or by a combination of the two operations into leaves or sheets barely one-thousandth part of an inch in thickness, under the name of *tin-foil*. This is the substance which is laid upon the back of glass mirrors, and there amalgamated with mercury, so as to form what is called the *silvering*.

The art of tin-plate working, or of forming sheets of tinned iron into an almost endless variety of useful vessels and utensils, depends more, observes the author just cited, on the manual dexterity of the workman than upon any peculiarity in the tools which he requires, which are few and simple, consisting of bench and hand-shears, mallets and hammers, steel heads and wooden blocks, soldering-iron and swages. In the formation of a vessel the first operation is to cut the plate to the proper size and form with shears; and when the dimensions of the article require it, to join them together, which is done either by simply laying the edge of one plate over that of the other, and then soldering them together, or by folding the edges together with laps, and then soldering them. Similar joints are required when gores or other pieces are to be inserted, and also at the junction by which a cylinder is closed in. The usual method of forming laps, bends, or folds for this or other purposes is to lay the plate over the edge of the beneh, and to bend it by repeated strokes with a hammer; but as it is impossible by this means to make the bend as even, or at as true an angle as is desirable, Mr. J. Basset, of Birmingham, contrived a simple and effectual apparatus for the purpose, for which he was rewarded by the Society of Arts in 1831. An end view of this apparatus is given in the subjoined cut, in which *a a* represents a metal block screwed down firmly to a beneh, and having a longitudinal cylindrical cavity, within which is laid a long iron cylinder, the end of which is distinguished in the cut by a tint. The



diameter of the cylinder is such that it will turn freely upon its axis within the cavity in which it lies, and which has a slit or opening about half an inch wide along the top of the cylinder at *b*. A squared axis projects from each end of the cylinder to receive a handle *c c*, which, when the instrument is at rest, lies in an horizontal position, and is supported by the block *d*. These handles are not fixed to the square axes of the cylinder, but are capable of being

taken off and put on again in any position of the cylinder, the length of which should be equal to that of the longest laps or bends. Longitudinal cuts, wide enough to receive the edge of a tin-plate, are made in the cylinder from the circumference towards the centre to any required depth or at any required angle, as at *b*, *e*, and *f*. In order to make a right-angled lap, such as is shown in the marginal figure G, the cylinder is turned into the position shown in the figure, with one of the radial cuts under the longitudinal opening in the block *a a*; the handles are put on, and the edge of the tin-plate *g* is inserted in the uppermost slit in the cylinder. The handles are then moved in the direction indicated by the arrow and dotted lines, and the plate is forced to assume the position of the dotted lines *g'*, receiving at the same time the required lap or bend. By returning the handles towards their original position, the plate may be easily removed. If, in addition to the making of the lap, the plate is to be bent so as to form a hollow cylinder or tube, the motion of the handles is continued until the cylinder is turned completely round, by which means the plate will be wrapped or rolled round it. The cavity in the block *a a* is made large enough to receive the cylinder with this addition to its thickness; and if this operation be intended, one side or cheek of the cavity is made moveable on a pivot, so that it may be opened for the purpose of lifting out the cylinder. The pipe is subsequently removed from the cylinder by detaching the handles and sliding it off longitudinally. Appended to the description of this apparatus, in the Society's 'Transactions,' is an account of a method of bending pipes of tin, copper, or brass, by filling them with hard solder, and passing them through two thick rings of the same substance, one of which is fixed in a vice or work-bench, while the other is attached to a handle of such length as to give the operator sufficient leverage for bending the pipe in that portion which intervenes between the rings. As the solder is softer than the material of the pipe, the rings will give way to any dangerous pressure sooner than the pipe itself. When the required curvature is obtained, the solder is melted from the inside of the pipe. It is observed that in performing this operation upon brass pipes, they should be previously tinned on the inner surface, in order to secure a perfect union between the tube and the core of solder.

After a tin vessel has been rounded upon a block or mandril, by striking it with a wooden mallet, and the seams finished as above described, all its exterior edges are strengthened by bending a thick iron wire into the proper form, applying it to what would otherwise be the raw edges of the metal, and dexterously folding them over it with a hammer. By this means the appearance of the articles is improved, and their durability and strength are greatly increased. A superior kind of tin-ware, commonly known as block-tin, is carefully finished by beating or planishing with a polished steel hammer upon a metal stake; by which means the surface, which otherwise appears somewhat wavy, is made very smooth and silvery, especially after it has been polished with dry whiting. It is principally in the production of block-tin wares that *swaging* is resorted to as a ready means of producing grooved or ridged borders or other embossed ornaments. This process consists in striking the metal between two steel dies or swages, the faces of which bear the desired pattern, and are made counterparts to each other. The mouldings round the edges of dish-covers and other similar articles are produced in this way; the swages embossing the pattern in short lengths, and the article being gradually turned round until every part of its circumference has been submitted to their action. It was formerly usual to make such mouldings separately for large articles, and to attach them with solder; and Holland states that the practice of swaging them was introduced by Mr. King, a tinman in Holborn, who executed very bold and handsome mouldings by placing the outside of the article upon a concave bed of lead, having a hollow line or groove sunk into it, into which the rim of the cover or vessel was forced by the application of a huge hammer on the inner side, until the required degree of projection was obtained. The border was then completed by the application of swages, as before described. The lower die is usually fixed in an apparatus to which moveable guides are attached to insure the correct position of the article to be operated on, and the upper is made in the form of a hammer, the handle of which is pivoted so as to insure its descent in precisely the right position. Sometimes the requisite power is applied by simply working the upper swage or swage-hammer itself; but in other cases the head of the swage-hammer is struck with a mallet. Very many ornamental articles are produced by embossing or stamping tin-plate, in the same manner as other metallic sheets, with a fly-press or other machinery. Many cheap coffin-plates are manufactured at Birmingham in this way; and these and similar articles are sometimes lacquered, painted, or japanned. A very beautiful method of ornamenting tin wares by producing a crystallized appearance on the surface was much practised a few years since, under the name of *moirée metallique*, or crystallized tin-plate. It consists in applying diluted nitro-muriatic acid to the surface of the plate while slightly heated, and then washing with water, and covering with a lacquer varnish, without which the lustre of the crystalline appearance is speedily lost by the action of the air. Dr. Ure observes that 'it would seem that the acid merely lays bare the crystalline structure really present on every sheet, but masked by a film of redundant tin;' and he gives the following directions for performing the process:—The tin-plate, slightly heated, is to be placed over a tub of water, and to have its surface rubbed with a sponge dipped in a liquor composed of four parts of aquafortis and two of distilled water, holding one part of common salt or sal-ammoniac in solution. When the crystalline spangles appear to be thoroughly brought out, the plate should be immersed in water, washed with a feather or a little cotton (taking care not to rub so hard as to disturb the crystallized film of tin which constitutes the feathered surface), dried with a gentle heat, and immediately coated with lacquer. If the whole surface be not plunged at once in cold water, but partially cooled by sprinkling cold water upon it, the crystallization will be variegated with large and small figures. 'Similar results will be obtained,' he adds, 'by blowing cold air through a pipe on the tinned surface, while it is just passing from the fused to the solid state; or a variety of delineations may be traced by playing over the surface of the plate with the pointed flame of a blow-pipe.' (*Dict. of Arts*, p. 863 and pp. 1253, 1254.) By using coloured varnishes very beautiful boxes and other ornamental articles may be produced by this process.

Manufacture of Tin Alloys.—Britannia Metal.—Tin forms the principal ingredient in various kinds of pewter and other white metallic alloys, which are manufactured into domestic utensils by casting, stamping, and other processes in which much ingenuity is displayed. Holland gives an interesting account of the manufacture of teapots and similar articles of Britannia metal, which may be briefly noticed here. This manufacture was commenced on a large scale at Sheffield, where it is still carried on, about the year 1770, by two individuals of the names of Jessop and Hancock; and the brilliancy, lightness, and cheapness of the wares, which, when well made, greatly resemble silver, have secured for them a very extensive sale in this and other countries. The extreme facility with which such alloys may be worked into any shape leads however to the manufacture of many articles of so flimsy a character that they speedily lose their form and beauty. Various authorities differ greatly as to the composition of Britannia metal, but the proportions given by Holland are 3½ cwts. of the best block-tin, 28 lbs. of martial regulus of antimony, 8 lbs. of copper, and 8 lbs. of brass. The tin is first melted and raised to a red heat in a stout cast-iron pot, and then the antimony, copper, and brass are successively poured into it from the crucibles in which they have been melted; the mass being stirred during the operation, to complete the mixture. The fusion being completed by the continued application of fire under the pot, the metal is removed by ladles to cast-iron boxes or moulds, in which it is cast into slabs fifteen inches long, six inches wide, and one inch thick; or if for casting small articles, into smaller moulds to form it into convenient ingots. The thick slabs of metal are then extended by passing them between polished steel rollers until they are reduced to the required degree of tenuity. This operation is performed without any annealing or softening; and the edges of the sheet become a little shattered or cracked by it.

Although most articles manufactured in silver are also produced in Britannia metal, and in other alloys of similar

character, the principal consumption is in candlesticks, tea-pots, coffee-biggins, and other vessels for containing liquids. The feet of candlesticks, the bodies of tea-pots, and other articles containing embossed work, are stamped between dies; and when the shape of the article will not allow it to be stamped in one piece, as in the case of a cylindrical vessel with raised work upon the sides, it is sometimes stamped in halves, which are subsequently fitted and soldered together. Articles approaching the globular form may in like manner be stamped in three or more pieces. In stamping brass, silver, and plated metal the dies must in almost every case be of steel, and the patterns upon them are executed at a very great expense, but in the manufacture of Britannia metal a cheaper process is followed. Plaster casts are produced of the required patterns, either from original models or designs, or from manufactured articles of silver, and from these are made moulds or dies of fine hard pig-iron, which, with a very little finishing, form dies fit for stamping so tractable a metal. When very thin, it may even be stamped in dies of brass or of spoon-metal.

The great facility with which this alloy may be moulded to any required form is illustrated by the operation termed *spinning*, by which the bodies of tea-pots with concentric circular swells are usually formed. A wooden chuck or model of so much of the intended vessel as may be slipped off the chuck when completed is fixed in a lathe worked by steam-power, and to this is applied a circular piece of sheet-metal cut to the proper size with shears. This is pressed against the centre of the chuck by a circular piece of wood with a blunt centre-pin; and as the whole revolves rapidly, the workman bends the plate over the model-chuck by pressing it with tools of hard wood or polished steel until it is brought into precisely the same form. The tools are applied at first very gently, so as to avoid crumpling or lacerating the metal; and such is the dexterity acquired by some workmen, that Holland states that some individuals can spin twenty dozen of these tea-pot bodies in a day. The form is perfected upon a second chuck; and in some cases articles are partially formed by a stroke in a die previous to the spinning. Spherical articles are, as in the case of stamping with dies, usually formed in two or more parts; but in some instances they are made to overlap the model, which is then composed of several segments, that may be taken out of the finished vessel by removing a centre-piece, in a similar manner to a boot-last.

Many small vessels, spoons, and other articles are cast in an alloy somewhat harder than that which is rolled into sheets. The facility with which Britannia metal may be run into any shape and cut in the lathe, as for turning measures and small vessels previously formed by casting, is a great recommendation to the manufacturer. Articles of this metal are cleaned from the oil, rosin, and other impurities acquired during their formation, by boiling in water containing sweet soap; after which they are polished, either by hand, or more commonly by the buff and brush set in motion by a steam-engine. The buff is a solid cylinder of wood, resembling a grindstone in form, the rim or periphery of which is covered with buff leather dressed with fine sand from the bed of the river Trent, which, after being dried and sifted, is mixed with oil. The brush is a similar but smaller circle of wood set all round with four or five rows of bristles; it, as well as the buff, is dressed with sand and oil, and afterwards for finishing with powdered rotten-stone and oil. The brush is used generally for such articles as from their form cannot be applied to the buff, and also for all stamped or embossed work. After buffing and brushing, the articles are boiled in a solution of pearlash, and finally hand-brushed and hand-polished by an application of soft soap, a little oil, and powdered rotten-stone. This operation is usually performed by females, as it is found that no instrument can supply an effectual substitute for a soft hand, which is one of the first requisites inquired into when persons apply for work in this department.

(Ure's *Dictionary of Arts, &c.*; *Manufactures in Metal* (by Mr. Holland), in Lardner's *Cabinet Cyclopædia*, vol. iii.; *Transactions of the Society of Arts*, vol. xlviii., pp. 241-248.)

TIN TRADE. The history of the trade in tin commences with the very earliest records of commercial intercourse with the British islands. [CASSITERIDES; and *Pict. History of England*, vol. i., pp. 91-95.] We shall only notice this trade as it has existed within the last two centuries. Davenant gives some interesting information concerning it soon after the middle of the seventeenth century. In 1663 our exports of tin to all foreign countries amounted to 153 tons; in 1669 to 240 tons; in the three years of peace, from 1698 to 1700, on an average to 1297 tons; and in the ten years of war, from 1700 to 1710, on an average to 1094 tons. In these last ten years the annual purchases of the Dutch amounted to 300 tons, of the estimated value of 21,374*l*. Davenant accounts for the great increase in the exportation as follows:—'All our neighbours,' says he, 'as well as ourselves, have increased in the luxurious way of living; such who heretofore were content with pewter are now served in plate; and such as made use of trenchers, wooden platters, and earthenware, will now have pewter; all which is visible within forty years, and has occasioned this great call of a commodity almost peculiar to us.' But the produce of the mines more than kept pace with the increased demand; and when Davenant wrote, Queen Anne had between 4000 and 5000 tons of tin on hand, a quantity equal to four or five years' consumption. 'As the case stands at present,' he adds, 'Holland is the great magazine for tin: the necessities of such as have it upon their hands, either in merchandize or security, drive it thither, and the Dutch set what price they please upon this rich product of England, to the damage of the public.' He proposed that a thousand tons of the dead stock should be coined into tin half-pence and farthings. The produce of the mines went on increasing, and the accumulation to which Davenant alludes is only about a year's produce of the mines at present.

In the 'Journal of the Statistical Society of London' (vol. ii., part iv.), there is a valuable paper, by Joseph Carne, Esq., on the 'Statistics of the Tin-Mines in Cornwall, and of the Consumption of Tin in Great Britain,' from which we borrow some of the following statements. From 1750 to 1785 the produce of the mines varied from 2273 tons, the lowest amount, to 3005 tons, which was the greatest quantity in any one year: the average production for this period was 2757 tons, and the average price 64*s*. 6*d*. per cwt. From 1789 to 1816 the annual average quantity was 2875 tons, at 79*s*. 9*d*. per cwt. From 1817 to 1837 inclusive, the annual average was 4211 tons, and the average price paid to the tinner was 73*s*. the cwt. In 1787 Banca tin was imported into this country for the first time, and the price of Cornish tin soon fell to 58*s*. the cwt., and would have declined still further if a new market had not been opened. It appears that the purser of an Indiaman, who took some tin from the Molucca islands to China in 1787, found the speculation so profitable that the East India Company were induced to direct their attention to the trade, and the Company shortly entered into arrangements with the Cornish tinners for an annual supply. The purchases of the Company were made at low prices, but the tinners were indemnified by the artificial scarcity which raised prices in the home market. At first the Company paid only 68*l*. 13*s*. 4*d*. the ton, delivered on board in London; in 1792 they gave 71*l*.; and on the renewal of the Company's charter they agreed to purchase 800 tons annually at 75*l*., and offered to take half as much more at 68*l*. 13*s*. 4*d*. In 1809 the difference between the prices paid by the Company and the prices in the home market was so great that the tinners refused to supply the Company, and their exports ceased; but in 1811 they agreed to pay 78*l*., and in 1812, 80*l*. per ton. The connection finally ceased in 1817, as the supply of the home market had become more profitable.

The gradual increase in the consumption of tin in Great Britain is shown in the following table:—

Periods.	Annual Average.
1783 to 1790	926 tons.
1791 to 1800	754
1800 to 1810	1118
1811 to 1820	1600
1821 to 1830	2616
1830 to 1837	3363

Until 1838 all the Cornish tin paid a duty of 4*s*. per 120 lbs. to the duchy of Cornwall, which, with the fees, was equivalent to 5*s*. This duty is now abolished. About 10,000 men, women, and children are supposed to be employed in the Cornish mines.

From 1783 to 1790 the proportion of British tin exported

was 7-10ths of the produce of the mines; in the next ten years it was 3-4ths; from 1800 to 1820 one half; from 1820 to 1830 it had diminished to 2-5ths; and from 1830 to 1837 to 1-5th. The quantity of foreign tin imported, the greater part of which is intended for re-exportation, since 1815, was as follows:—From 1815 to 1831 the annual average quantity imported was 213 tons; exported annually during the same period 224 tons. From 1831 to 1838 the imports of foreign tin averaged annually 1527 tons, and the exports were 1482 tons. This foreign tin can be supplied cheaper in Europe and America than the Cornish tin. In 1841 the imports were 28,434 cwt., or 1421 tons, of which 17,915 cwt. were from Singapore, 6197 cwt. from Java, and 5324 cwt. from the East India Company's territories. In the same year the exports of foreign tin were 25,344 cwt., or 1267 tons, principally to the United States, Holland, Russia, France, Italy, and Germany. The exports of British tin in 1841 were 1267 tons. France took 8905 cwt.; Turkey, 4061 cwt.; Russia, 2780 cwt.; the United States, 1753 cwt.; and Italy, 1329 cwt.; being more than three-fourths of the whole. In the Custom-House records the quantity of tin manufactures exported is not distinguished, but in 1840 the exports of 'tin and pewter wares and tin plate' were valued at 360,816*l*. Under the tariff of 1842 (5 & 6 Vict., c. 47), foreign tin-ore will be admissible for the first time, on paying a duty, which is 10*s*. the ton if from a British possession, and if of a foreign, 50*s*. But as none of the British possessions contain tin likely to be brought into the English market, the real duty is 50*s*. The former duty of 10*s*. the cwt. was prohibitory. The quantity of tin annually produced in Banca is estimated at 2700 tons, and in the Malayan peninsula about 1300 tons; and these are the parts from which a supply of ore, if any, is likely to be received.

TIN (*Medical Properties of*). It cannot be confidently asserted that tin in a metallic state has no influence over the human system, as many respectable writers affirm that tin-filings are decidedly anthelmintic, and that this is not owing to mechanical irritation of the worms causing them to be detached from the surface of the intestines; it is stated that water in which tin has been boiled, and wine digested in a tin vessel, are also anthelmintic. Others, denying to tin any inherent power over worms, have attributed these effects to the presence of a small portion of arsenic. Be this as it may, it is a very crude method of treating worms to exhibit such a material as tin-filings. [Anthelmintics.] Even oxide of tin is of doubtful efficacy, as might be expected from its extreme insolubility. Its powers may be heightened by occasionally meeting with acids in the stomach, such as the hydrochloric, and therewith forming a chloride. Two compounds of chlorine with tin are known, one the protochloride, the other the bichloride. Both of these are exceedingly soluble; the latter so much so that it can with difficulty be kept in the solid state, and more frequently occurs in the liquid state, and is then called the spiritus fumans Libavii, or butter of tin. The former is much used by dyers, among whom, when in the solid state, it is called *salt of tin*, and when liquid, *spirit of tin*. In the former condition, it has sometimes been mistaken for common salt: it has thus been the source of poisoning, though it is not very active when introduced into the stomach. A few grains of it injected into the jugular vein prove rapidly fatal to dogs. In case of any of it being swallowed, emetics or the stomach-pump, demulcent drinks, and, if necessary, moderate venesection, may be employed, followed after a time by vital stimulants. It has been thought by some to be dangerous to allow fluids containing acids, such as the weak acid wines, or cyder, or even fatty, saline, or albuminous substances, to remain long in tin-vessels, as an injurious action of these on the tin is supposed to occur. If any serious effects have ever followed from such a cause, it is most likely that these vessels were only coated superficially with tin, which being rubbed off, exposed the more potent metal beneath to the solvent power of these substances. It is therefore prudent to examine from time to time all copper and other vessels to see that the tinning is entire.

TIN PLATE. [Tinning.]

TIN PYRITES. [Tin.]

TINACTOR, Prince Maximilian's name for one of the Ant-Thrushes (*Formicarinæ*, G. R. Gray). This genus is the *Oxyprora*, Menetr. (1834), and belongs to *Myiothera*, Cuv., and *Thamnophilus*, Vieill.

Example, *Tinactor fuscus*, Guer. *Mag. de Zool.*, t. 10. [Thrushes.]

TINA'MIDÆ. [Tinamou.]

TINAMO'TIS, Mr. Vigors's name for a genus of birds (*Eudromia*, D'Orb. and J. Geoffr.). [Tinamou.]

TI'NAMOU (*Tinamus*, Lath., *Tetrao*, Linn., *Tridactylus*, Lacép., *Crypturus*, Ill., *Pezus*, Spix), a genus of birds placed by Cuvier, Mr. Vigors, and Mr. Swainson among the Tetraonidæ, in which article the account given by the last-mentioned zoologist of their habits and utility to man will be found.

The Prince of Canino (*Birds of Europe and North America*) has a family *Crypturidæ*, noticed in the article Tetraonidæ (vol. xxiv., p. 255), and, we presume, would there place the Tinamous.

Mr. G. R. Gray makes the *Tinamidæ*, the sixth family of the *Gallinæ*, according to his arrangement, consist of the following subfamilies and genera:—

Subfam. 1. Turnicinæ.

Genus:—*Turnix*, Bonn.

Subfam. 2. Tinaminæ.

Genera:—*Tinamus*, Lath.; *Nothura*, Wagl.; *Rhynchotus*, Spix; *Tinamotis*, Vig.

This family is placed by Mr. G. R. Gray (*loc. cit.*) next to the *Chrotidida*, and at the end of the *Gallinæ*, the next order to which is formed by the *Struthiones*.

We proceed to illustrate the present article by one of the Tinamous properly so called.

Generic Character of Tinamus.—Bill moderate, depressed, broader than high, tip obtuse, back broad. Nostrils lateral, medial, ovate, expanded, and open. Feet four-toed, cleft; hind toe very short. Tail none, or very short, concealed by the rump-feathers. Wings short. (Sw.)

Example, *Tinamus Tataupa*, Var.

Description.—Tinamou with the body above dusky-rufous, immaculate. Head and neck dusky-black; chin white; throat, neck, and breast cinereous; body beneath whitish; vent and flanks rufous-black, the feathers margined with white. Bill and irides red. Total length 8¼ inches. (Sw.)

Mr. Swainson, in his work on the 'Classification of Birds,' expresses his opinion that the Tinamous probably represent the group of Bustards in the New World [Tetraonidæ, vol. xxiv., p. 255]; but in a previous publication (*Zoological Illustrations*, 1st series), he says that they there 'seem to hold the same scale in creation which the partridges do in the Old Continent.' He refers, in the book last mentioned, to the work of M. Temminck (*Pig. et Gall.*), who, he observes, has described twelve species; and he states that the bird under consideration is the smallest of its family. He found it only once in the interior of Bahia, where, he says, it must be very rare, or frequent in particular districts only. Though differing in some respects from M. Temminck's description, he is inclined to consider it only a variety.

Tinamus Tataupa, Var. (Sw.)

Mr. Darwin, in his graphic description of the country around Maldonado, when he had reached the farthest

point which he was anxious to examine, says:—'The country wore the same aspect, till at last the fine green turf became more wearisome than a dusty turnpike-road. We everywhere saw great numbers of partridges (*Tinamus rufescens*). These birds do not go in coveys, nor do they conceal themselves like the English kind. It appears a very silly bird. A man on horseback, by riding round and round in a circle, or rather in a spire, so as to approach closer each time, may knock on the head as many as he pleases. The more common method is to catch them with a running noose or little lazo, made of the stem of an ostrich's feather, fastened to the end of a long stick. A boy on a quiet old horse will frequently thus catch thirty or forty in a day. The flesh of this bird, when cooked, is delicately white.' (*Journal of Researches in the Countries visited by H. M. S. Beagle.*)

TINCA, a genus of fishes founded by Cuvier, and which has for type the common tench, *Cyprinus tinca*, Linn.; *Tinca vulgaris*, Cuv. This fish belongs to the carp family (*Cyprinidæ*), and is separated generically on account of the small size of the scales with which the body is covered, combined with the small antero-posterior extent of the dorsal and anal fins, both of which are destitute of the anterior bony spine or any such as are observable in some allied fishes—as in the dorsal fin of the barbel for instance; the barbules to the mouth are very small.

The tench, observes Mr. Yarrell, inhabits most of the lakes of the European continent. In this country, though frequent in ornamental water and ponds, it is but sparingly found in the generality of our rivers. There is some doubt whether, like the carp, its origin be not foreign, and whether those rivers that can now boast of it are not indebted for it to the accidental escape of fish from the preserved waters of neighbouring gentlemen. The rivers it is mostly in are those which are slow and deep, and in such situations it does not appear to be so prolific as in ponds. Cuvier observes that the tench inhabits by preference stagnant waters. This is in accordance with the observations of Mr. Yarrell, and, rivers being an unnatural habitat for the fish, will account for their being less prolific in such situations.

The author of the interesting work on British Fishes, just mentioned, quotes the following account illustrative of the habits of the tench and of its tenacity of life: it is from Daniel's 'Rural Sports:'—'A piece of water which had been ordered to be filled up, and into which wood and rubbish had been thrown for years, was directed to be cleared out. Persons were accordingly employed; and, almost choked up by weeds and mud, so little water remained, that no person expected to see any fish, excepting a few eels, yet nearly two hundred brace of tench of all sizes, and as many perch, were found. After the pond was thought to be quite free, under some roots there seemed to be an animal which was conjectured to be an otter; the place was surrounded, and on opening an entrance among the roots, a tench was found of most singular form, having literally assumed the shape of the hole, in which he had of course for many years been confined. His length from eye to fork was thirty-three inches; his circumference, almost to the tail, was twenty-seven inches; his weight eleven pounds nine ounces and a quarter; the colour was also singular, his belly being that of a char, or vermilion. This extraordinary fish, after having been inspected by many gentlemen, was carefully put into a pond, and at the time the account was written, twelve months afterwards, was alive and well.'

Experiments have shown that a tench is able to breathe when the quantity of oxygen is reduced to a five-thousandth part of the bulk of the water: ordinary river water generally containing one per cent. of oxygen.

The general colour of the tench is greenish brown, or olive having a golden hue, which latter tint is most conspicuous on the under parts of the fish. From the carp it is readily distinguished by the small size of its scales, and also the small extent of the dorsal fin: its form is rather less deep in proportion to the length. It spawns usually about the middle of June, and deposits its ova on weeds.

TINCTURES are solutions of the active principles, mostly of vegetables, sometimes of saline medicines, and more rarely of animal matters, in certain solvents. From possessing more or less of colour, they have obtained this name. They are distinguished according to the kind of solvent employed. When alcohol is used, they are termed *alcoholic* tinctures, or more generally simply *tinctures*; when sulphuric æther is used, they are denominated *ætherial* tinctures. When wine is used, though differing little from pure alcohol, the term *medicated wines* is applied to them; and when the process of distillation is employed to aid the extraction, particularly of volatile oils, the result is termed a *spirit*, such as of rosemary. Ammonia is sometimes conjoined, and the proceeds termed an *ammoniated* tincture. In some cases less of the principal ingredient is taken up or dissolved when ammonia is used, than when simple alcohol is employed, as in the tinctura guaiacum ammoniatum. Formerly some tinctures were called *essences*, from the term *esse*, it being thought that they contained only the purer or more refined portion, the alcohol leaving all the baser principles, such as the starch, gum, woody fibre, &c., undissolved: *quintessence* was a still higher degree of this. These terms are now disused by pharmaceutists, though retained by the people. *Elixirs* differ only from being of a greater consistence: they are not unfrequently turbid from the extractive matter suspended in them. Tinctures are further distinguished into simple and compound. They are called *simple* when one substance only is submitted to the solvent; *compound*, when two or more are. Another important distinction among tinctures is founded upon the degree of strength of the alcohol employed. Where the active principle is nearly pure resin, a strong spirit is needed; when much gum is associated with the resin, a weaker is required. Hence some tinctures are prepared with *proof* spirit, as the greater number; a few with *spirit above proof;* and some with *rectified spirit*.

A well-prepared tincture should be clear, possessing the colour of the article which is its base, and partaking in an eminent degree of its characteristic odour and taste. As a general rule, five or six parts of the liquid chosen is to be used for one part of the solid material, which is to be bruised or comminuted before being submitted to maceration. The maceration, which should be conducted in well-stopped glass vessels, is generally continued for fourteen days, during which the ingredients are to be frequently shaken, and at the end strained. The pure tincture is then to be preserved in a tightly-stopped bottle, which should be opake, or sheltered from the light. From several tinctures a deposit falls down, either from some slow chemical change taking place among the ingredients, or from the evaporation of some of the spirit. This renders old tinctures not unfrequently turbid, and of variable strength. Thus tincture of opium when newly prepared contains one grain of opium in nineteen minims, but after some time one grain of opium is contained in only fourteen minims. This inconvenience may be avoided with all recent vegetables, by forming what are termed 'vegetable juices.' These are merely the juices of the fresh plant expressed by a powerful wooden press, and the juice allowed to stand twenty-four hours, during which a copious precipitation of feculent matter takes place, which is further promoted by adding alcohol 56° over proof, in the proportion of four fluid ounces to every sixteen fluid ounces of the juice. After standing for twenty-four hours, the juice is to be filtered through bibulous paper (prepared from wool), when it will keep unimpaired for a length of time.

These vegetable juices always retain their purity, and are of the same degree of strength at last as at first. By this means not only is the process simplified, and the time required for their preparation greatly abridged, being reduced from fourteen days to two; but their medicinal efficacy is greater than that of the ordinary tinctures, and, from containing less alcohol, they can be given in cases where the stimulating action of this principle interferes with the effect of the substance dissolved in it, or renders its exhibition improper, as in the case of young children.

In preparing the officinal *spirits*, the directions of the Pharmacopœia are rarely complied with. Most chemists content themselves with dissolving some of the essential oil of the plant in alcohol of the requisite strength, by which much expense and trouble, as well as loss of time, are avoided.

(See a pamphlet on *The Best Method of Obtaining the Most Powerful Vegetable Preparations for Medical Use*, by Edward Bentley.)

TINDAL, MATTHEW, LL.D., was the son of the Rev. John Tindal, parish clergyman at Beer-Ferres in Devon-

shire, where Matthew was born about the year 1657. In 1672 he was admitted of Lincoln College, Oxford, where Dr. Hickes was his tutor; but he afterwards removed to Exeter College; and he was finally elected to a law fellowship at All Souls, soon after he had taken his degree of B.A., in 1676. He proceeded LL.B. in 1679, and was created LL.D. in 1685. If we may believe certain charges which were long afterwards made in print by the opponents of his theological opinions, his debaucheries while he resided at Oxford were so scandalous as to have drawn down upon him on one occasion a public reprimand from his college. Soon after he obtained his doctor's degree he went over to the Church of Rome, not without subjecting himself to the imputation of having an eye to the worldly advantages which such a step might seem to promise under the popish king just come to the throne. It does not appear however that he actually obtained any court favour or patronage by his change of religion; and, according to his own account, given in a pamphlet he published in his own defence in 1708, he reverted to the Church of England some months before the Revolution, having attended mass for the last time at Candlemas, 1688, and publicly received the sacrament in his college chapel at Easter following. He asserts that his mind, which came a *tabula rasa* to the university, had been prepared for being seduced by James's Romish emissaries by the notions as to the high and independent powers of the clergy which then prevailed there, and which he had adopted without examination. Accordingly, when he threw off popery, he abandoned his high-church principles at the same time; or rather, as he puts it, he discovered that these principles were unfounded, and that at once cured him of his popery. 'Meeting,' he says, 'upon his going into the world, with people who treated that notion of the independent power as it deserved, and finding the absurdities of popery to be much greater at hand than they appeared at a distance, he began to examine the whole matter with all the attention he was capable of; and then he quickly found, and was surprised at the discovery, that all his till then undoubted maxims were so far from having any solid foundation, that they were built on as great a contradiction as can be, that of two independent powers in the same society. Upon this he returned, as he had good reason, to the Church of England, which he found, by examining into her constitution, disclaimed all that independent power he had been bred up to the belief of.' The Revolution having taken place, he now also, naturally enough, became a zealous partizan of that settlement. The history of the rest of his life, during which he appears to have resided mostly in London, consists almost entirely of that of his successive publications and of the controversies in which they involved him.

He first appeared as an author in November, 1693, by the publication, in 4to., of 'An Essay concerning Obedience to the Supreme Powers, and the Duty of Subjects in all Revolutions, with some considerations concerning the present juncture of affairs.' This was followed in March, 1694, by 'An Essay concerning the Law of Nations and the Rights of Sovereigns,' a second edition of which, with additions, was brought out in the same year. This year also he published 'A Letter to the Clergy of both Universities,' in recommendation of certain alterations which there was then some talk of making in the Liturgy; and in 1695 another pamphlet in support of the same views. But the first work by which he attracted general attention was an 8vo. volume which he published in 1706, entitled 'The Rights of the Christian Church Asserted, against the Romish and all other priests who claim an independent power over it.' This work, which is an elaborate attack upon the theory of hierarchical supremacy, or what are commonly called high-church principles, immediately raised a vast commotion. It is related that to a friend who found him one day engaged upon it, pen in hand, he said that he was writing a book which would make the clergy mad. Replies to it were immediately published by the celebrated William Wotton, by Dr. Hickes (Tindal's old college tutor), and others; the controversy continued to rage for several years: a bookseller and his shopman were indicted for selling the book. In 1707 Tindal published 'A Defence' of his work, and, a few months after, 'A Second Defence,' both of which he republished together, with additions, in 1709: the same year he also reprinted his two Essays on Obedience and the Law of Nations, along with 'A Discourse for the Liberty of the Press, and an Essay concerning the Rights of Mankind in matters of Religion:' about the same time he came forth with a fresh pamphlet, entitled 'New High Church turned Old Presbyterian,' in exposure of the pretensions put forward by Sacheverell and his party; upon which the House of Commons, which the day before had condemned Sacheverell's sermons to be burned, on the 25th of March, 1710, impartially ordered Tindal's 'Rights of the Christian Church' and the second edition of his two 'Defences' to be committed to the flames at the same time. This proceeding drew from Tindal the same year three more pamphlets:—the first, entitled 'A High-Church Catechism;' the second, 'The Jacobitism, Perjury, and Popery of the High-Church Priests;' the third, 'The Merciful Judgments of High Church triumphant, on Offending Clergymen and others, in the reign of Charles I.' The next year, on the Lower House of Convocation having drawn up and printed 'A Representation of the present state of Religion, with regard to the late excessive growth of Infidelity, Heresy, and Profaneness,' Tindal forthwith replied in 'The Nation Vindicated from the Aspersions cast on it' in the said representation. The second part of this performance is occupied with an explanation and defence of what has since been called the doctrine of philosophical necessity, in opposition to the assertion of the Convocation, that such views went to overturn the foundations of all morality, and of all religion, natural as well as revealed. For some years from this date Tindal's active pen was exclusively occupied with the politics of the day; but his performances do not appear to have been very effective at the time, and have been long forgotten. It is remarkable however that in so voluminous a work as Coxe's 'Memoirs of Sir Robert Walpole,' no notice should be taken of a personal controversy in which Tindal became involved with that minister after his resignation in 1717, and which produced various pamphlets on both sides. Tindal considered himself to have been ill-used by Walpole, who, according to his account, had first courted his alliance, and then suddenly dropped him after he had so far committed himself in writing that it was imagined his hostility in print was not to be dreaded. Walpole, on the other hand, or his friends, accused Tindal of a treacherous desertion to the opposite faction as soon as he found that Walpole had been or was about to be deprived of power. It is probable that there was some misunderstanding on both sides. In any case this ministerial rupture was merely a personal quarrel, in which little or no public principle was involved; and it implies therefore no political versatility or inconsistency in Tindal that a few years after this, in 1721, 1722, and 1723, when Walpole was at the head of the ministry, he came forward as a strenuous defender of his government in a succession of pamphlets. He did not return to his original field of theological polemics till 1728, when he published 'An Address to the Inhabitants of the two great Cities of London and Westminster,' in reply to a pastoral letter which the bishop of London, Dr. Gibson, had addressed to the people of his diocese on the subject of Anthony Collins's 'Scheme of Literal Prophecy Considered,' and other recent deistical writings. A 'Second Pastoral Letter,' soon after published by the bishop, called forth a 'Second Address' from Tindal; and both addresses were reprinted the same year, in an 8vo. volume, with alterations and additions.

From this date Tindal seems to have remained quiet till the year 1730, when he produced, in a 4to. volume, the work by which he is now chiefly remembered, his 'Christianity as Old as the Creation, or the Gospel a Republication of the Religion of Nature.' The object of this work, as is indeed sufficiently declared in its title, is to contend that there is nothing more in Christianity, properly understood, than what the human reason is quite capable of discovering for itself, and by implication to deny that any special revelation has ever been made by the Deity to man. It did not however contain any express denial of the truth of Christianity; of which indeed the author and his partizans rather professed to think that he had found out a new defence stronger than any that had been previously thought of. 'Tindal,' said Warburton, some years after, 'a kind of bastard Socrates, had brought our speculations from heaven to earth; and, under pretence of advancing the antiquity of Christianity, laboured to undermine its original.' The book made a great noise, and

various answers to it soon appeared, the most noted of which were—Dr. Waterland's 'Scripture Vindicated,' 1730; 'The Usefulness, Truth, and Excellency of the Christian Revelation defended,' by Mr. (afterwards Dr.) James Foster (the eminent dissenting clergyman), 1731; 'A Defence of Revealed Religion,' by Dr. Conybeare (afterwards bishop of Bristol), 1732; and 'An Answer to Christianity as Old as the Creation,' by the Rev. John (afterwards Dr.) Leland (another learned and distinguished dissenting divine), 1733. The book is also discussed in the last-mentioned writer's more celebrated work, his 'View of the Principal Deistical Writers,' published in 1754. Tindal defended himself in 'Remarks on Scripture Vindicated, and some other late Writings,' published along with a new edition of his 'Second Address to the Inhabitants of London and Westminster,' in 1730. But this was his last publication; his health now began to give way, and he expired on the 16th of August, 1733, at a lodging in Cold Bath Fields, to which he had been prevailed upon to remove a few days before from his chambers in Gray's Inn. Tindal never held any preferment except his fellowship; but it is stated, in the 'Biographia Britannica,' that in the reign of King William he frequently sat as judge in the Court of Delegates, and had a pension of 200*l.* a year granted to him by the crown for his services in that capacity. It is added that he 'rarely, if ever, practised as an advocate in the courts of civil or ecclesiastical law;' which would seem to imply that he had been called to the bar, or been admitted an advocate at Doctors' Commons, although that fact is not mentioned. A new edition of his 'Essay on the Law of Nations' was published the year after his death; but the publication of a second part of his 'Christianity as Old as the Creation,' which he left ready for the press, is said to have been prevented by the interference of Bishop Gibson. A will, in which he left nearly all he had to Eustace Budgell, in whose hands he was for some time before his decease, was contested by his nephew, the Rev. Nicholas Tindal, and was at last set aside: the will was printed in a pamphlet, with a detail of circumstances connected with it, in 1733.

Of the amount of talent and learning shown in Tindal's writings very different estimates have been formed by his admirers and his opponents. Waterland, in the Introduction to his 'Scripture Vindicated,' characterises his antagonist in the following terms:—'His attacks are feeble, his artillery contemptible; he has no genius or taste for literature, no acquaintance with the original languages, nor so much as with common critics or commentators; several of his objections are pure English objections, such as affect only our translation: the rest are of the lowest and most trifling sort.' Dr. Conyers Middleton, on the other hand, in a letter which he addressed to Waterland immediately after the latter had published his book, says, 'For my own part, to observe our English proverb, and give the devil his due, I cannot discover any such want of literature as you object to him; but, on the contrary, see plainly that his work has been the result of much study and reading; his materials collected from a great variety of the best writers; his pages decently crowded with citations; and his index of authors as numerous as that of most books which have lately appeared.' Tindal's English style is unaffected and perspicuous.

TINDAL, REV. NICHOLAS, was the son of a brother of Dr. Matthew Tindal, and was born in 1687. Having studied at Exeter College, Oxford, and taken his degree of M.A. in 1713, he was afterwards elected a Fellow of Trinity College in that university. In 1722 he was presented by his college to the vicarage of Great Waltham in Essex; in 1738 Sir Charles Wager, then first lord of the admiralty, with whom he appears to have some years before sailed for a short time as chaplain, appointed him chaplain to Greenwich Hospital; in 1740 he is said to have been presented to the rectory of Colbourne in the Isle of Wight, upon which he resigned Great Waltham; and very soon after he appears to have obtained his last preferment, the rectory of Alverstoke in Hampshire, from the bishop of Winchester (Hoadley). He died at Greenwich Hospital on the 27th of June, 1774.

Mr. Tindal's first literary attempt was a work published in monthly numbers in 1724, under the title of 'Antiquities, Sacred and Profane, being a Dissertation on the excellency of the History of the Hebrews,' &c., which is described as a translation from the French of Calmet. This was followed by two numbers of a History of Essex, which was then dropped. He then engaged in his most memorable undertaking, the translation, from the French, of Rapin's 'History of England,' which appeared in a successsion of octavo volumes in 1726 and following years, and was reprinted in two volumes folio in 1732. This second edition was dedicated to Frederick, prince of Wales, who in return presented the translator with a gold medal of the value of forty guineas. In 1744 a Continuation of Rapin, by Tindal, began to be published in weekly folio numbers, which was completed in two volumes (commonly bound in three), in 1747, the history being brought down to the end of the reign of George I. A second folio edition of this Continuation appeared in 1751, and a third, in 21 vols. 8vo., in 1757, with the addition of the reign of George II. down to that date. The translation and continuation of Rapin were very successful speculations; and the publishers, the Messrs. Knapton, of Ludgate Street, evinced their gratitude by making Tindal a present of 200*l.* It is generally stated that he was assisted in both undertakings by Mr. Philip Morant, to whom solely is attributed the Abridgment or Summary of the History and Continuation given at the end of the latter, and also printed in 3 vols. 8vo. in 1747; but it does not appear upon what authority it is asserted by Coxe, in the Preface to his 'Memoirs of Sir Robert Walpole,' that the Continuation, though published under the name of Tindal, 'was principally written by Dr. Birch.' There is no hint of this in the very full and elaborate Life of Birch, in the second edition of the 'Biographia Britannica,' which is stated to be compiled from his own papers and the communications of surviving relations and friends. 'His papers,' Coxe proceeds, 'in the Museum and in the Hardwicke Collection, which I have examined with scrupulous attention, and various other documents which were submitted to his inspection, and to which I have had access, prove great accuracy of research, judgment in selection, and fidelity in narration. He derived considerable assistance from persons of political eminence, particularly the late Lord Walpole, the late earl of Hardwicke, and the Honourable Charles Yorke. The account of the Partition Treaty was written by the late earl of Hardwicke. The account of Lord Somers's argument in Barker's case was written by his great-nephew the late Mr. C. Yorke. I can also trace numerous communications by Horace Walpole, though they cannot be so easily specified. Birch was a stanch Whig, but his political opinions have never led him to forget his duty as an historian. He has not garbled or falsified debates, or misstated facts; he has not wantonly traduced characters, or acrimoniously reviled individuals because they espoused the cause which he disapproved; but in his whole work, whether he praises or blames, there is a manly integrity and candid temperance, which must recommend him to the discerning reader.' This is a sufficiently just character of the Continuation of Rapin: but, although in some parts the work has a claim to be considered as an original authority, it is in the greater part not only a compilation, but a mere transcription from preceding writers. The authors indeed frankly state in their prefatory notice that they have not scrupled to copy or imitate any part of the several authors they have made use of, when conducive to the usefulness of the work, or where there was no occasion to alter or abridge. The numerous documents inserted at full length make the Continuation a convenient repertory of authentic information; and the notes which accompany the translation of the preceding part of the work add greatly to the value of the original text. Tindal's other publications were—the pamphlet relating to his uncle's will, an abridgment of Spence's 'Polymetis,' under the title of 'A Guide to Classical Learning for Schools,' and a translation, from the Latin, of Prince Cantemir's 'History of the Growth and Decay of the Othman Empire,' which appeared in a folio volume in 1734.

TINIAN is one of the Ladrone or Mariane Islands [vol. xiii., p. 269]: it lies near 15° N. lat. and 146° E. long. It is uninhabited and of small extent. It owes its name in the world not to its real importance, but to the circumstance that Lord Anson, just one hundred years ago, remained there nearly two months, from 26th of August to the 21st of October, 1742, and that in the account of his voyage a description of the island is given in glowing colours. It extends about 12 miles from south-south-west

to north-north-east, and the breadth is about half as much. The soil is somewhat sandy, but very dry and healthy. The land rises in gentle slopes from the beach to the middle of the island, but the ascent is often interrupted by small level valleys, many of which wind irregularly through the country. These valleys and the gradual swellings of the ground are most beautifully diversified by an alternation of woods and lawns, which traverse the island. The woods consist of tall and well-spread trees, mostly without under-wood, and the lawns are covered with a clean turf composed of very fine trefoil and intermixed with a variety of flowers. There are no running streams, but good water is found by digging a few feet below the surface, and near the middle of the island there are three small lakes. Black cattle, in a wild state, are numerous, and at the time of Anson's visit the number was computed to amount to at least ten thousand. Our common domestic fowl is plentiful in the woods, and several kinds of wild fowl are found in the lakes. There is also an abundance of wild hogs. Besides the cocoa-nut palm and the bread-fruit tree there are guavas, limes, and sweet and sour oranges, and antiscorbutic plants in great abundance, by the use of which the crew of the Centurion, the vessel commanded by Lord Anson, which suffered much by the scurvy, was restored to health in a short time. There is no harbour, but only an open roadstead near the south-western extremity of the island, which is dangerous during the prevalence of the western monsoon, from June to October, but tolerably safe during the remainder of the year.

(Anson's *Voyage round the World*; Kotzebue's *Voyage of Discovery into the South Sea, &c.*)

TINNEVELLY. [HINDUSTAN, p. 203.]

TINNING, TIN-PLATE MANUFACTURE. The art of tinning, or of coating other metals with a thin layer of tin, so as to protect them from oxidation, was known to the antients, although it does not appear to have been very extensively practised. Professor Beckmann, in his investigation into the early history of tin and tinning (*History of Inventions*, English edit. of 1814, vol. iv., pp. 1-45), states that we have no account of the process antiently employed in tinning, although the use of the words *incoquere* and *incoctilia* by Pliny seems to indicate that it was performed by immersing the vessels in melted tin. The degree of perfection to which the process was carried is indicated by his statement, accompanied by an expression of wonder, to the effect that the tinning did not increase the weight of the vessels, which shows that the tin must have been applied, as at present, in a very thin layer.

The art of tinning plate-iron is more modern than that of coating copper vessels with tin, and is supposed to have been invented either in Bohemia or in Germany. Mr. Parkes, in a paper on the manufacture of tin-plate, or tinned sheet-iron, addressed to the Literary and Philosophical Society of Manchester, in 1818, which was published in their 'Memoirs' (Second series, vol. iii., pp. 347-380), states that our ancestors, from time immemorial, procured that article from Bohemia and Saxony, where the manufacture was established near the tin-mines of the Erzgebirge mountains, which were the most extensive in Europe after those of Cornwall. From the time of the invention of tin-plate down to the close of the seventeenth century, if not later, both England and the whole continent of Europe depended upon the above-named countries for their supply of tin-plate; but about the year 1665 an attempt was made to introduce the manufacture into England, by some gentlemen who sent the ingenious Andrew Yarranton into Saxony to obtain information respecting it. Yarranton's account of the experiment, which is quoted at length by Parkes, was published in 1681, in the second part of his curious work entitled 'England's Improvement by Sea and Land,' now very rare. He was allowed freely to inspect the tinning establishments, and he became so well acquainted with the process, that after his return to England he made many thousand plates of iron, from the Forest of Dean, tinned with Cornish tin, the quality of which was admitted to be even superior to that of the German tin-plates, which they surpassed in toughness and flexibility. Before however the new manufacture could be fairly established, its promoters were stopped by a patent, which Yarranton says was 'trumped up' for the purpose by parties possessing court influence. The patentees did not understand the art sufficiently to enable them to succeed, and thus England remained dependent for some years upon the Continent for a manufacture for which she possessed the greatest facilities. Parkes states that he does not find that any manufacture of tin-plate was established in this country until between 1720 and 1730, and that the first was at Pontypool, in Monmouthshire, where, according to Watson's 'Chemical Essays,' it was practised as early as 1730. Shortly before that time the art was introduced into France by M. Réaumur, who communicated an account of the process, as practised by the Germans, to the French Academy of Sciences in the year 1725, in a paper which was translated by Rutty, and published in the 35th volume of the 'Philosophical Transactions' (No. 406, published in December, 1728). In his introductory remarks Rutty states that the making of tin-plates, or, as they were sometimes called, *latten* or *lattin*, was not commonly practised in England, notwithstanding the great consumption; and that we were obliged to export our own tin to Germany, and to receive it back again when manufactured. Anderson (*Hist. of Commerce*, vol. iii., p. 226) states that about 1740 the manufacture of tin-plate was brought to such perfection in England that very little was imported from foreign countries, and that the British manufacture was superior to the foreign in glossiness of surface, owing to the plates being drawn under a rolling-mill, instead of being hammered, as was common in those made beyond sea. The difficulty of extending iron, in what may be deemed the infancy of the manufacture, into thin uniform sheets, with a perfectly smooth and clean surface, which is essential to the adhesion of the tin in an equal film, was one of the principal obstacles to the progress of this department of the art of tinning.

The process of tinning depends upon the strong affinity which exists between tin and the metals to which it is applied, and it consists, essentially, in rendering the surface to be tinned perfectly clean and free from oxide, and then bringing it into contact with melted tin, which forms an alloy with the harder metal, imparts to it a bright silvery appearance, and protects it from oxidation. The tinning of sheet-iron, as the most important application of the process, will be first noticed. This operation is minutely described by Mr. Parkes, in the paper above cited, from which, with occasional reference to more recent accounts, the following description is condensed. Réaumur's account of the German process, in the 'Philosophical Transactions,' may also be consulted by those who are curious as to the details of the earlier method of tinning, which resembles that about to be described in all essential points.

The finest English or Welsh bar-iron, prepared with charcoal, instead of mineral coke, and known to the trade as *tin-iron*, is used for making tin-plates. This material is first made into flat bars, or slabs, about thirty inches long, six inches wide, and weighing eighty pounds. These bars are made red-hot, and extended by passing them repeatedly between rollers, until they are reduced to about three-eighths of an inch in thickness. When cooled, these pieces are cut by shears, worked by machinery, into plates about ten inches by six, which are repeatedly re-heated and rolled, until they are reduced to as thin a state as the process will conveniently allow. The sheet is then doubled and again rolled until reduced in thickness one-half, after which it is doubled again, and rolled until still further diminished in thickness. When thus brought to the required tenuity, the thin sheet is cut into plates of the sizes required to suit the market (most commonly about thirteen inches by ten), and then the several thicknesses or laminæ are separated,—an operation which needs the application of considerable force, as the compression of the rollers causes them to adhere strongly together. Parkes states that the cutting of the plates was, when he wrote, usually performed with hand-shears, but that an ingenious white-smith in Glamorganshire had invented a machine for the purpose, which was impelled by a water-wheel, and would cut a quantity equal to a hundred boxes (of two hundred and twenty-five plates each) in a day, which is four times as much as a hand-shearer could accomplish. After shearing, the plates are piled in heaps, one being laid cross-wise at intervals, to separate the number required to form a box. That name is technically applied to the number of plates just mentioned in all the subsequent processes, although it is not until they are completed that the plates are actually placed in boxes.

The next operation to be performed is the removal of every particle of oxide or other impurity from the surface of the plates. For this purpose each is bent to an angle of about 60°, so as to bring it into the form of an inverted A or ∩, and then steeped for a few minutes in a leaden trough containing a weak solution of muriatic acid. Four pounds of acid to three gallons of water makes a mixture of the proper strength, and sufficient for eighteen hundred plates. After being immersed for four or five minutes in this cleansing liquid, the plates are taken out, arranged on the floor in rows, and then removed, by means of an iron rod, to a reverberatory furnace or oven, in which they are submitted to a red heat. The reason for bending the plates now becomes obvious, because if they were flat, the two sides could not be equally exposed to the flame by which the furnace is heated; whereas by bending them, and placing them upon their edges, the flame is allowed to play upon both sides. The heat to which the plates are exposed, combined with their previous washing in the acid, causes them to throw off a scale of rust or oxide, whence this operation is termed *scaling*. If well performed, it gives to the iron a mottled blue and white surface, somewhat resembling marbled paper. The plates are then flattened by beating them upon a cast-iron block, and submitted to a second or *cold* rolling, which removes any warping acquired in the previous processes, gives a high degree of smoothness to their surfaces, and imparts elasticity to the iron. The rollers, or *rolls*, employed in this operation are formed of cast-iron, rendered very hard by casting in thick cold iron boxes or moulds, and their surfaces are carefully polished. Parkes states that rollers of about thirty inches diameter are much better than those of smaller dimensions for this purpose: the length of the rolls is usually seventeen or eighteen inches. After the *cold rolling* the plates are immersed singly, in a vertical position, in an acidulous preparation called the *lyes*, consisting of water in which bran has been steeped for nine or ten days, until it has fermented and become slightly acid. In this the plates are kept for ten or twelve hours, and occasionally turned, to insure an equal exposure of every part of their surface; and from the lye-trough they are transferred to a leaden vessel containing diluted sulphuric acid, the strength of which is varied according to the judgment of the workman. This trough is divided into compartments, which will contain a box of plates each; and both it and the lye-trough are slightly heated by flues, to assist the action of the acid menstrua. Parkes states that a temperature of 90° or 100° Fahrenheit is sufficient for this operation, which is called *pickling*, and which requires some nicety, to prevent the plates from being strained or blistered by remaining too long in the acid. They are usually agitated in the weak sulphuric acid for about an hour, until they become bright and free from black spots. They are then removed into pure water, in which they are scoured with hemp and sand, to remove any remaining oxide; and in this bath of pure water the plates remain until wanted for tinning, because, even if left for months, they will remain perfectly free from rust.

As the sole object of these operations is to cleanse the iron plates from rust and dirt, it is evident that the details may be varied considerably; but it is not necessary to notice particularly any deviations from the usual process. The *tinning* of the plates is effected in a range of cast-iron pots heated by flues, and forming together an apparatus called the *stow*. The plates are removed one by one from the last-mentioned bath of pure water, and dried by rubbing with bran, after which they are immersed singly in a pot filled with melted tallow or grease, in which they are left for about an hour. The grease preserves the surface from oxidation, and appears also to increase the affinity of the iron for tin; and for this purpose burnt grease, or any kind of empyreumatic fat, is found preferable to pure fresh tallow. From the grease-pot the plates are removed, with the grease which adheres to their surfaces, into the metallic bath, which contains a mixture of block and grain tin, covered with a quantity of grease sufficient to form a layer four inches deep. Parkes states that the mixture of block and grain tin usually contains about equal quantities of each; but he conceived that manufacturers would find it advantageous to use grain-tin alone; since, although it would be rather more expensive, its greater purity and fluidity would occasion it to adhere to the iron in a thinner film. The tin-bath or pot is heated to such a degree as almost to inflame the fatty mixture upon the surface of the tin; and its dimensions are such that it will receive two or three hundred plates standing upright on their edges. The precise size is immaterial, so that the number of plates put in is such as to prevent any from falling down; but it is convenient to make it large enough to hold a box and a half of plates, or about three hundred and forty. When the plates have remained in the tin-bath a sufficient time (usually about an hour and a half, but more for thick plates), they are lifted out with tongs, and placed upon an iron grating, to allow the superfluous tin to drain off; but as there still remains upon them much more than the proper quantity of tin, they are afterwards subjected to a process called *washing*, which consists in dipping them into a pot containing a quantity of pure grain-tin in a melted state, then rubbing them with a peculiar kind of brush made of hemp, plunging them again for a moment into the melted tin in the wash-pot, and then into a pot filled with clean melted tallow, or lard free from salt, which contains pins, to prevent the plates from touching each other. The heat of this second tin-bath melts and detaches the superfluous and coarser portions of the tin from the plates, and the drossy impurities rise to the surface; while the other portions unite with the grain-tin, and so deteriorate its quality, that, after washing sixty or seventy boxes, it becomes necessary to remove about three cwt. of tin from the wash-pot, and to supply its place by a block of pure grain-tin. The impure tin thus removed from the wash-pot is put into the bath in which the plates receive their first tinning. As it is desirable, in the final dipping of the plate, to preserve it from contact with the dross or scum which collects upon the surface of the bath, a partition is inserted in the wash-pot, to keep one compartment free of scum. The last dip serves to eradicate the marks of the brush, and to replenish the coat of tin wherever it may have been rubbed too thin; and the subsequent immersion of the plates in the grease-pot causes any superfluous metal to run off. The heat of the tallow-bath, and the period of immersion in it, must be regulated with care. Thick plates require the tallow to be cooler than for thin ones, because they retain more heat in themselves; and if a thick plate were placed in a bath of proper temperature for thin plates, it would come out of a yellow instead of a silvery-white colour; while, on the contrary, a bath intended for thick plates would be too cool to effect the required purpose upon thin sheets. Too short a period of immersion has a similar effect, and leaves too much tin upon the surface, and that in a wavy irregular film; while if left too long in the grease-pot, the tin would run off to such a degree as to render another dipping necessary. So soon as the workman employed in washing has placed five plates in the grease-pot, a boy lifts the first from it into a draining-pan with a grated bottom; and when the man has placed the sixth in the tallow, the boy removes the second. Notwithstanding the apparently complicated character of the operations just described, they are performed so rapidly, that an expert wash-man will wash and brush twenty-five boxes, or five thousand six hundred and twenty-five plates, in twelve hours.

Owing to the vertical position of the plates during the preceding operations, a selvage of tin accumulates along their lower edge, which is removed by the process called *listing*. This is performed by taking the plates one by one, as soon as they are cool enough to handle, and dipping their lower edges into a pot called the *list-pot*, or *listing-pot*, which contains enough melted tin to form a layer a quarter of an inch thick. The selvage of tin being thus melted, is shaken off by a smart blow with a stick, leaving only a faint stripe, which may be discerned upon all finished tin-plates. After listing, the plates are cleaned from grease by rubbing them, while yet warm, with dry bran; after which they are packed in boxes of wood or sheet-iron.

The tinning of the inner surfaces of cooking utensils and other vessels of capacity is performed by scouring the surface until it is perfectly bright and clean; then heating the vessel, pouring in some melted tin and rolling it about, and rubbing the tin all over the surface with a piece of cloth or a handful of tow: powdered rosin is used, as in soldering, to prevent the formation of oxide, which would impair the mutual affinity of the metals. Pure grain-tin should be used for this purpose, but it is frequently adulterated with lead. By this means vessels

of copper, brass, and cast-iron are lined internally, and thereby rendered fit for the most delicate culinary operations; and in a similar way any small portions of iron-plate may be coated with tin. Bridle-bits, stirrups, and many other small articles, are tinned by immersing them in fluid tin. Mr. Gill, in the eleventh volume of the 'Technical Repository,' p. 200, describes an ingenious method of tinning nails or tacks and other small wares, which consists in cleaning the surface by pickling the articles in diluted sulphuric, muriatic, or nitric acid, washing them afterwards in water, and then putting them into a gallon bottle of stone-ware, with an oval body and a narrow neck, together with a quantity of bar or grain tin, and of sal-ammoniac. This vessel is then to be closed, and laid on its side over a charcoal fire, made upon a forge-hearth, and by turning it round, and frequently shaking it, the tin is to be uniformly distributed over the surfaces of the inclosed articles. When tinned they are taken out, washed in water to remove the sal-ammoniac, and dried in warm sawdust. The great advantage of the process consists in the employment of the stone-ware bottle, which prevents the dissipation of the fumes of the sal-ammoniac, and gives up the whole of the tin, which no metallic vessel would do. The method of tinning pins is described under PIN, vol. xviii., p. 161.

(*Memoirs of the Literary and Philosophical Society of Manchester*, second series, vol. iii., pp. 347-80; *Philosophical Transactions*, December, 1728; *Manufactures in Metal* (in Lardner's 'Cabinet Cyclopædia,' vol. iii.); Ure's *Dictionary of Arts*, &c.)

TINNITUS AURIUM, ringing in the ears, may arise from many different conditions. It is sometimes due to an unnatural state of the circulation in some part of the ear, the movement of the blood producing a vibration of the nerve which the mind does not distinguish from that produced by sonorous vibrations of the air. But most frequently the sensation is due to some disordered state of the auditory nerve, and is entirely subjective. It is thus perceived in some diseases of the brain, in nervous persons, and in those who are much debilitated; and is a common sign of organic disease of the auditory nerve itself. It is analogous, in these cases, to the subjective sensation of sparks and flashes of light which is perceived in cases of disease of the retina or optic nerve. It may therefore be a sign of a dangerous condition, or a prelude to complete deafness; but in the great majority of cases it is unimportant, depending on some local temporary affection of the ear, or on some disturbance of the digestive organs with which part of the brain sympathizes.

TINNUNCULUS, Vieillot's name, after the antients, for a genus of *Falconidæ*. Type, *Tinnunculus alaudarius*, Briss.; *Falco Tinnunculus*, Linn., of which we proceed to give M. Temminck's

Description.—Wings reaching to three-fourths of the length of the tail; upper plumage of the male varied with numerous black spots; quills striped internally; claws always black.

M. Temminck states that this short indication is inserted to enable the observer to distinguish at the first glance this species from the *Falco tinnunculoides* (*Cresserelette*, or *Lesser Kestrel*), and he then proceeds to give the following details relating to the former:—

Male.—Top of the head bluish-grey; upper parts reddish-brown, regularly sprinkled with angular black spots; lower parts white, slightly tinged with reddish and with oblong brown spots; tail ash-coloured, with a wide black band towards its extremity, and terminated with white; bill bluish; cere, space around the eyes, iris, and feet yellow. Length about 14 inches.

Female, larger than the male; all the upper parts of a brighter reddish; lower parts yellowish rusty, with oblong black spots; tail reddish, with nine or ten narrow black bands, and with a large band of that colour near its extremity, which is terminated with reddish-white.

Varieties.—With the upper parts of a reddish hue spotted with black; the top of the head more or less clouded with bright blue; the plumage variegated with white; sometimes entirely white.

The *Young* have the top of the head, the nape, and the mantle brown-rusty streaked with black; these streaks form the angle of the back; on the first quills are seven reddish and whitish spots; tail reddish, undulated with grey-ash and transversely striped as in the female; throat reddish-white; at the opening of the bill a small black stripe which is prolonged on the upper part of the neck; the rest of the lower parts whitish-rusty with oblong black spots; iris brown; cere yellowish-green.

This is, there can be little or no doubt, the Κεγχρις (*Cenchris*) of Aristotle (*Hist. Anim.*, ii. 17; vi. 1; vi. 2; viii. 3), and so most zoologists are disposed to consider it, as well as that it is the *Tinnunculus* of the antient Italians. (Pliny, *Nat. Hist.*, x. 37.) It is the *Foutivento*, *Cimbello*, *Tristunculo*, *Acertello Falchetto di Torre*, *Gheppio*, and *Gavinello* of the modern Italians; *Cercrelle*, *Quercerelle*, *Cresserelle*, and *Epervier des Alouettes* of the French; *Turmfalke*, *Roethel-geyer*, *Mausefalke*, *Windwachl*, *Rittl-weyer*, and *Wannen-weher* of the Germans; *Kyrko-falk* of the Swedes; *Kestrel*, *Stannel*, *Stonegall*, and *Windhover* of the modern British; and *Cudyll cöch* of the antient British.

Geographical Distribution.—Europe generally, but not habitually beyond the regions of the arctic circle, where its place is occupied by the MERLIN. England, Scotland, and Ireland. Smyrna, in winter at least (Strickl.). Africa, from the north to the south, according to Temminck. Senegal, according to the same authority. The Zoological Society have received it from the Cape of Good Hope. Asia, India (Selby); banks of the Ganges (Yarrell); Java (Horsf.); Japan (Siebold and Bürger). Mr. Yarrell states that figures of it occur in drawings from China.

Kestrel, male and female. (Gould.)

Habits, Food, &c.—The provincial name 'Windhover' well expresses the most striking characteristic of this hawk. With its head to windward, whence Mr. Mudie suggests that one of its designations should be written 'Standgale,' not 'Stonegall,' it remains with outspread tail and winnowing wings suspended high in air, so that its piercing eye may include a considerable area, in which no field-mouse is safe: when the bird sees one, it drops unerringly on the surprised prey. When thus poised above the fields, it sometimes is within the range of a gun, and we have heard farmers exult in bringing one down, little thinking that the bird was then on the watch for one of their greatest enemies. Mr. Waterton has pleaded the cause of the Kestrel well, and shown how greatly it is the friend of the agriculturist. But though mice are its staple, it undoubtedly preys upon small birds, and also on beetles and their larvæ, and earthworms. Mr. Selby saw one hawking after cockchafers (*Melolontha vulgaris*) late in the evening. He watched one with a glass, and saw the

bird dart through a swarm of those insects, seize one in each claw, and eat them on the wing. The kestrel returned to the charge again and again, and Mr. Selby ascertained the fact beyond doubt, for he afterwards shot the bird.

If a kestrel can find the nest of a crow or a magpie as a receptacle for its eggs, it will not take the trouble to make one; indeed, it probably never does build: sometimes it lays upon the bare ledges of rocks and in old ruined towers. The number of eggs is four or five, and their ground-colour reddish-white, which is mottled closely with dark reddish-brown and sometimes blotched with reddish-brown. The young come forth from the egg towards the end of April or beginning of May, and are covered with a yellowish-white down.

In the *Portraits d'Oyseaux*, the following quatrain sums up the qualities of the Kestrel:—

'Mulots, Lezars, Rats, et autre vermine
Sont la viande à nostre Cresserelle.
Elle est amye avec la Colombelle,
Qu'elle deffend des oyseaux de rapine.'

The allusion here made to the friendship of the Kestrel for the Dove is probably taken from the passage in Pliny to which we have above called attention.

N.B. M. Brehm would make three distinct species from this hawk, under the names of, 1st, *Hochköpfiger* (high-headed); 2nd, *Mittlerer* (middle); and 3rd, *Plattköpfiger* (flat-headed). Upon this M. Temminek drily observes, that those who wish to multiply the catalogue of names and of species in favour of each accidental or local variety, may consult the work of M. Brehm. [FALCONIDÆ, vol. x., p. 182; KESTREL.]

TINO. [TENOS.]

TINO'PORUS. [FORAMINIFERA, vol. x., p. 348.]

TINTAGELL. [BOSSINEY.]

TINTERN ABBEY. [MONMOUTHSHIRE.]

TINTORETTO, JA'COPO, one of the most celebrated painters of modern times, and one of the heads of the Venetian school, was the son of a dyer (Tintore), whence the agnomen of Tintoretto: his family name was Robusti; and he was born at Venice in 1512. He exhibited a remarkable facility for drawing at a very early age, which induced his parents to place him in the school of Titian. Ten days however after young Tintoretto had entered the school of the great painter, he was sent home again to his parents; Titian's attention being attracted by some very spirited drawings he saw in his studio, he inquired who did them, and upon Tintoretto's acknowledging himself the author, Titian ordered one of his scholars to conduct the boy home.

This remarkable rebuff in the career of the young painter seems to have added vigour to his energies, and he commenced a course of indefatigable application. He purchased some casts from the antique and some from the models of Daniel da Volterra, from the statues of Michael Angelo of Morning, Twilight, Night, and Day, at the tomb of the Medici, in San Lorenzo at Florence, resolving to follow the style of Michael Angelo in design, and to combine with it the colouring of Titian.—which intention he proclaimed to his visitors by the following line, which he wrote upon the wall of his apartment:—

'Il disegno di Michel Angelo, e 'l colorito di Tiziano.'

By day he copied pictures by Titian; and by night he made drawings upon coloured paper, with chalk, from his casts, lighted merely by a candle; by which means he acquired a taste for strong contrasts of light and shade, a peculiarity for which all his works are conspicuous. To these studies he added the occasional study of the living model and of anatomy; and to attain a still greater mastery of chiar'oscuro, he used to make models of figures in wax, and place them in pasteboard cases, making apertures for the light as he required it: he also suspended models and casts from the ceiling, for the purpose of becoming familiar with various perspective views of the figure. In addition to these studies, he is said to have received much gratuitous assistance from Schiavone in colouring. Tintoretto's first picture which attracted notice was one containing portraits of himself and his brother, by candle-light, himself holding a cast in his hand, and his brother playing the guitar. He exhibited this picture in public, and shortly afterwards he exhibited a large historical piece upon the Rialto, which gave him a rank amongst the great painters of Venice. He undertook every commission which offered itself, and frequently painted large works merely for the price of the materials. It would be impossible to enumerate all his works here; they amounted to many hundreds. One of his first great works in fresco was a façade in the Arsenal, which he painted in 1546, representing Balshazzar's Feast and the Writing upon the Wall. Of his first oil pictures, the following were most remarkable:—The Tiburtine Sibyl, for the church of Santa Anna; the Last Supper, and the Washing of the Disciples' Feet, for the church of Santa Marcola; for San Severo, a Crucifixion, very large; and in the church of the Trinità, the Temptation of Eve and the Death of Abel, besides some others.

Tintoretto was so eager for employment, and so desirous of public notice and applause, that rather than be inactive or unoccupied with any public work, he frequently volunteered his services, or at most required no further outlay from his employer than would cover the cost of the materials. He painted upon such terms the façade in fresco of a large house near the Ponte dell' Angelo; on the lower part of the house he painted a very spirited representation of a cavalry battle, above which he placed an ornamental cornice in bronze; over this he painted a large historical composition containing many figures; between the windows he introduced various figures of women; and at the top a rich frieze: the great extent and the boldness of these paintings astonished the Venetian painters of that period. Upon very similar terms he executed two of his greatest works, at Santa Maria dell' Orto, where he painted, for 100 ducats, two immense pictures fifty feet high. In one was the Procession of the Jews with the Golden Calf, and Moses upon a rock in the background receiving the Tables of the Law, which were supported by a group of naked angels; the other was a representation of the Last Judgment, containing an immense number of figures; an extraordinary work, which, in the opinion of Vasari, would have been perhaps without its rival as a work of art, if the execution of the parts had been equal to the conception of the whole.

The following works also are accounted amongst Tintoretto's masterpieces:—Saint Agnes restoring to life the son of the Præfect, painted for the chapel of Cardinal Contarino; the Miracle of St. Mark, called 'Il Miracolo dello Schiavo,' where the saint delivers a Venetian, who had become a Turkish slave, from a punishment ordered by his master, by rendering him invulnerable, so that hammers and other instruments of torture were broken upon his body without hurting him; this picture, which is generally considered the best of all Tintoretto's works, was painted in his thirty-seventh year, for the brotherhood of St. Mark, and when it was finished and put up, the worthy friars disputed with one another about the price, a dispute which Tintoretto settled by ordering the picture to be taken down and sent home, and telling the brotherhood that they should not have it at any price. He however, after some entreaty, restored it to its place and received his own price, and the friars further gratified him by ordering him to paint three other subjects from the life of the same saint,—the Exhumation of the Body of the Saint at Alexandria, through the two Venetian merchants Buono da Malamocco and Rustico da Torcello; the Transport of the Body to the Ship; and the Miraculous Preservation at Sea of a Saracen Sailor through the Saint: the miracle of the slave is in the Academy of Venice; it has been engraved by J. Mathan; the other three are in the Scuola di San Marco. Pietro di Cortona is reported to have said, that if he lived in Venice, he would never pass a holiday without going to see these works; he admired chiefly the drawing. The pictures he painted for the Scuola di San Rocco are equally celebrated: they consist of the famous Crucifixion, which was engraved by Agostino Carracci, to the greatest satisfaction of Tintoretto; the Resurrection of Christ, engraved by E. Sadeler; the Slaughter of the Innocents and the Miracle of the Loaves and Fishes, engraved by L. Kilian; and several others of less note. To these must be added three painted for the Padri Crociferi, an Assumption of the Virgin, and a Circumcision of the Infant Christ, painted in competition with Schiavone; and a Marriage at Cana, now in the church of Santa Maria della Salute. The Miracolo dello Schiavo, the Crucifixion at San Rocco, and the Marriage at Cana, are said to be the only pictures to which Tintoretto put his name. There is an engraving of the Marriage at Cana, by Volpato, and a spirited etching by E. Fialetti.

Tintoretto executed many great works for the govern

ment of Venice, both in oil and fresco; and such was his activity, perseverance, and success, that he left little to be done by others. He was always occupied, and he worked with such unexampled rapidity that he used to be called Il Furioso. Sebastian del Piombo said that Tintoretto could do as much in two days as he could do in two years. He painted for the senate, in the council-hall, the Coronation of Frederick Barbarossa, by Pope Adrian IV., at Rome; and in consequence of Paul Veronese painting a picture in the same hall, Tintoretto procured permission to paint another, in which he represented Pope Alexander III. surrounded by cardinals and prelates, excommunicating the same emperor: the pope was represented throwing the extinguished candle amongst the populace, and a crowd of people was rushing forward to endeavour to catch it. He painted also for the senate, in the hall dello Scrutinio, the celebrated naval victory of the Venetians over the Turks in 1571. He painted many other works in the ducal palace, historical and allegorical, commemorating the history of Venice, of which the most famous are the capture of Zara by storm; and the great picture of Paradise, upon canvas, 74 feet by 34, containing a surprising number of figures. This was his last great work; he commenced it in several pieces in the Scuola Vecchia della Misericordia, and finished it, with the help of his son, in its place on the ceiling of the great council-hall of the Senate, now the library.

Tintoretto painted at Venice eight friezes for the duke of Mantua, recording the duke's feats, to be placed in his castle, and he visited the duke at Mantua, with all his family, and was splendidly entertained by him. He painted also the portrait of Henry III. of France and Poland, when that king visited Venice; of which picture Ridolfi relates a curious history. Tintoretto was engaged with Paul Veronese in painting some figures in chiar'oscuro upon the arch of triumph erected by Palladio at Venice in honour of the landing of Henry III., king of France and Poland; but wishing to take a portrait of the king as he landed, he prevailed upon Paul Veronese to complete the arch; and he dressed himself as one of the doge's attendants, and went in the Bucintoro, the state barge, with the others to receive the king, whose portrait he drew in small, in crayons, unknown to the king, whilst he was proceeding in the barge to the landing-place. This portrait he afterwards enlarged in oils, and procured permission from the king to retouch it from life. The king expressed himself very much pleased with the portrait, and accepted it from the painter, whom he wished to create a cavaliere; but Tintoretto declined the honour, upon the plea that to bear a title was inconsistent with his habits. Henry III. afterwards presented the portrait to the doge Luigi Mocenigo. Tintoretto painted many portraits, all in a remarkably bold style; he painted several of the series of doges' portraits along the frieze of the great council-hall.

It has been said above that Tintoretto was a remarkably rapid painter: he was however as careless about the execution of the parts as he was bold. There are pictures by him painted in his youth that are extremely carefully finished, but these are very few: Susanna at the Bath with the two Elders, is of this class; several of his large pictures are merely dead coloured, and many of them were painted off without the slightest previous preparation. His rapidly-executed and low-priced productions were a frequent source of complaint to his fellow-artists. Upon one occasion, when the brotherhood of San Rocco requested Paul Veronese, Salviati, Zuccaro, Schiavone, and Tintoretto to send them designs for a picture of the Apotheosis of San Rocco, that they might select the best of them, Tintoretto sent his finished picture as soon as the others sent in their designs, affirming that he had no other way of drawing; and to ensure its being fixed in its destined place, he made the institution a present of the work. Although Tintoretto professed to draw in the style of Michel Angelo, and to colour like Titian, there are few traces of either quality in the great majority of his works; they are however all conspicuous for his own peculiar style of chiar'oscuro, which is frequently both heavy and cold. In his larger compositions a principal characteristic is the number of figures, which are often crowded and confused, and the spectator looks in vain for a spot of repose to relieve the mind: this is however not the case with such pictures as the Miracolo dello Schiavo and other earlier productions. Annibal Carracci has eloquently expressed the inequality of this great painter—that if he was sometimes equal to Titian, he was often inferior to Tintoretto. The Venetians used to say that he had three pencils, one of gold, one of silver, and the other of iron. In his design Tintoretto was muscular, but lean, and often incorrect; and in the casts of his draperies frequently mean and confused; his colouring was not gaudy, like that of many of the Venetians, but was often even cold, and shadow predominates in perhaps all his pictures. He was once asked which were the prettiest colours, and he answered 'black and white.' It was also a maxim of his that none but experienced artists should draw from the living model, as they were not capable of distinguishing between the beauties and the imperfections of an individual model. Tintoretto painted Aretin's portrait, and Ridolfi relates the following anecdote connected with it:—Aretin was a great friend of Titian's, and was in the habit of abusing Tintoretto occasionally: the latter one day meeting the poet, invited him to come and sit to him for his portrait, to which Aretin assented; but he had no sooner seated himself in the painter's studio, than Tintoretto pulled out with great violence a pistol from underneath his vest and came towards him: up jumped Aretin in a great fright, and cried out 'Jacopo, what are you about?' 'Oh! don't alarm yourself,' said Tintoretto, 'I am only going to measure you;' and suiting the action to the word, he said, 'you are just two pistols and a half.' 'What a mountebank you are!' returned Aretin; 'you are always up to some frolic.' The poet was afterwards more cautious, and they became friends. Ridolfi records a few other whimsical feats of Tintoretto's. He died at Venice in 1594, aged eighty-two. He had two children—a son, Domenico, and a daughter, Marietta—who both practised painting. Domenico was born in 1562, and died in 1637. He followed in the steps of his father both in history and portrait; but, says Lanzi, as Ascanius did those of Æneas, non passibus æquis. Marietta was born in 1560, and died before her father, in 1590. She painted very excellent portraits.

TIOOMEN. [SIBERIA.]

TIPERAH MOUNTAINS. [HINDUSTAN, p. 216; SILHET.]

TIPPERARY, an inland county of the province of Munster in Ireland. It is on the northern border of the province, and is bounded on the north-east by King's County and Queen's County, and on the east by the county of Kilkenny, all in the province of Leinster. On the south-east and south it is bounded by the county of Waterford, on the south-west by that of Cork, and on the west by those of Limerick and Clare, all in Munster. On the north-west it is bounded by the county of Galway in Connaught, from which, as well as from Clare, it is separated by the river Shannon or the lakes through which it flows. It is one of the largest of the Irish counties, being exceeded only by those of Cork and Kerry in Munster, Galway and Mayo in Connaught, and Donegal in Ulster: its greatest length is from north to south, from the junction of the Lower Brusna with the Shannon to the Arra glen, 68 miles; the greatest breadth is from the border of the county of Limerick, between Tipperary and Bruff (in Limerick), to the border of the county of Kilkenny, north of Carrick-on-Suir, about 41 miles. The area is variously estimated. In the Population Returns (*Parl. Papers*, 1833, vol. xxxix.), and in the table annexed to the Useful Knowledge Society's Map of Ireland, it is given at 834,910 English acres (=1305 square miles); by Dr. Beaufort (*Memoir of a Map of Ireland*), at 882,398 English acres (=1379 square miles); and by Mr. R. Griffith, in his evidence before the Lords' Committee on Tithe (*Lords' Sessional Papers*, 1831-2), at 1,013,173 acres (=1583 square miles); comprehending according to this last estimate 819,698 acres (=1281 square miles of cultivated land), 182,147 acres (=284 square miles) of unimproved mountain or bog, and 11,328 acres (=18 square miles) of lakes. The excess of this last estimate above the previous ones is remarkable, and would render it liable to suspicion if it were supported by a less eminent authority. The population, in 1831, was 402,564, giving 308, 292, or 254 inhabitants to a square mile, respectively, to the three estimates of the area of the county. Clonmell or Clonmel, the chief town, is on the Suir, 90 miles

in a direct line south-south-west of Dublin, or 103 miles by the road through Naas, Castle-Dermot, Carlow, Leighlin Bridge, Kilkenny, and Callen.

Surface; Geology; Bogs.—The Knockmeledown Mountains, on the south border of the county, where it is conterminous with Cork, rise to the height of 2700 feet above the level of the sea. They are placed in 'a table-land of clay-slate, partly bordered on the flanks by sandstone, and on the higher grounds sustaining isolated caps of the same rock, or upholding more continuous mountain-masses.' The position of the sandstone on the flanks is generally conformed to the inclination presented by the surface of the subjacent clay-slate, but the masses on the higher grounds approach more and more to a horizontal arrangement. This tract (of clay-slate) is surrounded by floetz limestone on the north, the west, and the south: 'this limestone tract on the north separates the Knockmeledown Mountains from the Galtees, of which the principal summits (3000 feet high) are in this county. The general direction of these two ranges is nearly east and west: the intermediate limestone plain or valley is watered by two streams (with their respective affluents), one, the Tar, flowing eastward into the Suir; the other, the Funcheon, westward into the Blackwater. North of the Galtees, from which they are separated by a narrow valley (the Glen of Aherlow), rise the Slievh-na-Muck Mountains, which form a subordinate and lower range, and have the same general direction of east and west. Both the Galtees and the Slievh-na-Muck are composed wholly of sandstone, and the intermediate valley or glen appears to be occupied by the same formation. The northern face of the Galtees, towards this narrow valley, is in many parts extremely precipitous, and even inaccessible: the southern face, towards the broader valley or limestone plain, which separates them from the Knockmeledown Mountains, is of a tamer character. The strata of the sandstone are, in the upper region of the Galtees, almost horizontal, yet gently curved, following the form of the summit, and precipitously broken off on the sides, where they frequently crop out. On the flanks, where they are not abruptly broken off, they become more inclined, and appear to be conformed to the surface of the clay-slate on which they rest. The sandstone varies much in character, but in general it is a fine-grained rock, composed of grains of quartz closely aggregated. The sandstone of Slievh-na-Muck yields excellent flags.

In the south-eastern corner of the county, north of Clonmell and Carriek-on-Suir, is a group of hills called Slievh-na-Man, the geological character of which is similar to that of the mountains already described: the group 'consists of a nucleus of clay-slate, surrounded and surmounted by sandstone.'

In the centre of the county is another important range. It commences in the county of Limerick, north of the little river Mulkerne, or Bilboa, which joins the Shannon a short distance above Limerick. At this extremity the range is known as the Doon Mountains; but as it extends north-eastward into Tipperary, the most important summits are known as the Bilboa and Keeper Mountains (the latter 2100 feet high) and the Devil's Bit: it crosses the county of Tipperary in a north-eastern direction by Templederry and Roscrea, becoming narrower as it advances, and enters Queen's County and King's County, which it separates from each other, and where it is known under the designation of Slievh Bloom. The geological character of these mountains is similar to those already described: Keeper and Bilboa and the adjacent parts of the range consist of clay-slate, generally flanked by sandstone, except for a small space on the north-west side, near the village of Silvermines, where, at the foot of the hills, the clay-slate comes in contact with and immediately supports the floetz limestone. To the north-east of Templederry the range is entirely composed of sandstone. The direction of the strata of the clay-slate varies in this mountain-range. The sandstone in one part, near Newport, on the west side of the range, is a coarse red conglomerate, and rests unconformably on the clay-slate. Copper was formerly dug in these mountains, at Lackamore, five miles east of Newport. There are three veins, one of them thicker than the rest, and bearing rich copper-ore in bunches. The workings on this vein extended above 700 feet in length and 150 feet in depth. An attempt was made early in the present century to renew the works, but the machinery was insufficient to keep the mine free from water.

Considerable quantities of lead mixed with silver were obtained last century in an opening at the junction of the clay-slate with the floetz limestone, near the village of Silvermines. This opening had been filled with clay, sandy clay, sand, decomposed slate, and scattered blocks of limestone, Lydian-stone, and sandstone, the whole mass being penetrated or cemented by metallic depositions of various kinds; and in this 'softness,' as the miners termed it, the operations were conducted.

Near the lower part of Lough Derg, one of the lakes through which the Shannon flows, are the Arra Mountains, a group occupying a small part of this county on the western side, and extending across the Shannon into the county of Clare (where they are known by the name of Slievh Bernagh); they consist partly of clay-slate and partly of sandstone. There are quarries in these mountains which yield slate not inferior to that of North Wales.

The rest of the county is occupied by the floetz limestone, except a portion of the district between the southern groups of mountains (Slievh-na-Man and the Galtees) and the Central range, which is occupied by the coal-field of Killenaule; and one or two small tracts on the western side of the county, where trap rocks appear interstratified with the limestone. This floetz limestone presents in its connection with other rocks and in its organic remains several features similar to those of the mountain limestone of Derbyshire and the north of England; but differs in this, that the tract occupied by it forms an extensive plain, marked only by slight undulations.

The coal-field of Killenaule extends about eighteen miles in length from north-east to south-west, from near the river Nore to the neighbourhood of Cashel, and about six miles in breadth. It is partly in this county and partly in that of Kilkenny. There are two very small outlying portions near Cashel. This coal-field forms a low range of hills, placed upon the floetz limestone, and elevated above it. It varies in its elevation, being highest and most abrupt on the north-western side, where the hills rise from 300 to 600 feet above the limestone plain. On this side the dip both of the limestone and superincumbent coal strata is greater than on the other side. Towards the south-east the surface declines gradually, and the streams which water the tract mostly flow in that direction. The strata are more gently inclined here. The aspect of the hills varies, but they are commonly rounded with intervening hollows. The junction of the limestone with the coal-formation is generally at the foot of the hills, but sometimes half-way up their side. Immediately above the limestone, shale and gritstone alternate, there being two beds of each: the upper gritstone, when not covered by the superior beds, constitutes the main body of the elevated part of the coal-hills: it is marked by repeated undulations, forming unequal ridges, with intervening hollows or troughs, having their greatest extension or length generally from north-east to south-west. In these troughs the coal-beds are found resting upon fire-clay, which intervenes between them and the gritstone and forms the floor of the coal, and covered by shale, grit, and then shale again. Sometimes this series is repeated so as to give two seams of coal. The troughs are generally from fifty to seventy yards deep from the surface to the coal, near the centre of the trough, and from 500 to 700 yards wide at the surface. The coal is of the nature of blind-coal or anthracite. The coal-works have been carried on with increased activity of late years: before 1825 the yearly produce was valued at about 12,000*l.*; since that period it has been nearly doubled.

The principal bogs are in the eastern and central part of the county: one continuous line of bog extends from near the border of the coal-field, near Killenaule, to the south-eastern foot of the central range of hills at Roscrea, a distance of nearly 30 miles; and there are smaller detached bogs westward of this, and some in the northern part of the county, between the Lower Brusna and the Shannon.

Hydrography and Communications.—The greater part of the county is comprehended in the basin of the Barrow and the Suir, two rivers which unite in Waterford Haven. A small part on the eastern border is drained by the Minster, or King's River, a small affluent of the Nore, which itself is an affluent of the Barrow. The Nore rises in this county, but has its course chiefly in that of Kilkenny. But most of the waters flow into the Suir, which rises north of Templemore, on the south-eastern slope of the mountains that there cross the county, and flows by Thurles, Golden,

and Cahir, to the junction of the little river Nier; after which it flows along the border of this county and Waterford, first northward, and then westward, by Clonmell and Carrick, below which it quits the county, together. Its course in Tipperary may be estimated at about 76 miles. It receives a number of tributaries, most of them small. On the right bank the Multeen joins it above Golden Bridge; and the river which waters the glen of Aherlow, between the Galtees and Slievh-na-Muck, and the Tar, which drains part of the limestone valley between the Galtees and Knockmeledown, join it lower down. The Nier, which joins it on the border of the county, on the same bank, belongs to the county Waterford. Two streams join it on the left bank, one below Clonmell, and another on the border, below Carrick. The Suir is navigable by large barges up to Clonmell.

That part of the county which lies north-west from the central chain of mountains (the Keeper, Bilboa, and Devil's Bit) belongs to the basin of the Shannon. The Shannon itself, and Lough Derg, through which it flows, skirt the north-western border for about 45 miles, being navigable throughout. The streams which flow from the north-western slope of the central chain are affluents of the Shannon, but none of them are navigable: the principal are the Nenagh, which passes the town of Nenagh, and the Lower Brusna or Brosna, which skirts the north-eastern border, and unites with the Shannon at the northern point of the county.

There are no lakes in this county; but Lough Derg is on its border. There are no navigable canals. The road from Dublin to Cork enters the south-eastern side of the county, and passes through Clonmell and Clogheen. Another road from Dublin to Cork by Athy passes through Cashel and Cahir. The road from Dublin through Kildare and Maryborough (Queen's County) to Limerick crosses the northern part through Roscrea, Toomevara, and Nenagh: another road from Dublin through Tullamore and Parsonstown (both in King's County) unites with the foregoing at Nenagh. The road from Waterford to Limerick enters the county on the south-east at Carrick-on-Suir, and passes through Clonmell, Cahir, and Tipperary. There are roads from Clonmell to Cashel and to Cahir, and from Tipperary to Cashel, besides other roads of less importance, which do not require description. In the evidence taken before the Irish Poor Commissioners (*Parl. Papers*, 1836, vol. xxxiii.), the roads in the barony of Middlethird—which, as comprehending part of the mountainous country (including Slievh-na-Man) and part of the valley or plain between the central and southern mountains, may be taken to represent the county at large—are described as good and sufficiently numerous.

Agriculture and Condition of the People.—The information which we give under this head, extracted from the Appendix to the Irish Poor Commissioners' Report (*Parl. Papers for* 1836, vol. xxxiii.), has reference to the barony of Middlethird, from which alone witnesses were examined; but it may probably be regarded as in a great degree applicable to the rest of the county.

The land in the barony was estimated in the county books (though the measurement was old, and regarded as inaccurate) at 58,833¼ plantation acres: the plantation or Irish acre being equal to about an English statute acre and five-eighths, or accurately, to 1a. 2r. 19⅞p. The land was held as follows:—

70	persons held	above 100 acres.
20	"	from 80 to 100.
127	"	50 to 80.
551	"	20 to 50.
759	"	10 to 20.
745	"	5 to 10.
1056	"	1 to 5.
280	"	less than 1 acre.

The soil of the barony is chiefly a rich loam of some depth on a substratum of limestone, and is equally adapted to tillage or pasture ground. There is no public common land, nor any woodland except from 150 to 200 acres in gentlemen's demesnes: there are only about 500 or 600 acres of bog, and that in the northern part of the barony: in the southern part the want of fuel is severely felt. Of the remainder of the barony, after these trifling deductions, one-third or one-fourth is pasture-land, and the rest in tillage. Grazing-farms are chiefly large, and are occupied by gentlemen, but there are not many of them: the quantity of grazing-land had however increased in the five years preceding the inquiry; though previously to that period the converse had taken place, pasture having been converted into tillage. Farms are generally bounded by double ditches; fields are divided by single ditches. These fences are generally in good condition, and the loss from cattle trespassing is trifling. The quantity of land wasted in fences in this barony is greater than in others.

Rents have been decreasing: it was estimated that they had fallen in the twelve years preceding the inquiry from 20 to 30 per cent. The Irish acre is in general use. Farms at the time of the inquiry were generally held under lease, but the granting of leases was going into disuse, and farms of which the leases had fallen in during the preceding six years were generally held by tenants at will. The ordinary term of farm leases is thirty-one years, or three lives. Cottage and glebe lands are commonly let for twenty-one years. Since the subletting act, it has not been usual to grant leases to tenants in common; such leases had been found injurious; they had prevented draining and inclosing, and other improvements. About one-fourth of the barony was at the time of the inquiry held under middle-men, but the system is going into disuse; and though leases do not usually contain any prohibitory clause, yet there is an understanding that the lessee is not to sublet. There has been a disposition in the landowners to consolidate small holdings; but where ejectments have taken place they have been resisted by the peasantry, and threats have been used and outrages committed upon those who succeed to the occupation of the vacated land: considerable difficulty has thus been placed in the way of consolidation.

The average rent of land is not given; the competition for small holdings is however so great that when a vacancy occurs men will bid more than will allow them to make a subsistence from the land: and in most cases the cottier tenant cannot obtain more than a bare subsistence. The rent of these small holdings is generally paid in labour. This competition for land has been a fruitful source of crime. Good land may probably be worth from 2*l.* 10*s.* to 3*l.* per acre; but when let as con-acre it brings in a higher rent, which is usually paid in money, except when a farmer lets land to his own labourers. Dairy-land is worth 10*s.* an acre more than tillage-land, and grazing-land is yet more valuable.

The usual rotation of crops is threefold; potatoes, wheat, and oats form the series, and if the land will bear it, this is repeated. The potatoes are manured chiefly with 'town manure,' which sells in the towns for 2*s.* and 2*s.* 6*d.* for 15 cwt. The farmers, especially the smaller ones, keep very little stock; and stall-feeding for the purpose of making manure is not practised in the district; but weeds, furze, and bog-earth are carried to the dung-yard to be trodden down. Manure is the great want of the farmer, and various expedients are resorted to in order to procure it. The potatoes grown both by the farmers and the peasantry are commonly the white potatoes, because, though of inferior quality, they grow more freely and on more exhausted land. Potatoes are generally cultivated with the spade, but the practice of drilling them in by the plough is becoming more common: fallows are occasionally resorted to, though as much to give rest to the land exhausted by the frequency of the potato crop as to clean it from weeds: fallows are generally manured with lime, which is burned with culm or small-coal from the collieries in the county.

Wheat is more commonly grown after potatoes than after fallow: the seed is generally steeped in brine to preserve it from smut; and the crop while growing is usually weeded once, and rolled. Many of the smaller farmers break the lumps with a wooden mallet. None of the wheat is of the first quality: a good deal is threshed out by the small farmers immediately after harvest to pay their rent or other debts: the large farmers do not off thresh any before November.

The cultivation of clover, rye-grass, and vetches has much increased of late years; but neither turnips nor mangel-wurzel are cultivated: the potato is generally used for feeding cattle. The clover is left on the ground only one year, and is mown twice and then ploughed in.

After the common rotation of crops has been taken once or twice, or on some of the best lands three or four times, the ground is left to grass for six or eight years.

Grass or clover seeds are usually sown with the oats the last crop of the tillage course; and for the two following years the produce is mown, and then grazed until the land is again broken up by the plough. Small farmers frequently do not sow any grass seeds nor mow the crop; they also break up the ground after a shorter interval. Owing to the warmth and moisture of the climate, and from the later period (the month of August) at which they are cut, the crops of hay are heavier than would be produced by land of equal goodness in Great Britain; but it is probable that from its more succulent nature the hay will not support or fatten cattle better than a smaller quantity of English hay.

The long-horned Leicester breed of cattle was introduced many years ago; but the Durham and Hereford breeds are more in request. The common Irish (Limerick) breed is however most generally used, as being the most hardy. The stock of all kinds is very good. There are not so many cattle fattened for export as there were formerly, still some are fed for the English market, and are exported from Waterford to Liverpool. Cattle are fit for slaughter from three years and a half old; they weigh when fat from four cwt. to six cwt. Many young bullocks are sold at a year old to Roscommon and Galway men; others for grazing are bought in the neighbourhood or at Ballinasloe. The Ayrshire and Kerry cows are not much used except by gentlemen. The quantity of butter made is not great, but the quality is in general good, and the mode of preserving it is improving: Clonmell is the principal market. Very little cheese is made.

There are not many sheep kept: they are in general a cross of the Leicester breed, and are large well-made animals. There are no large flocks, and folding sheep is not in use; the small farmers keep two or three sheep for the sake of the wool; and those who have dairies mix some sheep in their pastures with their horned stock.

The horses are of an active light-boned sort, very useful for all farming purposes. Oxen are never employed in labour. Pigs are numerous, and of an improved breed: they are considered to be still improving.

Agricultural implements have undergone much improvement of late years. An iron plough, after the form of the Scotch plough, has superseded the old-fashioned one, which is now seldom seen in use: the harrows, though not so well made, yet, from the friable nature of the soil, do their work efficiently: rollers are getting more common every year; and these, as well as the harrows, are borrowed by the farmers from each other. The carts are of cheap construction, with narrow wheels and low sides formed of rails; they carry only a small load, and are drawn by one horse. The plough is used in the cultivation of every crop except potatoes, for which, among the small farmers, the spade is used; but the use of the spade is diminishing every year. The flail is used in threshing, except when the straw is wanted for thatching, and then the corn is often knocked out against a board by the hand.

The dairy-farmers have in general more capital than other farmers. They have better houses, and these, with their cattle-sheds and other farm buildings, are usually in good condition. Mud-walls are found to answer best for dairies, and little air is admitted.

Many of the resident gentry have set an example of superior cultivation, and have been the means of introducing improved stock and implements. They crop the land less severely than the common farmers, and give it longer intervals of rest or more manure, in which they are followed by the larger farmers.

The con-acre system is common; these allotments are commonly taken by the cottiers to raise their own food, but a considerable number are taken by servants and women with a view to profit from the sale of the produce. The usual quantity taken by a family is a quarter to half an acre; and the labouring class are always anxious to obtain it.

The demand for labour at the time of the inquiry was considered to have decreased, while the population had increased. Wages, which had in the course of ten years undergone a diminution of about two-pence per day, were usually for men 6*d.* a day with food, and in harvest 1*s.* a day with food; or when hired for a whole year, 7½*d.* a day in summer, and 6*d.* a day in winter, without food. Boys under sixteen received 8*d.* a day in harvest-time, or if hired by the year 15*s.* per quarter, or in some baronies 20*s.* per quarter. If a labourer worked 250 days in the year, at 8*d.* a day, he received 8*l.* 6*s.* 8*d.*, which may be considered as the full average of the yearly earnings of the class. In the seasons when work is slack, mid-winter and a month before harvest, many of them resort to begging. To this the labourer may add a little by eggs and about 3*l.* by his pigs. When food is dear, the labourer has to work sometimes for six weeks in July and August, merely for his food, consisting generally of potatoes and milk. When a farmer feeds his labourer, he gives him commonly better food than he would have at home. If a labourer has a cottage, potato-garden, and milk from his employer, as is usual, these are considered equivalent to a third or a half of his wages. The labourers in the richest grazing districts are the worst off. The labourers when they obtain permanent employment, at fixed wages, exhibit generally increased cleanliness and decency of appearance, and their cabins are better furnished.

There is no employment for women, except in some of the baronies in harvest-time, and perhaps in the potato-planting and digging seasons, when they earn about 6*d.* a day. Formerly they spun wool for their own clothes, but this practice has ceased for several years, probably because the manufactured article can now be purchased cheaper. The rearing of fowls is the source of some profit; and a couple of pigs will bring in about 3*l.*, which is depended upon to pay the rent of the potato-garden. There is no work for children under fourteen years of age: they are not employed in hoeing or weeding corn or other crops.

The cottier tenants, occupiers of less than ten acres of land, are enabled to feed and clothe their families better than a labourer, but are themselves worse fed than the labourers who are dieted by the farmers. Cottiers seldom keep a cow; they hold their land from year to year, and are generally in arrear for rent, which is always (if a man holds five acres or more) expected to be paid in money.

The potatoes which the labourer or small cottier grows constitute the food of his family; he himself is frequently fed by his employer. Milk is not used in more than one half of the families. The greatest expenditure on tobacco is 6*d.* a week. Candles for six months amount to 3*d.* per week, and other necessaries, under the general designation of 'kitchen,' cost from 1*l.* 10*s.* to 2*l.* 10*s.* for the year. The labourers do not consume any description of groceries. The fees to the Roman Catholic clergy form an important item in a labourer's outlay. The fee for marriage is 25*s.*, for churching a woman 2*s.* 6*d.*, and for blessing the clay and saying mass at a funeral 5*s.*; at confession at Easter and Christmas 1*s.* is expected: but these fees are often remitted.

The dwellings of the labourers are of the most wretched description, nor has any perceptible improvement taken place of late years. During the alarm of cholera they were whitewashed, but that is now neglected. They are generally 20 feet long by 12 broad, with walls from 7 to 8 feet high, divided into two or perhaps three very small apartments, and never having a second story; covered only with a thatch of straw, and having nothing but the bare ground for the floor, and that often full of holes, which in wet weather become little pools of water. A hole in the roof allows the escape of the smoke, and their windows, 15 inches square, are more commonly without glass than with it, and almost universally destitute of shutters. They have rarely any outhouse except a pigsty, and in many cases where they have not even that, the pig sleeps in the house. These wretched hovels usually cost in erection about 10*l.*, and the tenant pays from 20*s.* to 30*s.* a year as rent; with a rood of land, the rent is near 2*l.* 10*s.* The cabins are always kept in repair by the tenant. They are usually built separate, not grouped in villages or hamlets, and for convenience near the road-side.

It rarely happens that there is more than one bed for the whole family; a bedstead, a dresser, two chairs, a large iron pot, and some crockery, all of the worst description, usually complete the catalogue. In some wretched cabins even these are not found, and the family lie on the floor.

The chief article of food is the potato: the peasantry grow this in preference to corn, because it yields a more abundant supply with less care and less manure. A labourer, when employed, gets three meals of potatoes a day, his wife and children only two. In July and August, when the old potatoes have become unfit for food, and the

new crop is not ready, colic or other bowel complaints are produced by the unwholesomeness of the diet; and the failure of the potato crop is always productive of great distress: the labourer is then obliged to procure provision upon credit, which he obtains with great difficulty and by paying double the market-price.

In respect of clothing, considerable improvement has taken place, though the peasantry are still very indifferently clad. No material for clothing is of home manufacture, but the women generally make up their own dresses: sometimes however they are unable to do this, and have to pay for getting them made. The use of shoes and stockings is increasing. Old clothes, brought from London and Liverpool, are much worn. The yearly expenditure of a labourer's family on clothes is seldom less than a pound.

The ordinary fuel is turf: near the bogs this is cheap, but to one living at a distance of 8 or 10 miles from a turbary, the cost is doubled. When fuel is scarce, pilfering and the destruction of woods and fences are common. Straw and dried cow-dung are used as a substitute for turf. The county has always been one of the most disturbed in Ireland; 'although there is an ebb and flow of crime in other counties, Tipperary has always kept up steadily to high-water-mark.' This was the statement of the resident police magistrate of Cashel. (See *Parliamentary Papers* for 1836, vol. xxxii., p. 357.)

Divisions, Towns, &c.—The county is divided into eleven baronies, as follows:—

Barony.	Situation.	Pop. in 1831.
Clanwilliam . . .	W.	48,152
Eliogarty	Central	38,531
Iffa and Offa (East) .	S.E.	38,702
Iffa and Offa (West)	S.W.	40,192
Ikerin	N.E.	27,077
Kilnemanagh . .	W.	30,774
Middlethird . . .	Central	44,103
Ormond (Lower). .	N.	45,006
Ormond (Upper) .	Central	24,807
Owney and Arra. .	W.	32,454
Slievardagh . . .	E.	32,765
		402,563

It contains the county-town of Clonmell or Clonmel [CLONMEL]; the city of Cashel [CASHEL]; the ex-borough (formerly parliamentary) of Fethard; the market-towns of Cahir, Carrick-on-Suir [CARRICK-ON-SUIR], Clogheen, Killenaule, Nenagh, Roscrea, Templemore, Thurles, and Tipperary; the post-towns of Burris-o'-Leagh, Burris-o'-Kane, Cloghjordan, Golden, Littleton, New Birmingham, and Newport; and the villages of Ballina, Emly, Mullinahone, Silvermines, Toomavara, and others. Some of these are described as referred to above: of the others we give some account here.

Fethard is in the barony of Middlethird, 100 miles from Dublin by Kilkenny and Callen, and 9 miles north from Clonmell. The town contained, in 1831, 582 houses, inhabited by 689 families; 39 houses uninhabited, and 5 building, with a population of 3405: the whole parish contained 678 houses, inhabited by 797 families; 41 houses uninhabited; and 7 building; with a population of 4050. The town is irregularly laid out on both banks, but chiefly on the left or north-eastern bank of a small stream, the Glashall, which ultimately joins the Suir below Clonmell. Fethard is an antient and decayed town, in a bye situation, with little trade. Of the houses about 120 are slated, and chiefly of two stories: the rest are thatched cabins, and of the poorest description. There are a parish church; a Presbyterian and a Primitive Methodist meeting-house; two Roman Catholic chapels, one the regular parish chapel, the other attached to an Augustinian friary. The parish church, of which the chancel is in ruins, and the friary chapel, are antient structures. There is a good slated school-house. The town was formerly walled, and some portions of the walls and of the gateway towers remain. There are (or were lately) four mills and a tan-yard or two: the principal trade is shoemaking; but the chief occupation of the labouring class is agriculture.

The town was incorporated at an early period: the oldest known charter is dated 49 Edward III., A.D. 1376; but the corporation has been dissolved by the late Irish Municipal Reform Act. The borough sent two members to the Irish parliament, but was disfranchised at the Union. There is a market on Saturday, but it is of minor importance: the yearly sale of wheat is about 8000 barrels, of oats about 3000 or 3500 barrels. There are a dispensary and a charitable loan-fund: and (by returns to the House of Commons, printed in 1835) ten schools of all kinds, including a national school with 186 boys on the books, and an average daily attendance of 130.

Cahir, or Caher, is in the barony of Iffa and Offa (West), 111 miles south-west from Dublin by Clonmell, from which it is distant 7 miles west. The town had, in 1831, 515 houses, inhabited by 706 families; 61 houses uninhabited, and 16 building, with a population of 3408: the whole parish had 1291 houses, inhabited by 1625 families; 93 houses uninhabited, and 23 building, with a population of 8594. Cahir is pleasantly situated on the banks of the river Suir, at the eastern end of the valley, between the Galtees and the Knockmeledown Mountains: it is, for an Irish town, very clean, and has been steadily increasing, though not rapidly: the new houses are chiefly of a good description, worth from 10*l.* to 40*l.* per annum, and are respectably tenanted. There are a parish church, a Roman Catholic chapel, and a Quakers' meeting-house. Near the town are extensive cavalry barracks; and on the banks of the Suir are the demesne and residence of the Earl of Glengall. An attempt was made many years ago to establish the linen-manufacture, but it failed: since then the straw-plat has been introduced, and gives employment to a number of females: there are also some extensive flour-mills. The market is on Friday, and is an important corn-market: the yearly sales of wheat had increased from 23,662 barrels in 1826, to 56,131 in 1835: the sale of oats had continued steady through the same period, at 37,000 barrels. There is a bridewell, and a body of constabulary are posted in the town: there are also a dispensary and fever-hospital, and (by returns to parliament in 1835) fifteen schools of all kinds; one of them a national school, with 286 children (boys and girls) on the books, and an average attendance of 150; and two others on Erasmus Smith's foundation, one with 51 girls on the books, and an average attendance of 25; the other containing 11 boys. Near the town, on an island of the Suir, are the picturesque ruins of the castle of Cahir.

Clogheen is in the barony of Iffa and Offa (West), 120 miles south-west of Dublin through Clonmell, and 14½ miles from Clonmell. The town is chiefly in the parish of Shanraghan: it contained, in 1831, 291 houses, inhabited by 357 families; 17 houses uninhabited, and 3 building, with a population of 1928: the whole parish had 1087 houses, inhabited by 1199 families; 39 houses uninhabited, and 4 building: the parish of Tullaghnrton, into which the town extends, had 297 houses, inhabited by 305 families; 5 houses uninhabited, and 5 building, with a population of 1965. What portion of these belong to the town we have no means of ascertaining. There is a Roman Catholic chapel in the town: the parish church of Shanraghan is in the immediate neighbourhood. Tullaghorton parish has no church. A large corn-market is held on Saturday, at which the yearly sale of wheat had increased from 42,125 barrels in 1826, to 62,824 in 1835; but that of barley had decreased from 3200 barrels in 1826, to 2281 in 1835: there are seven flour-mills in and round the town, the flour from which is sent by land to Clonmell, and from thence down the Suir to Waterford, where it is shipped. There is also a large brewery. A body of constabulary are posted in the town; and there are a small cavalry barrack, a small bridewell, and a dispensary and fever-hospital. Near the town are the ruins of an antient parish church and of an antient abbey. Shanbally Castle, the seat of Lord Lismore, is also in the neighbourhood. By the returns to parliament in 1835 there were in the two parishes eight private schools, but not any national or other school supported by subscription or endowment.

Killenaule is in the barony of Slievardagh, 92 miles south-west from Dublin by Urlingford, and 16 north from Clonmell by Fethard. The town, in 1831, contained 275 houses, occupied by 321 families; 34 houses uninhabited, and 2 building, with a population of 1578: the rest of the parish had 279 houses, inhabited by 300 families; 9 houses uninhabited, and 3 building, with a population of 1889; making a total population of 3467. There are a church, a Roman Catholic chapel, and a dispensary: the church is small and antient. There is a weekly market, and several yearly fairs are held: a portion of the county constabulary is stationed in the town. Several of the collieries of

the Killenaule coal-field are in this parish. By the returns to parliament, A.D. 1835, there were in the parish six schools, all supported by the payments of the children: school-houses had been built by subscription for two of these schools.

Nenagh is partly in Upper Ormond, but chiefly in Lower Ormond barony, between 95 and 96 miles south-west of Dublin, on the road to Limerick. The town contained, in 1831, 1282 houses, inhabited by 1703 families; 55 houses uninhabited, and 9 building, with a population of 8466: the remainder of the parish contained 104 houses, inhabited by 104 families, and 2 houses uninhabited, with a population of 693; making a total population of 9159. This town antiently belonged to the Butler family, who had a strong castle here: it had two ecclesiastical foundations; an hospital for the canons of St. Augustin, founded A.D. 1200; and a friary for conventual Franciscans, deemed the richest foundation of that order in Ireland, founded in the reign of Henry III. The town was burned, A.D. 1550, by the natives under O'Carrol, and the friary was included in the destruction, but the castle was saved by the garrison. The town was repeatedly taken and retaken in the great civil war in the reign of Charles I. It was taken by the native forces of James II., A.D. 1688, but after a time abandoned and burned by them. The town stands on the river Nenagh, which flows with a circuitous course from the Keeper Mountains into Lough Derg, and consists of four streets meeting in the centre. The ruins of the castle, consisting chiefly of a large circular donjon or keep, called Nenagh Round, are on one side of one of the streets, Castle Street. There are a barrack for cavalry; a fever-hospital and dispensary; a church, rebuilt some years since; a Roman Catholic chapel; and a bridewell, unless it has been disused since the completion of the county gaol, lately erected here. Some remains of the Franciscan friary may be traced. A portion of the county constabulary are stationed here. There is a well-attended market on Thursday for corn and cattle. The number of barrels of wheat sold on the average of the years 1826 to 1835 was above 45,000, of barrels of oats about 4500, and of barrels of barley 1300. The sale of bere, which was about 1000 barrels in 1826, had quite ceased before 1835. There are in or near the town a brewery, a flour-mill, and a small stuff manufactory. There are several yearly fairs. There were in the parish, by the return made to parliament in 1835, eight schools of all kinds, including a national school, with an average attendance of 190 boys; a parish free-school, with an average attendance of 40 boys and girls; and a school on Erasmus Smith's foundation, with an average attendance of 28 boys and girls.

Roscrea is in the barony of Ikerin, 75 miles west-south-west of Dublin, on the road to Limerick, and about 50 to 52 north of Clonmell. A monastery for regular canons is said to have been founded here by St. Cronan as early as the beginning of the seventh century, which became subsequently the seat of a bishopric, afterwards united to Killaloe. According to Keating (*History of Ireland*) there was antiently a great fair held at Roscrea on the festival of St. Peter and St. Paul, at which fair, about the middle of the tenth century, an army of Danes, collected from Limerick and Connaught, attempted to surprise the natives; but these, having some suspicion of the attack, had brought arms with them, and made so stout a resistance, that they repulsed the enemy, with the loss of their leader and four thousand men. In 1213 King John erected a castle at Roscrea, of which a circular tower remains; and there is in the centre of the town a square castle of the Ormond family, occupied as a depôt for the troops quartered in the infantry barracks. About A.D. 1490 a Franciscan friary was founded.

The town of Roscrea is in a fertile and pleasant situation: it consists of several streets, irregularly laid out, and had, in 1831, 907 houses, inhabited by 1136 families; 61 houses uninhabited, and 6 houses building, with a population of 5512: the whole parish, which extends into the baronies of Ballyhrit and Clonlisk in King's County (Leinster), had 1546 houses, inhabited by 1797 families; 79 houses uninhabited, and 12 building; with a population of 9199. The parish church is an antient building, with Norman doorways and niches, and several sepulchral crosses and curious architectural decorations. Near the church is a round tower 80 feet high and 15 feet in diameter, with a window with an arch of the usual form, 15 feet from the ground, and a window with a pointed arch, about 30 feet from the ground. There are some remains of the antient monastery of canons of St. Augustin, consisting of the western gable, having an arched doorway, which forms an entrance to the present churchyard. There are also some remains of the Franciscan convent, which are (or at least were some years since) in good preservation: the tower of the conventual church forms the entrance to the present Roman Catholic chapel. There are a Primitive and a Wesleyan Methodist chapel and a Quakers' meeting-house in the ecclesiastical union of Roscrea (comprehending the parishes of Roscrea and Kyle), but we are not aware whether they are in the town.

The town has considerable trade as the mart for the surrounding district. Formerly there was a considerable manufacture of woollens, especially serges and stuffs, in which a thousand looms are employed; but this had so fallen off about 1835, that it gave employment only to a hundred looms. There were at that time a distillery and three breweries. There are two weekly markets and several yearly fairs for cattle and farming stock: there are public shambles and a commodious market-house. The sale of grain at the markets is considerable: the average yearly sale of wheat had increased in the ten years from 1826 to 1835, both inclusive, from 4140 barrels to 6700; and that of oats from 18,500 to 22,100 barrels; the yearly sale of barley had continued steady at 13,000 barrels. There is a savings' bank, the deposits in which had (in 1835) considerably increased: the depositors were chiefly farmers, small tradesmen, and servants: there were at the same time a fever hospital, a cholera hospital, and a dispensary. The number of places where spirits were sold was very great, amounting to above two hundred in the town alone; of these nearly half were licensed public-houses. There are a small bridewell, an infantry barrack, and a station of the county constabulary. There were, by the Parliamentary Returns for 1835, ten day-schools in the parish, including a national school, with an average attendance of 52 boys; a school on Erasmus Smith's foundation, with an average attendance of 91 boys; and a day-school for young girls in connection with the Ladies' London Association and the Hibernian Society, with an average attendance of 45.

Templemore is in the barony of Eliogarty, about 87 miles south-west of Dublin, and about 39 or 40 north of Clonmell. It is supposed to derive its name from the Knights Templars, who had a house here, of which the remains form an entrance to the demesne of the Carden family. There were in the town, in 1831, 404 houses inhabited by 609 families; 12 houses uninhabited and 7 building; with a population of 2936: the whole parish had 664 houses, inhabited by 885 families; 15 houses uninhabited, and 18 building; with a population of 4583. The town is pleasantly situated near the right or west bank of the Suir, and is (comparatively at least) a well-built and neat town. The church, which has a handsome tower and spire, was rebuilt about fifty or sixty years ago; there are a handsome and spacious Roman Catholic chapel, a good market and court-house, a bridewell, extensive barracks, a fever hospital and dispensary, and ball and news-rooms. The town is approached on all sides by avenues of ash-trees; and there are several gentlemen's seats and the remains of some very antient castles in the neighbourhood. There were, according to the returns of 1835, seven schools in the parish, including a free-school on Erasmus Smith's foundation, with an average attendance of 47 scholars, boys and girls.

Thurles is in the barony of Eliogarty, 96 miles south-west from Dublin by Templemore, and about 32 from Clonmell. It is a place of considerable antiquity, and was in the tenth century the scene of a severe battle between the native Irish and the Danes. There is a tradition that the Knights Hospitallers had a house here, but no record of it has been discovered. A Carmelite monastery was founded here about A.D. 1300; and in the fourteenth century a castle was built by the Butler family, which in the civil war of Charles I. was garrisoned by the Royalists and taken by the Parliamentary forces. Of these buildings there are some remains: a tower and some part of the north transept of the church of the monastery stand on the east side of the Suir; and there are considerable portions of the walls of the castle, inclosing an extensive area, and flanked by towers, some round, others square. There were not long since (and perhaps still are) some remains of St. Mary's church, built in the fifteenth century, and very

much dilapidated; there is an extensive mansion, formerly belonging to the earls of Llandaff, now converted into a barrack. There are a neat modern church, a handsome Roman Catholic chapel, which is the cathedral of the Catholic archbishop of the diocese of Cashel and Emly, a Roman Catholic college, two nunneries, one of Ursulines, the other of the order of the Presentation, a Baptist meeting-house, a good market-house, a small barrack for infantry, a neat sessions-house, a well-arranged bridewell, and a dispensary. Considerable trade is carried on in the town: there are two market-days in the week, a monthly fair, and three yearly fairs: the sale of corn in the market is considerable; the wheat sold in the year increased from 30,400 barrels in 1826 to 50,600 in 1835; and that of barley from 9400 barrels in 1826 to 11,000 in 1835: that of oats had continued stationary at from 3000 to 4000 barrels. Some brewing and tanning are carried on. There were, by the Parliamentary Returns of 1835, seventeen schools; including one of 300 girls, taught by the nuns of the Presentation convent; a boarding-school of 60 girls, and a day-school of 120 girls, kept by the nuns of the Ursuline convent; a day-school with an average attendance of 200 boys, under the direction of the Religious Brothers; and a day-school under the superintendence of the curate of the established church and some of the parishioners, with nearly 40 children.

Tipperary is in the barony of Clanwilliam, 110 miles south-west of Dublin, and 23 miles west-north-west of Clonmell. A monastery for Eremites of the rule of St. Augustin was founded here in the reign of Henry III. In the reign of Edward III. (A.D. 1329) the town was burned by the natives under Brien O'Brien. Its former importance is indicated by its having given name to the county, and by the fact of its having been antiently incorporated; but it no longer possesses the same relative importance, and the corporation has long ceased to exist. The town is chiefly in the parish of Tipperary, but extends into those of Curdangan and Kilshane: it had, in 1831, 988 houses inhabited by 1284 families; 36 houses uninhabited and 18 building; with a population of 6972: the whole parish of Tipperary had 1113 houses, inhabited by 1379 families; 36 houses uninhabited, and 16 building; with a population of 7996.

The town of Tipperary stands near the little river Arra, which flows into the Suir, and consists of one principal street, from which smaller streets branch off at right angles. Several of the houses are well built, and of handsome appearance: many old buildings have been taken down and new ones erected in their place, so that the town has a neat and thriving appearance. The inhabitants are supplied with water from a public fountain. The church is a modern structure, and there is a Roman Catholic chapel. There are some remains of the Augustinian monastery, chiefly consisting of an arched gateway in front of the building occupied by Erasmus Smith's classical school, which has obtained from this circumstance the popular designation of 'the abbey school.' The principal trade is in butter, of which a large quantity is sent to Limerick and to Waterford for exportation. There are two weekly markets (for which there are a neat market-house with a news-room over it, in the centre of the town, and shambles) and four yearly fairs. The sale of wheat is small; but it had increased in the ten years from 1826 to 1835, from 1125 to 3160 barrels; that of oats had increased from 7708 to 10,675 barrels: but the sale of barley had declined from 610 to 256 barrels. There are a dispensary, a fever hospital, a temporary barrack, and a small bridewell: a portion of the county constabulary are stationed here. There were in Tipperary parish, according to the return made to parliament in 1835, nineteen schools of all kinds, including a classical boarding-school on Erasmus Smith's foundation (the Abbey School), with about 30 scholars, another school on the same foundation with about 34 children, boys and girls, and national schools for boys and for girls, attended each by about 110 scholars. Kilshane parish had no school, and Curdangan only one, a hedge-school, with 24 scholars in winter and about 70 in summer.

Burris-o'-Leagh, or Burrisillegh, is in the parish of Glankeen, in the barony of Kilnemanagh, 92 miles south-west of Dublin. It had, in 1831, 210 houses, inhabited by 260 families, 14 houses uninhabited and 4 building, with a population of 1304. The parish church and the Roman Catholic chapel are both in the town. There is a small brewery: three yearly fairs are held, one of them a considerable fair for pigs. A body of the county constabulary are posted in the town, and there is a dispensary. There were (*Part. Returns*, 1835) in the whole parish eleven schools, including three national schools, with an average attendance of from 210 to 220 children; and another school with 23 children, partly supported by private contributions.

Burris-o'-Kane, or Burris-o'-Kean, or Burros-o'-Keane, is in the barony of Lower Ormond, 91 miles west-south-west of Dublin. The town had, in 1831, 206 houses, inhabited by 217 families; 14 houses uninhabited and 1 building; with a population of 1185: the whole parish had 465 houses inhabited by 477 families, 24 houses uninhabited, and 2 building; with a population of 2634. The town has been much improved of late years; many new houses have been built. There are a Roman Catholic chapel and a Wesleyan chapel, besides the parish church, a plain modern building; a dispensary and fever hospital, and a small bridewell. There are some remains of a square castle of massive construction, called Tunibricane. Four fairs are held in the year. There were in the parish, by the returns of 1835, six schools, including three free-schools, one with about 35 children, connected with the Baptist Irish Society; another with 30 boys, in connection with the Society for discountenancing Vice; and a third, with an attendance in summer of 80 girls, supported by private subscription.

Cloghjordan is in the parish of Modereny, in the barony of Lower Ormond, nearly 90 miles west-south-west of Dublin. It had, in 1831, 129 houses inhabited by 144 families, 6 houses uninhabited and 3 building, with a population of 824. There are a district church of the establishment, of light and elegant architecture, built A.D. 1830; and meeting-houses for Baptists, Wesleyans, and Primitive Methodists; also a dispensary and fever hospital. There is a considerable distillery. Three yearly fairs are held. A society for the relief and diminution of pauperism, called 'the deacons' poor fund,' exists in this and the adjacent parishes. There were no schools in the district parish of Cloghjordan in 1835; but in the whole of Modereny parish there were five day-schools, including two parochial schools, one with about 50 boys, and the other with about 60 girls; there were also three Sunday-schools for religious instruction.

Golden is in the parish of Relickmurry, or Religmurry, in the barony of Clanwilliam, about 102 miles S.W. of Dublin, between Cashel and Tipperary. There were, in 1831, in the town, 101 houses inhabited by 105 families, 2 houses uninhabited, and 5 building; with a population of 684. It is a neat and improving place, situated in 'the Golden Vale,' one of the most fertile districts of the county, and is divided into two parts by the river Suir, over which is a stone bridge. It has the ruins of an old castle; and in the neighbourhood are the remains of Athassel Augustinian Abbey, originally one of the most splendid ecclesiastical structures in the kingdom; the ruins are extensive and worthy of notice. The parish church and a Roman Catholic chapel are in the town. There are flour and oatmeal mills; and four fairs are held yearly. There is a dispensary. A body of the county constabulary are posted here. The united parishes of Relickmurry and Athassel had, in 1835, six day-schools; one, with 60 children, partly supported by Lady Elizabeth Mathew.

Littleton is in the parish of Borrisleigh, in the barony of Eliogarty, 90 miles S.W. of Dublin. It contained, in 1831, 44 houses inhabited by 54 families, 3 houses uninhabited, and 1 building; with a population of 283. It is a place quite of modern origin, chiefly erected by the late Rev. Thomas Grady. The parish-church, a handsome building, is in the town; and there is also a dispensary: a body of the county constabulary are stationed here. There were, in 1835, five day-schools; one of them was the parish-school with about 30 children; one of the others was held in a school-room erected by subscription.

New Birmingham is in Kilcooley parish, in the barony of Slievardagh, 95 miles S.W. of Dublin. This town owes its origin to the late Sir Vere Hunt, who obtained patents for two weekly markets and twelve yearly fairs; but these have been discontinued, and the place is comparatively deserted. There are a Roman Catholic chapel and a small prison. There were, in 1831, 48 houses inhabited by 62 families, and 1 house uninhabited; with a population of 298.

Newport is in Kilvolane, or Killevolane, parish, in the barony of Owney and Arra, 109 miles S.W. of Dublin, on the road to Limerick. It had, in 1831, 127 houses inhabited by 162 families, 24 houses uninhabited, and 12 building; with a population of 852. The houses are for the most part neatly built. The parish-church is in the town; and there are a Roman Catholic chapel, a bridewell, a dispensary, and infantry barracks. There are four yearly fairs, one of them a large cattle-fair.

Ballina is in Templeichally, Temple Ichally, or Templekelly parish, in the barony of Owney and Arra, on the bank of the Shannon, near where it leaves Lough Derg, opposite Killaloe. This village is connected with Killaloe, of which it may be considered as a suburb, by a bridge of nineteen arches over the Shannon. The population of the village, in 1831, was 832. There is a Roman Catholic chapel; and a body of the county constabulary are posted here. There is a yearly fair for pigs. Near the bridge are the remains of a castle erected to defend the passage of the river.

Emly is in the barony of Clanwilliam, near the western border of the county, about 9 miles west of Tipperary. It is of great antiquity. An abbey of regular canons of St. Augustin was early founded here; and the town subsequently became the seat of a bishop's see. Some of the prelates appear to have exercised temporal power as well as spiritual; and one of them in particular, in the ninth century, distinguished himself as a warrior against the Danes. King John granted to the town the privilege of holding markets and fairs; but the privilege of a market, if ever used, is now disused. The diocese was united to that of Cashel A.D. 1568, and the removal of its episcopal seat caused the decline of the place. It had, in 1831, a population of 701. A body of the county constabulary are posted here; and there are two yearly fairs. The parish church is in the village, and there is a Roman Catholic chapel. There are the ruins of a church and a large stone cross. Some antiquities have been dug up in the neighbourhood.

Mullinahone is in Kilvemnon parish, in the barony of Slievardagh, on the road between Callen and Fethard; it is also between Carrick-on-Suir and the Killenaule coal-district, so that it is a common resting-place for the car-drivers in their way from Carrick. A considerable quantity of butter is sold here in a weekly market (though the place ranks only as a village), held on Thursday, and sent to Kilkenny, Clonmell, or Carrick. There are several well-attended yearly fairs for cattle and pigs, and a body of the county constabulary are posted here. There are a Roman Catholic chapel and a dispensary. The population of the village, in 1831, was 1175.

Silvermines is in the parish of Kilmore and the barony of Upper Ormond, about 5 or 6 miles south of Nenagh. It is at the foot of the north-western slope of the central hills, and takes its name from the lead-mines formerly worked, the produce of which yielded an unusual quantity of silver. The population, in 1831, was 791. Some of the houses are neatly built: the parish church and a Roman Catholic chapel are in the village, and there is a dispensary. There are four yearly fairs.

Toomavara, or Toomavarra, is in the parish of Aghnameadle, in the barony of Upper Ormond, between Nenagh and Burris-o'-Leagh; it had, in 1831, a population of 790: there are a Roman Catholic chapel, a national school, and a dispensary in the village. There are at least two yearly fairs, and a body of the county constabulary are posted here.

Divisions for Ecclesiastical and Legal Purposes.—This county was formed at what is commonly deemed to be the first establishment of counties in Ireland, by King John, A.D. 1210; though Sir James Ware has shown that counties or some equivalent divisions must have existed before that time. The county was subsequently enlarged by the annexation of what was called 'Cross-Tipperary,' a district having a sheriff and other officers distinct from the county. Antient records speak of the 'Vice-Comes Crocear Tipperary.'

It contains the whole or part of a hundred and sixty-three parishes. (*Pop. Returns* for 1831.) These parishes constitute or are comprehended in one hundred and nine unions or other ecclesiastical benefices, in several dioceses, as follows:—

Diocese.	Total Number of Benefices.	Rectories and Vicarages.	Perpetual Cures.	Impropriate Cures.	Parishes without cure of souls.
Cashel	49	39	2	6	2
Emly	9	7	1	..	1
Killaloe	28	24	2	..	2
Lismore	22	20	..	1	1
Meath	1	1	..	..	..
	109	91	5	7	6

Cashel was an archbishopric, having in its province the united dioceses of Cashel and Emly, the diocese of Cloyne, the united dioceses of Cork and Ross, of Killaloe and Kilfenora, of Limerick, Ardfert and Aghadoe (which last two were incorporated), and of Waterford and Lismore. By the Act 3 and 4 William IV., c. 37, a further union of the dioceses of Cashel and Emly with Waterford and Lismore was enacted, to take place on the next avoidance; and this union has now been effected. The greater part of the county is in this united diocese. The same Act deprived Cashel of its archiepiscopal rank, on the decease of the then existing holder of the see, and added the province to that of Dublin: this change has been effected. The only part of the county in the diocese of Meath is the parish of Eglish, which is partly in this county and partly in King's County, and is comprehended in the ecclesiastical union of Fircal. The diocese of Meath is in the ecclesiastical province of Armagh; but with the exception of the small part included in that diocese, the rest of the county is in the ecclesiastical province of Dublin.

In the Roman Catholic church the archbishop of Cashel retains his dignity, and is primate of Munster. His cathedral is at Thurles. His province includes the united dioceses of Cashel and Emly, of Cloyne and Ross, and of Waterford and Lismore, and the dioceses of Cork, Kerry, Killaloe, and Limerick. In which of these dioceses the county is included we have no means of ascertaining exactly; but the greater part, if not the whole, is included in those of Cashel and Emly, Killaloe, and Waterford and Lismore.

The county is included in the Leinster circuit; the assizes are held at Clonmell: the county-gaols are at Clonmell and Nenagh, the latter very lately erected; and there are bridewells at Cahir, Clogheen, Tipperary, Cashel, New Birmingham, Thurles, Templemore, Roscrea, Nenagh (we are not sure if this is continued since the completion of the county-gaol), Burris-o'-Kane, Newport, and Carrick-on-Suir. The county-gaol at Clonmell comprehends a gaol, house of correction, and sheriffs'-prison: the house of correction is under very good management; the silent system of prison discipline is acted upon, the prison not being adapted for the introduction of the separate system. Considerable improvements had been made in the sheriffs'-prison according to the 'Nineteenth Report of the Prison Inspectors' (1841), the last we have seen; but a complete system of discipline could not be introduced until the removal of part of the prisoners to Nenagh gaol, which was not then completed. The bridewells are many of them in a bad state; those of Cahir, Cashel, and Templemore are miserably dilapidated, and that at Cahir very badly managed; those of New Birmingham, Burris-o'-Kane, and Tipperary, insecure and altogether insufficient: Carrick bridewell, though new, is badly finished and ill-managed by the keeper; and that at Clogheen, though in tolerable good order, falls very far short of the well-regulated bridewells of other counties: those of Newport, Nenagh, Roscrea, and Thurles (the last a large prison) are in good order. (*Inspectors' Report*, 1841.) It is stated in a note to that Report, that great improvement has been made in several of these prisons since the inspectors' visit.

The number of criminal offenders committed for trial in 1839 was 2110, being greater than in any county of Ireland, except the metropolitan county (including the city) of Dublin; and more than twice as great as in any other county, except only Cork (including the city of Cork); Galway (including the town of Galway); Limerick (including the city of Limerick), and Kerry; and of these the only one which approached it was Cork (1932 committals), which had more than twice the population; the others barely exceed half the number in Tipperary, though Galway rather exceeds it in population; Limerick has about three-fourths of the population of Tipperary, and Kerry nearly two-thirds. So far therefore as the number

of committals is a test of the state of crime, Tipperary that year exceeded all other counties in Ireland, except that of Dublin, and in most cases very far exceeded them. Of the 2110 persons committed, 946 were convicted, and 1164 acquitted or discharged; 9 of the convictions were for capital offences, and 4 of the criminals were executed. In 1840 the number of committals was 1642, the county still retaining, or nearly so, its unhappy pre-eminence: of the persons committed, 718 were convicted, and 924 acquitted or discharged; 5 of the convictions were for capital offences, but no persons were executed. A large proportion of the offences were murders, manslaughters, assaults, riots, and other violent offences, indicative of the prevalent tendency to disturbance and insubordination.

The county returns two members to parliament, who are elected at Clonmell; and one member each is returned from the borough of Clonmell and the city of Cashel. The number of registered electors for the county in February of each of the years 1835, 1837, and 1841, was as follows:—

	50*l.* Freeholders.	20*l.* Freeholders.	20*l.* Leaseholders.	10*l.* Freeholders.	10*l.* Leaseholders.	Holders of a rent-charge.	Total.
1835	660	361	2	1459	2	1	2485
1837	854	437	15	1773	51	5	3135
1841	792	316	13	1217	120	44	2502

The number of voters in Clonmell and Cashel, in the same three years, was as follows:—

CLONMELL.

	10*l.* Householders.	7*l.* Householders.	Freemen.	Total.
1835	601	..	84	685
1837	699	..	96	795
1841	587	..	100	687

CASHEL.

1835	302	..	6	308
1837	353	..	..	353
1841	267	..	..	267

Before the Union the county returned eight members to the Irish parliament, namely, two for the county itself, and two each for Clonmell, Cashel, and Fethard, but the last was disfranchised at the Union, and Cashel and Clonmell reduced to one member each: no change in the number of members was made by the Reform Act.

The amount of grand jury presentments for the years 1839 and 1840 was as follows:—

	1839.	1840.
New roads, bridges, &c.	£ 2,219 13 5	£ 3,165 13 0
Repairs of roads, &c.	19,871 17 7	24,831 8 1
Court and Sessions houses, erection and repairs of	950 0 0	6,093 10 0
Gaols, bridewells, &c., erection and repairs of	3,999 17 1	4,698 0 11
County gaol and bridewell, and prison expenses	6,776 8 1	8,001 13 2
Salaries to officers in gaols	237 0 8	302 13 0
Constabulary police, payments to witnesses, &c.	17,195 11 2	17,537 15 4
Salaries to county officers, collectors' poundage, &c.	5,074 3 3	5,548 6 1
Public charities	6,408 17 1	7,423 18 1
Repayments to government	1,959 1 11	2,307 11 9
Miscellaneous	2,834 13 7	2,338 13 6
	£67,527 3 10	£82,249 2 11

The county constabulary on the 1st January, 1840, and 1841, consisted of the following:—

	County Inspectors. 2nd rate.	Sub-Inspectors. 1st rate.	Sub-Inspectors. 2nd rate.	Sub-Inspectors. 3rd rate.	Head Constables. 1st rate.	Head Constables. 2nd rate.	Constables.	Sub-Constables. 1st rate.	Sub-Constables. 2nd rate.	Horses.
1840	2	4	4	5	2	15	109	481	170	not stated.
1841	2	3	7	3	2	14	122	531	79	17

The whole expenditure on the constabulary force in the year 1839 was 36,276*l.* 9*s.* 1½*d.*, and in 1840, 36,595*l.* 15*s.* 10*d.* The amount of the constabulary force and the cost of maintaining it are greater than in any other county in Ireland.

There is a county lunatic asylum at Clonmell; which in the year from March, 1840, to March, 1841, contained 94 patients, and was maintained at an expense of 222*l.* 3*s.* 3*d.*, or 2*l.* 6*s.* 9*d.* for each patient. There is a county infirmary at Clonmell, into which the following number of patients were admitted:—

	In-Patients.	Out-Patients.	Total.
1835	322	4386	4708
1836	278	4759	5037
1837	326	7760	8086

There are fever hospitals at Burris-o'-Kane, Cahir, Carrick-on-Suir, Cashel, Clogheen, Clonmell, Cloghjordan, Nenagh, Roscrea, Templemore, and Tipperary: and dispensaries at Ballingarry, Ballymackay, Ballymunty and Kilcooley, Ballyporeen, Birdhill, Bourney, Burris-o'-Leagh, Burris-o'-Kane, Cahir, Cappaghwhite, Carrick-on-Suir, Clogheen, Clonmell, Cloghjordan, Drangan, Dundrum, Fethard, Golden, Grangemockler, Killenaule, Kilshelan, Littleton, Lorrha, Mullinahone, Nenagh, Newcastle, Newport, Portroe, Poulmucca, Roscrea, Rosegreen, Silvermines, Templemore, Templetuohy, Thomastown, Thurles, Tipperary, and Toomavara.

History and Antiquities.—Sir James Ware supposes that the Coriondi (Κοριόνδοι) and the Udiae, or rather Uodiae (Οὐοδῖαι), of Ptolemy, occupied this county and the adjacent ones to the west and south-west. We think it not improbable that the Brigantes (Βρίγαντες) may have occupied the south-eastern parts, while the Uodiae occupied the south-western.

In the division which prevailed before the English conquest the following territories are noticed by Sir James Ware as corresponding to portions of this county:—

Aradh-Cliach: probably the half-barony of Arra, in the western part of the county, on the bank of Lough Derg and of the Shannon.

Corca-Eathrach: the territory round Cashel, comprehending part of the Vale of Goulin, or Golden Vale. Some writers consider the territory of North Desies to be identical with this.

Eoganacht: a name common to a sept or clan, and to the territory occupied by them near Thurles.

Hy-Fogarta: the country of the sept of O'Fogarty, in the neighbourhood of Thurles.

Hy-Kerin: the country of the sept of O'Meagher. This territory has retained its name with little alteration, being now the barony of Ikerin.

Muscraige-Thire, or *Muscraighe-Thire*: the country the sept of Kennedy, now the baronies of Upper and Lower Ormond, a name which signifies East Munster.

In the early periods of Irish history these territories appear to have been divided between the kingdom of Thomond or North Munster, governed by princes of the Dalcassian race; and Desmond, or South Munster, held by princes of the Eoganacht or Eugenian family; the princes of which two kingdoms appear to have possessed in alternate succession the paramount dominion of Munster. Early in the ninth century, soon after the landing of the Northmen or Danes (or as they are usually termed in Irish history, from the position of their original country with reference to Ireland, the Ost-men, or East-men) under their king Turgesius, Feidlim Mac-Crimthan, king of Desmond, held the paramount sovereignty of Munster. The capital of his kingdom was Cashel. His course, which was one of violence and tyranny, was marked by success: he was victorious over the chieftains of Connaught and over the king of Meath, the nominal sovereign of all Ireland. At the commencement of the tenth century the regal and sacerdotal characters were united in Cormac MacCulinan, bishop of Cashel and king of Munster, of the Eoganact race. He was not the first of his family in whom these characters had been combined. In 907 he defeated Flann-Siona, king of Meath and titular monarch of Ireland, on the heath of Moylena, in King's County; but having attempted to enforce the tribute which the people of Leinster had been compelled reluctantly to pay to the kings of Munster, he was defeated and slain (A.D. 908) by the Leinster forces, supported by the monarch of Ireland and the princes of the northern part of the island. Cormac built a chapel at Cashel, which still retains his name, and was the reputed author of the history commonly called 'The Psalter of Cashel.'

Callachan, who was king of Cashel towards the middle of the tenth century, appears in the history of this troubled period as an active but unprincipled warrior. He was surrendered by his own subjects into the hands of Murkertach, heir apparent to the monarchy of Ireland. In the latter part of the same century the throne of Munster was occu-

pied successively by Mahon and his brother Brian Boromh, or Boromhe, or Boru, two princes of the Dalcassian family, the latter of whom acquired the monarchy of Ireland. At the commencement of the twelfth century (A.D. 1101) Murkertach, king of Munster, gave over the city of Cashel to the church, dedicating it to God and St. Patrick. The holders of the see of Cashel had previously assumed the rank of archbishops.

In the English invasion, Henry II. (A.D. 1172) summoned an assembly of the Irish prelates and princes at Cashel, where the sovereignty of the English king was recognised, and various regulations made, increasing the power of the clergy, and more completely assimilating the practices of the Irish church to those of the church of Rome. Tipperary, or part of it at least, seems to have remained under the dominion of Donald of the sept of O'Brien, native prince of Thomond and Ormond, subject to the nominal sovereignty of the English king. In the irregular warfare which followed Henry's departure from Ireland, a body of Anglo-Normans under Richard, earl of Strigul, surnamed Strongbow, and governor or commander in Ireland, and of Hervey of Mount-Morris, entered the county (A.D. 1174) to attack Donald O'Brien, and advanced as far as Cashel, where they were to be joined either by a department from the Anglo-Norman garrison of Dublin or by a body of Ost-men from that city: but this detachment was surprised near Thurles by Donald, and put to the sword almost without resistance; and Strongbow and Hervey retreated to Waterford. The invaders appear to have crossed the county again the same year, in their march to Limerick (which was also under the dominion of Donald), which they succeeded in taking. In A.D. 1175 a considerable Anglo-Norman force with a body of native allies entered the county under Raymond Le Gros, marching to the relief of Limerick, to which Donald O'Brien had laid siege. The Irish, hearing of their approach, advanced, and entrenched themselves in a defile near Cashel, where they were defeated with great slaughter: the garrison of Limerick was relieved, and on the banks of the Shannon or of Lough Derg, near Killaloe, the victorous Raymond received the submission not only of Donald O'Brien, but of Roderick O'Connor, titular king of Ireland; and exacted hostages from both for the faithful performance of the engagements into which they entered.

This county was probably included in the grant of the principality of Thomond to Philip de Braosa (A.D. 1177), but the prudence or the cowardice of that noble prevented his dispossessing Donald O'Brien, who still retained possession. In A.D. 1185, while prince (afterwards king) John was in Ireland, sent over by his father, as lord of the island, the Anglo-Normans erected castles at Tipperary and Ardfinnan in this county; that of Ardfinnan was however soon taken by Donald, who, in A.D. 1190, defeated the Anglo-Normans under William, earl-marshal (who had married Strongbow's only child and succeeded to the Irish estates of that nobleman) near Thurles. Donald died A.D. 1194. The oldest part of the present cathedral of Cashel was built by him. Tipperary appears to have passed in the course of a few years afterwards into the hands of the Anglo-Normans, as it was one of the counties erected by King John (A.D. 1210), during his expedition to Ireland, at the head of a considerable army. It is probable that the northern part at least of the county was part of the seat of war (A.D. 1274-1277) between the O'Briens, who retained a portion of Thomond, and the Anglo-Norman, or as we may now term them, Anglo-Irish family of the De Clares.

It is probable that the Scots and their Irish allies were in this county (A.D. 1317) in the invasion of Ireland by Edward Bruce and his brother King Robert, since they ravaged the country from Kilkenny as far as Limerick. In A.D. 1328 the royal privileges in the county were granted to James Butler, earl of Carrick, now created also earl of Ormond; these royalties were long retained by the earls of Ormond. In A.D. 1330 Brien O'Brien, prince of Thomond, ravaged the county and burned the towns of Athassel (near Cashel) and Tipperary to the ground. In the period of anarchy which was contemporaneous with the war of the Roses in England, and continued long after that war was closed, the county was included in the scene of the frequent contests between the rival septs or families of the Geraldines, to which belonged the earls of Desmond and Kildare, and of the Butlers, at the head of which was the earl of Ormond. The burning of the cathedral of Cashel was one of the charges brought against the Earl of Kildare in his examination before the privy council (A.D. 1496). His reply to the charge was characteristic: 'Spare your evidence,' said he; 'I did burn the church: for I thought the bishop had been in it.'

In the great civil war in 1642, Clonmell, Cashel, Carrick-on-Suir, Fethard, and all the other towns in Tipperary, were seized by the insurgents, or, as they were termed, 'the Confederates,' almost at the first outbreak in the central and southern provinces. At Cashel, Fethard, and Silvermines there were some murders committed: those at Cashel were perpetrated by the relatives of some persons recently put to death by Sir W. St. Ledger, president of Munster, who had previously entered the county with two troops of horse and exercised great severity. The Earl of Inchiquin, who commanded in Munster for the parliament, invaded the county A.D. 1647, took Cahir by capitulation, and stormed Cashel, where he mercilessly slaughtered twenty priests and an unresisting multitude who had taken shelter in the cathedral. He levied contributions in all the neighbourhood, and was prevented from taking Clonmell only by want of provisions. When Cromwell invaded Ireland, and (A.D. 1649) was opposed by the Royalists and Confederates, now united under the Earl of Ormond (to whom Lord Inchiquin, shocked at the execution of the king, had joined himself), a detachment from his army took Carrick-on-Suir, where Cromwell himself crossed the river to besiege Waterford. A body of Royalists under Lords Inchiquin and Taafe, attempting to retake Carrick (24th October), was repulsed with severe loss. Ormond with the main body of his army was about this time near Clonmell watching Cromwell, whom sickness and the approach of winter obliged to raise the siege of Waterford; soon after which Ormond withdrew to Kilkenny, having posted a considerable body of Ulster men at Clonmell.

About the latter end of February, 1650, Cromwell opened the campaign by taking Cahir, Cashel, Fethard, Clogheen, and other places in this or the adjacent counties; and in the course of the following April laid siege to Clonmell. This siege cost him more trouble and loss than any other part of his Irish expedition: he lost above 2000 men in a fruitless assault; however after a siege of two months the place was obliged to surrender for want of ammunition: the garrison had previously withdrawn to Waterford without Cromwell's knowledge, and the townsmen obtained good conditions, Cromwell supposing that the garrison was still in the town. In 1651 Ireton, who was after Cromwell's departure, general-in-chief for the parliament, concentrated his army at Cashel and marched to the bank of the Shannon, over which he forced a passage at Killaloe. On the restoration of royalty in Ireland, which rather preceded its restoration in England, Clonmell was one of the towns occupied by the Royalists.

In the war of the Revolution Clonmell was abandoned by the Jacobites on William's advance toward the south after the battle of the Boyne (A.D. 1690). William, after his unsuccessful siege of Limerick, retired with his army to Clonmell, and there leaving them, proceeded to Duncannon and embarked for England.

In the rebellion of 1798 this county was not involved; and though it has been the scene of much agrarian disturbance, there has been no serious outbreak to require particular record.

C. Taylor's *Civil Wars of Ireland;* &c.)

TIPPOO SAIB, sultan of Mysore, was born in the year 1749. His father Hyder Aly Khan [HYDER ALY], sensible of the disadvantages under which he himself laboured from want of education, procured for his son the best masters in all the sciences which are cultivated by the Mohammedans. But Tippoo, although he had acquired a taste for reading, did not make any considerable progress, and he preferred martial exercises, into which he was initiated at an early age. The French officers in the employment of his father instructed him in tactics; and in 1767, when

Hyder Aly overran the Carnatic, Tippoo was entrusted with the command of a corps of cavalry. He was at that time nineteen years of age; but the success with which he carried on the war in the neighbourhood of Madras sufficiently proved how much he had profited by his European teachers. During the war with the Mahrattas, which lasted from 1775 to 1779, Tippoo acquired the universal esteem of the army; and he rose so high in the favour of his father and his counsellors, that the left division of the Mysore army, consisting of 18,000 cavalry and 6000 regular infantry, was put under his command. With this force Tippoo attacked Colonel Bailey in the neighbourhood of Perimbakum, on the 6th of September, 1780. He was obliged to retire; but on the 10th of the same month an engagement, in which Tippoo Saib is said to have taken an active part, ended in the entire defeat of the English army. The whole of the war in the Carnatic gave him opportunities of perfecting himself in the art of war; and on the 18th of February, 1782, he showed his skill in the attack and complete defeat of Colonel Braithwaite, on the banks of the Kolerun. This was undoubtedly his greatest stroke of generalship. A few months afterwards he was obliged to move towards the south, in order to meet the English troops in the provinces of Tanjore and Malwa, under the command of Colonel Humbertson. On the 20th of November Tippoo found the English at Paniany. He made a vigorous attack, but was repulsed and compelled to retreat. He crossed the river Paniany, and prepared himself for another engagement, when, on the 11th of December, 1782, he received intelligence of the death of his father. On the 20th he was at Seringapatam, where he mounted the musnud without much display or ceremony. He had scarcely performed the funeral rites of his father when he returned to Arcot, and assumed the command of his army. But whilst he was engaged in the Carnatic General Matthews took Onore, and the country of Bednore was in the hands of the English. In order to regain these more valuable possessions, Tippoo was obliged to relinquish his conquest in the Carnatic, and by the end of March, 1783, scarce a Mysorean was left in that country. His operations were so rapid and successful, that on the 28th of April Tippoo Saib had already reduced the garrison of Bednore to the necessity of capitulating. General Matthews and several of the principal officers were barbarously put to death. After the reduction of this city, it was Tippoo's object to repossess himself of Mangalore, the principal seaport in his dominions. But the place was well defended; and in the midst of his preparations for the assault accounts were received in the camp of peace having been concluded between England and France. It was early in July, 1783, when M. de Bussy, in consequence of this news, declined to act any longer against the English. He quitted the camp with his detachment. A considerable reinforcement having arrived under General Macleod, Tippoo agreed to a suspension of arms; and early in the year 1784 Sir George Staunton and two other ambassadors from Madras arrived in the camp, and on the 11th of March a treaty of peace, which stipulated for the liberation of all the prisoners and the restitution of all places taken by either party during the war, was concluded. About the end of the same year Tippoo concluded a treaty of peace with the court of Poonah. He then returned to Seringapatam, and assumed the title of Sultan, thereby throwing off all dependence on or allegiance to the captive Raja (imprisoned by his father) or the Great Mogul.

In 1786 he occupied himself with internal regulations; and from an inventory made at this period we find that the treasure, jewels, and other valuable articles were estimated at eighty millions sterling. He had also 700 elephants, 6000 camels, 11,000 horses, 400,000 bullocks and cows, 100,000 buffaloes, 600,000 sheep, 300,000 firelocks, 300,000 matchlocks, 200,000 swords, and 2000 pieces of cannon, and an immense quantity of gunpowder and other military stores. His regular army consisted of 10,000 cavalry, 10,000 artillery, and 70,000 infantry. He had also 5000 rocket-men, and 40,000 irregular infantry.

During the years 1787 and 1788 the attention of the Sultan was principally engaged in the conversion and subjection of the Nairs, or chiefs of Malabar. He is said to have carried away from that province 70,000 Christians, and to have made Mussulmans of 100,000 Hindus. This he effected by forcible circumcision, and compelling them to eat beef.

It was about this time that he published an edict for the destruction of all the Hindu temples in his dominions, excepting those of Seringapatam and Mail Cottah. Fortunately his officers did not enforce this barbarous regulation.

Although Tippoo Sultan did not show any overt hostility toward the English after he had signed the treaty of 1784, yet in 1787 he sent an embassy to France, to enter into an offensive and defensive alliance, and to stimulate the court of Versailles to a speedy renewal of hostilities with England. The ambassadors returned to Seringapatam in the month of May, 1789, without having obtained their object. The disappointed Sultan vented his rage by putting two of them to death as having betrayed his interests. Tippoo hated the British power in India, and he took every opportunity to annoy such of the native kings as were under its protection. The Raja of Travancore had by the treaty of Mangalore stipulated for the security of his territories. In April, 1790, Tippoo invaded the country and subjected the whole of the northern district. The reasons assigned by Tippoo for the infraction of the terms of the treaty were that two forts, Cranganagore and Jyacotta, which were on the northern boundaries of the Raja's possession, had belonged to his father. This aggression was considered by the English equivalent to a declaration of war, and Colonel Hartley was sent with a considerable detachment to the assistance of the Raja. At this intelligence Tippoo withdrew his army from Travancore, and returned to Seringapatam, when, to his dismay, he heard that the Mahrattas and the Nizam had promised the English a zealous co-operation with their forces.

On the 15th of June, 1790, the English troops, under the command of General Medows, entered the Sultan's territory, and took possession of the fort of Carur without resistance. Daraporam and Coimbatore were shortly afterwards reduced. About the same time a detachment, under Colonel Stuart, captured Dindigul and Paligautchery. The movements and operations of the English forces were so well conducted, that Tippoo found himself unable to oppose them, and he resolved to follow the plan of warfare adopted by his father: instead of defending his own territories, to lay waste those of his enemy. This he did with considerable ability; for in the beginning of 1791 the English, instead of being masters of great part of Mysore, as they had expected, found themselves attacked and annoyed in the very neighbourhood of Madras.

On the 29th of January, 1791, Lord Cornwallis assumed the command of the army, and on the 11th of the same month he was at Vellore. On the 21st of March the fort of Bangalore was taken by storm. On this event Tippoo retired to some distance, and wrote to Lord Cornwallis, requesting a truce. This was refused, and he proceeded to Seringapatam, leaving his army under the command of one of his generals, to watch the motions of the English. On the 3rd of May Lord Cornwallis was at Arakery, within sight of the Sultan's capital; but his troops had suffered a great deal from want of food and forage, and he was compelled to retreat towards Bangalore. The Mahrattas came however to his assistance, and the warfare was carried on with great success.

However, whilst the English were carrying on their successful operations in the north-west part of Mysore, the Sultan made a diversion towards Coimbatore, situated to the south of Seringapatam; and Lieutenant Chalmers, with the whole of his party, were made prisoners. The skill of Tippoo Sultan enabled him to protract the war till the month of February, 1792, when the allies (the English, the Mahrattas, and the troops of the Nizam) encamped in sight of the capital. But it was not until General Abercromby had united his forces to those of Lord Cornwallis, and had determined to take the town by storm, that the haughty mind of the Sultan was humbled. He agreed to give the allies one half of his dominions, and to pay them in the course of twelve months the sum of three krores and thirty lacs of rupees (3,030,000*l.*), to restore all the prisoners, and to deliver up as hostages two of his sons. Abdulkhalik and Moâz Addeen were the names of the two princes, and the attention and kindness evinced by Lord Cornwallis towards them were such as to afford the highest gratification to the Sultan their father. By signing the definitive treaty of the 16th March, 1792, the Sultan lost one half of his dominions. Soon after this the allies quitted the neighbourhood of Seringapatam, and Tippoo sought

the means of replenishing his treasury. This was soon done by imposing exorbitant and extraordinary taxes, which were chiefly levied upon the agriculturists.

Notwithstanding this seeming tranquillity from 1792 to 1796, the Sultan was engaged in inciting all the native chiefs against the British power in India; but it was not until 1798 that the whole extent of his secret machinations and intrigues became known. At the commencement of this year ambassadors were sent from Seringapatam to the Mauritius. Their object was to renew the Sultan's relations with France, and to solicit the aid of 10,000 European and 30,000 negro troops. The proceedings of the embassy were first made known in the month of June to the Marquis Wellesley, the governor-general. About the same time intelligence was received in India of the operations of the French in Egypt. Circumstances like these left no doubt as to the intentions of the Sultan, and on the 3rd of February, 1799, orders were issued for the British armies and those of the allies immediately to invade the dominions of Tippoo. Hostilities commenced on the 5th of March; and, on the 5th of April, General Harris took a strong position opposite the west side of Seringapatam. After besieging the place some time, a general attack was made on the 4th of May, 1799. The Sultan had scarcely finished his repast when he heard the noise of the assault. He instantly repaired towards a breach which the English had succeeded in making a few days before. His troops fled; he endeavoured to rally them; and so long as any of his men remained firm, he continued to dispute the ground against an English column which had forced the breach and gained the ramparts. Finding all his efforts against the enemy fruitless, he mounted his horse, and, in endeavouring to effect his retreat, arrived at a bridge leading to the inner fort; but the place was already occupied by the English, and in his attempts to proceed he was met by a party of Europeans from withinside the gate, by whom he was attacked. Owing to two wounds which he received in his breast, he fell from his horse; his attendants placed him upon a palankeen, in one of the recesses of the gateway, and entreated him to make himself known to the English. This he disdainfully refused to do. A short time afterwards some European soldiers entered the gateway, and one of them attempting to take off the Sultan's sword-belt, the wounded prince, who still held his sword, made a thrust at him and wounded him in the knee; upon which the soldier levelled his musket and shot him through the head. On the afternoon of the 5th of May he was buried in the mausoleum of Hyder Aly. Four companies of European troops escorted the funeral procession, which was strikingly solemn.

When Tippoo met his death he was in his fiftieth year. He was of dark complexion, and about five feet nine inches high; he had a round face, with large black eyes, and an aquiline nose, which gave much animation and expression to his countenance. Although after his misfortunes in 1792 he oppressed the people more than they had ever been in the time of his father, he was nevertheless very popular; and even now the Mysoreans consider him as a martyr to the faith, and as a prince who fell gloriously in the cause of his religion. He used to pass a great portion of his day in reading, and his library, consisting of about 12,000 volumes, was well selected. About one-half of this collection is preserved at the East India House, London; the other half was left at Fort William for the use of the college. The Museum and the Library of the East India House contain many articles both of value and curiosity which once belonged to Tippoo Saib.

('Memoirs of Tippoo Sultan,' in Stewart's *Descriptive Catalogue of the Oriental Library of the late Tippoo Sultan of Mysore*, Cambridge, 1809. This is the most authentic account of Tippoo's life.)

TIPTON. [STAFFORDSHIRE.]

TIRABOSCHI, GIROLAMO, born at Bergamo in 1731, studied in the college of Monza, and afterwards entered the order of the Jesuits. About 1766 he was made professor of rhetoric in the university of Milan, where he wrote his first work, the history of a monastic order long since suppressed, under peculiar circumstances: 'Vetera Humiliatorum Monumenta,' Milan, 1766. In 1770 he was appointed by the duke of Modena librarian of his rich library, in the place of Father Granelli, deceased. He now applied himself to the undertaking of his great work, 'Storia della Letteratura Italiana,' published at Modena, 1772-1783, which he completed in eleven years. The subject was vast and intricate; the only author who had yet attempted to write a general history of Italian literature, Gimma of Naples, had only sketched a rough and very defective outline of it in his 'Storia dell' Italia Letterata.' There were however local histories and biographies concerning particular towns and districts, and the rest of the materials had to be sought among the archives and libraries of Italy. Tiraboschi undertook to write the history of the literature of antient and modern Italy in the most extended sense of the word, including most of, if not all, the individuals deserving of mention in every department of learning, who have flourished in Italy, from the oldest times on record, beginning from the Etruscans and the Greek colonies of Magna Græcia and Sicily, and then proceeding with the history of Roman literature through its rise, progress, and decay, down to the invasion of the northern tribes, with which the second volume concludes. The author distributes the great divisions of learning in separate chapters; poetry, grammar, oratory, history, philosophy, medicine, jurisprudence, and the arts; he gives an account of the principal libraries, and of the great patrons of learning, and although he does not profess to write biography, properly speaking, yet he gives biographical notices of the more illustrious writers and of their productions. The third volume comprises the literary history of Italy during the dark ages, as they are commonly called, from the fifth to the twelfth century. The author makes his way through the scanty and obscure records of those times, and brings to light much curious information concerning the intellectual state of Italy under the Goths, the Longobards, and the Franks. The ecclesiastical writers come in for a great share of this part of the work. The fourth volume includes the period from 1183 to the year 1300. The revival of studies, the formation of the Italian language, the foundation of universities, notices of the civilians and canonists who flourished in that age, an account of the Italian troubadours, of the earliest Italian poets, and of the Italian Latinists, and a view of the splendid architectural works of Arnolfo di Lapo, of Niccolò and Giovanni of Pisa, and other artists, impart a cheering aspect to this period. The fifth volume embraces the 14th century, the age of Dante, Petrarca, and Boccaccio. The author is particularly diffuse in speaking of Petrarca. The sixth volume concerns the 15th century, an age of classical studies; the age of Cosmo and Lorenzo de' Medici, of Poggio, Filelfo, Niccoli, Palla Strozzi, Coluccio Salutati, Paolo Manetti, Cardinal Bessarion, and other collectors of MSS., founders of libraries, and encouragers of learning, and the age also of distinguished jurists and ecclesiastical writers. This volume is very large and is divided into three parts, whilst the preceding volumes are divided each into two parts, each part being subdivided into books and chapters. We cannot help thinking that this mode of division is too formal and cumbersome, and that it might have been simplified and made clearer.

The seventh volume of Tiraboschi's history treats of the 16th century, the age of Leo X., the Augustan age, as it is sometimes called, of Italian literature. This volume, which is still more bulky than the one preceding, is divided into four parts. After giving a sketch of the general condition of Italy during that period, of the encouragement to learning afforded by the various princes, of the universities, academies, libraries, and museums, the author treats first of the theological polemics which arose with the Reformation, then of the philosophical and mathematical studies, of natural history and medicine, of civil and ecclesiastical jurisprudence, of historical writing, and of the Italian Hellenists and Orientalists. He passes next in review the Italian poets, among whom Ariosto and Tasso hold a conspicuous place, and afterwards the Latin poets, the grammarians, rhetoricians, and pulpit orators, and lastly the artists, among whom Michael Angelo, Raffaello, Tiziano, and Correggio stand prominent. It is impossible to peruse this long list of illustrious names without being struck with the seemingly inexhaustible fertility of the Italian mind in almost every branch of knowledge.

The eighth volume embraces the 17th century, which in Italy is scornfully styled the age of the 'seicentisti,' or the age of bad taste, a reproach however which applies mainly to the poets, and not even to the whole of them. The department of history is filled with good names, as well as

that of the mathematical sciences, in which Galileo holds the first rank. With the 17th century Tiraboschi concludes his work. Various reasons prevented his entering the field of contemporary history. This however has been done of late years by Lombardi, in his continuation of Tiraboschi's work: 'Storia della Letteratura Italiana nel Secolo xviii.'

Tiraboschi's work was highly esteemed, and went through numerous editions in various parts of Italy. The author himself superintended the second edition of 'Modena,' 1787-94, in which he made corrections and additions, chiefly in the shape of notes to the text. Antonio Landi made an abridgment of the work in French, which was published at Paris, and at Bern, in 1784; and J. Retzer made a similar abridgment of it in the German language. When the work of Tiraboschi appeared, no other country of Europe had a general history of its own literature. The learned Benedictines of St. Maur had begun a work of this kind concerning the literature of France, which however they left imperfect. The work of Tiraboschi does not give all the information that one might wish, but it contains probably as much information as could be collected and compressed together by any one man upon the subject. It has been said to be deficient in criticism, and in the analysis of conspicuous works, of which he has not given extracts; but this, as he says in his preface, did not form part of his plan, which was already extensive enough, or the work would have had no end. His accuracy and conscientiousness are undisputed. The tone of his remarks, especially on religious matters, is perhaps as temperate as could be expected from a man of his profession, times, and country, who was a sincere believer in the tenets of his church, though not a bigot. For a proof of this we might refer the reader to Tiraboschi's letter to Father Mamachi, a Dominican, who edited at Rome an edition of Tiraboschi's great work with corrections and notes to those passages which were not consonant with his own high notions of Papal prerogative and Roman supremacy, both spiritual and temporal. Tiraboschi's letter was published at Modena in 1785, and was afterwards inserted at the end of the last volume of the second Modena edition of the 'History of Italian Literature.' A tone of refined cutting irony, half veiled, under a most courteous style of language, pervades the whole of the letter. The French writer Ginguené has followed closely Tiraboschi's footsteps in his 'Histoire Littéraire d'Italie,' which however contains only the modern part, or the history of the literature of the Italian language. [Ginguené'.]

The duke of Modena, Ercole III. of Este, in consideration of Tiraboschi's useful labours, made him a knight, and appointed him member of his council in 1780. By the suppression of the order of Jesuits, Tiraboschi had become a secular priest. In 1781 he began to publish another work of bibliography and biography: 'Biblioteca Modenese, o Notizia della Vita e delle Opere degli Scrittori natii degli Stati del Serenissimo Duca di Modena,' 6 vols. 4to., Modena, 1781-86; to which he afterwards added a seventh volume, containing notices of the artists who were born in the dominions of the house of Este. Having thus illustrated the literary history of Modena, and of the other territories of the house of Este, he afterwards wrote the political history of the same country, in his 'Memorie Storiche Modenesi, col codice diplomatico, illustrato con note,' 3 vols. 4to., Modena, 1793. He also published the history of the antient monastery and abbey of Nonantola in the duchy of Modena, founded about the middle of the eighth century by Anselmus, Duke of Friuli, and afterwards greatly enriched by Charlemagne and other princes, and which became a powerful community during the middle ages: 'Storia dell' augusta Badia di S. Silvestro di Nonantola, aggiuntovi il codice diplomatico della medesima, illustrato con note,' 2 vols. folio, Modena, 1784. The other works of Tiraboschi are: 1, 'Vita del Conte D. Fulvio Testi.' Testi was a lyric poet of the seventeenth century, and enjoyed for a time a high office at the court of Modena, but ended his days in prison for state reasons. 2, 'Lettere intorno ai viaggi del Sigr. Bruce,' inserted in the 'Notizie Letterarie' of Cesena, 1792; 3, 'Memoria delle cognizioni che si avevano delle sorgenti del Nilo prima del Viaggio del Sigr. Jacopo Bruce,' inserted in the 1st vol. of the 'Memorie dell' Accademia delle Scienze di Mantova;' 4, Two memoirs on Galileo, his discoveries, and his condemnation by the Inquisition, inserted in the last vol. of the second Modena edition of the 'History of Italian Literature;' 5, 'Notizie della Confraternità di S. Pietro Martire;' 6, 'Vita di Sant' Olimpia, Vedova e Diaconessa della Chiesa di Costantinopoli;' 7, 'Elogio Storico di Rambaldo de Conti Azzoni Avogaro;' besides other minor writings, especially in answer to the critics of his 'History of Italian Literature.' He left unpublished: 1, 'Dizionario Topografico degli Stati Estensi,' published since at Modena, 1824-5; 2, 'Catalogo ragionato dei Libri del già Collegio dei Gesuiti di Brera;' 3, Lettera sulla Venuta di Gustavo Adolfo in Italia;' 4, 'Vita di Giannandrea Barotti Ferrarese;' 5, 'Notizie sulla Zecca di Brescello, sopra alcuni Luoghi del Modenese, ed Albero della casa Montecuccoli;' besides several dissertations and orations. His voluminous correspondence is preserved in the Modena Library.

Tiraboschi died at Modena, in June, 1794, of a disease brought on by sedentary life and constant application. He was buried in the church of SS. Faustino e Giovita, outside of the city, and a Latin inscription was placed on his tomb, written by Father Pozzetti, who succeeded him as librarian, commemorative of his labours and his virtues, among which modesty and charity were most conspicuous.

TIRA'NO. [Valtellino.]

TIRHUT. [Hindustan, p. 217.]

TIRIDA'TES, prince of Media, and afterwards king of Armenia, was the brother of Vologeses, king of the Parthians, that is, of Media. He first appears in history in A.D. 53, in the first war of Corbulo against Vologeses (Tacitus, *Hist.*, xii. 50), who was compelled to desist from his schemes upon Armenia in A.D. 54. In A.D. 58, however, the Parthians again overran Armenia, having been invited by the inhabitants of that country, and Vologeses ceded his conquest to his brother Tiridates, who thus became king of Armenia. As the Romans would not allow this country to become a possession of the Parthians, Corbulo directed his forces against the royal brothers, knowing that Vologeses was prevented from employing his army against him in consequence of an insurrection of the province of Hyrcania. Corbulo therefore soon persuaded Tiridates to submit to the emperor Nero, and to prefer a moderate dependence to an uncertain and dangerous independence. When they were about to meet, in order to settle the conditions of the peace, Tiridates suddenly became afraid of some treacherous design on the part of the Romans, and he therefore broke off the negotiations and renewed the war. Corbulo however defeated him at Artaxata on the Araxes, took and destroyed this old capital of Armenia, and forced the new capital, Tigranocerta [Tigranocerta], to surrender after a short siege. (Tacitus, *Hist.*, xiv. 24; Frontinus, *Stratag.*, ii. 9, exempl. 5.)

Tiridates fled to his brother, who had taken the field against the Hyrcanians, and who entrusted him with the command of a new army, with which Tiridates hoped to expel the Romans from Armenia. He attacked them on the side of Mesopotamia, but the strong position which the Romans kept at Tigranocerta, and the care which they showed in watching the passages of the Euphrates, prevented him from either penetrating into the valley of the Upper Tigris, or from invading Syria, a manœuvre by which Corbulo would have been obliged to hasten to the relief of this province, and to leave Armenia to the incursions of Vologeses. Tiridates therefore listened once more to the pacific proposals of the Romans, who were anxious to avoid any war with the Parthians if they could do so on conditions which would secure their influence over Armenia. Their intention was not to make a Roman province of Armenia. Ambassadors from Tiridates arrived in the camp of Corbulo, and they declared, in the name of Tiridates and his brother Vologeses, that Tiridates was ready to submit to Nero, as a vassal-king, and that Vologeses would keep in future a better understanding with the Romans than before. In order to settle the peace, a day was fixed on which Tiridates was to appear in the camp of Corbulo, who sent Tiberius Alexander [Tiberius Alexander] and his son-in-law Vivianus Annius as hostages into the camp of Tiridates (A.D. 63). When Tiridates en-

tered the tent of Corbulo, he took off his royal diadem, and placed it at the foot of a portrait of the emperor Nero, taking an oath that he would not exercise any right of sovereignty in Armenia till he had again received the same diadem from the hands of the emperor in Rome. (Tacitus, *Hist.*, xv. 28, 29.) Tiridates arrived in Rome in A.D. 66, and when he approached the city a great number of people came out from the gates to behold the entrance of an oriental king descended from the mighty sovereigns of the Parthians. In Zumpt, 'Annales veterum Regnorum et Populorum, imprimis Romanorum,' the Armenian king who entered Rome in A.D. 66 is called Tigranes, but this is a typographical error. (Tacitus, *Hist.*, xvi. 23.) The latter circumstances of the life of Tiridates are unknown. [PARTHIA.]

TIRLEMONT (in Dutch, *Tienen*), situated in 50° 50′ N. lat. and in 4° 50′ E. long., is an inland town in the kingdom of Belgium, in the province of South Brabant, on a small river called the Great Geete. It is a pretty well-built town, and has 8000 inhabitants, who have considerable manufactures of flannel and stockings. There are also brandy distilleries, and breweries which produce a celebrated kind of beer. It is said to have been formerly more populous and thriving than at present. In the wars of the French revolution, several battles took place here between the French and the Austrians; first, in November, 1792, when the Austrians were defeated; secondly, on the 16th of March, 1793, when they again sustained a check, for which they took ample revenge two days afterwards by the decisive victory of Neerwinden.

(Hassel; Stein; Cannabich; Hörschelmann.)

TIRO. [CICERO.]

TIRVALORE, TABLES OF. [VIGA GANITA.]

TIRY, or TYREE. [HEBRIDES.]

TIRYNS was an antient city of Argolis, in the Peloponnesus, situated in 37° 40′ N. lat. and 41° 1′ E. long., at no great distance from the head of the Argolic Bay, now the Gulf of Napoli di Romania. According to a legend in Strabo (viii., p. 373; Casaub.), it was built by Prœtus, an antient king of Argolis, who in the construction of the citadel employed masons from Lycia, who were called Cyclopes. The Greeks attributed most architectural works which were characterised by rude massiveness and great antiquity to the Cyclopes, and such works were consequently described as Cyclopean. Homer (*Iliad*, ii. 559) calls Tiryns the 'walled,' or rather the 'wally' Tiryns: and Pausanias (ii. 25), 1000 years after him, thus describes the remains, as they existed in the second century of our æra. 'The ruins of Tiryns,' he observes, 'were on the right of the road leading from Argos to Epidaurus. The wall of the fortification, which still remains, is the work of the Cyclopes, and is built of unwrought stones, so large that not even the least of them could be even moved by a pair of mules. The intervals between them have been long since filled up with smaller stones, so as to make the whole mass solid and compact.' No cement or mortar was used in these constructions, and it is evident that they were the first rude attempt at building with stone among the Pelasgic Greeks, and constituted their first style of architecture. The second is still visible in the remains of MYCENÆ.

The ruins of Tiryns are thus described by Col. Leake, in his 'Morea,' vol. ii., p. 350:—'They occupy the lowest and flattest of several rocky hills, which rise like islands out of the level plain. The length of the summit of that of Tiryns is about 250 yards, the breadth from 40 to 80; the height above the plain from 20 to 50 feet; the direction nearly north and south. The entire circuit of the walls still remains more or less preserved. Some of the masses of the stone are shaped by art, some of them are rectangular; but these are probably repairs, and not a part of the original work described by Pausanias. The finest specimens of the Cyclopean masonry are near the remains of the eastern gate, where a ramp, supported by a wall of the same kind, leads up to the gate. The ruined wall of the fortress still exists to the height of 25 feet above the top of the ramp; but this is the only part in which the walls rise to any considerable height above the table summit of the hill within the fortress. On one side of this gateway I measured a stone of 10.6 by 3.9 by 3.6. Here the wall is 24½ feet in thickness; in other parts from 20 to 23. But the principal entrance was not here, I think, but on the southern side, adjacent to the south-east angle of the fortress, where a sloping approach from the plain is still to be seen, leading to an opening in the walls.'

In its general form the fortress appears to have consisted of an upper and a lower enclosure of nearly equal dimensions, with an intermediate platform. The southern entrance led, by an ascent to the left, to the upper level, and by a direct passage between the upper inclosure and the eastern wall of the fortress into the lower inclosure, having also a branch to the left into the middle platform, the entrance into which last was nearly opposite to the eastern gate already described. There was also a postern on the western side. In the eastern, as well as in the southern wall, there were galleries in the body of the wall of singular construction, the angle of the roof being formed by merely sloping the courses of the masonry. In the eastern wall there are two parallel passages, of which the outer has six recesses in the exterior wall. These niches were probably intended to serve for the protracted defence of the gallery itself, and the galleries for covered communications leading to places of arms at the extremities of them. One of these places of arms still exists at the south-west angle of the fortress, and there may have been others on either side of the great southern entrance. The passage which led from this entrance to the lower division of the fortress was about 12 feet broad; and about midway there still exists an immense door-post, with a hole in it for a bolt, showing that the passage might be closed upon occasion. In these contrivances for the progressive defence of the interior we find a great resemblance not only to Mycenæ, which was built by the same school of engineers, but to several other Grecian fortresses of remote antiquity. A deficiency of flank defence is another point of resemblance: it is only on the western side, towards the south, that this essential mode of protection seems to have been provided. On this side, besides the place of arms at the south-western angle, there are the foundations of another of a semicircular form, projecting from the same wall, fifty yards farther to the north; and at an equal distance, still farther in the same direction, there is a retirement in the wall, which serves in aid of the semicircular bastion in covering the approach to the postern of the lower inclosure. This latter division of the fortress was of an oval shape, about 100 yards long and 40 broad: its walls formed an acute angle to the north, and several obtuse angles on the east and west. Of the upper inclosure very little remains.

The fortress itself is only a third of a mile in circumference, so that in all probability it must have been no more than the citadel of the Tirynthii, the town itself being situated in a plain of two or three hundred yards in breadth, on the south-west of the fortress: beyond this plain lies a marsh, extending a mile farther towards the sea.

Prœtus, the reputed founder of Tiryns, was succeeded by his son Megapenthes, who is said to have transferred it to Perseus. Perseus transmitted it to his descendant Electryon, whose daughter Alcmena married Amphitryon. The latter prince was expelled from Tiryns by Sthenelus, king of Argos; but his son Hercules recovered his inheritance, and was in consequence called Tirynthius. (Diodorus, iv. 10; Pindar, *Olymp.*, x. 37.)

From Perseus to Amphitryon, Tiryns was a dependency of the neighbouring city Mycenæ. At the time of the Trojan war, Homer (*Iliad*, ii. 559) represents it as being subject to the kings of Argos. Subsequently it was partially destroyed by the Argives. The date of that event is uncertain; but from two passages of Herodotus (vi. 83, and ix. 28), in which mention is made of Tiryns, it appears that it existed up to B.C. 480, and it is probable that it was overthrown about the same time as Mycenæ, B.C. 468. (Clinton, *Fasti Hell.*, ii., p. 425.) According to Strabo (viii., p. 373), the Tirynthians, on leaving their homes, retired to Epidaurus: according to Pausanias (ii. 25), the greater part of them were sent to Argos.

Pausanias also notices what he calls the chambers (θάλαμοι) of the daughters of Prœtus lying between Tiryns and the sea; but he gives no description of them. Strabo speaks of some artificial caverns near Nauplia, which he places at the distance of only 12 stadia from Tiryns, and says that they were attributed to the Cyclopes. It is not improbable that he alludes to the same excavations as Pausanias; but Strabo had probably not seen them, for he never saw Mycenæ. The Tirynthian citadel was also called Licymnia, from Licymnius, a son of Electryon, and brother of Alcmena. (Pindar, *Olymp.*, vii. 49.)

(Leake's *Morea*, ii. 353; Cramer's *Greece*, iii. 253; Sir W. Gell's *Itinerary of the Morea and Argolis*; Dodwell, *Class. Tour*, ii., p. 250.)

TISCHBEIN, JOHN HENRY, called the Elder, one of the most celebrated painters of the eighteenth century, was the fifth son of a baker of Hayna near Gotha, where he was born in 1722. He was first apprenticed to an uncle on the mother's side, who was a locksmith; but he displayed so much talent for drawing, that an elder brother, John Valentine, took him away from his uncle and placed him, in his fourteenth year, with a paper-stainer and decorator in Cassel, of the name of Zimmermann. He received also some instruction from Van Freese, the court painter at Cassel, and soon gave proof of his ability. Tischbein met with an early and a valuable patron in Count Stadion, through whose assistance he was enabled, in 1743, to visit Paris, where he remained five years with Charles Vanloo, and acquired his style of painting. From Paris he went to Venice, and there studied eight months with Piazzetta: from Venice he went to Rome, where he remained two years; he again visited Piazzetta in Venice, and after a short time, in 1751, he returned to Cassel, where, in 1752, he was appointed cabinet painter to the landgrave.

Tischbein excelled in historical and mythological subjects, in which lines are his best pictures, painted from about 1762 until 1785; he died in 1789, as director of the Academy of Cassel, and a member of the Academy of Bologna. A biographical notice of Tischbein with criticisms upon his works was published in Nürnberg in 1797, eight years after his death, by J. F. Engelschall, entitled 'J. H. Tischbein, als Mensch und Künstler dargestellt.' In that work there is a list of 144 historical pieces by Tischbein, of which the following have been considered the best:—the Resurrection of Christ, very large figures, painted in 1763, for the altar of St. Michael's church at Hamburg; the Transfiguration, in the Lutheran church at Cassel, 1765; Hermann's Trophies after his Victory over Varus in the year 9, in the palace of Pyrmont, 1768; ten pictures of the Life of Cleopatra, painted in the palace of Weissenstein, 1769-70; sixteen from the life of Telemachus, in the palace of Wilhelmsthal; an Ecce Homo, in the Roman Catholic chapel at Cassel, 1778; a Deposition from the Cross, and an Ascension, altar-pieces in the principal church of Stralsund, 1787; Christ on the Mount of Olives, an altar-piece presented by him to the church of his native place Hayna, 1788; the Death of Alcestis, 1780; and the Restoration of Alcestis to her husband by Hercules, 1777.

Tischbein painted many pictures from the antient poets, and some from Tasso; several of which are now in the Picture-gallery at Cassel. He painted also a collection of female portraits, selected chiefly for their beauty, which is now at the palace of Wilhelmsthal near Cassel. He also frequently copied his own pictures. Nearly all his works remain in his own country, on which account he is little known out of it. It is remarkable that of all the great galleries of Germany, Münich is the only one that possesses a specimen of his works, and that is only a portrait.

Tischbein painted very slowly, but he was very industrious: he was generally at his easel by five in the morning in the summer time, and he painted until four in the afternoon. He painted in the French style; his colouring was a mixture of the French and the Venetian, and in large compositions very gaudy, but his drawing and chiar'oscuro were very good. In costume however he was incorrect, yet he was as correct perhaps as his sources of information would allow him to be, and it is a fault that he had in common with most of the great painters, especially the Venetians; but according to the critics he generally contrived in his antient pieces to make his actors look much more like Frenchmen and Germans than Greeks or Romans. In his religious pieces he was more successful: he was no follower of Lessing's theory of beauty; he considered beauty of little consequence. He etched several plates after his own pictures:—Venus and Cupid; Women Bathing; Hercules and Omphale; Menelaus and Paris; Thetis and Achilles; and his great picture of the Resurrection of Christ, at Hamburg.

Tischbein was a man of very domestic habits: he had an old servant named Conrad Otto without whom he used to say he should be helpless; he had a cook also who lived with him 21 years. He was twice married, and yet was a husband scarcely four years: he married his first wife in 1756, by whom he had two daughters; he lived with her three years, when she died, and in 1759 he married her sister, with whom however he lived only a few months. His elder daughter Amalia was a clever painter; she was elected, in 1780, a member of the Academy of Cassel; she used to sit to her father for many of the females in his historical works. After Tischbein's death, the Landgrave of Cassel purchased all the works that were in his house, and placed them together in the palace of Wilhelmshöhe.

(Meusel, *Miscellaneen Artistischen Inhalts*; Füssli, *Allgemeines Künstler Lexicon*; &c.)

TISCHBEIN, JOHN HENRY WILLIAM, called the Younger, the youngest son of John Conrad Tischbein, and nephew of the preceding, with whom he is sometimes confounded, was born at Hayna in 1751. He was instructed by his uncle John Henry at Cassel in historical painting, and he afterwards studied landscape painting three years with his uncle John Jacob at Hamburg; in 1770 he went to Holland, where he remained two years, and in 1772 returned to Cassel and painted portraits and landscapes; he visited also Hanover and Berlin, and painted many portraits in both places. In 1779 he left Cassel, by the desire of the Landgrave, for Italy, but he spent about two years in Zürich, where he painted many portraits and made the design of his celebrated picture of Conradin of Suabia, playing, after his sentence to death, a game at draughts with Frederick of Austria. In 1781 Tischbein arrived in Rome, and his first studies were some copies in oil after Raphael and Guercino, and some drawings after Raphael, Domenichino, and Llonardo da Vinci. His first original picture was Hercules choosing between Vice and Virtue, after which he painted his picture of Conradin of Suabia, now in the palace of Pyrmont. In 1787 he went to Naples, and the next year painted the portrait of the crown-prince for the queen, who presented Tischbein with a valuable snuff-box and 200 ducats, expressing her complete satisfaction with the picture. In Naples he appears to have acquired laurels rapidly, for in 1790 he was appointed director of the Academy with a salary of 600 ducats per annum, which however he lost again in 1799, at the breaking out of the revolution at Naples, but he found no difficulty in obtaining permission from the French authorities to return to Germany with what property he chose to take with him. He accordingly embarked, with the painter Hackert and another, for Leghorn, taking with him the plates of his illustrations to Homer, his designs for Sir W. Hamilton's second collection of vases, and some other works of art: but the ship was driven by a storm upon the coast of Corsica, and was captured by a French ship of war; it was however set at liberty again, and after a troublesome journey of four months Tischbein at last reached Cassel in safety. During his residence in Naples he published there, in 1796, a remarkable work upon animals, in two parts, folio, entitled 'Têtes des Différents Animaux, dessinés d'après Nature, pour donner une idée plus exacte de leurs caractères.' The first part contains 16 designs of animals, and the first plate of this part is the celebrated design called in Italy Tischbein's Laocoon; it represents a large snake attacking and destroying a lioness and her young in their den; a design of remarkable power and spirit: the second part contains 8 plates only, consisting of characteristic heads of men and gods, as—Correggio, Salvator Rosa, Michael Angelo, Raphael, Scipio Africanus, Caracalla, Jupiter, and Apollo. Tischbein after his return to Germany lived principally at Hamburg and at Eutin in Oldenburg near Lübeck; the majority of his works are in the possession of the grand-duke of Oldenburg; the following paintings are three of his most celebrated works:—Ajax and Cassandra, painted in 1803; 'Let the Little Children come unto me,' painted in 1806, for the altar of the church of St. Angari at Bremen; and Hector taking leave of Andromache, painted in 1810. He painted also the portraits of Klopstock, of Heyne, and of Blücher.

In Göttingen in 1801-4 he published in royal folio his favourite work on Homer, with explanations by Heyne—'Homer, nach Antiken gezeichnet von Heinrich Tischbein, Direcktor, &c., mit erläuterungen von Chr. Gottl. Heyne,' i.-vi., each number containing 6 plates: the portraits of the Homeric heroes were engraved by R. Morghen. Tischbein's drawings for Sir W. Hamilton's second collection of vases, published at Naples from 1791, in 4 vols. folio, amount to 214: the work is entitled 'A Collection of Engravings from Antient Vases, mostly of pure Greek workmanship, discovered in Sepulchres in the Kingdom of the

Two Sicilies, but principally in the environs of Naples, during the years 1789 and 1790; now in the possession of Sir W. Hamilton, published by William Tischbein, director of the Royal Academy of Painting at Naples.' The text, which is in French and English, is by Italinsky. Tischbein published other works, and etched also several plates, after Paul Potter, Roos, Rosa di Tivoli, Rembrandt, &c. As a painter his drawing was correct, and his expression and colouring good, and he excelled in drawing animals. He died in 1829. There were many other artists of this family, of various degrees of merit, but they are unknown beyond their own circles.

TISIAS. [Oratory.]

TISSAPHERNES. [Cyrus the Younger.]

TISSOT, SIMON ANDREW, an eminent Swiss physician, was born at Lausanne, in the canton de Vaud, in 1728. He studied first at Geneva, and then at Montpellier, from 1746 to 1749, where he took his degree of Doctor of Medicine. He then returned to Switzerland and settled at Lausanne, where he joined to an extensive practice a considerable degree of theoretical knowledge. His reputation spread rapidly through Europe in consequence of his medical publications, and caused him to be consulted from all parts. He was also offered at various times several important situations at different foreign courts and universities, all which he declined, and remained satisfied with the respect and comfort which he enjoyed at home, and with the office of professor of medicine at the college of Lausanne. However, in 1780, he could not resist the warm solicitations of the emperor Joseph II., who conferred on him the professorship of clinical medicine at the university of Pavia. Being thrown thus late in life into so difficult a post, and being naturally of a modest and shy disposition, he did not at first answer the expectations formed of him. However there soon after broke out in the province an epidemic bilious fever, as to the treatment of which the physicians of the place were not agreed. On this occasion the Count de Firmian, the celebrated minister under the archduke, gave orders that Tissot's directions should be followed, as he had treated a similar disorder with great success in the canton of Le Valais in 1755. His system was again successful, and the students not only celebrated his triumph with fêtes, but, wishing to render the memory of it more durable, they caused a marble inscription, beginning with the words *Immortali Præceptori*, to be placed under the portico of the school. After holding his professorship for three years, Tissot obtained permission to retire from office. During his stay in Italy he had made use of the vacations to travel through the finest parts of that country, and was everywhere received with the most marked and flattering attention. Pope Pius VI. signified his desire of seeing so estimable and eminent a man; he accordingly received him with much kindness, excused him (as being a Protestant) from the ceremonial customary at presentations at the Papal court, and made him a present of a set of the gold medals struck during his pontificate.

Having always lived economically and without any display, Tissot had saved while in Italy a sum of money sufficient for the purchase of a country-seat, which he intended to be the retreat of his old age. He had only engaged himself in the Austrian service for a very limited period; he had now finished the medical education of a favourite nephew; and, lastly, as he himself with characteristic playfulness expressed it, having received the title of 'Immortal,' he thought it prudent not to run any risk of descending from such a height, and of outliving (as he might easily do) his apotheosis. He was succeeded in his professorship at Pavia by the celebrated J. P. Frank, and died unmarried, on the 15th of June, 1797, in his native land, at the age of sixty-nine. A complete list of his works is given in the 'Biographie Médicale,' from which work the above account is taken: of these the following are the most interesting: 'Tentamen de Morbis ex Manustupratione Ortis,' Louvain, 8vo., 1760; which was translated into French, and has been frequently republished. 'Dissertatio de Febribus Biliosis, seu Historia Epidemiae Lausanensis anni 1755,' Lausanne, 1758, 8vo. 'Avis au Peuple sur sa Santé,' Lausanne, 1761, 12mo., which was translated into no less than seven different languages, and in less than six years reached the tenth edition. It has since been frequently reprinted, and contributed more than any of his other works to make the author's name known throughout Europe. It served also as the model and foundation for many similar popular works in more recent times. 'De Valetudine Litteratorum,' Lausanne, 8vo., 1766, which was translated into French, and frequently reprinted, and of which the latest and best edition is that by F. G. Boisseau, Paris, 1826, 18mo., with notes by the editor, and a memoir of the author. 'Essai sur les Maladies des Gens du Monde,' which has also gone through several editions. There is a complete edition of his works by J. N. Hallé, in 11 vols. 8vo., Paris, 1811, with notes by the editor and a memoir of the author. Besides these original works Tissot edited at Yverdun, 1779, in three volumes 4to., the treatise of Morgagni, 'De Sedibus et Causis Morborum per Anatomen Indagatis,' to which he prefixed a history of the Life and Works of the author.

TISSUES, VEGETABLE. The various organs of plants, as the leaves, flowers, roots, stem, &c., are composed of certain ultimate structures, which are called elementary organs or vegetable tissues. Most parts of a plant, when cut into, present to the naked eye an almost perfectly homogeneous character; and it is only by calling to our aid the microscope that we can distinguish the various structures of which they are composed. On taking a leaf or a portion of the stem of one of the higher plants, and submitting it to the microscope, it will be found to consist, 1, of a thin transparent homogeneous membrane, which is arranged in the form of cells or cylindrical tubes; 2, of fibres, which are arranged in a spiral form in the interior of the cells or tubes; and 3, a fluid of varying density, filling the cells and existing between them, and containing in it globules of various sizes and kinds. These parts constitute what are known respectively as 'elementary membrane,' 'elementary fibre,' and 'organic mucus.' Elementary membrane, and the fluid from which it is developed, are the only two which are constantly present in all plants. Fibre is only found in the higher forms of plants.

The primary form in which organization appears is that of a simple cell containing or surrounded by a fluid; and however complicated may be the forms which the tissues of plants may assume, they mostly originate in this primitive form. Some late researches on the development of tissues in animals seem to lead to the conclusion that some of these tissues are formed from a primitive fibre; and from analogy it has been supposed that the same may occur in vegetable organization. Whether however the cell or the fibre shall be determined to be the primitive form of tissue in the animal kingdom, there can be little doubt that the cell is so in the vegetable kingdom.

The development of the cell itself is a subject of much interest, and great light has been thrown on this obscure department of physiology by the late researches of Dr. Schleiden. It was long since observed by Robert Brown that in the cells of the tissue of Orchidaceous plants there was an opaque spot, or '*areola*,' in the interior of the cell: Schleiden, finding this spot very constant in the cells of certain plants, concluded that it must have some important relation to them, and submitted it to a very strict examination. He found that these bodies were the original particles from whence the cells were formed; hence he called them cytoblasts. The best parts of the plant for observing the phenomena to which these bodies give rise are, the large cell which exists between the embryo and the membranes of the seed, and in which the albumen is subsequently deposited, the embryonal sac, and the end of the pollen-tube, from which the embryo itself is developed. In the gummy fluid that exists in these parts in the process of growth a number of granules are developed, rendering this transparent homogeneous fluid opalescent, or almost opaque. It is among these granules, which assume a brownish-yellow colour under the influence of tincture of iodine, that the cytoblasts make their appearance. Whilst in this state the cytoblasts increase considerably in size, becoming larger than the granules of the gum; and as soon as they have attained their full size, a delicate transparent vesicle rises upon their surface: this is the young cell, which at first represents a very flat segment of a sphere, whose plane side is formed by the cytoblast, and the convex side by the young cell, which is situated on it, somewhat like a watch-glass on a watch. In its natural medium it is almost distinguished by this circumstance alone, that the space between its convexity

and the cytoblast is perfectly clear and transparent, and probably filled with an aqueous fluid, and is bounded by the surrounding mucous granules, pressed back by its expansion. But if these young cells are isolated, the mucous granules may almost entirely be removed by shaking the stage of the microscope. This cannot however be long observed, as they entirely dissolve in a few minutes in distilled water, leaving the cytoblasts behind. The vesicle gradually gets larger and becomes more consistent, its parietes being formed entirely of vegetable gelatine (Gallerte), except the cytoblast, which always forms a portion of the wall. The whole cell now gradually enlarges beyond the edges of the cytoblast, and gets so large, that at last the latter appears as a small body enclosed in one of the side walls. At this point the cytoblast assumes the character of the areola described by Brown. The young cell frequently presents great irregularities, a proof that the expansion does not proceed regularly from a fixed point. The cell grows progressively, and becomes, under the influence of surrounding objects, more regular, and most frequently assumes the form of a rhomboidal dodecahedron. The cytoblast still remains in the cell, partaking of the life inherent in the cell, unless it is in cells destined to a higher development, when it is either reabsorbed in the walls of the cell, or cast off into the cell as a useless member, and there reabsorbed. It is only after the reabsorption of the cytoblast that secondary depositions are observed to commence on the inside of the walls of the cell. (Schleiden.)

The cytoblast remains in the cells in only a small number of cases. They are found in a portion of the cellular tissue of Orchidaceæ, also of Cactaceæ. In hairs likewise, and cells in which the function of cyclosis is carried on, they are very frequently permanent; also in the pollen granules of Abietinæ. Dr. Schleiden always found them present in recently-formed cellular tissue.

The increase of the bulk and size of plants depends upon the development, in the interior of the old or originally formed cells, of several new cytoblasts, each of which develops a new cell, and causes by its presence the absorption or destruction of the old one.

But all the parts of plants do not consist of simple cells; the cells become elongated, forming fibrous or woody tissue, and spiral fibres are generated both in cells and tubes, constituting the various forms of fibro-cellular and vascular tissue, and it will be necessary to say a few words on their development. One great error that has arisen from the naming and classification of the tissues of the plants has been the supposition that they were essentially distinct and possessed a different origin. This is seen in the theories of the origin of wood. Woody fibres are nothing more than elongated cells with thickened walls; but they were supposed to originate in a different manner from the cellular tissue; and an ingenious theory of Du Petit Thouars has been adopted by many eminent botanists for the purpose of explaining this phenomenon.

In referring to Du Petit Thouars' views, Dr. Lindley says, 'The wood is not formed out of the bark as a mere deposition, but it is produced from matter elaborated in the leaves sent downwards, either through the vessels of the inner bark along with the matter for forming the liber, by which it is subsequently parted with, or it and the liber are transmitted distinct from one another, the one adhering to the albumen, the other to the bark. I know of no proof of the former supposition; of the latter there is every reason to believe the truth.' And again, 'It is not merely in the property of increasing the species that buds agree with seeds, but that they emit roots in like manner; and that the wood and liber are both formed by the downward descent of bud-roots, at first nourished by the moisture of the cambium, and finally imbedded in the cellular tissue which is the result of the organization of that secretion.' This theory then supposes that woody tissue is sent down as a deposit from buds and leaves. But it is much too general, and whatever may be the agency of the leaves in elaborating the sap, and preparing the secretions of plants, they are certainly not the only agents engaged in developing the woody tissue. There are many parts of plants that possess no leaves, and some whole orders, as Cactaceæ, that possess no leaves that yet develop woody tissue. Trees also that have the bark removed in a circle from the stem at the spring of the year, before the leaves are developed, will at the end of the year exhibit between the bark and wood new woody tissue. This was proved by a series of experiments performed on beech-trees by Dr. Lankester. The existence of woody excrescences in the bark of trees is also another fact opposed to Du Petit Thouars' theory. These excrescences exist in the form of knobs, and are most frequent on the beech, projecting from the bark of the tree. On examining them it will be found that they have no connection with the wood of the tree, and consist of several layers of contorted woody tissue, enveloped in a bark of their own, consisting of liber and cellular integument. They are of all sizes, from a mere point to that of an orange. The smallest consist of cellular tissue, in the centre of which a darker spot is seen, as though the tissue was injured or diseased. It is around this spot that the fibres of woody tissue develop themselves. These bodies appear to have their origin in an undeveloped bud: hence they are called by Dutrochet *embryo-buds;* but as they go on increasing in size, and development occurs in a circular, rather than a longitudinal direction, they are described by Lankester as *abortive branches*. From the researches of Schleiden there can be little doubt but that the elongated tissue is developed in the same manner as cells. A question that still arises, and requires solution, is, as to whether the single fibres of woody tissue are the product of a single cytoblast or of several. In the tissue called pitted or Bothrenchyma, there are evident indications of its cylindrical tubes being formed of several cells united together, and the walls, being absorbed at their point of union, have thus produced a continuous tube.

The above observations of Schleiden have set aside the supposition that the cell is composed entirely of spiral fibres intimately superposed. But still the question recurs as to whether fibre may not be generated independent of membrane. Meyen found fibres without membrane in the genus *Stelis;* Lindley observed them in *Collomia;* and many other instances are known in which fibres are found in plants without any apparently enveloping membrane. The late researches of Dr. Martin Barry on the development of animal tissue from the spiral fibre of the blood-globule have induced some botanists to examine this question; and Dr. Willshire, in a paper in the 9th volume of the 'Annals of Natural History,' has endeavoured to prove that the irregular-shaped bodies marked with dark lines, and found in the juices of many plants, are the cytoblasts of pure fibrous tissue. If such a development of fibre takes place, it can be only in exceedingly rare cases. Schleiden in his memoir on Phytogenesis states that fibres are never formed free, but always in the interior of cells, and that the walls of these cells in the young state are simple and of a very delicate texture.

Whether fibre is formed independent of membrane or not, there is no doubt of its formation in a large number of organs in the inside of cells and tubes forming the fibro-cellular and fibro-vascular tissues. According to Schleiden, the cells in which the development of fibre takes place are in the commencement of the formation of the fibres filled with starch, rarely with mucus or gum, although the starch passes into the state of mucus or gum, and then into that of gelatin (gallerte). From this latter vegetable fibres are formed which in their development always follow the direction of a spiral line, whose coils are narrower or wider according to circumstances. The development of the fibre is the same in the spiral vessel as in the spiral cell, there being no difference between the two but in their dimensions. In the first volume of the 'Transactions of the Microscopical Society of London' (1842), Mr. Quekett gives the following account of the development of fibre in the vascular tissue of plants:—'When the young vessels (that is, membranous tubes) are recognised, they appear as pellucid glossy tubes, with a cytoblast in some part of their interior; earlier than this they are not to be readily recognised from cells. As they grow older the cytoblast diminishes, and the contents, which at first were clear and gelatinous, become less transparent from containing thousands of granules, which are too small to allow of the passage of light, and consequently appear as dark points; these atoms are about the $\frac{1}{30000}$ of an inch in diameter, and have the motion known as "active molecules." If the vessel be wounded at this period, the gelatinous contents pour slowly out, and then the singular movements of these molecules are still more clearly seen. These atoms, from their freedom of motion, are arranged indiscriminately in the interior of the vessel, but in a short time some of them

enlarge, and then transmit a little light, which, on account of their minute dimensions, is not suffered to pass as a white pencil, but is decomposed in its course, the granule thereby becoming of a greenish hue. 'The granules exhibiting this greenish hue are now in a fit state to enter into the composition of the fibre that is to exist in the interior of the membranous tube.' This is effected in the following manner:—'The granules which are in active motion in the viscid fluid near one of the ends become severally attracted to the inner wall of the vessel, beginning at the very point; those granules first attracted appear as if cemented to the spot by the viscid fluid in that direction losing some of its watery character; for there appears a string of a whitish colour, besides granules, in the line which the fibre is to occupy. As the other granules are attracted to those already fixed in an inclined direction, the spiral course is soon to be seen, and the same action progressively goes on from the end where it began towards the other, around the interior of the tube in the form of a spiral; the fibre being produced, like a root, by having the new matter added and continually attached to the growing point, thereby causing its gradual elongation.' Spiral cells and vessels thus formed exhibit a great variety of appearance, depending on the period in the age of the cell or tube at which the development of the fibre takes place, as well as the modifications that occur in the chemical changes of the substances from which the fibres are formed. The cause of the arrangement of the particles in a fibrous form is still not satisfactorily explained, and it is most commonly referred to an attraction between the sides of the membrane, of the cell, and the particles it contains, but why they form a spiral is a mystery yet to be solved. [Spiral Structure of Plants.]

The various forms of vegetable tissue found in the different organs of plants are included in the following arrangement:—

I. Fibrous.

Tissue in which elementary fibre is alone apparent.

II. Cellular.

Tissue composed of membrane in the form of cells whose length does not greatly exceed their breadth.

1. *Merenchyma*, the cells of which touch each other only at some points.

2. *Parenchyma*, the walls of the cells of which are generally united.

3. *Prosenchyma*, the cells of which are always fusiform, and overlie each other at their ends.

III. Vascular.

Tissue composed of cylindrical tubes of membrane continuous, or overlying each other at their ends.

1. *Pleurenchyma*, with the sides of the tubes thickened and tapering to each end.

2. *Cinenchyma*, the sides of the tubes of which anastomoze, and convey a peculiar fluid.

IV. Fibro-cellular.

Tissue composed of cells, in the inside of which fibres are generated.

a. Genuine.

1. Fibrous cells.

b. Spurious.

2. Porous cells.
3. Dotted cells.

V. Fibro-vascular.

Tissue composed of tubes, in the inside of which one or more spiral fibres are more or less perfectly developed.

a. Genuine.

1. Spiral vessels.
2. Annular vessels.
3. Moniliform vessels.

b. Spurious.

4. Scalariform vessels.
5. Porous vessels. (Bothrenchyma.)
6. Dotted vessels.

This arrangement includes the principal forms of tissue observed in plants, but the divisions are not founded upon any essential difference in the structure or functions of the various tissues. The most important distinction exists between membrane and fibre, which are apparently developed under the influence of different forces. The cell and the tube differ but in their dimensions, and the same is true of them when fibre is generated in their inside.

Fibrous Tissue.—Although the development of fibre independent of membrane is still undecided, many of the parts of plants exhibit fibres divested of membrane. Fibres spirally arranged and adhering only together by vegetable mucus, which is dissolved away by the application of water, were discovered by Brown, in the seed-coat of Casuarina, and by Lindley, in the same position in *Collomia linearis*. Meyen, who maintains that all cells may be composed of minute fibres, records many instances of vegetable structure in which fibre of a spiral form alone is most apparent, as the parenchyma of a species of Stelis, in the external layer or bark of the aerial roots of many species of Orchidaceæ, and also in species of Melocactus and Mammillaria. Fibres not assuming a spiral form, and independent of cells or tubes, have been described by Purkinje. In the lining of the anthers of Polygala Chamæbuxus they are found short, straight, and radiating; in the anthers of Linaria cymbalaria they form distinct arches; and in those of some species of Campanula, they are arranged like the teeth of a comb. The fibre in all cases is very minute, varying from $\frac{1}{2000}$ to $\frac{1}{10000}$ of an inch in diameter. It is most commonly transparent and colourless, but in some cases has been observed of a greenish colour. Purkinje, who has recently investigated it very attentively, asserts that it is hollow; but Lindley, Schleiden, and Morren are of opinion that it is solid.

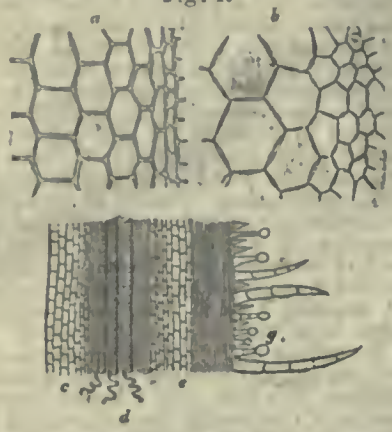
Cellular Tissue; also called *utricular* and *vesicular tissue* the Parenchyma of Lindley and Morren, *tela cellulosa* of Link, and *contextus* and *complexus cellulosus* of older writers; *Zellgewebe*, Germ.; *Tissu cellulaire*, French.—This tissue consists of cells or cavities, which are closed on all sides, and are formed of a delicate, mostly transparent membrane developed from a cytoblast. It is present in the whole vegetable kingdom; and all the lower forms of plants, constituting the class Acrogens, are composed entirely of it, and have hence been called *Cellulares*. In the higher plants it is most abundant in fruits and succulent leaves. It exists in larger quantity in herbs than trees, and the younger the plant is the more it abounds, and constitutes the entire structure of the embryo.

The normal form of the cells is spheroidal, and when they exist in this or in an elliptical form, and only touch each other at a few points without exerting pressure, they constitute the tissue called by Meyen *Merenchyma*. The cells in this case may form a regular or irregular layer, a distinction which may be of some importance. Such tissue is found in many parts of plants, especially those which are delicate and easily torn, as in the pulp of fruits like the strawberry, in the petals of the white lily, in the stem of Cactus pendulus, where they are spheroidal, and in the leaf of the Agave Americana, where they are elliptical. The cells also which constitute the entire of many of the lower plants belong to this division of cellular tissue. They are seen separate or loosely adhering to each other in the Protococcus nivalis, the plant of the Red snow [Snow, Red], in many of the smuts and brands, as Ustilago and Uredo. Chroolepus, and many of the lower forms of algæ and fungi, consist of filaments which are entirely composed of spheroidal cells arranged one upon another.

In the higher forms of plants the vegetative force is greater, and a greater number of cells being generated in a given space, they press on each other on all sides, assuming a variety of forms, and constituting the tissue called by Meyen *Parenchyma*. The most common form which the cells present under these circumstances is the rhomboidal dodecahedron, which is the mathematical form that a globe assumes when subjected to the pressure of a number of globes touching each other at the same time. These cells when cut through, as in the section of a portion of pith, or the leaf of a plant, will present their cut margins, when seen through the microscope, in the form of hexagons. (*a* and *b*, *Fig.* 1.) But the pressure is not always equal on all sides of the cells, so that a great number of secondary forms are the result. When the vesicles are elongated, the dodecahedrons assume the form of right-angled prisms, terminated by four-sided pyramids, whose faces replace the angle of the pyramids at varying degrees of inclination to the axis. Many of the forms thus assumed characterise parts of plants, and are very constant in the

same species of plants. The principal varieties of Parenchyma distinguished by Meyen are

Fig. 1.



1. The *cubical*, which exists in the cuticle of some leaves, and is not unfrequently met with in bark and pith, as in the pith of Viscum album. (e, *Fig.* 1.)

2. The *columnar*, of which there are two varieties: the *cylindrical* (*cylindrenchyma* of Morren), examples of which may be seen in Chara and in Agaricus muscarius; the *prismatical* (*prismenchyma*), frequently seen in the pith and the bark of plants, and when compressed it becomes the muriform tissue (*f*, *Fig.* 1), which is constantly found in the medullary rays, and has its name from the cells being arranged as bricks in a wall.

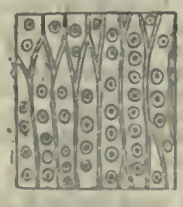
3. The *dodecahedral:* the natural form of parenchyma when the cells are of equal size and exert on each other equal pressure, and when cut present a hexagonal form. (*a*, *c*, *Fig.* 4.)

4. The *stellated* (*actinenchyma*), in which the cells, from the irregularity of their walls, assume a star-like form, seen in Musa.

5. The *tabulated*, seen in the epiphlæum of many plants: other forms, as conical (*conenchyma; h*, *Fig.* 1), oval (*ovenchyma*), fusiform (*atractenchyma*), sinuous (*colpenchyma*), branched (*cladenchyma*), entangled (*dædalenchyma*), have been described by Morren.

Prosenchyma differs from Parenchyma in the cells always having an elliptical form which taper to their extremities, where they overlie each other. This form of tissue is found only in the bark and wood, and is a transition from cellular to what is called woody tissue. Meyen applies this term especially to the tissue forming the wood of Coniferæ and Cycadaceæ. In these families this tissue is marked with dots, which are surrounded by a circle.

Fig. 2.



(*Fig.* 2.) These dots were formerly supposed to be glands, and to secrete the resinous matter which abounds in them, and hence it was called 'glandular woody tissue.' The researches of Mohl and others have however shown that these dots are the result of the development of fibre within the walls of the cells, and in this view the Prosenchyma not only constitutes a transition from cellular to vascular tissue, but also a transition from fibro-cellular to fibro-vascular tissue.

Contents of Cells.—The vesicle of cellular tissue when it rises from its cytoblast is a thin transparent membrane, which as it enlarges becomes thickened from within by the appropriation of proper nutriment which is contained in the cell. This cell in the early stages of its growth is filled with a fluid, at first clear, but afterwards opalescent from the development in it of minute granules. These granules are of various shapes and sizes, and always excessively minute. In their early stages they possess the characters of starch, more particularly the property of assuming a blue colour when brought in contact with tincture of iodine. In the older cells many of the granules lose the character of starch, and possess other properties. Some of them, and these more minute than those of starch, are not coloured by iodine, and are soluble in alcohol, and partake of a resinous character. They give the peculiar colour to the elaborated sap, whatever that may be, and in plants with milky juices constitute the caoutchouc which they yield. They seem also to be the constituents of the volatile oils, resins, balsams, gums, &c. that plants yield. [Secretions, Vegetable.] Another set of globules are also found present in old cells, and these constitute what is called *chlorophyl*, or *chromule*, and exist especially in the cells of plants on their surface, giving to them their peculiar colours. [Sap.] It is from the remaining granules of starch that the cells are nourished. Previous to being appropriated by the walls of the cell they are converted into a substance called by Meyen vegetable jelly (gallerte). It is from this substance, varying in almost every family of plants, that the cells are thickened, by which the delicate membrane in many cases becomes excessively hard, as in the stones of many fruits, the seed of the Phytelephas Macrocarpa, and the wood of many trees. In simple cellular tissue and in woody tissue this material is applied equally to the whole surface of the cell, forming regular layers: in the fibro-cellular and fibro-vascular tissues it is appropriated in the form of fibre.

Another class of bodies found in the interior of cells, and which appear to have nothing to do with the nutrition of the plant, are those crystalline bodies called Raphides. They occur singly or in bundles, and have an acicular form, and are long or short according to circumstances. In length they measure from $\frac{1}{40}$th to $\frac{1}{100}$th part of an inch. These crystals were first observed in the proper juices of plants, and have been subsequently found in all parts of plants where cellular tissue exists. They were formerly supposed to exist between the cells, but later observers have seen them in cells, and they probably exist in both situations. The form of these bodies is not satisfactorily determined. Mohl describes them as right-angled four-sided prisms vanishing into points. Quekett, who is one of the latest observers on this point, says they are decidedly four-sided prisms, but not always right-angled. Those which are conglomerated are called crystal-glands (krystal-drüsen) by Meyen. They seldom present more than the pyramid of each little crystal composing them. The proportion in which they exist in plants is sometimes very great. In some species of Cactaceæ, according to Quekett, the crystals equal the weight of the dried tissue. One hundred grains of Turkey rhubarb-root yield between 30 and 40 grains of raphides; the same quantity of tissue of Scilla maritima yielded 10 grains. In most plants these crystals are composed of either oxalate or phosphate of lime. Raspail says the crystals of the oxalate of lime are four-sided prisms with pyramids of the same base; those of the phosphate, six-sided prisms. In Chara crystals of carbonate of lime occur in great abundance on the outside of the tissue, and we have observed them in the intercellular passages immediately under the epidermis, but they do not occur in the interior parts of the plant. Schübler found that the crystal-glands of Hydrurus crystallophorus consisted of carbonate of lime, and Saigey and De la Fosse found silica in the crystals of the Mirabilis Jalapa. Silica is a very prominent constituent of the Graminaceæ, but is seldom found crystallized. It gives the hardness to the epidermis of the Dutch rush, and is secreted in large quantities in the joints of the stem of the bamboo, and is used as an article of commerce under the name of *Tabasheer*. From the variable form of the crystals in plants it may be inferred that other salts form them besides the above. These bodies do not appear to be necessary parts of the tissues in which they occur, and they have been compared by Link to *calculi* and other concretions in the animal kingdom. This view is rendered very probable by the fact that they are always composed of those elements which the plants take up from the soil as necessary nutriment. Meyen has pointed out the fact that plants growing near the sea will throw off the superabundance of chloride of sodium in their tissues in the form of crystals; and we have found crystals of carbonate of lime most abundant in Chara flexilis, where the water in which it grew contained most of that substance. Phosphate of lime

is necessary to the nutrition of many plants, and the elements of oxalic acid exist in the sap of all plants; and when these are in greater abundance than the vital energies of the plant can appropriate, the laws of chemical affinity come into play, and crystallization is the result.

Growth, Form, &c.—The vesicles of cellular tissue are very small, and cannot be distinguished with the naked eye; and in fact all investigations on the structure, development, and functions of the tissues of plants, can only be conducted with the aid of the microscope. The measurements of the cells give them a size varying from $\frac{1}{30}$th to the $\frac{1}{1000}$th of an inch in diameter. In the lower tribes, as in the Fungi, their generation is very rapid, and it is well known that mushrooms, puffballs, &c. will attain a great size in the course of a single night. The force too with which they are generated is very great, and there are many well-authenticated instances of agarics springing up beneath pavements and displacing stones of great weight and size.

The walls of the loose spheroidal cells in merenchyma consist of a single membrane, but the walls of the more closely-pressed cells of parenchyma consist of two membranes, originally distinct, but fused into one by growth. It frequently happens that the walls of the cells are not accurately applied to each other, and consequently spaces of various kinds occur between the cells. These are called *intercellular passages*. They occur in the greatest abundance in the loose merenchymatous tissue. When these passages exist between the walls of two cells whose sides are united in their middle and recede towards their margins, they are called by Link *meatus intercellulares*. These are most frequently met with in the epidermis of plants. Where the passages are formed of three or more cells the sides of whose walls do not touch, they are called *ductus intercellulares*. These are very well seen in the parenchyma of the stem of the iris and hyacinth, and Heracleum. These passages have been supposed by De Candolle and others to convey the sap; but this has probably arisen from an error in observation, as they are easily filled with sap when cut through. Others again confound these passages with the peculiar vascular tissue described by Schultes as Laticiferous tissue (Cinenchyma).

Another kind of intercellular formation are the *air-cells*, the *lacunæ intercellulares* of Link, which are large cavities formed in the tissue of plants, and whose walls are entirely formed of cellular tissue. They may be very distinctly divided into two kinds, the *regular* and the *irregular*. The regular exist under the epidermis of many plants and vary in size, but have in all cases a regularity of structure, their sides being formed of equal-sized cells of cellular tissue. They may be seen in the leaf-stalk of Calla æthiopica, the stem of Œnanthe Phellandrium, and the petioles of Nymphæa. They are very common in water-plants. They are always filled with air in these plants, and serve as a means of buoying them up in the water. The irregular air-cells, *lacunæ* of Link, are found in old plants; they arise from the growth of the plant tearing asunder the cellular tissue, or from a deficient development or even the absorption of this tissue in particular directions. They may be seen in the stem of the fronds of the Aspidium Filix Mas, of Hippuris and Equisetum, and in nearly the whole of the family Umbelliferæ.

The other organs which are formed by and found in the midst of the cellular tissue are the *sap-cells* and *glands*. The sap-cells, the *opangia* of Link, consist of enlarged cells of tissue, varying much in size, but always filled with elaborated sap. They are found in the skin of the fruit of the citron, pomegranate, &c. These are regular in form, but in the roots and rhizomata of such plants as the ginger, Archangelica, and Aristolochia, they are found of an irregular form. The glands, which are by some supposed to be the agents by which the peculiar secretions of the plant are immediately separated from the latex, are composed of cells pressed together, and assuming a variety of forms. When examined, these cells are found to contain in many instances the resin, gum, oil, &c. which give to the plant some of its peculiar physical properties.

The organs just enumerated as present in the cellular tissue are met with chiefly in the merenchymatous and parenchymatous forms.

Vascular or *Tubular Tissue* consists of continuous tubes of simple membrane, and comprehends the woody and the laticiferous tissues. On the one hand they are distinguished by their length from the forms of cellular tissue, and on the other hand by their plane membrane from those tissues of which fibre forms a constituent element.

Pleurenchyma, or *Woody Tissue* (*vasa fibrosa* of Link, and *Fasergefässe*, German), is found abundantly in the wood, and especially the liber, of all plants. It is composed of very long, thin, tough, transparent, membranous tubes. No bars or dots are seen in their walls, although when they cross each other the points at which they touch may be taken for such markings. They taper acutely to each end, and do not appear to have any communication one with the other, although they are occasionally seen with open extremities, which Slack supposes to arise from the breaking off of one fibre where it was united to another. In the wood and bark of dicotyledonous plants they are frequently mixed with prosenchyma, and in monocotyledonous plants with parenchyma. They grow by increasing in length both above and below. Their diameter varies from $\frac{1}{150}$ to $\frac{1}{3000}$ of an inch. The walls increase in thickness by the deposition of vegetable jelly, called by Turpin *sclerogen*, to their insides, and in the woody tissue of Betula alba and other trees the sclerogen may be seen forming successive layers around the sides of the tubes. Their form is mostly cylindrical, but in Cycas revoluta Link has observed them assuming a prismatic form.

The tubes of woody tissue are very tough, and will resist considerable force without breaking. It is on this account that they are used extensively in the manufacture of cloths of various kinds. The plants used most commonly for this purpose are the hemp and flax. The fibres of Tilia, Daphne, Lagetta, and of many of the plants of the order of Malvaceæ, are used for making mats, cordage, whips, &c. The following is a comparative statement of the relative strength of silk and some woody fibre:—

Silk supported a weight equal to	34
New Zealand Flax . . .	23¼
Hemp	16¼
Flax	11¾
Pita Flax (Agave Americana) .	7

Woody tissue gives firmness and tenacity to the plant, and assists in conveying the sap from the roots to the leaves.

Cinenchyma, or *Laticiferous Tissue*, consists of tubes which are mostly branched and anastomosing; their walls are exceedingly delicate in young plants, and thicker in old ones; and they are characterised by conveying a fluid called the *latex*, which differs from the sap in other parts of the plant. [Sap.] The older botanists, Spigelius, Malpighi, and Grew described them, but they were generally confounded with woody tissue, till they were very fully investigated by Schultes. In older writers they are called *vasa propria* or *peculiaria*; by Link, *vasa opophora*. Some writers have supposed that they are nothing more than intercellular passages, and have denied that they possess membranous parietes; but their existence has been ascertained, and the observations of Schultes on their structure confirmed by Link, Meyen, Mohl, and others. The walls of these vessels are mostly plain, but have been sometimes observed marked with bars and fibres. They do not exist in all plants, and have not been found at all in the lower forms of Cryptogamia, nor in some of the Phanerogamous plants, as Valisneria and Stratiotes. Their most frequent position is on the sides of spiral vessels, or amongst the bundles of this tissue found in the midrib and nerves of leaves. They are most obvious in the order Euphorbiaceæ, where the latex is of a white colour. This juice is not always coloured or opalescent, but is sometimes quite clear. The tubes are not always regular in size. In some species, as in Glycine Apios, they are irregularly contracted and expanded; in Papaver nudicaule they have a moniliform appearance; in Acer platanoides they are very regular. In the stem they are generally simple, but in very young plants and the younger parts of plants they are branched, and anastomose. (*Fig.* 3.) Link has observed their terminating in blind extremities. In their distribution they gradually diminish in size, and have been traced into the most delicate parts of plants, as the hairs.

Schultes supposes that these vessels perform the same functions in the plant as the arteries and veins in animals. The fluid in them has a peculiar motion, which he calls *cyclosis*. [Sap.]

Fibro-cellular Tissue, or *Inenchyma*, consists of cells formed of membrane, in the inside of which fibre is de-

Fig. 3.

veloped. This tissue may be divided into two kinds, *genuine* and *spurious*; the genuine being that in which the fibre is distinctly marked on the inside of the cell, and the spurious that in which the fibre, either by absorption or the union of its various parts, forms rings, bars, dots, and other appearances on the sides of the cell. The genuine fibro-cellular tissue is mostly found in parenchymatous and prosenchymatous cells. It has been known for a long time amongst botanists, and was first described by Hedwig, who was followed by Moldenhawer and others. They are abundant in the external parchment-like layers of aerial roots of Orchidaceæ, and have been described by Meyen in Oncidium altissimum, Acropera Loddigesii, Brassavola cordata, &c. They occur in the hairs of the pericarp of many of the Compositæ, as in Perdicium taraxaci, Senecio flaccidus, and Trichocline humilis. Horkel has described them in the epidermis of many Labiatæ, as Ziziphora, Ocymum, and many Salviæ. The seed-coats of many plants possess them, as Gilia Ipomopsis, Polemonium Cantua, and Caldaria; and Kippist has lately demonstrated their presence in many of the species of Acanthaceæ. In some of these cases, and many others might be mentioned, the fibre appears to constitute the whole of the cell, as stated under fibrous tissue.

The fibre in these cells varies in its position and form. In the cells of the leaf of Oncidium altissimum they are very distinct, and occasionally branched. In the testa of the seed of Maanandya Barcleyana, where they were first pointed out by Lindley, the fibres run in different directions over each other, forming a network. In the endothecium of Calla æthiopiaca they are parallel, and in this form are very common in the same organ of other plants. In the endothecium of Nymphæa alba the fibres form regular arches arising from a plane base. In the elaters of Jungermannia and in the testa of Acanthodium the cells are greatly elongated, with a single spiral fibre in their interior.

The spurious fibro-cellular tissue includes the porous and dotted cells of many authors; the *cellulæ porosæ et punctatæ* of Link. If a portion of the parenchyma of Viscum album be examined, the inside of the cells will be found to possess a number of bright spots. They were first discovered by Treviranus in Cycas revoluta, and supposed by him to be granules. They were thought by other observers to be pores; hence their name porous cells. Sprengel, Mohl, and Link consider them little vesicles, but Meyen has given a different explanation of their nature. He ascribes their existence to a metamorphosis of the fibres generated in cells. They are often met with in the same cells as fibres, and it is by the union of some parts of the fibre and the absorption of others that the spaces are produced, which when first viewed appear as though they were granules, pores, or vesicles. The same appearance is frequently found in the various forms of fibro-vascular tissue, where there can be little doubt of the spots arising from the irregular formation of the fibres. Even those botanists who do not subscribe to Meyen's view on this point with regard to cellular tissue, admit its correctness in vascular tissue. As it must be admitted that there is no essential difference between the cellular and vascular tissues, it is undoubtedly a correct inference that these spots have the same origin in both tissues.

A transition from porous cells to porous tubes is seen in the tissue which has been called Bothrenchyma. In this tissue, which can be well seen in Phytocrene, as well as Cycas, a number of truncated porous cells are placed one on the other so as to form a cylinder, which becomes a tube by the absorption or removal of the cellular partitions. Porous vascular tissue is referred to this form by Lindley under the name of continuous Bothrenchyma, as the partitions or union of the cells are not visible. Where the points of union of the cells are evident, he calls it articulated Bothrenchyma.

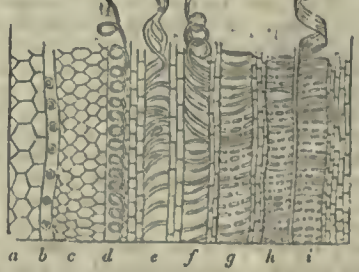
Dotted cells have their walls marked with dark spots. These cells have been observed in the pith of Calycanthus floridus and in the stem of Dracæna terminalis. They appear only to differ from the porous cells in the matter from which they are formed having greater opacity, and not transmitting the light so freely.

Fibro-vascular Tissue, or *Trachenchyma* (*vasa spiroidea* of Link), consists of tubes, in the inside of which spiral fibres are generated. The fibres of this tissue, like the last, are subject to metamorphosis, the consequence of which is, the tubes present the appearances of rings, bars, and bright and dark spots.

The tubes consist of a very delicate membrane, which is mostly cylindrical; it may however assume a prismatical form when the tubes are in bundles and closely pressed together, as in ferns and many monocotyledonous plants. The fibres generated in this tissue are mostly compressed, and wind up the sides of the tube in a spiral form. When the membrane is broken, the fibre in most cases may be unrolled. It is in the younger tubes that this is most easily effected; as in the older tubes those changes go on which connect the membrane and the fibre firmly together, and convert the latter into bars, dots, &c. The number of fibres included in a tube varies; it is frequently single, but in some instances as many as twenty-two have been counted. They have no fixed direction; some pass from right to left, others from left to right. Some difference of opinion has existed as to whether the fibres are tubular or not. Schleiden says in most instances they are solid, but where they are formed from large globules of jelly they appear to be tubular in both vascular and cellular tissue.

Link divides fibro-vascular tissue into *genuine* and *spurious*; the former includes all those vessels which possess perfect fibres. The principal forms of these are the *spiral*, *annular*, and *moniliform* vessels. The *spiral vessel* consists of a tube, in which one or more fibres run continuously along its sides from one end to the other. (*d*, *e*, *f*, *Fig.* 4.) When the fibres are single, they are called

Fig. 4.



simple; when there is more than one, *compound*. The spiral vessels are most abundant in young plants, as their character becomes changed by age. When the fibres adhere to the sides of the membrane, they are said to be *closed*. The spiral vessel was at one time considered a very important tissue, performing especial vital functions. From the circumstance of air being frequently found in them, and this air containing a larger quantity of oxygen than the atmosphere, they were supposed to carry on the function of respiration. Subsequent observation however proves that they as frequently convey liquid as air, and Meyen supposes that they are only filled with air when a larger quantity of fluid ceases to be required by the plant.

Annular vessels or *ducts* consist of tubes with perfect rings of fibre on their sides. (*g*, *Fig.* 4.) These are evidently formed from the interruption of the spires, and the union of the broken ends, as they are frequently found present with a spiral fibre in the same tube. They are mostly larger than the spiral vessels, and the fibre is also thicker: they are very abundant in monocotyledonous

plants; amongst dicotyledons they are found chiefly in quick-growing plants, as Cucurbitaceæ.

Moniliform vessels have successive dilatations and contractions of the tube, and a perfect spiral fibre in their inside. It has been proved by Slack that these vessels derive their peculiar form from accidental compression. They are found in the knots of trees where branches are given off, in roots, and other parts where they meet with obstacles to their longitudinal development.

Spurious fibro-vascular tissue includes *scalariform*, *porous*, and *dotted vessels*. The spurious vessels are not found in the tissues of young plants, and are either developed after the appearance of the genuine spiroids, or are formed from them. Meyen maintains the latter view, but Link and other botanists are still inclined to give to some of the barred and dotted tissues an original development. In the medullary sheath, the spurious spiroids are never found in the young plant, although they are sometimes in the albumen and bark; but it is not necessary that a pure spiral fibre should always be visible previous to its being converted into some one of the forms of spurious spiroids. If in a very large number of cases there is evidence that rings, bars, and dots are formed from the metamorphosis of spiral fibres, we may fairly conclude that in those cases where no observation proves to the contrary, the same effects are to be attributed to the same cause.

Scalariform vessels consist of tubes mostly prismatical, with spots on their walls resembling bars or straps. These bars are placed one above another in a ladder-like form; hence their name. They are abundant in ferns, where the prismatic form of the spiroid is most frequently seen.

Porous vessels are tubes with bright spots upon their walls (*h*, *i*, *Fig.* 4); they constitute the continuous Bothrenchyma of Lindley. They are found in greatest abundance in the old wood of Coniferæ, in the same positions where spiral vessels are found, in the young wood, and also in the roots of plants. The dots constituting what were erroneously thought to be pores, have the same character as those of fibro-cellular tissue. These vessels often attain a great size, measuring as much as a quarter of a line in diameter.

Dotted vessels constitute the tissue which has been called '*glandular woody tissue*,' and to which Meyen applies peculiarly the term *Prosenchyma*. (*Fig.* 3; *b*, *Fig.* 4.) The dotted vessel, like the dotted cell, has dark spots on the inside of its membranous walls; but in addition to the dot there is also a circle. This dot does not appear to be formed by the remains of a partly-absorbed fibre, or the crossing of the fibres, as in some of the forms of porous cells and vessels, but from the sinuous flexures of one or more fibres uniting together and forming between them a little cavity or depression: this is attended with depression of the external membrane, which gives the appearance of the larger circle surrounding the depression. (*Fig.* 2; *b*, *Fig.* 4.) These phenomena make their appearance very early in the tissues of Coniferous plants; but if buds and very young plants are examined, the sinuous spiral vessels, called by Link *vasa spiroida fibrosa*, may be easily seen.

Function.—The function of the tissues of vegetables is not so varied as their forms have led botanists to suppose. As a summary of them we give the following. In the simple cell we have the type of all the other tissues, and in the lowest forms of plants it alone performs all the functions of the higher plants. The cell of the Ustilago absorbs nutriment from without: this nutriment undergoes the changes that fit it for becoming a part of the structure of the cell. This is the process of nutrition. Within this cell another is generated, which is capable of performing the same functions as its parent. This is reproduction. As we ascend in the scale of organization of plants, the structure becomes more complicated. Cells are accumulated together; some simply absorb sap, others expose the sap to the atmosphere; whilst others separate peculiar secretions, and another set are employed as the depositaries of these secretions. As the functions of the plant become more localised in the organs called leaves and flowers, tissues strong enough to bear them up in the air are required, and the cells are elongated and strengthened by an increase of thickness in their membrane, and woody tissue is formed. Where the same objects are required, and at the same time space for a large quantity of fluid to pass through the cells, fibre is generated within the membrane; and for this reason fibro-cellular, and especially fibro-vascular, tissue is found abundant in succulent plants, and in those which require a large supply of moisture. These tissues are absent or very small in dry plants, as well as those which are constantly immersed in water. In the higher plants the conveyance of the prepared juices from one part of the plant to another is provided for by the Laticiferous tissue. It is upon the cell of the ovule in the Dicotyledonous and Monocotyledonous plants that the mysterious dynamic agency is exerted by another cell from the anther, the result of which is the production of another plant, similar to the one from which it is developed. It will thus be seen that all the tissues of plants partake more or less of the functions of the simple cell, which, as the fundamental form of vegetable organization, performs in all cases the most important functions. It is not so much by a difference in the form as by a difference in the function of particular cells that the complicated organs of the highest plants are distinguished from one another.

TITANIC ACID. [TITANIUM.]

TITA'NIUM. This metal was first recognised by Mr. Gregor, in 1791, as a distinct substance; he detected it in a black sand found in the bed of a rivulet near Menaccan in Cornwall. In 1795 Klaproth discovered it in some other minerals, and he gave it the name it now bears. The properties of titanium were not however satisfactorily determined until 1822, when Dr. Wollaston examined and described it as it occurred in its perfect metallic and crystallized state, in the slag of an iron-furnace at Merthyr Tydfil in South Wales. The form of the crystals is the cube; their colour resembles that of bright copper; they are sufficiently hard to scratch rock-crystal, and their specific gravity is 5·3.

Titanium is not acted upon by nitric, hydrochloric, or sulphuric acid, either cold or hot, concentrated or diluted; aqua regia, or nascent chlorine, is also powerless, but a mixture of nitric and hydrofluoric acid dissolves titanium: for fusion an extremely high temperature is required: when strongly heated with nitre, titanium is oxidized and rendered soluble in hydrochloric acid, and it is precipitated from solution by the alkalis in the state of a white oxide.

We shall now describe the principal minerals known to contain titanium, except PYROCHLORE, POLYMIGNITE, ZIRCONIA, &c., which are described under these heads.

Anatase, *Octuedrite*, or *Oisunite.*—This is protoxide of titanium nearly pure. It occurs in attached and imbedded acute octohedral crystals. Primary form a square prism. Cleavage parallel to the terminal planes, and to those of the octohedron. Fracture conchoidal, indistinct. Hardness: scratches phosphate of lime, and is scratched by quartz. By friction becomes negatively electrical, and when heated gives out a reddish yellow phosphorescent light. Colour, various shades of brown, more or less dark, sometimes indigo blue. Streak white. Lustre adamantine. Translucent, transparent. Specific gravity 3·826. It occurs in Cornwall, in Dauphiny, at Bourg d'Oisans, in Spain, Switzerland, and some other places. It consists almost entirely of oxide of titanium, probably the protoxide.

Rutile, or *Titanite: Peroxide of Titanium*, or *Titanic Acid.*—Occurs crystallized and in crystalline masses. Primary form a square prism. Cleavage parallel to the lateral planes. Crystals frequently geniculated. Fracture uneven. Hardness: scratches glass, and sometimes quartz. Colour red, reddish brown, and occasionally yellowish. Streak very pale brown. Lustre adamantine. Translucent, transparent, opaque. Specific gravity 4·249 to 4·4. Occurs not unfrequently inclosed in quartz, in fine red filamentous

crystals. Rutile is found in Perthshire, Bohemia, Switzerland, especially at St. Gothard, and in various other parts of Europe; and also in Brazil and North America. It consists of, according to H. Rose—oxygen, 33·95; titanium, 66·05. It is frequently more or less mixed with oxide of iron and of manganese, and sometimes with oxide of chromium.

Brookite.—Probably a dimorphous variety of rutile. Occurs in attached crystals. Primary form a right rhombic prism. Cleavage parallel to the lateral planes and short diagonal. Fracture uneven. Hardness: scratches fluor-spar, and is scratched by phosphate of lime. Brittle. Colour, deep red, and reddish or yellowish brown. Streak yellowish white. Lustre adamantine. Translucent, transparent, opaque. Specific gravity unknown. Occurs in Dauphiny and Switzerland, but in larger crystals at Snowdon in Wales. It has not been completely analyzed, but appears to be titanic acid with traces of iron and manganese.

The minerals which we shall next describe are the titaniates of iron: they vary greatly both in form and composition, some being crystallized and others granular; the latter are frequently termed titaniferous iron-sand.

Kibdelophan; Axotomous Iron.—Occurs in imbedded crystals. Primary form a rhomboid. Cleavage perpendicular to the axis; distinct. Fracture conchoidal. Hardness 5·0 to 5·5. Brittle. Colour dark iron black. Streak black. Lustre imperfect metallic. Opaque. Specific gravity 4·661. Found at Gastein in Salzburg; in Sweden, and Siberia. Analysis of a specimen from Gastein, by Kobell:—titanic acid, 59·00; protoxide of iron, 36·00; peroxide of iron, 4·25; protoxide of manganese, 1·65.

Ilmenite.—Occurs in imbedded crystals. Primary form a right rhombic prism. No cleavage observed. Fracture uneven to conchoidal, with a vitreous lustre. Hardness 5·0; scratches glass slightly. Colour black. Opaque. Specific gravity 5·43. It is found near Lake Ilmen in Siberia. Analysis by Mosander:—titanic acid, 46·92; protoxide of iron, 37·86; peroxide of iron, 10·74; protoxide of manganese, 2·73; magnesia, 1·14.

Crichtonite.—Occurs in attached crystals. Cleavage parallel to the axis. Fracture conchoidal, splendent. Hardness: scratches fluor-spar, but not glass. Brittle. Does not obey the magnet. Colour shining black. Streak black. Lustre imperfect metallic. Opaque. Specific gravity 4. It has not been completely analyzed; but, according to Berzelius, it consists of titanic acid and oxide of iron.

Mohsite.—Occurs in attached macled crystals. Primary form a rhomboid. No visible cleavage. Fracture conchoidal, shining. Hardness: scratches glass readily. Brittle. Does not affect the magnet. Colour iron black. Streak black. Lustre metallic. Opaque. Found in Dauphiny. It appears to be a titaniate of iron, but has not been completely analyzed.

Of granular titaniate of iron and titaniferous iron-sand, we shall describe three varieties:—

Nigrin.—Occurs in flat rounded grains of about the size of a pea, with occasional indications of a crystalline form. Structure foliated. Very hard. Brittle. Colour greyish black. Lustre metallic. Specific gravity 4·445. Analysis by Klaproth:—titanic acid, 84; protoxide of iron, 14; protoxide of manganese, 2. Found in Transylvania.

Menaccanite.—Occurs in small angular grains. Structure imperfectly lamellar. Fracture fine-grained, uneven. Hardness—yields to the knife. Colour greyish black. Lustre glistening. Opaque. Specific gravity 4·427. Occurs in rivulets in the parish of St. Keverne, Cornwall; it has also been found in New South Wales. The picked grains, analyzed by Dr. Colquhoun, gave—titanic acid, 57·187; protoxide of iron, 39·780; protoxide of manganese, 2·175.

Iserine.—Occurs in very small flattish angular grains, which have a rough glimmering surface. Structure lamellar. Cross fracture conchoidal. Very hard. Slightly attracted by the magnet. Opaque. Lustre semi-metallic. Specific gravity about 4·5. Found on the Riesengebirge, near the origin of the river Iser in Silesia; in Bohemia; in the river Don in Scotland, and that of the Mersey opposite Liverpool. By the analysis of H. Rose, it consists of—titanic acid, 50·12; protoxide of iron, 49·88. It is probably a variety of Menaccanite.

Greenovite: Titaniate of Manganese.—Occurs in small amorphous masses and crystallized. Primary form probably an oblique rhombic prism. Hardness, greater than that of fluor-spar or phosphate of lime, but does not scratch glass. Colour deep rose red; the crystals are splendent, except the terminal faces, which are often dull and tarnished. Specific gravity 3·44. It is found in the manganese deposit of St. Marcel in Piedmont. Analysis by M. Carearié:—titanic acid, 74·5; oxide of manganese, 24·8.

Sphène; Spinthère: Silico-titaniate of Lime.—Occurs in attached and imbedded crystals, and massive. Primary form an oblique rhombic prism. Cleavage indistinct. Fracture even, slightly conchoidal. Hardness: scratches phosphate of lime, but is scratched by felspar. Colour, various shades of grey, green, yellow, and brown. Streak white or greyish-white. Lustre adamantine, resinous. Transparent, translucent, opaque. Specific gravity 3·468 to 3·6. Sphène is found interspersed in primary rocks, as in granite and gneiss, and more particularly in syenite, in Norway, Germany, Switzerland, and also in America. The results of the analysis of sphene vary considerably; the following is by Klaproth:—titanic acid, 33; silicic acid, 35; lime, 33.

Aeschynite.—Titaniate of zirconia and cerium, &c. Occurs crystallized. Primary form a right rhombic prism. Cleavage difficult, and only parallel to the basis of the primary form. Fracture conchoidal. Hardness: scratches phosphate of lime, and is scratched by felspar. Colour black; streak greyish-black. Lustre resinous. Opaque. Specific gravity 5·14. Found at Miask, in the Uralian Mountains, Siberia. Analysis by Hartwall:—titanic acid, 56·0; zirconia, 20·0; oxide of cerium, 15·0; lime, 3·8; oxide of iron, 2·6; oxide of zinc, 0·5.

The principal natural substances containing titanium being now described, we proceed to consider its artificial compounds.

Oxygen and Titanium.—It has already been stated that these combine with difficulty by direct means. When rutile, or titanic acid, is dissolved in hydrochloric acid, a piece of zinc immersed in the solution occasions the formation and precipitation of a deep purple-coloured powder, which is protoxide of titanium: so great however is the facility with which it returns to the state of peroxide, that it cannot be collected; and hence the composition of this oxide has not been perfectly determined. It is however probably composed of—

One equivalent of oxygen .	8
One equivalent of titanium .	24
Equivalent . .	32

When also titanic acid is exposed to a strong heat, a portion of it loses oxygen, and a black mass is formed, which is the protoxide; it has an earthy fracture, is insoluble in acids, and difficult to reconvert to the titanic acid. It has been already mentioned that anatase is probably the protoxide of titanium.

Peroxide of Titanium, Titanic Acid.—Rutile is titanic acid nearly pure: when it is reduced to fine powder and fused in a platina crucible, with three times its weight of carbonate of potash, titaniate of potash is obtained, mixed with some excess of carbonate of potash; this is to be removed by washing with water, and titanic acid is then precipitated by dilution and heat; and after washing with dilute hydrochloric acid, is nearly pure titanic acid. Its properties are, that when pure it is quite white, very infusible, and after it has been heated is soluble only in hydrofluoric acid. Its acid powers are feeble; it is insoluble in water, and does not act on vegetable blues; it combines however with alkalis and metallic oxides, forming salts which are termed *titaniates*. It is probably composed of—

Two equivalents of oxygen .	16
One equivalent of titanium .	24
Equivalent . .	40

Chlorine and Titanium combine when the gas is passed over metallic titanium at a red heat. It is a colourless transparent fluid, and boils at a little above 212°, is volatilized, and condenses unchanged. When exposed to the air it deliquesces, and when a few drops of it are mixed with an equal bulk of water, combination takes place with considerable violence and the evolution of intense heat. It absorbs dry ammoniacal gas, and from the compound so

obtained Liebig prepared metallic titanium. It appears to consist of—

Two equivalents of chlorine	72
One equivalent of titanium .	24
Equivalent . .	96

Tincture of galls, when added to a solution of titanic acid, occasions an orange-red colour, probably owing to the tannic acid which the tincture contains; this is very characteristic of the presence of titanic acid.

The other compounds of titanium are but little known; the peroxide, or titanic acid, unites both with bases and acids to form saline compounds: the former are called *titaniates*.

TITANS (Τιτᾶνες, fem. Τιτανίδες) is the name by which in the mythology of antient Greece a certain class of sons and daughters of Uranus and Gaea are designated. The original name of Gaea was said to have been Titaea, from which Titans was derived. (Diodorus Sic., iii. 56.) The beings generally comprised under the name of Titans were Oceanus, Coeus, Crius, Hyperion, Iapetus, Cronus, Thetys, Rhea, Themis, Mnemosyne, Phœbe, Dione, and Theia. (Apollodor., *Biblioth.*, i. 1, 3; Diodorus Sic., v. 66.) Other writers, as Stephanus of Byzantium (*s. v.* Ἄδανα), Pausanias (viii. 37, 3), and others, differ both in the names and numbers of the Titans. Uranus had by Gaea two other sets of children, viz. the Hecatoncheires (centimani, or beings with a hundred arms), and the Cyclops; and these two he cast into Tartarus, at which Gaea, their mother, was so indignant, that she induced the Titans to revolt against their father, Uranus, and gave to Cronus an adamantine sickle with which he castrated his father. Oceanus took no part in this rebellion. After Uranus was deprived of the sovereignty, and the Hecatoncheires together with the Cyclops were led back from the lower world, the supreme power was given by the brothers to Cronus. But Cronus again threw them into Tartarus, and married his sister Rhea; as however Gaea and Uranus had prophesied to him that he would be deprived of the sovereignty by his own children, he devoured all the children whom Rhea bore him. But when she was pregnant with Zeus, she withdrew to Crete, where she gave birth to him in a cavern, and afterwards had him educated by the Curetes and nymphs. To deceive Cronus, she had given him a stone wrapt up like a child, which he devoured. When Zeus had grown up, he took Metis, the daughter of Oceanus, and with her assistance he administered a poison to Cronus, which made him vomit out the children he had swallowed, viz. Hestia, Demeter, Hera, Pluto, and Poseidon, and with their aid Zeus now commenced a war against his father, which lasted for ten years. This struggle, celebrated in mythology as the war of the Titans, was terminated by Zeus relieving the Cyclops from Tartarus, and by his gaining with their weapons the victory over the Titans, who were now cast into Tartarus, and were guarded there by the Hecatoncheires. Zeus and his brothers now divided the sovereignty of the world among themselves. (Apollodor., *Biblioth.*, i. 1 and 2.)

The name Titan has also been given to those superhuman beings who were descended from the Titans, such as Prometheus, Hecate, Latona, Pyrrha, Helios, &c. It moreover occurs as a designation of a very early race of men in Crete and Egypt.

(Lobeck, *Aglaophamus*, p. 763; Böttiger, *Ideen zur Kunstmythologie*, p. 217, &c.; Völcker, *Mythologie des Japetischen Geschlechtes*, p. 280, &c.)

TITCHFIELD. [Hampshire, vol. xii., p. 32.]

TITHES are the tenth part of the increase yearly arising and renewing from the profits of lands, the stock upon lands, and the personal industry of the inhabitants, and are offerings payable to the church by law.

Under the theocratic government of the Jews the tenth part of the yearly increase of their goods was due to the priests by divine right. 'And behold I have given the children of Levi all the tenth in Israel for an inheritance, for their service which they serve, even the service of the tabernacle of the congregation.' (*Numbers*, xviii. 21.) And again, 'Thou shalt truly tithe all the increase of the seed, that the field bringeth year by year.' (*Deut.*, xiv. 22.) 'And all the tithe of the land, whether of the seed of the land or of the fruit of the tree, is the Lord's; it is holy unto the Lord.' 'And concerning the tithe of the herd or of the flock, even of whatsoever passeth under the rod, the tenth shall be holy unto the Lord.' (*Levit.*, xxvii. 30, 32.)

In the earliest ages of the Christian church offerings were made by its members at the altar, at collections, and in other ways, and such payments were enjoined by decrees of the church and sanctioned by general usage. For many centuries however they were voluntary, and not enforced by any civil laws. When the church was struggling against persecution, the Christians brought all their worldly goods into a common stock for the benefit of all. 'And the multitude of them that believed were of one heart and of one soul: neither said any of them that aught of the things which he possessed was his own; but they had all things in common.' 'Neither was there any among them that lacked; for as many as were possessors of lands or houses sold them, and brought the prices of the things that were sold, and laid them down at the apostles' feet: and distribution was made unto every man according as he had need.' (*Acts*, iv. 32, 34, 35.) They then had no other object than the defence and support of their faith; they required no compulsion to make offerings to their infant church. But when the church had increased in power, and began to number amongst its members many who adhered to it because it was the prevailing religion, rather than on account of any enthusiasm or reverence for its divine origin and doctrines, it was found necessary to enforce certain fixed contributions for the support of the ministers of religion. The church relied upon the example of the Jews, and required a tenth to be paid. Meanwhile the conversion of temporal princes to Christianity, and their zeal in favour of their new faith, enabled the church to obtain the enactment of civil laws to compel the payment of tithes. In England the first instance of a law for the offering of tithes was that of Offa, king of Mercia, towards the end of the eighth century. He first gave the church a civil right in tithes, and enabled the clergy to recover them as their legal due by the coercion of the civil power. The law of Offa was at a later period extended to the whole of England by king Ethelwulph. (Prideaux, *On Tithes*, 167.)

At first, though every man was obliged to pay tithes, the particular church or monastery to which they should be paid appears to have been left to his own option. In the year 1200, however, Pope Innocent III. directed a decretal epistle to the archbishop of Canterbury, in which he enjoined the payment of tithes to the parsons of the respective parishes in which they arose. This parochial appropriation of tithes has ever since been the law of the land. (Coke, 2 *Inst.*, 641.) The same pope gave similar instructions in other countries at about the same time.

The tithes thus payable were of three kinds, viz. *prædial*, *mixed*, and *personal*. *Prædial* tithes are such as arise immediately from the ground, as grain of all sorts, fruits, and herbs. *Mixed* tithes arise from things nourished by the earth, as colts, calves, pigs, lambs, chickens, milk, cheese, and eggs. *Personal* tithes are paid from the profits arising from the labour and industry of men engaged in trades or other occupations; being the tenth part of the clear gain, after deducting all charges. (Watson, *On Tithes*, c. 49.)

Tithes are further divided into *great* and *small*. The former consist of corn, hay, wood, &c.; the latter of the prædial tithes of other kinds, together with mixed and personal tithes. This distinction is arbitrary, and not dependent upon the relative value of the different kinds of tithe within a particular parish. Potatoes, for instance, grown in fields have been adjudged to be small tithes, in whatever quantities sown (Smith *v.* Wyatt, 2 Atk., 364), while corn and hay, in the smallest portions, still continue to be treated as great tithes. The distinction is of material consequence, as great tithes belong, of right, to the rector of the parish, and small tithes to the vicar.

No tithes are paid for quarries or mines, because their products are not the increase, but are part of the substance of the earth. Neither are houses, considered separately from the soil, chargeable, as having no annual increase. By the common law of England no tithe is due for things that are *feræ naturæ*, such as fish, game, &c.; but there are local customs by which tithe has been paid from such things from time immemorial, and in those places such customary tithes may be exacted. Tame animals kept for pleasure or curiosity are also exempt from tithes.

Tithes were all originally paid in kind, *i.e.* the tenth wheat-sheaf, the tenth lamb or pig, as the case might be, belonged of right to the parson of the parish as his tithe. The inconvenience and vexation of such a mode of payment are obvious. The practice could only have originated in times and in countries in which barter formed the only means of exchange, and the products of the earth were the sole test of value. The improved habits and civilization of centuries were nevertheless unable to alter what had been sanctioned by custom since the memory of man, and no attempt had been made in this country, until very recently, to introduce a general improvement in the mode of collection. The inconvenience of paying tithes in kind must long since have been felt, and certain modes of obviating it were occasionally practised. Sometimes the owner of land would enter into a composition with the parson or vicar, with the consent of the ordinary and the patron of the living, by which certain land should be altogether discharged from tithes, on conveying other land, or making compensation. In other words, the owner of the land purchased an exemption from tithes. Such arrangements between landowners and the church were recognised by law, but it was found that they were often injurious to the church by reason of an insufficient value being given for the tithes. The acts 1 Elizabeth, c. 19, and 13 Elizabeth, c. 10, were accordingly passed, which disabled bishops, colleges, chapters, parsons, and vicars from making any alienation of church property for a longer term than twenty-one years or three lives. In order to establish an exemption from tithes on the ground of a real composition, it is therefore necessary to show that such composition had been entered into before the statute of Elizabeth. Since that time compositions have rarely been made, except under the authority of private acts of parliament.

Another method of avoiding the payment of tithes in kind was that of a *modus decimandi*, commonly known as a *modus*. This consists of any custom in a particular place, by which the ordinary mode of collecting tithes has been superseded by some special manner of tithing. In some parishes the custom has prevailed, time out of mind, of paying a certain sum of money annually for every acre of land, in lieu of tithes. In others a smaller quantity of produce is given, and the residue is made up in labour, as every 12th sheaf of wheat instead of the 10th, but to be housed or threshed by the owner.

A large portion of the land of this country is tithe-free, from various causes. Some has been exempted under real composition, as already explained, and some by prescription, which supposes a composition to have been formerly made. The most frequent ground of exemption is that the land once belonged to a religious house, and was therefore discharged in this manner. All abbots, priors, and other chief monks originally paid tithes from the lands belonging to them, until Pope Paschal II. exempted all spiritual persons from paying tithes of lands in their own hands. This general discharge continued till the time of King Henry II., when Pope Adrian IV. restrained it to the three religious orders of Cistercians, Templars, and Hospitalers, to whom Pope Innocent III. added the Præmonstratenses. These four orders, on account of their exemption, were commonly called the privileged orders. The Council of Lateran, in 1215, further restrained this exemption to lands in the occupation of those religious orders of which they were in possession before that council. Bulls were however obtained for discharging particular monasteries from the payment of tithes, which would not otherwise have been exempt; by which means much land has been ever since tithe-free. Another mode by which lands belonging to religious houses became not liable to the payment of tithes, was that of *unity of possession*; as where the lands and the rectory belonged to the same establishment, which would not, of course, pay tithes to itself. Yet the lands were not absolutely discharged by this unity of possession, for upon any disunion the payment of tithes was revived; so that the union only suspended the payment. The act 31 Hen. VIII., c. 13, which dissolved several of the religious houses, continued the discharge of their lands from tithes, though in the possession of the king or any other person. Many monasteries had previously been dissolved by act of parliament, but as no such clause as that contained in the 31 Hen. VIII. had been introduced into other acts, the lands of the monasteries dissolved by them became chargeable with tithes.

We have stated enough concerning the nature of tithes and the various circumstances affecting them, to show how complicated must be the laws, and how entangled the interests of different parties who had to pay or to receive them. But apart from such considerations it may be well to inquire whether tithes be, in their original nature, a fit mode of supporting a religious establishment; and if not, in what manner they might be made so. There can scarcely be a doubt that the payment of tithes in kind is a cause of constant irritation and dispute between a clergyman and his parishioners. With the best intentions on both sides, the very nature of tithes is such, that doubts and difficulties must arise between them; and even where there is no doubt, the form and principle of payment are odious and discouraging. The hardships and injustice of tithes upon the agriculturist are well described by Dr. Paley:—'Agriculture is discouraged by every constitution of landed property which lets in those who have no concern in the improvement to a participation of the profit: of all institutions which are in this way adverse to cultivation and improvement, none is so noxious as that of tithes. A claimant here enters into the produce who contributed no assistance whatever to the production. When years perhaps of care and toil have matured an improvement; when the husbandman sees new crops ripening to his skill and industry; the moment he is ready to put his sickle to the grain, he finds himself compelled to divide his harvest with a stranger.' (*Moral and Political Philosophy*, chapter xii.)

If tithes then be in principle an injurious and restrictive tax upon agriculture, and if the mode of collection be vexatious and unpopular, it became the duty of a legislature to provide a remedy for these evils. But tithes are unlike any other tax, which being found injurious to the state, may be removed on providing others. They are not the property of the state, but of its subjects; they are payable not only to the church, but to lay impropriators; they have been the subject of innumerable private bargains; land has been sold at a higher price on account of its exemption from tithe; the value of the patronage of the greater portion of the livings of this country is dependent upon the existing liability of land to tithes; in short, the various relations of society have been for centuries so closely connected with the receipt and payment of tithes, that to have abolished them would have been a gross injustice and spoliation to many, and no advantage to the community; for the whole profit would immediately have been enjoyed by those whose lands were discharged from payments to which they had always been liable, and subject to which they had most probably been purchased.

As for these reasons the extinction of tithes was impracticable, a commutation of them has been attempted and has been found most successful. Dr. Paley, who saw so clearly the evils of tithes, himself suggested this improvement. 'No measure of such extensive concern appears to me so practicable, nor any single alteration so beneficial, as the conversion of tithes into *corn-rents*. This commutation, I am convinced, might be so adjusted as to secure to the tithe-holder a complete and perpetual equivalent for his interest, and to leave to industry its full operation and entire reward.' (*Moral and Political Philosophy*, chapter xii.) This principle of commutation was first proposed to be applied by the legislature to Ireland. In addition to the common evils of a tithe system, that country was labouring under another. Its people were paying tithes for the support of a clergy possessing a religion at variance with their own. Resistance to the payment of tithes occasioned by this appropriation of them had become so general, that a commutation was deemed absolutely necessary for the safety of the church of Ireland. It was recommended by committees of both houses of parliament in 1832, but not finally carried into effect until 1838.

The statutes for the general commutation of tithes in England are the 6 & 7 Will. IV., c. 71, the 7 Will. IV. and 1 Vict., c. 69, the 1 & 2 Vict., c. 64, the 2 & 3 Vict., c. 32, and the 5 & 6 Vict., c. 54. Their object is to substitute a rent-charge, payable in money, but fluctuating according to the average price of corn for seven preceding years, for all tithes, whether payable under a *modus* or composition, or not. A voluntary agreement between

the owners of the land and of the tithes was first promoted, and in case of no such agreement, a compulsory commutation was to be effected by commissioners. In case of dispute, provision was made for the valuation and apportionment of tithe in every parish. The rent-charge was to be thus calculated:—The comptroller of corn returns is required to publish in January the average price of an imperial bushel of British wheat, barley, and oats, computed from the weekly averages of the corn returns during seven preceding years. Every rent-charge is to be of the value of such number of imperial bushels and decimal parts of an imperial bushel of wheat, barley, and oats, as the same would have purchased at the prices so ascertained and published, in case one-third of such rent-charge had been invested in the purchase of wheat, one-third in barley, and the remainder in oats. For example, suppose the value of the tithe of a parish to have been settled by agreement or by award at 300*l*., and that the average price of wheat for the seven preceding years had been 10*s*. a bushel, of harley 5*s*., and of oats 2*s*. 6*d*.; the 300*l*. would then represent 200 bushels of wheat, 400 bushels of barley, and 800 bushels of oats. However much the average prices of corn may fluctuate in future years, a sum equal in value to the same number of bushels of each description of corn, according to such average prices, will be payable to the tithe-owner, and not an unvarying sum of 300*l*. The quantity of corn is fixed, but the money payment to the tithe-owner varies with the septennial average price of corn. Land not exceeding 20 acres may also be given by a parish, on account of any spiritual benefice or dignity, as a commutation for tithes to ecclesiastical persons, but not to lay impropriators. (6 & 7 Will. IV., c. 71, s. 26-28.)

By the last Report of the tithe commissioners, it appears that already voluntary proceedings have commenced in 9381 tithe districts; 6348 agreements have been received, of which 5804 have been confirmed; 2178 notices for making awards have been issued; 1355 drafts of compulsory awards have been received, of which 1030 have been confirmed; 5220 apportionments have been received, of which 4347 have been confirmed. Of the whole business of assigning rent-charges and apportioning them, about half is completed.

The complete and final commutation of tithes must be regarded as a most valuable measure. It is perfectly fair to all parties, and is calculated to add security and permanence to the property of the church, and to remove all grounds of discord and jealousy between the clergy and their parishioners. Nor must we omit to mention an improvement in the mode of recovering tithes, consequent upon the commutation. There were formerly various modes of recovery, in the ecclesiastical as well as in the civil courts, and before justices of the peace, all more or less leading to unseemly litigation. The present mode of recovering the rent-charge, if in arrear, is by distraining for it in the same manner as a landlord recovers his rent; and if the rent-charge shall have been forty days in arrear, possession of the land may be given to the owner of the rent-charge until the arrears and costs are satisfied. Indeed the whole principle of the tithe commutation Acts is to strip tithes of the character of a tax, and to assimilate them as much as possible to a rent-charge upon the land.

[Agriculture; Benefice; First-Fruits; Impropriations; Tax, Taxation; Taxatio Ecclesiastica; Tenths.]

TITHING (*Tithinga*; from the Saxon, *Theothunge*) is an antient municipal division of land in England under the Saxon kings. The whole country was divided into tithings and hundreds by Alfred the Great. The former was a district containing ten heads of families; the latter comprised ten tithings, or one hundred heads of families. Every tithing had its chief man annually appointed to preside over the rest, who was called the tithing-man or borsholder, and sometimes the headborough or borough's elder. Each of these little communities was bound to keep the peace within their own jurisdiction, and the members were responsible for each other. So important were these associations deemed to be, that no man was allowed to abide in England above forty days without being enrolled in some tithing. Although the institution has long ceased, the name and division are still retained in many parts of England.

TITI, SANTI DI, an Italian painter and architect, born of a noble family at Borgo San Sepolcro in Tuscany, 1538, was a scholar of Bronzino's, and, according to Lanzi, also studied under Cellini. While at Rome he was employed upon some subjects in the chapel of the Palazzo Salviati, and painted a St. Jerome in San Giovanni de' Fiorentini, besides executing several works in the Belvedere of the Vatican. He returned to Florence in 1566, with a reputation for great ability in design; nor was such reputation at all diminished by the works he there produced, for among them are some of his best, including his Resurrection and Supper at Emmaus, in Santa Croce; of which, and of his other performances, a full account is given by Borghini, in his 'Reposo.' It was also at Florence that he chiefly exercised his profession of architect. The Casa Dardanelli, the Villa Spini at Peretola, and his own house at Florence, are enumerated among his works of that class, but without much commendation; although he is said to have displayed great taste in some of his architectural backgrounds in painting, in which he also showed great knowledge of perspective. His pencil was frequently employed on merely temporary decorations, either on occasions of solemn funeral obsequies or splendid festivities, of which latter kind were those which he painted at the celebration of the nuptials of the duke of Braceiano. Santi died in 1603, leaving a son named Tiberio, who was also an artist, and who did not long survive him.

TITIAN. [Vicellio, Tiziano.]

TITICA'CA, LAKE. [Bolivia, vol. v., p. 86.]

TITLARKS. Mr. Swainson characterises the *Titlarks* (genus *Anthus*) as slender-shaped birds, having the plumage and long hinder toes of the true larks, but with the slender bills of the *Wagtails;* and he places the former next to the East Indian genus *Enicurus*, which in his view succeeds to the Wagtails (*Motacilla* and *Budytes*). *Anthus* indeed seems to him to have its position at the very extremity of the Dentirostres, just as the family of the *Alaudinæ*, or True Larks, is in the circle of the *Conirostres;* 'in other words, they are not only analogous, but this analogy actually blends into an affinity.' (*Classification of Birds*. [Larks.] In the *Synopsis*, at the conclusion of the work, *Anthus* is arranged as the last genus of the *Motacillinæ*, with the following

Generic Character.—Bill very slender, the sides compressed, the upper mandible longest, with the tip deflected over the lower, and distinctly notched. Wings moderate; the four first quills nearly equal: tertials obtuse, lengthened. Tail moderate, slightly forked. Legs slender, black. Tarsus and middle toe equal. Lateral toes and claws of the same length and size. Example, *Anthus aquaticus* (*Fauna Boreali-Americana*, pl. 44). The Prince of Canino also places the genus *Anthus* among the *Motacillinæ*, which, in his arrangement, is the sixth subfamily of the *Turdidæ*.

The True Larks are placed by the Prince, in the same highly useful work (*Birds of Europe and North America*), under the *Alaudinæ*, the fourth subfamily of the *Fringillidæ*, standing between the *Emberizinæ* and the *Loxinæ*.

The *Alaudinæ* of the Prince comprise the following

Genera.—*Certhilauda*, Sw.; *Alauda*, Linn.; *Galerida*, Boie; *Philereuios*, Brehm (*Eremophilus*, Boie); and *Melanocorypha*, Boie. Mr. G. R. Gray (*List of the Genera of Birds*) also makes *Anthus* one of the genera of his *Motacillinæ*, placing it between *Ephthianura*, Gould, and *Corydalla*,* Vigors. The *Motacillinæ*, in Mr. Gray's arrangement, form the seventh subfamily of his *Luscinidæ*.

The True Larks (*Alaudinæ*) are arranged by him as the sixth subfamily of the *Fringillidæ*, with the following

Genera.—*Alauda*, Linn.; *Galerida*, Boie; *Otocoris*, Bonap.; *Melanocorypha*, Boie; *Saxilauda*, Less.; *Erana*, G. R. Gray; *Mirafra*, Horsf.; *Calandrella*, Kaup; *Fringalauda*, Hodgs.; *Megalophonus*, G. R. Gray; *Macronyx*, Sw.; and *Certhilauda*, Sw.

The *Alaudinæ* are placed by this zoologist between the *Emberizinæ* and the *Pyrrhulinæ*.

But we must now return to the *Titlarks*, and we quite agree with Mr. Yarrell, who, in his *British Birds*, observes that it would assist correct definition if, among ourselves, the term *Titlark* could be discontinued entirely; 'the Tree

* In the Appendix Mr. Gray states that *Pipastes*, Kaup, and *Leimoniptera*, Kaup, should come next to *Anthus*, and that Mr. Swainson's genus *Agrodroma* should be placed here.

Pipit being called the Titlark by some, the Meadow Pipit a Titlark by others; and round the sea-coast, where the Rock Pipit is generally the most frequent of the three, that is also called Titlark.'

Bechstein separated the Pipits from the true Larks, giving the former the generic appellation of *Anthus*, and Mr. Yarrell elevates them into a family, *Anthidæ*.

The following species are British:—

The Tree Pipit, *Anthus trivialis*; the Meadow Pipit, *Anthus pratensis*; the *Rock Pipit*, *Anthus obscurus* (*Anthus petrosus*, Flem., Jen.; *Anthus aquaticus*, Selby, Gould; *Alauda obscura*, Auct.); and *Richard's Pipit*, *Anthus Ricardi*.

The *Titlark* of Pennant is the *Meadow Pipit* of the above list; and Mr. Yarrell well observes that scarcely any two British birds have been so frequently confounded together as the Tree and the Meadow Pipits; but when the two species are examined in hand, obvious and constant distinctions appear; and there are, he adds, besides, differences in the habits of these birds, as well as in the localities they each frequent. 'The Tree Pipit is rather the larger bird of the two; the beak is stouter and stronger; the spots on the breast longer and fewer in number; the claw of the hind toe is not so long as the toe itself; the tertial feathers of the wings are rather longer in proportion to the primaries; the white on the outer tail-feather on each side is neither so pure in colour, nor is it spread over so large a portion of the feather; and, as far as my own observation goes, it does not appear to be so numerous as a species as the Meadow Pipit.'

Unlike the Meadow Pipit, the *Tree Pipit* is a summer visitor, only arriving in our well-wooded enclosures towards the end of April. The male generally begins his agreeable song from the top of a bush or an upper branch of some 'hedge-row elm;' from his perch he rises into the air, his wings shivering, till he has reached an elevation about as high again as the tree from which he started. As soon as he has attained his greatest height he poises his wings, spreads his tail and slowly descends, singing all the while, to the same station whence he rose, or the top of some neighbouring tree. The nest, placed generally on the ground, is framed of moss, root-fibres, and withered grass, lined neatly with bents and hairs. The eggs, four or five in number, vary much in colour in different nests. Mr. Yarrell considers the most characteristic hue to be greyish-white clouded and spotted with purple-brown or purple-red; the length of the egg about 10 lines, diameter 8. Food, insects and worms. Total length of the bird about 6½ inches. This bird must not be confounded with the Wood-Lark.

The winter-quarters of this species are probably in Northern and Western Africa. It is a Madeira bird, and also inhabits Japan.

The *Meadow Pepit* remains with us throughout the year, and is the smallest and most common species, its total length being 6 inches only. It haunts heathy and hilly districts, as well as meadows and marsh-lands. Mr. Yarrell thus describes its habits:—'When progressing from place to place, the flight of this bird is performed by short unequal jerks; but when in attendance on its mate and undisturbed, it rises with an equal vibratory motion, and sings some musical soft notes on the wing, sometimes whilst hovering over its nest, and returns to the ground after singing. Occasionally it may be seen to settle on a low bush; but is rarely observed sitting on the branch of a tree, or perched on a rail, which is the common habit of the Tree Pipit. The Meadow Pipit, when standing on a slight mound of earth, a clod, or a stone, frequently moves his tail up and down like a wagtail; and Mr. Neville Wood mentions that he has heard him sing while thus situated on or very near the earth. The Meadow Pipit seeks its food on the ground, along which it runs nimbly in pursuit of insects, worms, and small slugs. In the stomach of one of these birds, examined in the month of December, Mr. Thompson, of Belfast, found two specimens of *Bulimus lubricus*. It is, according to the last-named zoologist, the *Moss-cheeper* of the north of Ireland, a name which Sibbald gives as applied to it in Scotland.

Nest on the ground, generally among grass, made of dried bents on the outside, with a lining of finer ones and a few hairs: eggs from four to six, reddish brown mottled with darker; length nine lines by seven.

Pennant gives *Cor Hedydd* as the Welsh name of the Titlark, and *Hedydd y cae* as that of the Field-lark, *Alauda minor*.
